The most brilliant minds in the country are being turned not to practical daily problems like these, which concern every living being for the greater part of his or her life, but to other and far less important problems. Trace the course of a clever boy or girl. The boy is taught Latin, Greek, arithmetic, French, and so on, in a remarkably inadequate fashion. Later on he has to decide in what direction to turn his brain. He probably thinks of the Church, the Bar, the Army, the Civil Service, farming, teaching, business, &c. In the future he will put prominently on his list the practical study of the body, as the Americans are already doing in their universities, under the able leadership of such men as Dr Anderson of Yale, and the instructors at Harvard, Columbia, Princeton, &c. In the future some of the very best men and women will, I repeat, devote their very best energies to the improvement of the body and the first and most feasible means to it. The idea of a university without a Professor of Physical Culture -not a mere military drill-man, but a man of education and mental and moral culture—will be too ridiculous to be believed! And, depend upon it, these intelligent people will not make such mistakes as our pedantic 'authorities' so often make to-day. Like Professor Luther Gulick in America, they will, for example, examine the question of the importance of play in education. They will not dictate absurdities from some ill-ventilated study, as 'learned' fossils do to-day. They will search for useful truth. They will recognise the value of play of the right sort—a value physical and hygienic, esthetic, intellectual, economical, social, prospective, cumulative. They will insist on play as an integral part of education. As a consequence, there will be in the future facilities for play. Truly today our masses are starved for want of play, as they are for want of the occasional sight of green fields, silver rivers, yellow sands, blue sea, and forest, mountain, and valley.

As a second consequence, there will be, in the future, training for play. The intelligent directors of the nation's education, including its play, will not only utilise spaces for games and adapt these games so as to make them appeal to all; they will also comprise in the fundamental physical training, in the A B C of the body's arts, some exercises that will make the play of the great English games and sports not only safer, but also more successful and more enjoyable.

I know this may sound far-fetched. Many of those who are sufficiently advanced to recognise the importance of physical culture and play, still think that physical culture should be serious and dull (like the declension of mensa and dominus), and that play should simply be played, never prepared for, as if it did not matter how badly people played! I contend, however, that this is wrong. Play has its lessons. These lessons are not properly learned unless play is properly practised. I feel sure that while the play should be played so long as the game lasts, and played with heart and soul, the alphabet of the play, the fundamental movements (corresponding to the correct movements of the wrist and fingers in piano-playing, or of the vocal organs in voice-production) should be mastered before the game begins and between games.

I may here mention an interesting point. When, several years ago, I was asked to write a comprehensive work on physical education, I very carefully went into and analysed various systems of physical culture with a view to finding out which systems, or rather which movements, were most valuable practically for all-round training of the body with a view to real health and fitness, as distinct from mere athletic achievement; and I found that the movements of our great English games, especially cricket, football, hockey, racquets, lawn-tennis, fives, &c., and sports, were, when correctly performed, as good as the movements of any orthodox systems, and much better than the movements of most. So that the training of the body to prepare for a reasonable standard of success in all games and sports would serve also as general physical culture.

One point, however, is to be noted, and it has an important bearing on this subject of the exercise of the future. I should be willing to stake my very existence on the fulfilment of the following prophecy. The exercise of the future will include adequate training of the left side, and especially of the left hand. The left hand of the future man and woman will not be a clumsy thing, nor will it usurp the functions of the right hand. But, if only for the sake of self-respect, symmetry, and the relief of the right hand, especially in case of accident, it will be skilful, and capable of independent action. The exercise of the future will not, like so many systems of to-day (based on custom and ignorance), do most of its movements with the two hands working alike. As I said before, the exercise of the future will be devised-and from time to

time emended—by intelligent and educated men who shall have their mind's eye on the best possible all-round results, æsthetic as well as muscular. These men will insist that each hand be able to work while the other either rests (scarcely one person in a hundred properly rests his unused and unwanted hand) or else, if required, performs a different task—here, again, most people are lamentably incompetent and clumsy.

Such seem to me to be some of the main respects in which the exercise of the future will differ from the exercise of the present, or, alas! the almost exerciseless sedentariness of the present. In the future, thanks to more generally practised, more scientific, more sensible, more interesting, more truly educational exercise, we shall find a people with stronger lungs, and therefore with more endurance and power; with stronger hearts, and therefore with more courage and energy; with stronger digestion; with better eliminations of poisons; with more beauty and gracefulness, more manual skill and success, more happiness, more all-round prosperity, more capacity to inspire each other. We shall find people a step nearer the ideal of manhood and womanhood, and improving in every way from generation to generation. We shall find such scourges as heart-disease, consumption, and insanity being swept away from our land.

But exercise must not rely on itself alone. It must work with all other sensible helps to fitness: with diet, cleanliness, control, intelligence, help-

fulness.

OLD-AGE PENSIONS IN GERMANY.

By Dr Andrew Wilson, F.R.S.E., &c.

LTHOUGH the question of old-age pensions has over and over again been mooted and discussed in Britain, nothing of a practical nature has issued out of such deliberations. At present, provision for the working-

man in his declining years is largely a matter of his own individual making. His sick and benefit clubs and the systems of insurance against disease, providing sick-pay for a certain period, and the various societies to which he contributes, represent practically the resources at his command for his support in evil days or when he becomes too old to be reckoned amongst the effective units of labour.

In all probability the question of old-age pensions will be periodically revived. The question of providing for the aged units of a nation is one which cannot be solved by the workhouse alone. Apart altogether from the view that the laying by in an easy way of a certain provision for old age would represent a practical encouragement towards thrift and exercise a distinctly moral effect on the masses, there would also ensue from such a plan or practice the cultivation of a spirit of independence and the prospect of a degree of comfort which the spectacle of the workhouse as the end of a working life cannot by any means be supposed to represent. On all grounds we may, therefore, assume that if the masses could be persuaded under one scheme or another to co-operate with Government in the institution of a scheme whereby reasonable provision would be made not merely for old age, but also against permanent ill-health totally incapacitating them for duty, we should in all probability be able to solve many of the difficult problems connected with this subject.

It may interest readers to know that in one country, at least, a scheme has been in operation since January 1891, and is carried out in a highly successful manner. From a memorandum of certain

details with which I have been provided, I find that the 'Imperial Law of Insurance' of German working men and women against permanent ill-health and old age was passed in June 1889. As I have said, this edict came into force at the beginning of 1891. The inception of this scheme appears to have rested with William I. It has been described as the most valuable legacy left to his people. The Emperor devoted a very large amount of time and attention to the elaboration of this scheme, and therein had the assistance of the leading men of his Empire versed not merely in finance but in statistics, and in such details as naturally fall to be considered when a great scheme of this kind has to be evolved and inaugurated. Under the auspices of the present ruler of Germany, the scheme of his grandfather has undergone further developments, so that in Germany to-day the question of the support in old age or in permanent ill-health of the workingclasses of the country may be regarded as having been completely and successfully solved.

The first characteristic of the German scheme is that of mutual help and aid, whilst, as we shall see, a certain proportion of the required funds comes from the public purse. The individuals who benefit from the scheme have taken part in founding its financial basis. It is estimated that twelve millions of working men and women exist in the German Empire. On their backs alone, however, is not wholly laid the cost of the premiums paid. If we term this an insurance scheme we describe it in fairly correct terms. Of each premium, a half comes out of the pockets of the workers, the remaining moiety being contributed by their employers. In so far as the practical carrying out of details is concerned the expense involved in this item is nil, seeing that the whole business of national insurance is managed and controlled by the Imperial Post-Office.

The German masses have no option in this matter

between choosing or refusing to insure. The system is, in other words, of a compulsory nature. We read that every man-servant, every maid-servant, and factory workers both male and female-in a word, the whole working population of Germanyare bound by law to insure on completing the sixteenth year of life. In addition to the workingclasses, clerks and tradesmen in a small way are eligible for insurance provided their incomes do not exceed one hundred pounds a year. This latter class, however, are known as self-insurers. They pay the whole premium demanded, no employers being forced to contribute to this particular class of insurance. Turning now to the details of this excellent scheme, we find that the premiums are regulated according to the wages of the individual. There are four classes included in the scheme. The first class consists of those who earn eighteen pounds a year and under that sum (the amounts here are taken roughly without entering into fractional details); the second class includes those earning twenty-eight pounds a year and under-that is, to the eighteen pounds limit; the third class is formed by those whose wages amount to forty-two pounds a year; whilst the fourth class is represented by persons whose incomes, whilst above forty-two pounds per annum, do not exceed a hundred pounds.

The premiums are paid weekly, and are paid, as has been said, by the working-classes and their employers in equal proportions. For the first class the weekly premium amounts in English money to about three farthings; for the second class the premium is represented by the weekly penny; for the third class it amounts to a penny farthing, and for the fourth class three halfpence. Practically, therefore, for every penny which is paid as a premium by the working-man, the servant, and the like, the employer is bound to hand in a like amount. It is also his duty to see that both pennies are promptly paid each week. Viewed from the employer's standpoint, it might be thought that in the case of a large business concern the insurance premium may amount to a considerable sum. Yet, whatever be the amount, it is paid cheerfully enough, and is not regarded in Germany, as a rule, in any sense but as a beneficent tax. In the case, for example, of a German household, the practice is, therefore, that of insuring each servant by means of the weekly penny, to which is added the employer's penny. In the case of what may be called irregular workers, such as charwomen, the weekly penny is contributed by them, the regulation here being that the person who employs the woman on the first day of the week pays the supplementary sum. If the woman only begins work on Tuesday, it is the Tuesday employer who discharges this duty. It is no uncommon thing in German households to find that the employer in the case of his servants not merely pays his own penny, but adds the servant's contributions as well. This latter fact says much for the deep interest which is taken in this scheme

of national insurance by employers of labour at large.

Coming now to those details which refer to the manner in which this huge insurance business is carried out, we find, as has been stated, that the Post-Office is responsible for its supervision. It must be admitted that the proceedings may be regarded as involving some little trouble; but as the work in question is entirely of a routine description, and as the German nation of all others is accustomed obediently to conform to rules and regulations, it cannot be said that any great difficulty is experienced in working this great trust. The weekly premium is paid into the Post-Office, and a stamp or stamps is given in exchange for the money. This stamp is duly pasted on a card, which is the property of the person who insures. The card when full is exchanged for another, the value of the previous one being duly added to the new card. Saturday, being the chief day for paying the premiums, is an extremely busy one at the postoffices of certain districts, many hundreds of persons attending in order to receive the value in stamps of the premiums paid. The Germans have nicknamed the insurance the 'stick law,' in consequence of the large portion of time occupied in sticking stamps on the cards. In two years after the scheme of insurance was started, it is stated that over five million pounds sterling were collected. In twenty years the amount of the accumulated fund, it is estimated, will amount to twenty-five millions, and this latter sum, it is calculated, will double itself in eighty years.

The practical benefits of the scheme thus outlined are that an insured person, if thrown out of employment permanently from any cause of the nature of sickness or accident, can draw a sick-pension. Alternatively, if he or she lives till seventy years of age, an old-age pension is paid. In so far as the sick-pension is concerned, it can be claimed in cases where less than one-third of the yearly wage has been earned. If the person recovers sufficiently to earn his or her full wage, the pension ceases. The amount of the pension is necessarily not great; but the German authorities appear to have kept in view the idea that the pension should be of such an amount that the sick or aged person, as the case may be, by aid of this money, may obtain board and lodging in a family to whose resources the amount of the pension would be a welcome addition.

The conditions on which pensions are paid may be regarded as liberal and generous. We find that a man or woman may draw sick-pension after having paid the premiums for five years. If it so happened, however, that a man or woman had been permanently thrown out of employment during the first or second year of the working of this scheme, and if it was proved that he or she had been in receipt of honestly earned wages during the previous five years, the individual would become entitled to the benefits of the scheme. In the case of old

persons who have paid in for one year, they can draw the old-age pension provided they have earned their livelihood during the preceding three years. With regard to the sums paid in case of permanent want of employment from sickness or accident, after five years' payment of premiums, the amounts, less fractions, are: for class one, five pounds fourteen shillings a year; the second class receives six pounds five shillings a year; the third, six pounds eleven shillings a year; and the fourth, seven pounds. It is also an interesting fact that the pensions increase proportionately with the years of insurance. Suppose an insured man has paid premiums for fifty years, his pension under class one would amount to eight pounds a year, increasing respectively for the remaining three classes to twelve pounds ten shillings, sixteen pounds, and twenty pounds fifteen shillings. Any person, irrespective of sickness altogether, who has passed his or her seventieth year, and has paid premiums for thirty years, receives an old-age pension. For the four classes the amounts of such pensions respectively are: five pounds six shillings a year, six pounds fifteen shillings, eight pounds three shillings, and nine pounds eleven shillings. A case is given in the memorandum from which I quote of a woman aged thirty-seven years. In her twentyfourth year she lost her right arm. If the present system of insurance had been inaugurated in her time, from her sixteenth year she would have paid her half-premium, her employer contributing the other half. In eight years she would have paid about thirty-eight shillings; but for the last thirteen years she would have been receiving a pension of six pounds fifteen shillings, or over eighty pounds in all; and, what is more to the point, this pension would be paid her as long as she lived.

In the case of a man aged forty-nine years, incapacitated for eleven years for work through illhealth, he would under this scheme-under, say, class three—have paid a total sum of about six pounds four shillings, an equal amount having been contributed by the employer. For the last eleven years he would have drawn a pension amounting to about ten pounds five shillings a year. In eleven years he would thus have received about one hundred and twelve pounds, the premium still continuing during his lifetime. It is added that if the man's wife earned a certain wage of her own, and had sons and daughters contributing to the household expenses, such a house, even with its head disabled, would be in a fairly comfortable position. In the case of servant-girls or female workers who marry, the system of insurance may be continued, with this difference, that the woman pays the whole of the premium herself. If on marriage payments are discontinued they receive the sum which stands to their credit through previous payments. More interesting still is it to know that if a man dies without having benefited by the insurance, the widow, or the children if under fifteen years of age, inherit the sum which is

standing to his credit. If a woman dies in similar circumstances, her children, if fatherless and under the age of fifteen, inherit her share. To show the care with which the regulations have been framed, it may be added that if an insured person is proved to be a habitual drunkard the pension is not paid in cash but in kind.

Such is a bare outline of what can only be regarded as a very beneficent scheme. Its main feature is that it is not worked on purely charitable lines, but on a proper business footing. There is no idea of pauperism involved in the details, seeing that whilst the State manages the business and employers of labour contribute thereto, the insured person has also contributed to the funds, and in this way is benefited partly through the exercise of thrift, compulsory as this exercise may be.

It is not necessary here to discuss the question whether or not such a scheme would commend itself to the British nation. There is, on the face of things, no obvious reason why it should not find favour in the eyes of the people. At least it presents us with a solution of a very difficult problem. The amounts involved in contributions towards premiums payable by the insured and by employers of labour are so small that even in the case of a large firm employing many hands we can only regard the amount demanded as proportionate to the earnings of the firm. The impost can in no sense be considered either as unfair or tyrannical, so that if our nation seriously set itself to discuss in a practical fashion the possibility of making provision for old age and for the disablement produced by accident or sickness, there can be little doubt that amongst the points to be carefully and seriously considered we should certainly enumerate the German scheme of insurance above described.

LOST.

OH, firelit gate of Tir nan Og!
Oh, hard-fought way of stars!
With distant sounds of steel and steel
Beyond thy woven bars.

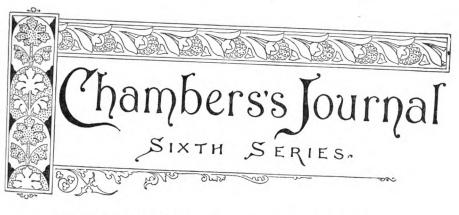

Thy hills are cloud and wreaths of mist,
Thy waters lie at rest;
And in thy skies the sunset rose
Sinks slowly to the west.

Thy heroes dream the dream of swords,
Where bloom forgotten hours;
Thy daughters weave the threads of dawn
From scents of bygone flowers.

How oft we seek thy golden road With eyes by shadows dimmed! How oft by shores of rose and pearl We see thy waters brimmed!

For thou art lost to hearts of men, As are the days of old; The days of love, the days of fire, The days of steel and gold.

LILIAN NAPIER.

PARIS HOTELS AND RESTAURANTS.

By W. A. SOMMERVILLE.

HAVE sometimes thought when I have been out all day on a Highland river salmon-fishing, casting twentyfive yards of line, more or less, and coming home tired and hungry, how pleasant it would be to dine at, say,

Paillard's in the Boulevard des Italiens, or at any of the other great restaurants in Paris. You have to be more careful in writing about restaurants than in writing about books or plays. If the dramatic critic, who goes to supper at the Carlton prepared to write an adverse criticism of the play he has been witnessing, were to say half the things about his supper that he will say about the play, there would be an action involving heavy costs and damages. Minor poets have to submit to criticism that would not be tolerated for a moment by the chefs at the Café Anglais or the Savoy.

I once wrote Thomas Cook & Son a cheque for six hundred and fifty pounds for a party of three to visit Palestine and the Nile, and I have many times used their railway and steamboat tickets when travelling; but sometimes you may wish to have a change and travel independently. For those who care to do so this paper may be of service, and enable them to calculate to within a few francs what a visit to Paris will cost.

Omar Khayyam, the poet-prophet of Persia, writing more than eight hundred years ago, has said: Many are able to write learned books, many are able to govern kingdoms and empires; but few there be that can keep an hotel.'

His Majesty the King, when he visits Paris, now stays at the Embassy, in the Rue du Faubourg St Honore. In the old days, when he was Prince of Wales, he used to live in the Hôtel Bristol, in the Place Vendôme. The manager of the Bristol once assured me that if I would take rooms the charges would be most moderate, and that their chef had no equal in Paris. One of the characteristics of the Hotel Bristol is that there are no public rooms. If like the King, you travel with an entourage of friends, this is all very well; otherwise it is dull

spending the evening in a private room in Paris, and you will find it more cheerful to dine at one of the restaurants on the Grand Boulevard. Should you think of living in pomp and circumstance in the Bristol, a private sitting-room and two bedrooms, including lights, bath, and attendance, will cost forty francs a night.

Another hotel patronised by royalty, also in the Place Vendôme, is the Hôtel du Rhin. On May 16, 1871, the Communists threw down the column erected in the Place Vendôme by Napoleon I. to commemorate victories over the Russians and Austrians. The proprietor of the Hôtel du Rhin offered them five hundred thousand francs to spare Napoleon III. lived here when he was a member of the National Assembly in 1848. It is said that he one day asked a friend to dinner, and apologised for proposing to entertain him at a cabaret—rather a contemptuous designation for the commodious and well-appointed Hôtel du Rhin.

The Grand Hotel in the Boulevard des Capucines and Place de l'Opéra, from its central situation, is the most convenient hotel to live in in Paris. During the Franco-German war it was used as a hospital. It has recently been renovated and undergone considerable alterations. There used to be a large courtyard in the centre of the hotel, where it was interesting to sit and watch the arrival and departure of the guests. This courtyard is now a winter garden, where a band plays in the evening. The charge for a sitting-room and bedroom on the first floor is seventy francs. A bedroom on the fifth floor will cost six francs, including light and attendance. The fifth floor has many advantages: you go up by the lift, it is quiet, and, sleeping with your window open a hundred feet above the level of the street, you breathe pure air.

I have passed pleasant days in the Grand Hotel. I remember asking Mr Arthur Melville, whose pictures have recently been exhibited in the Gallery of the Institute of Painters in Water-Colours, to come and dine with me. At this time he was an art-student, living in the Latin Quartier, and occupying one MAY 11, 1907.

[All Rights Reserved.]

room, which served as studio and bedroom. We arranged that we would first go to the Louvre and look at six pictures. One of these pictures was 'Mona Lisa,' which hangs in the Salon Carré. It took Leonardo da Vinci four years to paint this portrait, and after four years' work, from his point of view, it was still unfinished. Our reason for looking at only six pictures was that in the Louvre you see so many that you may easily come away without having been able to appreciate any one of them.

Belonging to the same class as the Grand Hotel is the Hôtel Continental, at the corner of the Rue de Castiglione, facing the garden of the Tuileries. It occupies the site upon which once stood the Ministry of Finance, which was burnt to the ground under the Commune in obedience to a message sent by the Communists' Flamber Finances. It has a pathetic interest as being the residence, when she is in Paris, of the Empress Eugénie. The death of her son the Prince Imperial gained for her the deepest sympathy of the English people. She is to be seen sometimes in the Tuileries gardens.

Even if you do not reside in the Hôtel Continental, you may find it interesting to lunch or dine there. The charge for lunch is five francs, and for dinner seven, in both cases including wine. The table-dhôte dinner at the Continental is one of the best in Paris. Here is a copy of one of the menus:

Croûte au Pot. Parmentier.
Truite saumonée à l'Amiral.
Selle de Pre-Salé Bouquetière.
Dindonneau à la Broche. Salade.
Choux-Fleurs au gratin.
Riz Impératrice. Religieuse.
Corbeille de Fruits. Fruits. Dessert.
Biscuits Pernot. Bordeaux. Medoc.

Among the more recently built hotels in Paria, there are the Hôtel Ritz, the Elysée Palace, and the Palais d'Orsay. The Hôtel Ritz is in the Place Vendôme, and has a little garden at the back. In connection with the hotel is the Restaurant Ritz, at the present time on the crest of the wave and the most popular restaurant in Paris. A single bedroom in the hotel, with bath and including light and attendance, costs sixteen and a half francs; early breakfast, coffee and bread and butter, two francs fifty centimes. The charge for this at the Grand and Continental is one franc fifty centimes.

The Elysée Palace, from its proximity to the Champs-Elysées, the children's playground, situated midway between the Place de la Concorde and the Arc de Triomphe, is one of the most pleasant hotels in Paris in which to live. A bedroom, including lights and attendance, costs eight francs.

Should you wish to reside on the other side of the river, there is the Palais d'Orsay, situated between the Hôtel des Invalides and the Luxembourg. On my first visit to Paris I lived in the old Hôtel du Louvre, now known as the Magasin du Louvre. I remember the inconvenience in the morning of descending many flights of stairs to the bathroom. In this respect Paris has changed for the better. In the Palais d'Orsay there are some four hundred bedrooms, and to each bedroom there is a dressing-room with a bath. You can get a room, including bath, lights, and attendance, for a modest six and a half francs a day.

The hotels I have been referring to are comparatively costly, and if you wish to live with economy you must be content to reside in one that is less ambitious, such as the Hôtel St Marie, 83 Rue de Rivoli. Here you can get a bedroom for three francs, and a plain breakfast for one and a quarter franc. South of the Boulevard de la Madeleine is the Hôtel Burgundy, 8 Rue Duphot: bedroom three francs, breakfast one and a half franc; in the Rue du Helder the Hôtel de l'Opéra: bedroom four francs, breakfast one and a half franc. All of these hotels have the approving mark in Baedeker.

The first restaurant I dined in in Paris was Vefour's, in the Palais Royal. I was on my way to Switzerland with a school friend, our first visit to the Bernese Oberland. We dined à la carte, leaving by the night train for Lucerne.

In the Boulevard des Italiens, at the corner of the Rue Marivaux, stands the Café Anglais; it is painted white, and forms a landmark on the Boulevard. It is one of the historical restaurants of Paris, dating its reputation as far back as 1815. The wine-cellars are illuminated by electric light. The dining-rooms are to the left and right as you enter—plainly furnished, unpretentious little rooms. You may dine here at a moderate cost and without fear of being overcharged. The King, accompanied by the Queen, dined in it recently; he uses a private room called 'Le Grand 16.'

Durand's, nearly opposite to the Madeleine, is another of the famous restaurants in Paris. During the Exhibition year of 1867, it is said, M. Durand had five kings who supped in a cabinet particuliere in his restaurant, and not one of their Majesties had money enough about him to pay for his supper. It is a café celebrated for its suppers, and was the headquarters of General Boulanger.

The restaurants in London and Paris used by those who have distinguished themselves in literature and art are of interest. Tennyson used to lunch at Verrey's in Regent Street, and drink white wine or lager beer. Dumas was a regular customer at the Maison d'Or, at one time the most famous dining-place in the capital of France. I once suggested to the mattre d'hôtel that the fish for dinner should be a sole à la colbert, a large sole, fried and served with butter. He objected, saying that it was too simple a dish, and would give his chef no opportunity to display his skill. It was here the Duke of Hamilton fell down a narrow staircase and was killed. The Maison d'Or ceased to exist as a restaurant in 1902. The truth was that the prices became so high that they killed the goose that laid the golden egg.

The closing hours for restaurants in Paris are

different from those of London. The Café de la Paix remains open until two o'clock in the morning, so that after visiting one of the theatres you may sup at your case. During the carnival time it is open all night. After a mask-ball in the Opera-House, I once had supper in it at four in the morning. In this restaurant the system of tipping has become a fine art. A waiter pays as much as twenty francs a day for permission to work. Messrs Lyons, in their new café in Piccadilly, have succeeded in completely doing away with tips. They employ more than two hundred waiters, and pay them two pounds a week, giving them in addition a commission on the sales, which comes to ten or fifteen shillings. When a waiter has a salary of about one hundred and thirty pounds a year there is no need to give him a tip. I recently asked one of them, who hailed from Leipzig, if he had any thoughts of returning to the Fatherland. He said no, he was very comfortable where he was.

When you visit the Bourse or the Halles Centrales you may find it convenient to lunch at the Restaurant Champeaux, Place de la Bourse. was here that the thickly cut fillet-steak named a chateaubriand was first served, which has formed the pièce de résistance in so many Parisian dinners.

How it delights a chef to invent a new sauce! But, like more ambitious artists, sometimes he fails. I once met a Parisian, an old friend of mine, in the Rue de la Paix, who insisted that I should come and lunch with him at Noel Peter's, in the Passage des Princes, a restaurant celebrated for its fishdishes. For hors-d'œuvre we had oysters. the aid of a large lemon I had eaten one, when my friend remembered that the chef at Peter's had invented a sauce to be eaten with oysters. With the sauce Peter I ate the remainder of my oysters; but I do not think that even Peter and his brother apostles could induce me to do so again.

Should you have a friend who does not care to enter one of the professions, send him to Paillard's in the Boulevard des Italiens and ask them to

teach him to be a chef. I fear chefs seldom receive the consideration they deserve. A rich Parisian who lived to a great age said that he owed his long life more to his chef than to his physician. Paillard's is not only a school for chefs; it is also a cheerful restaurant, a place to dine in when you visit Paris on your honeymoon.

Among the less costly restaurants in Paris is the one kept by M. E. Boulant, 35 Boulevard des Capucines, nearly opposite to the Grand Hotel, and situated in the centre of Paris. You have good cooking at a moderate price. From the menu I give a dinner à la carte which will cost three and a half francs:

Hors-d'œuvres Salade Tomates70	contimes
Coquille de Turbot Morney 70	
veau Sauté jardinière 70	
Epinards au Veloute 50	
Fromage Gervais le demi os	
Carafe Vin Rouge60	"

Beer costs ten centimes more than wine. These prices are a little higher than at the Duval restaurants, but the portions are larger. twenty-seven Cafés Duval in Paris; they are excellently managed. In many of them the only difficulty is to find a seat at the dinner-hour. Living in one of the small bed-and-breakfast hotels I have referred to, and paying the prices for food mentioned above, you can make a visit to Paris at a moderate cost.

If you are not afraid of the new-styled Apaches who haunt the less-frequented parts of Paris by night, you will find it interesting to spend an evening at the Théâtre de l'Odéon, and afterwards have supper at the Taverne de Lorraine, adjoining the Musée de Cluny. It is a restaurant à la carte, and will give you an opportunity of seeing the artstudents who frequent the Latin Quartier, 'the classic land of Trilby.' I saw Jules Bastien Lepage there, whose large picture of peasants resting from their labour arrests your attention when you enter the first gallery of the Luxembourg. Lepage died when he was thirty-six.

HOPPY.

CHAPTER VI.

RE'S eyes blazed, and he dashed the offending print to the floor with a string of savage oaths. At this instant the door opened, and the landlord, a tall, soldierly-looking

fellow, appeared on the threshold bearing a note upon a small salver. He was an ex-sergeant of the Sooties, who, having captured the affections of a buxom goddess of the kitchen well dowered with the savings and the perquisites—let us call them—of many years' service in the 'hupper succles,' had offered her his hand and heart, together with a large moustache and a

small pension. They had invested their modest fortune in the lease of a comfortable and wellsituated lodging-house; and the woman being a good cook, and the man-who before his enlistment had been a footman-a good valet, they had at once achieved a success, and were patronised, of course, by most of the Sootie officers. He was a brother of the Private Rex whose cool and careful shooting had so much conduced to Hoppy's escape at Rhanibad, and he kept up a more or less regular correspondence with the 'champion shot,' of whom he was fond and

'What the devil do you mean by coming in with-

out knocking, Rex? Curse you!' savagely cried Vare, hurriedly stooping to pick up the paper and glaring furiously at the intruder.

'Beg pardon, sir,' answered the latter. 'I did knock, an' thought I 'eard you say, "Come hin."

A note, sir, waitin' hanswer.'

'Put it on the table. I'll ring when I'm ready,'

growled the captain.

And the man, doing as he was bid, quietly and with an impassive face withdrew. But once he was outside the door, his countenance underwent a rapid change, and a look of hatred swept over his

rugged features.

'Ay, an' curse you too, hif it comes to that,' he muttered as he slowly descended the stairs. 'Wat d'you think I'm made hof? Just because I was once hin the rig'ment, an' you're a bloomin' cocksparrer hof a capt'in, you think you can come yer barrack-manners hover me 'ere. Hif it wasn't that hall the rest o' the gen'lemen 'u'd leave me, 'owever much they knowed I was hin the right, I'd tell you and one or two more o' yer kidney to find hother rooms w'ere their pretty speeches 'u'd be more happreciated. W'at's 'e cussin' an' swearin' hat, an' the paper hall crumpled hup on the floor, I wonder? I'll 'ave a look biembye; p'r'aps I'll see somethink hinterestin'.' And the aggrieved ex-sergeant gained the lower depths, where he soothed his irate feelings by taking it out of his lodger's clothes with the hardest brush he could find.

Meanwhile the object of his wrath, blissfully unconscious of the assault being committed on the nap of his best dress-coat, was writing an answer to the dainty little missive that lay open upon the

table beside him.

'DEAR CAPTAIN VARE,' ran the letter, 'if you have nothing better to do, will you dine with us to-night at eight o'clock, do a theatre, and go on afterwards to Lady Havant's dance-for of course you are going? Please excuse such short notice, and don't think that you are a stop-gap! No party; only ourselves. - Yours sincerely,

'MIRABELLE MELGROVE.'

'Of course I'll dine with you, my beauty, if I had fifty other engagements; and dance with you all night, too, if you will let me!' exclaimed Vare as he carefully stuck down the envelope of his answer and rang the bell for Rex. 'And it will be odd,' he continued, 'if I don't make good progress to-night in winning you back from the man who cut me out.' For, since he had returned to London with his scar and interesting story, he had noticed that Mirabelle, still indulging in her romantic admiration for any thing or body that had to do with gallant deeds, had not only welcomed him warmly, and forgiven him his former offence, but had been rather inclined to fall into line with the foolish hostesses already mentioned, and place him on an exalted pedestal.

He had also remarked, or imagined that he had, that the indignation openly expressed by both Lord

Idsworth and Sir Ralph against General Ranger for having brought her betrothed to trial had not found in her such enthusiastic support as would naturally have been expected under the circum-

F.54

These things had caused him to hope afresh; and, knowing the lady's weak point, he had cunningly adopted a line of conduct eminently suited to dis-

parage his rival in her eyes.

'It's too bad,' he would say, 'that poor old Hoppy hit upon such a stickler for duty as Ranger. Any other man would have recommended him for a V.C., and taken no notice of the other thing. And when one comes to think of what a chance he had then, and one which he will probably never get again, it does seem awfully hard. Of course,' he would go on, 'Ranger has a large party who side with him, and consider that Hoppy's breach of discipline, leading as it did to a man's death and the niggers getting inside the wall-which, if there had been any considerable number of them, might have been a very serious matter in the state of disorganisation which existed at the moment-was disgraceful. I, naturally, don't sympathise with them, because if Hoppy had not flung all ideas of right and wrong to the winds I should not be here now; but, of course, from a quite impartial point of view, you know-er'- and he would hesitate and caress his moustache with a well-feigned air of confusion, as if he had been led into saying rather more than he intended.

All these hints, so skilfully thrown out, that her fiancé's action, brave as it had been, did not commend itself to the majority of those best qualified to judge-she put her father and Sir Ralph aside as interested parties-had an unhappy effect on Mirabelle. Though she was careful not to show it, she could not hide from herself that she had a very distinct feeling of annoyance with Hoppy; and though she answered his letters affectionately enough, and betrayed nothing of what she had in her mind, the court-martial and long after-period of suspense were a sore trial to her pride. All this Vare had been clever enough to perceive, and, with renewed ardour, had quietly set himself to work to be in a position to step into Hoppy's shoes should the court pronounce such a severe sentence upon the latter as would make it impossible for Lord Idsworth to allow his daughter, even if she still wished it, to marry him.

It was, therefore, not to be wondered at that he had given way to such sudden passion when he read in the paper how nearly his hopes had been realised, and that had it not been for the Commander-in-Chief's leniency his disgraced and cashiered rival would have probably been removed from his path for ever; and he was still scowling at the thought when he rang the bell for Rex and flung him his answer to Miss Melgrove. As the man retired Vare lit a cigarette, and again taking up the newspaper, re-read the obnoxious paragraph with fierce, resentful eyes.

'At all events,' he reflected, 'the fellow had been sentenced to about as bad a punishment as could be inflicted on an honourable man, and that showed what the court thought of his conduct, in spite of the Commander-in-Chief's pardon, which all the world would guess had been forced from him by certain political pressure.' He would be careful to put it to Mirabelle to-night in such a way as would impress her with a sense of its disgrace.

But would she have already heard about it? She might not, by Jove! It was an insignificant paragraph, and might not even appear in the Morning Toas; and Lord Idsworth, he remembered, was to

be away all day in the country, and the news might well, under such conditions, escape him also. There was just the possibility of both father and daughter having known it long since, direct from the Horse Guards before the papers went back to India; but he thought not. Nothing in their behaviour had given rise to any such idea. He could not himself broach the subject—it would be tactless; and yet he didn't want to have to leave it alone that evening. It would be too good an opportunity for improving his position to be lost.

(To be continued.)

EARTHQUAKES AND LIFE.

By W. H. SIMMONDS.

OME of those observers who have been reckoning up within the last few weeks how many scores of thousands of human lives have been destroyed within the past century by earth-

quakes may perhaps be surprised to hear that even earthquakes have been cited as proofs of beneficent design in the world. In his Bridgewater Treatise, Dr Buckland devotes more than one chapter to the proof of design in the effects of disturbing forces on the earth's strata. 'In the proofs of the agency of a wise, and powerful, and benevolent Creator,' he writes, 'in conaidering the great geological phenomena which appear in the disposition of the strata, and their various accidents, a third kind of evidence arises from conditions of the earth which are the result of disturbing forces that appear to a certain degree to have acted at random and fortuitously. Elevations and subsidences, inclinations and contortions, fractures and dislocations, are phenomena which, although at first sight they present only the appearance of disorder and confusion, yet, when fully understood, demonstrate the existence of Order, and Method, and Design, even in the operations of the most turbulent among the many mighty physical forces which have affected the terraqueous globe. He refers to the effects of such forces 'in elevating, and converting into habitable lands, strata of various kinds which were formed at the bottom of the ancient craters; and in diversifying the surface of these lands with mountains, plains, and valleys, of various productive qualities, and variously adapted to the habitation of man and the inferior tribes of terrestrial animals.'

A Quarterly Reviewer of 1826 declared, in an article which Buckland quotes, that 'it scarcely admits of a doubt that the agents employed in effecting this most perfect and systematic arrangement have been earthquakes, operating with different degrees of violence, and at various intervals of time, during a lapse of ages. The order that now reigns has resulted, therefore, from causes which

have generally been considered as capable only of defacing and devastating the earth's surface, but which, we thus find strong grounds for suspecting, were, in the primeval state of the globe, and perhaps still are, instrumental in its perpetual renovation.' In short, the same seismic force which overthrows in one quarter uplifts in another; and if the balance of the ocean is so disturbed that it overflows in a tidal wave in one country, it at the same time uncovers some new land. As the Reviewer proceeds: 'Sources of apparent derangement in the system appear, when their operation throughout a series of ages is brought into one view, to have produced a great preponderance of good, and to be governed by fixed general laws, conducive, perhaps essential, to the habitable state of the globe.' But to those who suffer or are bereaved in the process all this will but prove the case against Nature:

> So careful of the type she seems, So careless of the single life.

In Japan, where earthquakes are counted by hundreds every year, human nature has proved its superiority to the 'thousand natural shocks that flesh is heir to,' and we read that after the great earthquake of 1891, when nine thousand nine hundred and sixty Japanese lost their lives, those who escaped one shock would rush for the open when they heard the premonitory sounds of a fresh one, and return laughing and joking at the false alarms! Nevertheless, as Professor Milne (the writer on 'Earthquakes' in the Encyclopædia Britannica) has remarked, notwithstanding the lightheartedness of this particular nation, it is difficult to imagine that the long series of seismic effects chronicled in Japanese history, which culminated in 1896 in the loss of twenty-nine thousand lives by sea-waves, has been without some effect upon its mental and moral character. In Japan's temples some earthquakes are annually commemorated by special services; and, in bygone times, earthquakes regarded as the visitations of an angry deity have induced governments to repeal stringent laws and

taxes by way of propitiation. How this should be we can well understand when we recall such a catastrophe as that which devastated Central Japan in October 1891, when 'nearly every building within the epifocal district fell, the ground was fissured, forests slipped down from mountain-sides to dam up valleys, whilst the valleys themselves were permanently compressed.' On that occasion the horizontal shudders were nine inches or a foot in extent, and people could actually see the earth's surface undulating. They must have felt that earth's cloud-capped towers and gorgeous palaces were about to crumble 'like the baseless fabric of a vision' and leave not a rack behind.

Though Scotland, it has been asserted, may once, long ages ago, have been as Japan is now for its earthquake throes, we in the British Isles happily know but very little of these phenomena nowadays, and even our Grampians and Macgillicuddies and Moel Fammaus wear their winter snows in the undisturbed serenity of a perfectly quiescent old age. The British reader may therefore be interested in a scientific account of the earthquake of otherwhere. 'A typical earthquake,' writes Professor Milne, 'usually commences with minute, elastic vibrations, the periods of which vary between one-fifth and onetwentieth of a second. These are recorded by seismographs, and are noticed by certain of the lower animals, like pheasants, which before the occurrence of movement perceptible to human beings scream as if alarmed. When an earthquake is preceded by a sound we have evidence of preliminary tremors even more rapid than those recorded by seismographs. Following these precursors there is a shock or shocks, the period of which will be one or two seconds. From this climax the movements, although irregular in character, become slower and smaller until finally they are imperceptible. The duration of a small earthquake usually varies from a few seconds to a minute; but large earthquakes, which are accompanied by surface undulations, may be felt for two or three minutes, whilst an ordinary seismograph indicates a duration of from six to twelve minutes. A free horizontal pendulum tells us that with severe earthquakes the ground comes to rest by a series of more or less rhythmical surgings continuing over one or two hours.' Note, also, that while the chief 'shake' has a definite direction, the successive vibrations, like the shudders of a ship, may have many.

Professor Sollas, who gave the presidential address in the Geology section of the British Association at Bradford, ventured upon an opinion which is interesting just now as to the way in which earthquakes and modifications of the earth's crust are brought about. So little do we know of the behaviour of rock under the enormous pressure it must endure deep down in the earth's interior that the geologist (he remarked) would seem to be left very much to his own devices; but according to the mathematicians he must not take refuge in the hypothesis of a liquid interior. 'We shall boldly

assume,' the Professor proceeded, 'that the contraction at some unknown depth in the interior of the earth is sufficient to afford the explanation we seek. The course of events may then proceed as follows: The contraction of the interior of the earth, consequent upon its loss of heat, causes the crust to fall upon it in folds, which rise over the continents and sink under the oceans, and the flexure of the area of sedimentation is partly a consequence of this folding, partly of overloading. By the time a depression of some thirty or forty thousand feet has occurred along the ocean border the relation between continents and oceans has become unstable, and readjustment takes place'-as at Port Royal in the seventeenth century, and again in the same neighbourhood around Kingston in this year of 1907-'probably by a giving way of the continents, and chiefly along the zone of greatest weakness-that is, the area of sedimentation-which thus becomes the zone of mountain-building. It may be observed that at great depths readjustment will be produced by a slow flowing of solid rock, and it is only comparatively near the surface, five or ten miles at the most below, that failure of support can lead to sudden failure and collapse; hence the comparatively superficial origin of earthquakes.'

5 B

It will be but small consolation for those who feel alarm at the prospect of earthquakes, like the poor, being always with us-since the earth goes on cooling and shrinking-to hear that they are likely, in the nature of things, to grow worse. Professor Milne thinks that too little attention has been directed to the conditions which accompany the adaptation of the earth's crust to its shrinking nucleus. He points out that as the nucleus of the earth grows smaller the puckerings and foldings of its crust should grow larger, and each succeeding geological epoch should be characterised by mountain formations more stupendous than those which preceded them, whilst the fracturing, dislocation, caving-in of ill-supported regions, and creation of lines of freedom for the exhibition of volcanic activity which would accompany these changes would grow in magnitude. On the other hand, we are reassured by finding evidences of progressive quiet in our own particular region. Milne believes it not improbable that in the early Tertiary period Scotland was pre-eminently remarkable for its volcanoes and earthquakes. There are now but one or two Scottish earthquakes in a year. It is true that in Perthshire a round dozen earthquakes were recorded in a single month in 1844; but that was exceptional, and to-day, if a few tiles fall in Oban, people are as much upset mentally as though something really serious had happened.

It is in Japan—first-fruits of the awakening to Western civilisation and its methods—that earth-quake lore has been most diligently acquired. In earthquake science Japan leads the world. Japan has a thousand observing stations, and spends much money upon them. Italy, Austria, Germany, and Russia have also their 'seismographic' observa-

tories. By the instrumentality of the British Association, seismographs have been established at the Isle of Wight, Kew, Paisley, Birmingham, and Edinburgh in the British Isles, and outside them at Toronto, Victoria (B.C.), Philadelphia, Mexico, Trinidad, Arequipa, Cordova (Argentina), New Zealand, Hawaii, Japan, Java, Calcutta, Madras, Bombay, Mauritius, Cairo, Beyrout, San Fernando in Spain, the Cape of Good Hope, and elsewhere—some fifty in all. One of the chief and best-equipped is that at Shide, near Newport, Isle of Wight, under the control of Professor Milne, who, judging by the newspapers' resort to him, is Seismologer-General to the British Empire.

By the aid of the seismograph and seismometer many earthquakes which would otherwise pass unobserved are now clearly recorded and measured. Professor Milne's study of the world's records has enabled him to state that every year poor Mother Earth's frame is racked from seventy to eighty times, whilst the slight local tremors may be counted by thousands. The reason that the larger shakes cause so little destruction is simply that they originate where but little damage can be done-in the beds of oceans or in uninhabited deserts. When the earthquake originates in the neighbourhood of a populous part of the world its effects quickly disturb us, and, as has been the case recently, we become apprehensive lest the earth is becoming too active to be comfortable. So far, however, there is no evidence that the earth has been more energetic 'seismically' during this last year than in former years. So we may calm our fears and go on making our notes with proper scientific serenity. According to Dr Knott, who recently lectured on the subject before the Edinburgh Geological Society, 'recent earthquake investigation has taught us something of the internal structure of the earth, has impressed upon us the fact that a large earthquake shakes the whole globe, and has proved that there is an intimate connection between the origins of earthquakes and the differential movements of rocks which in former ages produced faults and fissures, and that along these old fissures and faults movements are still going on.'

Whilst the scientists are thus learning a good deal concerning Mother Earth and her quakings, the 'velocity' of her tremblings and shudderings, and so on, it does not appear that they are discovering much that is likely to lessen the toll of human lives that earth exacts through her seismic struggles. Students of Scripture hear of the fall of the Tower of Siloam, and how those who questioned the justice of it were sternly told that they all might suffer the same fate as did those whom it crushed. But where Siloam took its tens, a modern earthquake slays its ten thousands. Look at the destruction of Lisbon in 1755, when over thirty thousand persons perished; or the visitation of Calabria in 1857, by which ten thousand lives were lost; that of Peru and Ecuador in 1868, when some twenty-five thousand were killed; or that in Japan already mentioned, slaughtering twenty-nine thousand. Some day, perhaps, we may learn to discern the signs of the great earthquake early enough, and to spread the knowledge of its coming quickly enough, to save folk's lives by giving them warning. In the meantime something, at least, is being done in the earthquake-ridden part of the earth to protect life by building earthquake-proof structures. Students of engineering and architecture in Japan are specially educated in this direction, and much knowledge has been collected, from sad experience, as to the kind of architecture, sites of ground, and decorations in building that are best avoided. Let us be thankful that in this foggy and dismal, but still in some respects 'right little, tight little' island, we can enjoy that questionable Greek pleasure of contemplating others' woes and earth's throes at a safe distance from the awful reality.

THE RIVER PASS.

CHAPTER III.

AULAC DES ORMEAUX stood behind the palisades that gave upon the river, and watched the hurried launching of many canoes. His face was filled with a noble scorn. Beside him stood as the second of the

him stood on the one side a group of the Sixteen, on the other Jules Desbarres and three Indians.

'And this,' cried Daulac, 'is the valour of the Hurons! Word comes of the enemy, and the Hurons flee like chaff. Dogs, and the children of dogs!' He spat on the ground contemptuously, then faced round on the four silent men in war-paint. 'Consider again,' he cried. 'The Iroquois kill and spare not. Their arrows fly true; their scalping-knives cut home; their torturc-

fire burns hotly. Consider, and flee with your friends, O chiefs! Live, O brave Hurons, whose hearts are less than the hearts of squaws! Live, O captains of cowards! This is no place for Huron warriors.'

The four dark forms stood motionless. Only, the mouth of the trapper was hard and drawn. The wind, coming from the river, flapped the banner of France above the fort.

The French leader tapped him on the arm. 'See! your warriors are affoat. Run, O brave Hurons, ere it be too late!'

Stung beyond endurance, the trapper flung out his hand fiercely towards the Ottawa. 'Curse them!' he cried after the departing Huron band. 'May the river swallow them! May the wolves gnaw their carcasses!' Tears of rage started in his eyes. He turned to Daulac. 'Forbear, chief! Do not kill us with thy words. The Iroquois come down the river. Send us naked against their arrows, and we will go. Order what thou wilt, and we shall not hold back. At least we four are men, and not cattle.'

'Who fights beside us dies,' said Daulac grimly.

'Who dies beside the brave dies well, and wins the Happy Lands,' said Jules Desbarres.

There came a cry from the sentry. Round the bend of the river the first canoes of the Iroquois came darting. Already the fugitive Hurons were out of sight down the rapids.

Daulac des Ormeaux gave a few sharp orders, and

each man stood ready at his post.

The Iroquois approached the landing, but, suddenly catching sight of the canoes upon the bank, sheared off suspiciously into midstream, and waited while the main body of their fleet arrived. The fort lay in a dead silence, every man in his place, invisible from without. The flutter of the fleur-delys above was the only sign of movement.

Suddenly an appalling yell shook the air—the dreaded war-cry of the Iroquois. It was repeated thrice, and ere the last whoop died away the air was darkened with a flight of arrows. A hundred paddles splashed in the water, and at full speed a dozen of the canoes darted to the landing-place, and their warriors leaped ashore.

'Fire!' cried Daulac. 'God and St Denis!'

The arquebuses roared along the rampart, and the enemy, taken by surprise at so vigorous a reception, stood a moment in confusion. At such close range the execution was heavy.

A second discharge from those in the fort who had held their fire braced the enemy's courage. With a yell of defiance, the warriors rushed on the defences, and their axes crashed upon the outer palisades. But the stockade was well planted, and at the end of some minutes of furious hand-to-hand fighting the Iroquois recoiled. The four men of the Huron band had taken no part in this struggle. Only Jules Desbarres had been busy in his own way.

As the Iroquois retreated to the bank he touched the French leader on the shoulder. 'Fire again, mon capitaine,' said he. 'See, there are weapons loaded.' Daulac looked, and saw that in those few fierce minutes the other had reloaded the arquebuses of several of his men. The battle-light began to shine in the seeming Indian's dark eyes.

'God and St Denis! Fire, mon capitaine!' cried he, suddenly dropping his halting accent.

Daulac stared at him, and raised an arquebuse. 'A Frenchman!' he cried. 'Who are you, monsieur?'

'Jules Desbarres, monsieur. The Gray Wolf.'

'Fire!' cried Daulac, and ere the Indians could recover from their repulse the reloaded guns roared death at them again. Several fell, and the remainder hastily launched their canoes and rejoined their companions.

Within the fort one of the Sixteen lay dead, one arrow through his leathern cap, another in his side. Half-a-dozen more were sorely hurt at the stockade.

The Iroquois attacked no more that day. They landed, and encamped round the edge of the clearing, and when the night fell their fires threw a fitful glare among the solemn pine-trunka. But three times during the night the war-cry sounded again, the arquebuses gave tongue, and the little garrison fought for their lives.

In the pale morning light Gray Wolf stood beside Daulac. 'God keep the hands that first made this fort!' said he. 'See, captain, the heathen

fear us.'

Peering cautiously forth, they beheld warriors standing under the trees, gazing with doubt and hesituncy at the little stronghold, at the loopholes ringing it round, and at their dead that lay below.

'If they knew that we are less than a score!' said Daulac. 'Monsieur Desbarres, why have you come here?'

The trapper shrugged his shoulders. 'One of my comrades is dying, captain. You do not doubt us now?'

'I do not doubt you, but I do not understand you.'

'It is not necessary, monsieur. I am a Frenchman. An excommunique has his feelings, voild tout. Let us rest and tend our wounded, for I think there will be no more fighting for a time. See, they hold a council.' The chiefs of the Iroquois were met round a fire.

There was no more fighting that day or the next, save that if a man's head appeared but for an instant above the ramparts a shower of arrows was loosed. In the evening of the second day another fleet of canoes appeared upon the river, laden with more warriors, who disembarked and joined the besiegers. That night another fierce attack was delivered on the fort, but once more knife and hatchet wrought in vain against the stout defences. But when the morning broke only four halffainting men of all that stubborn crew still lived beneath the fleur-de-lys within the circle of the fort. Their cheeks sunken and hollow, their clothing caked with blood, they lay waiting for the end. But the end was long in coming. All day they lay in the pleasant May sunshine beside their loaded weapons.

'Comrade,' said the French leader to Jules Desbarres, 'my heart is sore for thee. As for us, our peace is made, and we are ripe to die. I love a brave man, and it grieves me to know thee an

outcast from Holy Church.'

'Grieve not,' answered Jules. 'I do but share the lot of these poor heathen that lie dead because they followed me. Captain, I have a favour to ask.'

'What favour a condemned man can render, count as given.

'If by any miracle any one of you escapes alive to Montreal, say this to Monsieur de Maisonneuve: "Four Huron warriors stood by us to the death to hold the river-way."

'Four Hurons?'

'Four, mon capitaine.'

'And of Jules Desbarres?'

'Of Jules Desbarres no word.'

'I promise. But in case yourself alone should live ?

'Give me the same in writing.'

Daulac des Ormeaux wrote and signed the message, and gave it to the trapper.

A minute later one of his companions laid a hand on his arm, and pointed to the pine-forest.

'The last chapter, captain.'

Daulac looked, and gripped his arquebuse. In a great ring all round the fort, the Iroquois were advancing behind shields of branches. Some bore flaming torches.

The guns blazed out a last defiance till all were discharged, and the savages were already attacking the stockade. In the first rush the French leader fell, and the rest, shoulder to shoulder, held the Indian horde at bay for a few seconds as they fell back within the fort. Then the Iroquois war-cry rang out, and before the fierce rush of the savages the French were overborne. Jules Desbarres was the last of all. Fighting with the fury of despair, he cleared a space for a moment around him, and well knowing the fate of prisoners, shouted bitter taunts to his foes. But a sudden voice of authority stayed their final onslaught, and the trapper beheld on the painted faces a cruel smile as the order was given to take him alive. He fumbled vainly for something he could not find, till he suddenly remembered Woonona, to whom he had given that last remedy. moment a stunning blow from behind stretched

The cords cut into the trapper's bleeding wrists, but he had ceased to feel them. His head dropped forward on his chest, and his eyes, half-closed, no longer saw the green wood heaped for the slow fire that would presently continue his torments. The glare from the burning fort came redly among the pine-trunks, to one of which he stood fast bound. The Iroquois held revel by the river. Oblivious for the moment of all the savage scene, notwithstanding he was to furnish the later entertainment, Jules Desbarres was asleep. Even the near prospect of death by torture could not rouse him from the torpor of utter exhaustion.

But that which the presence of death failed to do was effected by one word that was suddenly whispered in his ear: 'Jules!'

The trapper raised his head, but saw no one save the distant figures of his fierce captors. He experienced a slackening of the cords that bound him. For an instant the bright blade of a knife was held before his eyes.

'Jules,' came the voice again, 'I have cut the cords. Try to move your feet and hands.'

He did so, and found that he was free.

'Quick!' came the voice. 'Come behind the

Jules moved his stiff limbs, and crawled to the side of the tree that lay in shadow from the burning fort. Woonona stood behind the tree. The hope of life sprang in the trapper's heart. He needed no more telling what to do; but his limbs, torn by the cords and sore from the torments he had already undergone, were numb and stiff. Holding the girl's arm, he reached a second tree farther in the forest, and a third, and a fourth. Under the stimulus of exertion his hardy muscles resumed their functions.

They had retreated thus perhaps a quarter of a mile into the pine-forest, and were beyond the circle of light cast by the flames, when a fierce yell told the prisoner that his escape was discovered. He heard the breath of Woonona come in quick, frightened gasps.

'Give me thy knife, pretty one,' said he, and took it from her hand.

'No, no!' she cried. 'Jules, the river-quick! There is a canoe!' She dragged at his arm, and Jules called up his last strength to run beside her. The forest behind them rang with the cruel shouts of the Iroquois. They expected every instant the whoop that would tell of their discovery and signal their doom.

A dark shape sprang in front of them. Jules, driving blindly forward with his knife, fell to the ground on top of the Indian, who gave a gurgling cry and lay still. Woonona dragged her lover to his feet, and they stumbled on.

The river gleamed before them in the moonlight. A canoe lay on the bank. The trapper sank fainting on his knees; but the Indian girl lifted the light craft to the water, and dragging Jules to it, followed him in and seized the paddle.

At the same instant a shout of triumph rang from the darkness of the pines. Bending low, Woonona struck the water with her paddle, and the canoe shot out into the current as an arrow sang in the air beside her. She struck forward with strong strokes, urging the canoe to midstream. Another arrow hissed, and buried itself in the birch-bark just above the water-line. But now Ottawa had them in his keeping. Borne on the hurrying current, the frail shell flew towards the rapids. No Iroquois torture-fires for them now. Death, if they must meet him, lay waiting in the rioting eddies of the Long Sault. There was no more question of pursuit. The bravest warrior of the Five Nations would never attempt that to which her love had urged the Huron girl-the shooting of the dreadful rapids of the Long Sault at night, alone, in the pale and tricky moonbeams. No need now to drive the canoe forward. It leaped and darted down the

stream in the midst of a roaring white wilderness of foam. With stiffening muscles and eyes wide with fear, the girl held firm the paddle on which hung both their lives. Like a living, sentient thing, the canoe flew on, drenched now with cold spray from some tossing crest, now slipping by a hair's-breadth past black fangs of rock ringed round with foam, now straining nearly gunwale under as she thrust it past the deadly skirts of a whirlpool. The spirits of the Sault mocked her with dreadful noises. The girl's brain reeled with the terrors that surrounded her. But still she held the paddle firmly in her small brown hands.

Suddenly the rapids were gone. The canoe shot swiftly down-stream in calm water. Woonona gave a low cry, and drawing in the paddle, crouched

fainting beside her lover.

In the Governor's house at Montreal Jules Desbarres-once more in trapper's garb-stood in the room of Monsieur de Maisonneuve. That brave

soldier of France sat before his writing table, his head buried in his hands, and the tears trickled through his fingers. On the table before him a bit of soiled paper lay. He sat so for a long time, shaken by hard sobs, while the trapper stood and watched him in silence. At last the Governor looked up.

Ser

'You know the natives, Monsieur Desbarres. This Huron's story—it admits of no doubt?'

Jules Desbarres shrugged his shoulders. 'I go

by the paper, monsieur.' 'Ah, the paper, mon Dieu! Oh, my brave children, all dead! Would God I had stood with them! Pardon me, monsieur. You also are brave; you will understand. What is life, compared to a

death like theirs?' 'They have saved Montreal,' said Jules in his

'They have saved Canada,' said Monsieur de impassive way. Maisonneuve.

THE END.

FUEL. PATENT

ROM time immemorial the thrifty farmers and peasants of west Wales were accustomed to take home in their two-wheeled carts or in sacks on horseback the small, weatherbeaten coal from the mountain-side,

where the veins of coal showed themselves at the surface. With pickaxe and shovel the natives of west Glamorgan, Carmarthenshire, and Pembrokeshire could obtain, practically at no cost to themselves, sufficient anthracite (or stone-coal, as it is called locally) to satisfy their wants for the one fire in the room or kitchen in which they

The coal, in consequence of being exposed to the action of the weather, is very friable, and therefore small in size; and as small anthracite of itself cannot be induced to make any kind of fire, it has been the practice to knead a certain amount (about one-third) of clay with it, and by so doing produce balls of coal and clay mixed, of the bulk of one's fist, which, when burnt in a fireplace, will afford a good heat and remain alight for an indefinite period.

The shape of the balls is conducive to the passage of plenty of air through the fire, and thus produces nearly perfect combustion. One condition is essential—namely, that once the fire is made and kindled, it must not be touched with a poker except to rake out the ashes. If the fire were stirred in the usual manner, as with other coals, the result would be that the clay in the balls would separate and fall to pieces, the draught become clogged, and the fire be certain to disappear in a short time. In some places in the rural districts the fire hardly ever ceases to burn; certainly it will go on for years if

it be properly replenished every night and morning. Apropos of this characteristic of stone-coal balls, the writer, after duly admiring the fire in an old farmhouse where he had to shelter during a storm, inquired of his hostess how often the fire was allowed to go out, and, to his astonishment, received the reply that she was nearly seventy years of age, and had lived in the same house all her life, but lad never seen the fire go out from any cause whatever-which speaks well for the durability of small stone-coal used under such primitive conditions. This system is continued, but the coal is now purchased at collieries, where small coal is, generally speaking, a drug in the market. These balls of coal and clay were the precursors of what are today known as briquettes.

In Chambers's Journal for 1906, in the article 'Welsh Coal,' it was shown how, in the early part of last century, Welsh coal began to be known as the best steam-coal in the world; and this characteristic, which is still maintained, has caused large towns to be built, valleys to be populated, and enormous fortunes to be amassed.

At the same time, it is a fallacy to assume that, because coal is wrought in Wales, all Welsh coal is of the best steam kind. Probably in no other coalfield does the quality of the seams vary so much as in that of Wales.

For the object of this article, Welsh coal may be divided into three sorts: bituminous, steam, and anthracite; the volatile properties varying from 35 per cent. in the bituminous to 7 per cent. in the anthracite, the best steam-coal containing from 15 per cent. to 18 per cent. volatile matter.

Under ordinary circumstances, bituminous and anthracite coals are not shipped for steam purposes; the former caking or coking too much, and the latter does not possess a sufficient length of flame, although the heat produced is intense.

In the mines where steam-coal is raised, as a consequence of large coal only being required for sale vast quantities of small coal are left behind, the prices realised for it at the pit-mouth not being sufficient to pay for bringing it up. At the same time, for one reason or another, a portion does reach the surface, and a great deal more would be obtained if a market could be found at anything resembling a fair price.

It being clearly shown that when small coal was mixed with clay and kneaded a serviceable article was created, which in a lesser degree took the place of large coal, acting as a ready substitute and obtained at a low cost, it naturally follows that if a more suitable bond than clay could be found, the small steam-coal might be converted into a highly profitable commodity. Clay as a bond creating too much ash, numbers of gentlemen interested have endeavoured to find a cheap suitable binding agent which should not add ash in a marked degree to that which already existed in the coal; and numberless patents have been filed with this object in view.

The problem to be solved was, and still is, difficult. A bond which should join particles of coal together and contain a minimum of ash is hard to find; and even at this advanced stage it cannot truly be said that the problem has been satisfactorily solved. About sixty years ago Mr Sidney Hall, after thinking the matter out, had an idea that if he used tar as a bond to agglutinate the particles of small steam-coal, he might obtain, by the aid of machinery, a fuel which would compete with large steam-coal. He followed this idea out to its fullest extent, and eventually produced blocks of brick-size, to which he gave the name of 'Patent Fuel.' It did not turn out to be a commercial success, as, although the tar suffilled most of the conditions of a perfect bond, it produced too much smoke, and the fuel was too sticky to be handled until a portion of the tar had been burnt off. This led to a further complicated process, which in the end was a failure; so tar as a bond was abandoned in the early sixties, about which time a marked advance in the manufacture of briquettes took place.

It may here be mentioned that Mr Hall had established two factors by adopting tar as a bond. In the first place, the volatile matter contained in the tar would supply any deficiency in this direction which might be caused by an insufficient quantity existing in the coal. Thus, always assuming that fuel should hold 17 per cent. volatile matter, if the coal did not contain more than 12 per cent, the difference could readily be supplied by regulating the addition of tar. Secondly, he proved that by the employment of tar the fuel so made was immune from the action of weather or climate, and could withstand for years such influences without being disintegrated or losing any

portion of its burning properties—a great advantage over coal.

While these experiments were being conducted with tar, others were being made with pitch, or tar in a dry state. It was found that ordinary pitch would melt under the influence of hot steam; so, with the aid of a French press invented by M. Couillard, the coal, after being ground by a disintegrator and mixed with 10 per cent. of pitch, also ground, was conducted to a pug-mill, into which hot steam was injected. The pitch, melting, formed the whole mass into a coherent state sufficiently plastic to allow of its being pressed in moulds on a revolving table; the moulds giving the required size and shape to the fuel. Generally, the shape was that of an ordinary brick; hence the term 'briquettes' used by the French merchants, to whom the fuel was largely exported, and this name is gradually superseding the old term 'Patent Fuel.'

Having now a bond which is cheap and easy of application, combined with a press simple and reliable, the new industry made rapid progress, resulting in great wealth being gained by those who foresaw the possibilities of utilising a comparatively waste product and converting the same into a valuable article for everyday use. Even now the potentialities are not exhausted, and in time to come it is quite possible that the supremacy of 'best Welsh' will be challenged by its humble offspring, resulting from small coal shaped into briquettes. The reasons for so assuming are as follows: briquettes at present made from small steam-coal are of necessity inferior to large steam-coal, because of the ash or dirt left after burning, in the ratio of nine to four in favour of large coal, the latter also producing steam in the ratio of ten to eight as compared with briquettes. These disadvantages, combined with the dense yellow fumes evolved from the pitch during the process of combustion, cause the employment of briquettes to be to a certain extent restricted to locomotives or stationary boilers, where the smoky qualities are not so much called into question.

Two important features in the use of best steamcoal are those of breakage and climatic influence. It is well known that if large coal be carried, say, to an Eastern port, and there deposited, exposure to wet and heat will affect it to a marked degree, and every week during which coal is subject to such influences causes grave deterioration in quality. If the same coal be loaded again on board ship there will be a loss through breakage of 25 per cent. of small coal left behind as useless. On the other hand, the advantages derived from the facility with which briquettes can be transported, the lesser breakage as compared with coal, the ease with which they may be stowed, and immunity from the action of weather and climate, would make them an ideal fuel if there were less ash and if the thick fumes could be eliminated.

As it is, in all directions the briquette industry is steadily increasing, and when a bond is dis-

covered which shall possess the advantages of pitch without its smoke, then may Welsh steam-coal fear for its supremacy. Such a bond, when found, will influence large areas of coal now practically untouched by briquette manufacturers, and it may be confidently predicted that in the near future anthracite will be so blended with bituminous coal that a fuel will be made which shall afford better results at sea than are derived from the best hand-picked Welsh coal.

It is a figure of speech to say that the best steam-coal is smokeless. This term is comparatively correct only when used in comparing steam-coals with bituminous or well-known smoke-producing coals. If the volume of smoke seen coming from boilers in which anthracite is burned were compared with the fumes emanating from steam-coal, the latter would be termed really smoky.

With our present knowledge it is practically impossible advantageously to employ anthracite coal by itself for sea-going boilers; the intense heat given out is too local and the flame too short for marine boilers, even when under forced draught. Bituminous coal does not yield the same amount of heat for the same weight, and in other respects is not so satisfactory as steam-coal; but if a calculated mixture of anthracite and bituminous coal were united by a fitting bond the long-wished-for fuel would be in sight. The heat of anthracite would be distributed by the flame of the bituminous coal, and the smoke of the latter destroyed by the action of the anthracite. Even if such a state of affairs were to come to pass, Wales would more than hold its own as against other countries, for nowhere else has the same class of anthracite been discovered as exists in west Wales. The United States produces more anthracite from its mines than is obtainable in the United Kingdom; but the grade is very different in the two countries, the superiority of quality resting with Welsh anthracite. Statistics are from time to time compiled as to the duration of the seams of best steam-coal, without reference

to anthracite proper; but, seeing that the anthracite measures are practically untouched, we have as a nation further reserves to draw upon than have been calculated hitherto.

It is curious to note how the ingenuity of inventors has been devoted to the discovery of a bond applicable to the manufacture of briquettes. Clay, tar, pitch, lime (as lime-water), plaster of Paris, creosote, wheat, durra, tapioca, sugar, resin—all have been, either singly or by mixing several together, put forward as the perfect bond; but of these only pitch remains in a commercial sense. There is still room for another.

In 1854 a series of interesting experiments were instituted for the purpose of ascertaining the possibility of extracting the tarry matters contained in bituminous coal when mixed with small steam-coal and treated under certain conditions. Large iron pipes were filled with this mixture, and heat applied externally, when the tarry constituents began to distil, and in so doing rendered the mass of a pasty condition. Rams were employed to force out the agglomerate, which was then conveyed to the press. This plan, which was to do away with pitch or added tar, promised well, but mechanical and other difficulties occurred which precluded its adoption; the chief obstacle being that, whilst the tarry particles did their work in binding, they either became incinerated before reaching the press, and so lost plasticity, or they caused such an adhesion to the pipe that the coal could not be forced out. Similar experiments have been repeated of late years with the same results, and at the moment pitch as a bond holds the field; its power of waterproofing the surface of the briquette, added to its strength as a tie, renders it an easy first, the rest nowhere. Such, briefly, was the origin of briquettes, the success of the production of which as a business is assured, with a prospect before it little thought of by the Welsh farmer when he first mixed clay with coal as a fuel for his home

THE PINK HAT.

By Mrs SMART.

HE sun streamed brightly in at the windows of a room on the first floor of a hotel in the Rue de Rivoli. The outside shutters had been closed all the morning, but the French maid had just thrown them open

for a special purpose—a very special purpose.

'Ah, madame, but it is charming—ravissant!
The couleur de rose does so well become madame,'
the little Frenchwoman said as she clapped her
hands with the exuberant rapture of her nation.

Hilda Trevelyan turned slowly round in front of the large mirror, and used the hand-glass so as to obtain the best view of her delicately cut profile.

Yes, I think it will do,' she said slowly as she put down the glass with a sigh of content. 'After all, where does one buy hats as you find them in the Rue de la Paix? Eugénie is a veritable artiste; she deserves to be canonised in the Chronicles of Millinery. It was a very good idea of yours, Marie, to think of buying some hats to take back with us to England—stupid Old England!'

'Ah! ze English are a leetle—'ow one say it?
'eavy, like their roast-bif and plum-pudding;' and the maid laughed merrily. 'They cannot create like Eugénie; they only trim ze 'at. But, madame!' striking an attitude of reverent admiration, 'dest charmant vraiment, le chapeau, et pour le Grand

Prix - ze very zing;' and she laughed merrily

'Yes,' said Mrs Trevelyan, 'we will decide on that, and the black toque, I think; and I may as well have these two little travelling things. The others can go back. You had better pack them up quickly, Marie, and let Eugénie know when to send for them, and then you must dress me. I told Mr Trevelyan I should be ready to go for a drive in the Bois directly after lunch.

Hilda Trevelyan had been married only two months, the greater part of which was spent honeymooning in Italy. It sometimes occurred to her, lazily-for she was an extremely indolent woman-that she had been extraordinarily fortunate. Her wedding was quite one of the most noticeable of the early London season. She hadafter several London seasons-made what was supposed to be a brilliant match in marrying the junior partner of a wealthy City firm; she, the penniless niece of Lord Gresham, who, it was well known, had told her when he paid the cheque for her wedding and trousseau expenses that in future she must look to her husband to provide those luxuries and necessaries of life with which he had grudgingly provided her for a considerable number of years. And Arthur Trevelyan more than acted up to his promises; he had loaded his lovely bride with every conceivable thing her wide-ranging fancy could think of.

Yes, she was a fortunate woman. It made her shiver to think of others less happily situated; her old schoolfellow, Rosalie Chiene, for instance, whom she met yesterday in the hotel vestibule, the poor, ill-paid, nerve-driven companion of a penurious old maid.

But why think of disagreeable things? The day was fine; the sun shone with the brilliance of June; she was married to Arthur Trevelyan, the best man in the world; she was in Paris-gay, beautiful Paris - and had just found the most lovely hat possible for the Grand Prix. What could heart desire more? Her cup of happiness was full, and with a sigh of content she again turned to the mirror and for the third time tried the effect of the pink hat.

A knock was heard on the door.

'Come in,' she called out, and turned round to see, as she expected, her husband.

'Is it not sweet?' she cried gaily as she ran towards him and kissed him. 'Have you ever

seen a prettier hat, Arthur? Trevelyan disengaged himself from her embrace

and stood for a moment looking at his wife. She made truly a graceful picture, this well-born, well-dressed woman, with the love-light shining in her eyes. Was it for him, this gleam of sunshine, this manifestation of affection? Was it for him, or was it for the pink hat and such-like material things which he had hitherto been able to give

'Send Marie away,' he said in a hoarse voice

which sounded unnatural to the summer-day wife, who had only known him in his moments of sun-

'Why, Arthur?' she asked with wide-eyed surprise. 'She had to pack these hats to go back to Eugénie. Look, we are going to keep four-the pink, of course, and the black, and these two little travelling things'-

'And they cost?' he said with a note of anxiety in his voice totally foreign to her.

'Oh, what does that matter?' she said petulantly. 'I think it is about four or five hundred francs altogether.'

'Send them all back,' he said, again in that hard, dry voice.

'Arthur! Why, think of the Grand Prix, and Ascot coming on! I did want to have that pink hat for Ascot. What has happened to change you

Marie had discreetly withdrawn. With the ferret-like instinct of a Frenchwoman, she had 'smelt a rat,' as she graphically put it to herself, and retired to her bedroom, where she immediately consulted the Paris edition of the New York Herald as to 'Situations Vacant.'

'Hilda,' said Arthur Trevelyan as he put a cold hand on hers-'can you bear it, Hilda? We are ruined. Do you hear what I say-ruined?'

She still gazed at him with these wide-open eyes, which seemed to see nothing.

'The firm has smashed,' he went doggedly on. 'Roper has been speculating, and has absconded with the money. We have nothing, or almost nothing, left, Hilda. For God's sake, say something, or I shall go mad!'

'I don't understand,' she answered at length in a voice which seemed to belong to somebody else. 'What are we to do? I don't understand. How are we to live?

'God knows!' he said hopelessly. 'There will be a few hundreds left when things are settled up. We must think—think;' and he pressed his hand to his brow. 'It is for you-for you-that I feel it, Hilda. For mercy's sake tell me you still love me; that it was not only for money'-his voice stuck in his throat—'that you married me!'

She was silent. How could she be otherwise? Her beautiful castle of life had tumbled to pieces, and the ruins were represented by a pile of open band-boxes and a pink hat.

'I don't know,' she said at last petulantly. 'What is the good of asking me questions like that just now, when we don't know how we are going to live?'

The maid had discreetly re-entered the room.

'You may send all the hats back to Madame Eugénie, Marie,' her mistress said. 'I-I do not require any of them—just now—and I shall not drive to-day.

'Oui, madame,' Marie replied demurely.

Ten years later.

The rain dripped drearily in Hereford Square, Bayswater. It had rained all the morning, and the soot on the window-panes was dissolved into black tears. A tall, handsome woman stood in the back sitting-room of a dingy London boarding-house. She had just come in from her daily shopping, whereby she supplied the corporeal needs of the 'paying guests' at No. 9 Hereford Square, and put up her hands to remove her shabby black hat. As she did so the gesture seemed oddly familiar to a man who lounged, smoking, in the ragged armchair by the fireside.

In a moment his memory went back to a sunshiny May day in Paris, a laughing girl in a summer frock and a pink hat. Could this worn, brokendown-looking woman be the same Hilda?

She placed the shabby hat beside a pair of mended gloves and a worn, lean-looking purse on the table, and commenced to take off her sodden shoes.

'I'm afraid you've got wet,' the man said as he looked up from his paper.

'Wet! I should think so,' she replied. 'My feet are soaking through and through. There is a hole in my shoe you could put your fist into.'

'Why don't you have it mended, or buy a new pair?' asked her husband.

'Why don't I do lots of things? The usual reason: want of money,' she replied, with a short, unmirthful laugh.

'Poor girl, it's too bad!' he said as he filled his pipe.

'Yes, it is too bad,' she replied, turning furiously round. 'Why can't you make a little money, instead of leaving us to be entirely dependent on the whims of a few crotchety old women here'—

'My dear Hilda, you forget I have tried, and

can get nothing to do.'

'Tried!' she said in a tone of bitter scorn.
'However, there's no use breaking my heart over
it. I must just go on, as I have done, till the end
of the chapter, I suppose;' and she commenced to
jot down her purchases in a little note-book.

'Please, m'm'—and a grimy head appeared at the door—'I forgot to tell you, but the bacon's finished, and the gas-man called for the money for last quarter's bill when you were out.'

Hilda turned round angrily, and vented her fury on the woman.

'Why didn't you tell me in the morning? How do you expect me to go out again in this pouring rain? You—you'll just have to go without, that's all.'

'Very well, m'm, it's not my business; but the boarders will have their bacon.'

Mrs Trevelyan sighed assent, and began wearily to put on the soaking shoes again.

'Couldn't I go?' said the man from the arm-

'I suppose you could,' she said dryly; 'but they'd cheat you; they always do.'

'Oh, very well;' and he resumed his paper.

An angular lady of uncertain years waylaid Mrs

Trevelyan in the passage. 'I wish to tell you I am going on Monday,' she said.

'I am sorry,' Hilda replied, with some truth, for this was her best-paying boarder, who could ill be spared.

'Yes; your establishment is too mixed for me, Mrs Trevelyan. I cannot forget that my great-uncle was Lord Mayor of London; and when you introduce persons like Miss Pringle into your circle I feel it is time for me to go. Besides, the fish-sauce at dinner last night was distinctly burnt, and I believe—I do really believe—the lamb was foreign!'

'It is very difficult to provide everything of the best for the terms I ask, Miss Jones,' Hilda replied meekly; 'and as for Miss Pringle, she works, it is true, for her living in a milliner's shop, but she is of good birth. I happen to know her antecedents, and to work for one's daily bread is surely no crime?'

'I prefer to go,' the lady said with a snap of her jaw. 'I did not know Miss Pringle's antecedents, and I am not accustomed to associating with shopgirls;' and she flounced upstairs.

Hilda smiled grimly when she remembered her own many titled relations and their complete

neglect of her since her misfortunes.

'It is retribution,' she said bitterly as she went out into the blinding rain. 'I forgot others in my days of prosperity, and now others forget me.' She bought the bacon, after a furious dispute over a penny in the purchase price, and returned with it tucked under her cloak. An Italian child with a barrel-organ smiled at her as she passed, and she could not resist giving him the disputed penny. His face brought back to her that glad springtime ten years ago, and the dark Italian faces which clustered round their carriage to beg for alms as they drove through the Chiaia at Naples or the Corso in Rome, through the fresh greenness of the 'Signora bella, bellissima!' Cascine at Florence. she could hear again the soft Southern voices say. What would they call her now? she thought as she stood before the mirror in her dingy bedroom.

Often she lacked the courage to look her reflection in the face; but to-day she took almost a cruel pleasure in doing so. It was a tired face which looked back at her; the pencils of care and poverty had drawn deeply under the suffering eyes; already some gray was plainly visible in the nut-brown hair, once—in the days of Marie—so shining and beautifully coiffée, now so dull and uncared for

Her husband had entered the room as she stood before the mirror. He came up to her and put his arm round her waist.

'Poor Hilda,' he said, 'it has been hard for you!

'Has been? Is, you mean—will be till the end of time. Oh Arthur! do you remember that happy time long ago in Paris, and the pink hat? I took you "for better, for worse," but it has been mostly worse, hasn't it?'

'Never mind, dear; perhaps you will have the better again now.'

'How? Have you got something to do?' she asked quickly, starting back so as to see his face.

'Look;' and he showed her an open letter. Tremblingly, she commenced to read:

'Dear Sir,-We write to inform you that your late uncle, Mr Benjamin Smith, of whose demise you are probably aware, has died intestate, and that his estate reverts to you, being nearest of kin.

'We should be glad to be favoured by a call from you, at your early convenience, so as to receive your instructions.

We believe the amount of property is considerable.-We are, dear Sir, yours faithfully,

'GRAHAM & STOKES.'

'Oh Arthur!' she said as she wept in his arms from sheer relief, 'I can't believe it. No more worries with boarders, or bacon, or gas-bills! Oh, is it not lovely to think we shall be well off again? But I have been so horrid,' she continued in a tone of regret. 'I have rebelled—bitterly rebelled—ever since that day of the pink hat'-

And now you shall have the best pink hat to be had in London to make up for that one,' he said as he dried her tears.

Oh, the relief of it! Hilda thought, as she leaned back in the neat victoria and watched the gay crowd go by in the Park. It had gone by her for so long that now she seemed not to know any of the gay butterflies of fashion. But that would all come—that would all come! She knew her London well enough to understand that as flies gather round the jam-pot, so people congregate together where there is wealth. And they were rich-Arthur and she were positively rich.

That very day they had signed the lease of a house in Mount Street, engaged a staff of servants, and commanded the purchase of a complete carriage outfit and suitable horses. They still sheltered in their Bayswater wilderness. It would not do to burst upon the London world too soonuntil all was settled - though already ominous paragraphs had appeared in the society papers about a hostess formerly well known in London society who was to reappear this season and entertain on a glorified scale. To-day Hilda had come out to reconnoitre. A good firm supplied her modest equipage; the coachman was unadorned by a cockade and unaccompanied by a footman. To-day she was only a looker-on at the scene where she persuaded herself she would soon be a personality.

She looked at the crowds of people walking. They crushed against the railings so as to get a better view of the carriages. She remembered the last day she and Miss Pringle were here, only last month, and how the twopence for the chairs had been such a consideration that they tacitly agreed not to rest unless they could find a vacant bench.

Poor Miss Pringle! She must ask her to come for

a drive-some day. Oh, how delicious it all wasthe scent of the horse-chestnuts, the fresh green of the leaves, the gay crowd of well-dressed people! And for the last time she was an onlooker. A month—a week hence she would again be 'in society.' Oh, money! The wonderful power of money! Its wonderful, wonderful power! Again the scene in the Paris hotel and the incident of the pink hat occurred to her. Had it ever been absent from her brain since it was branded there ten years ago? And those dreadful ten years of poverty and hardship and sordid care! She would soon forget them; she and Arthur would start again as if those years had never been. Ah! could they? Something lay on the sleeve of her neat black dress. What was it? A gray hair? Oh, possibly the wind had blown it there—possibly. But probably?

Never mind; she would make up for the past in the future. She was still a young woman; a woman of thirty-five was quite a girl in these days, and she was not so very much more. 'Not if she has had a life like yours,' whispered a voice in her ear. 'All the more necessary to make up for that life,' she argued mentally. Next time she drove out she must really have a companion, so as to make her feel more cheerful and banish all these horrid thoughts. There was her husband coming towards her. How handsome he looked in a well-cut frock-coat! How different from the man who had lounged in the old arm-chair a month ago! He came up to the carriage with a smile on his face.

'Had you forgotten we were to drive to Madame

Jeanne's in Bond Street to choose a pink hat?' 'Oh Arthur, you darling!' she said, as she timidly touched his arm.

He gave the coachman the address, and took his place beside her; he loved giving her pretty things -when it cost him no exertion or self-sacrifice to do so. How bright Piccadilly looked, and how nice it was to have an obsequious attendant to help you out of your carriage at a well-known milliner's door, instead of jumping off a penny bus and subsequently wrangling with the shopwoman over the difference of a shilling in the price of a hat!

'Madame wishes to see a pink hat?' said the elegant saleswoman deferentially. 'Mauve is more the mode just now, or hydrangea blue; but it must be pink? The gentleman wishes it so?' and she smiled indulgently at Arthur. 'Here is a hat just newly come from Paris, madame-from Madame Eugénie, the great modiste in the Rue de la Paix. No, madame; it goes so-so; and she gently patted the hat into place.

Hilda looked critically at her reflection in the mirror.

The tone of pink in the hat accentuated the lines in her face and made the colour in her cheeks appear more faded; it was the hat of a young woman, and seemed to make her look years older. Or was it a nightmare born of her imagination? No, there was no doubt about it, and her eyes grew big with horror as she looked steadily in the glass.

'Madame does not like it?' the woman asked anxiously.

'No; take it off,' she gasped.

'Why?' said her husband, who was standing behind and had not noticed the little tragedy. 'It is all right, isn't it? It is just the same colour as that one-you know'-

'Yes; but that was ten years ago,' said Hilda as

she swallowed her tears.—'Bring me something plainer; not so bright, not so young, she said with

Yes, it was all true. Youth was gone; the poverty had passed away, but in its cruel wake it had carried

her youth with it. Alas! alas!

'Perhaps madame might prefer the mauve?' said the saleswoman sympathetically.

では、これのことがは、これのことをは、これの

SPECTACLES. THE ORIGIN OF

PECTACLES do not seem to have been known until about the year 1300, though, of course, men even in Roman times had discovered the use of convex and concave glasses to modify the sight, and single eye-

glasses were eventually developed from these; that is to say, single lenses of some sort were rounded off so as to fit in the eye without the support of the hand. The Chinese, who are usually supposed to have invented almost everything first, certainly derived their knowledge of spectacles from Europe, most probably from the Jews settled at K'ai-feng-

The first certain mention of spectacles occurs in a work published about A.D. 1460, called Local Miscellanies. The passage runs as follows: When I was at the metropolis—that is, Peking staying at the house of a certain military friend, I noticed that his father was in possession of an object presented to him by the late Emperor (d. 1426), having the appearance of two discs of mother-of-pearl, but very slender in bulk, with rims of gold amplified into a sort of handle. Old men whose eyes are too dim to make out small writing place this object in front of the two eyes, on which the size is magnified double or more. Moreover, I have recently met with one at the house of one of the Assistant-Secretaries of State, and I tested it with identical results. He said he had obtained it in exchange for a good horse from a Western Region trading Hu Mwan-la, and he understood its name to be ai-tai.

It must be explained, with reference to the term Hu, that it had been for many centuries applied indiscriminately to Syrians, Persians, Hindus, and Tartars; the words 'Western Region,' however, exclude Tartars, and usually Hindus. The only known use of the sound Mwan-la is in reference to the Jewish mollahs (mostly Persian), who precisely in the year 1421 received some favours and presents at the Emperor's hands. The learned Shanghai priest Father Pierre Hoang (a native Chinese) thinks that the syllables ai-tai may represent the Portuguese luneta; but, besides being rather far-fetched, this derivation does not take into consideration that the Portuguese had not yet for a century begun their trading career. Besides, the first spectacles were made in Italy, and it is not

impossible that Marco Polo had introduced them into China, or more probably one of the Italian

archbishops of Peking. A later work, called Rare Objects Explained, says that 'the ai-tai are as big as money discs, of transparent substance, and almost colourless; they are used as eye-mirrors, and derive their name from the idea (ai-tai means this) of light clouds shrouding the sun and moon.' (The Chinese still call spectacles 'eye-mirrors.')

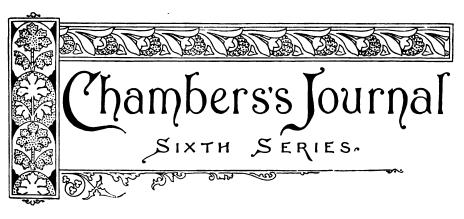

A still later work, of a century and a half ago, called the Collection of Omissions, says that 'eyemirrors were considered as extremely valuable objects during the preceding dynasty (1368-1643), and were either given as presents from the Palace, or were purchased from Hu traders; only the wealthy possessing means to procure them. Now, however, they are cheap all over China, having originally come from abroad, and all being made of glass. The Cantonese artisans, imitating their shape, now manufacture a much superior article out of crystal.'

In conclusion, I may say that I have often seen the Cantonese spectacle-makers sawing lumps of crystal with the aid of water and emery at their shop-doors. The crystal thus sawed has the colour of sea-water.

TRYST-DAY.

I WOKE at the whisper of dawn. Could I sleep ! Could I sleep ! Could I rest-I-knowing the day? I stood by the curtains withdrawn, And I watched the warm sweep Of the red rolling over the gray. That was long ago, long ago-two hours, or three! Hurry, sun, up the blue of your stair! Ah! why do the hours go so slowly for me? This is tryst-day, and she will be there! Oh! laggard and leisurely hours,

Go ye swiftly, go swift! Would ye madden me thus with delay? Have ye not heard from the flowers, Or the winds as they drift, Of the tryst that is named for to-day? However so slow, at the last ye must go, Though ye loiter as long as ye dare! Soon 'twill be noon—then the moon—and I know It is tryst-day, and she will be there! WILL H. OGILVIE.

MAGGIE OF THE DUNES.

A DORSET TALE.

By CLIVE HOLLAND.

CHAPTER I.

the pale light of an autumn morning a girl stood shading her eyes at the door of a cottage standing solitary and bleak amid the sand-dunes.

Away in front of it, facing the east, where a faint rosy flush was

discernible in the sky, stretched a limitless expanse of gray-green water above the grass-tufted sanddunes, finally merging softly above the horizon into a gray sky. Around the cottage lay a waste of coarse green flats and moorland, the latter, when the sun shone, an expanse of purple heather and brown bracken of exquisite harmony, broken here and there by thread-like rivulets wending by devious ways to the harbour and the sea, and tiny pools, the haunts of wildfowl.

Overhead the clouds hung heavy, sweeping the uplands to the south-west, and at times even obscuring their not lofty summits. But in the eye of the wind, which blew north-east, there was a break, which in these parts betokened a bright day by noon.

In that vast expanse of low-lying moorland—which was almost swept by the waters of the little bay when an easterly gale blew, and was only, indeed, saved from invasion by the rampart of sand-dunes skirting the broad, sandy shore—there was not a sign of life to be seen save the girl, who stood at the cottage door and looked out anxiously towards the murmuring sea.

At last a small black speck appeared above the wind-swept ridge of a distant sandhill.

Though it was featureless, the watcher recognised it, and, with a muttered exclamation, gave one long look and then hastily entered the cottage.

'What news, Meg?' inquired a voice from an inner

'Little enough, father,' said the girl; adding hastily, with a flush of anger, 'cept that Rodway is over yonder near Sand Beach.'

No. 494 - Vol. X.

A gruff but not ill-natured laugh was the response from the man; and then, after a slight pause, during which the girl busied herself about the room getting the meal ready, the voice said, 'Seems to me, Meg, youm be a-vooling Jim Rodway. Leastways, he's hanging about more than's conwenient at times.'

Maggie said nothing, but murmured under her breath; and the man went on.

'Ne'er mind, lass. But don't 'e fall in love with the likes of 'e, that 's all. A dirty "preventive," who spies upon honest folk.'

The girl laughed.

'Fall in love with Rodway! Not me, father. Though he do look smartish Sundays. But I wish the chap wouldn't pester I so.'

The door of the inner room, which had been ajar, was pushed open, and Isaac Gutteridge came out into the kitchen-like parlour knotting a woollen neckerchief round his bronzed throat.

He was a big man—one of the tallest and finest built on that strip of the Dorset coast which lies between Weymouth and Poole; and, making due allowance for the softening influence of sex, there was a remarkable similarity of build and facial appearance between Isaac and his daughter. And, 'Any one can tell whose darter Meg is,' as the fisherfolk of South Haven were wont to exclaim on occasion, was more than a conventional saying.

'Well, my lass,' said Isaac, sitting down to the table and cutting himself a slice off the loaf, 'I tell'e what now. I'd as lief see thee dead (lonesome though I'd be), like your dear mother, God bless her! as either vooled or wed by that chap over

The speaker made a significant gesture with his thumb towards the south-eastern corner of the room, in a line with which Maggie had but a short time before descried the distant figure of the 'preventive' man.

[All Rights Reserved.]

MAY 18, 1907.

'Not that I'm afeard,' the man went on, 'for I'm main sure that Bob Livesey stands first. Eh?'

The speaker shot a glance from a keen pair of blue-gray eyes in his daughter's direction, and Maggie dropped her head lower over the blackbrown ware teapot, whilst into her bronzed cheek a flush of deeper colour swept, staining also the skin of her neck.

'Bob!' she said lightly, after a pause. 'Why,

father, I haven't seen him for days.'

'Maybe yes, maybe no,' was the rejoinder. 'But what matter, my girl? Livesey's a fine fellow, and a good comrade to boot; and some day he'll be rich enough to marry the best and smartest lass that walks Poole High Street o' Saturday nights. And why not you?'

'Them-them light o' loves!' exclaimed Maggie with an indignation which seemed to please and amuse her father; 'if he likes that sort he needn't

come near me.'

'There, there, lass,' said Gutteridge, 'ye needn't flare up like your poor mother used to do when I had a bit of a joke. Youm a girl-child, and I misconceive your ways half my time. If you were a boy, now'-

'That's not my fault, father,' cut in the girl; and then both the man and the girl laughed till the sound of it must have reached some distance,

for an echo came from without.

"Bob!' exclaimed Gutteridge laconically.

A deeper tinge of colour suffused Maggie's face, and her hand shook as she raised the teapot to pour her father another cup.

A moment or two later the door was pushed open and a young fellow dressed as a fisherman entered with a cheery 'Good-morning.'

'You're early afoot,' said Maggie.

'I've business, Maggie,' said the other somewhat shortly. 'Is there any one about?'

The speaker glanced round towards the inner room and then up the stairs, as though suspicious.

'None,' said Gutteridge, replying to the question.

'Any news?'

'Yes,' was the reply. 'Tom's heard from the other side,' indicating the sea with a jerk of his thumb. 'It's to-night. There's no moon, and the coast is clear. The Seagull's off down Portland way, and there is a headwind if she were to attempt to beat down here. The Kestrel is somewhere in the Solent, 'tis true. But there won't be a better chance this side of the new moon. Collins and Duke and the rest of them know, and we'll get out well on the ebb, and lie-to for the Belle Marie in the old place. And then, if all goes well, we'll get in on the flood unless the wind drops altogether.

Maggie listened intently.

She had done so to many a like conversation during the last fifteen years that she could remember out of her less than twenty years of life. But it was only of late that she had fully realised what these periodical disappearances of her father -and the lonely nights she often spent, when the

wind moaned round the house and whistled like mocking demons in the chimney-meant.

'Very well,' said Gutteridge, after thought; 'but you'd better be going lest that white-livered Hawkins claps eyes on you, as well as Rodway. See that Hine and the rest are ready with the boat, and that the horses are near Deep Pool, under the lee of the big sandhill. The gorse is high enough there near the clump of hollies to prevent them being seen.'

The younger man rose, and Maggie followed him

when he went out of the cottage.

'Bob,' she said quickly, 'what be you up to

to-night?' 'Never you mind,' said the young fellow. 'It's no consarn o' womenfolk;' and then he looked admiringly at the handsome girl, who had laid a restraining hand on his arm, and smiled. Then he said, 'Look'e here, Maggie; don't you go clacketing with that Rodway agen. He's no good to yer father nor me, curse him! And he's as artful as the devil's own son.'

'And why shouldn't I talk to Rodway?' rejoined the girl, half-petulant, half-laughing, but with a downward droop of her shapely head, crowned with its rebellious coils of wavy brown

'Because,' said her companion, 'I luv 'e, and I hair. can't abide that sneaking, crawling "preventer"

spying on us and ruining our trade.'

Maggie smiled up into the handsome bronzed face of the speaker. Bob was the properest young fellow for miles around; and, to tell the truth, she loved him with a passionate devotion, which, however, for the most part seemed to slumber beneath the restraint of a strong character, like the glowing embers of a live fire beneath the fresh-cut peat on the hearth.

'Never you fear,' she replied. 'I have naught to do with the likes of Jim Rodway. Leastways, when he don't pester with his "Youm lovely" and "You be lookin' fine to-day," and like nonsense. Not that I mind that sort of talk,' said the girl, with a glance at her companion's face, which had clouded over; 'but he's always hanging around, and father can't abide him noways.'

'Let me catch him round here,' said the man, 'and it'll be the worse for his sneaking carcass. But I must be off, and not one kiss have I had.'

Maggie made a show of resistance. She had been known to the lads about, ever since she reached that age when there was some 'flavour' in kissing, as not of the kissing sort; and those who had attempted to ravish her of such favours had found her hand as heavy as her lips were sweet. But Bob Livesey always prevailed over her, ever since he had one day four years ago caught her sitting alone under the great sand-dune which, like a small castellated hill, stood out solitary and detached from the group near the entrance to South Haven, where the tide at ebb hummed seaward in a froth of tiny wavelets and miniature whirlpools.

Now, and for long past indeed, Maggie's resistance to Bol's caresses was merely that matter of form which the fighting instinct of her race of hardy forebears had implanted in her. On this occasion she yielded her face to his somewhat rough caress with a beating heart, 'tis true, for she loved him, but with only a faint pretence of resistance and none of that sensation of exquisite shame which used to flood her face and neck with a darker flush than sun and wind had given it.

As her head nestled against his shoulder, with a beating heart she thought of the fears which had of late taken form in her mind regarding the expeditions in which both her father and her lover engaged.

Now she spoke, and asked him whether there was any danger in the plan to be carried out that night which she had just heard debated.

For an instant the man's face grew grave. Then he replied with a laugh, 'Youm a queer lass, Meg. Danger? There's naught. Leastways, none that I, or the old man, or Duke, or Hine, or the rest of us count such. Never you fear, lass; and after to-night maybe we'll be asking the parson at Kingston to put up the banns;' and, releasing her, the speaker laughed to see her hang her head and the colour suffuse her face.

Maggie watched him stride away across the flat of heather and tussock-grass till his figure disappeared behind one of the dunes. Then she turned and entered the cottage, after a glance at the sky.

A strange feeling of distrust and apprehension possessed her, a foreboding of calamity.

CHAPTER II.

HE night was clear, and a gentle wind from the south-east served but to ruffle the darkling sea and rustle the grass on the summits of the ghostly sand-dunes. On the moorland it was more dark than by the shore, where the broad belt of sand, on which the tiny wavelets crept, appeared a gray strip against the darker gray of the sea. Overhead the stars shone innumerable and twinkling in the autumn night—diamond points in a setting of half-luminous, half-shadowy blue.

Some hours before, from South Haven, on the clib-tide which ran strong and fierce to the southward, the Fortunate Maggie had swept silently seaward like a ghost-ship in the gloom of the night, watched from the summit of one of the dunes by her namesake, and—unknown to the latter—from the hollow between two neighbouring dunes by the half-crouched figure of a man.

Maggie Gutteridge had known many such settings forth, had experienced many a night of loneliness in the solitary cottage which was her home. But to night, as she sat over the smouldering fire watching the shadows flicker on the wall, she shivered with apprehension, she hardly knew why.

There was no sound without, for the wind sang so softly over the heather and gorse that it had no pipe when it came to the angle of the wall where it wailed so drearily on tempestuous nights.

Suddenly, just as night was merging into midnight, and the fire burnt up with a flame as the pile of driftwood upon the peat caught alight, there was the sound of a nailed boot striking against some stray stone of the sandy path which led to the door.

Maggie started and listened.

On another night she would scarcely have given the sound a second thought. It might have been the hoof of one of the pariah donkeys which sometimes strayed down from the hillside for shelter behind the cottage. But to-night Maggie's ears were keener than even their wont. Her nerves were those of a woman who as yet has known no fear, and perhaps has looked the terrible in the face without knowing it.

There was no further sound, though she listened intently; and so in a few moments she got up from the fire, lit a candle, and went to the door. As she opened it a draught of air entered, which made the candle left on the table swale with a sickly flame and the shadows of the articles on the rude dresser dance upon the wall like impsin quick motion.

At first she could see nothing. But when her eyes became accustomed to the darkness she started.

'Meg, I want to speak to you,' said a voice, and a man's figure stepped into the shaft of feeble light which fell through the doorway on to the path.

Maggie recovered herself; and though her pulses beat quickly, and something more nearly approaching fear than she had ever before known seized hold upon her, she said in low but not unsteady tones, 'You, Mr Rodway! What, then, do you want with me? What are you after that you come at midnight to speak with me?'

'I'll tell you, lass,' said the man, making to pass

'No, no!' exclaimed the girl, barring his way and speaking sharply. 'You can tell me all you have to say where you stand. Now, what is it?'

Jim Rodway paused for an instant; and then he suddenly stretched out his hands, and, seizing Maggie at a disadvantage, bore her inwards and shut the door.

For a moment the girl was speechless with astonishment and a kind of fear which had not found a place in her before. Then the old spirit of antagonism against the 'preventives,' which had doubtless possessed her ancestors and ancestresses for a century or more, reasserted itself, reinforced by that vague fear of calamity to come which had sat so heavily upon her heart ever since her parting with Livesey in the morning.

'You're a brute beast, Jim Rodway,' she said slowly, whilst steadying herself against the table and struggling to gain her breath and still the heavy beating of her heart. 'What would Lieutenant Hawkins say if he saw you now, breaking

in upon a lone girl at midnight?' 'He won't,' said the man laconically. 'And what I've come to say I'm going to say, and you've got

to listen. D' ye hear?'

'Ay, I hear,' replied the girl. 'Maggie,' said Rodway thickly, for he had been drinking, 'you know I love you. I am fair mad

The speaker made a step forward; but the girl after you.' retreated behind the table. Her face was pale as the bronze would let it be, and the beating of her heart sent the folds of her cotton bodice fluttering.

'Stay!' she shouted, and there was something so tragical and overmastering in her tone and gesture that Rodway paused unsteadily.

Then, after a moment or two, he seemed to pull himself together, and continued: 'I didn't mean to frighten you, lass. But you shall love me, and I'll brook no refusal.'

1 2

Maggie steadied herself and her nerves. Something told her that Rodway was dangerous. There was a brutal bravado in his tone, as though he was sober enough to know that he had her in his

What good to call for aid? For all she knew there was not a living soul, save perhaps some of his fellow 'preventives,' within a couple of miles. As for her father or Bob, or any of the others-Gutteridge would be home at dawn perhaps. Who knew?

(To be continued.)

CANAL. PANAMÁ THE

By DAY ALLEN WILLEY.

HE idea of cutting the western hemisphere in two parts by digging a canal across Central America is nearly four hundred years old, for the famous explorer Cortez thought of such a scheme when he first saw

the waters of the great western ocean. Before Cortez led his expedition along the Isthmus of Tehuantepec, however, Balboa the great navigator had landed upon the shores of what was known as Darien. From the highest point on this isthmus he also saw the Pacific Ocean for the first time. Thinking he might find a waterway from ocean to ocean, he carefully examined the country on foot, and found that no such channel existed. History records that he took his ships to pieces and actually carried them across the isthmus, to be launched on another voyage of discovery on the Pacific.

Balboa performed a great feat for those times, since all this happened back in the sixteenth century. As already stated, since then the idea of an isthmian canal has been considered, and some of the world's greatest engineers and other geniuses have made a study of the problem. As is well known, Panamá is not the only place in America where a canal has been thought of. The project of cutting the Isthmus of Tehuantepec in two was given careful attention; but it is so much wider than the Isthmus of Panama that finally the idea was abandoned. In the State of Nicaragua there is a lake. Another plan which bade fair to be adopted was the construction of watercourses from this lake to the Atlantic and the Pacific Oceans, utilising the lake, of course, as a part of the channel. The American Government seriously thought of this project; but at last it was given up, and the United States determined to complete the work begun by the famous builder of the Suez Canal, De Lesseps.

In addition to these proposed canals, however, an engineer named Eads conceived the remarkable

project of carrying ocean vessels across the Isthmus of Tehuantepec by a great ship-railroad. He planned two tracks, one for vessels going from the Atlantic to the Pacific, and the other for vessels going in the opposite direction. Each track was to contain five or six rails. When the ship was pulled out of the water by means of an engine and cable, she was to be placed in an enormous cradle or framework fitting closely to her bottom. This framework was to be mounted upon wheels which would run along the rails comprising the track. When the ship was placed in the cradle it was to be hauled from one side of the isthmus to the other by several powerful locomotives built especially for the purpose. On its arrival at the land terminus, the cradle was to be moved upon a sort of dry dock, which, when filled with water, would float the ship, and the latter, released from the cradle, would then resume her voyage. While the Eads ship-railway was never built, there are many men of science who believe that it would have been practicable; but, instead of the ship-railway, an ordinary railroad, built by enterprising British engineers, took its place, and is now in operation across the Tehuantepec, being a formidable rival to the Panamá railroad, since it carries so much traffic across this narrow portion of America.

It was back in the year 1879 when a congress of men from various nations met in Paris and recommended the building of a sea-level canal from Colon on the Atlantic to Panama on the Pacific. Although many members of the congress considered that a canal with locks would be the most advisable type to build, the influence of M. De Lesseps prevailed, and a sea-level canal route was adopted. It was estimated that such a canal could be completed in twelve years, at a cost, including interest on capital, of two hundred and forty million dollars. Work was begun in 1881, and at the outset the funds of the company were called upon heavily for the vast amount of machinery that had to be purchased and placed along the line of the canal, and in providing the necessary shelter and accommodation for fifteen thousand labourers.

Work was no sooner commenced than trouble was experienced. Climatic and other difficulties began to make themselves felt. For twenty-five miles the route of the canal followed the river Chagres, which in the rainy season is subjected to enormous freshets, and not enough thought had been given to controlling these floods. As the excavation of the threemile cut through the Culebra divide proceeded it was found that the ground was of an unstable character, and disastrous slides occurred, filling the cut as fast as it was excavated. Then the first opening of the surface soil along the route induced an appalling amount of sickness, and gradually the conviction forced itself upon the company that the task of building a sea-level canal was beyond their power, being for them at least both physically and financially impossible. The company abandoned the scheme of a sea-level canal, and adopted a less expensive plan which called for summit elevation and the provision of locks. But the change was made too late, and in 1889, after one hundred and fifty-six million dollars had been expended, a receiver was appointed. The commission appointed to examine the company's affairs found that there had been an enormous amount of mismanagement and misappropriation of money; but they stated that the vast quantity of machinery on hand, the engineering data procured, and the labour actually done on the excavation and embankment were worth to any new company at least ninety million dollars.

The United States, however, bought the ditch so far as completed, all the machinery which had been carried to Panama to dig it, as well as the many buildings which the French company had erected, for forty million dollars. The machinery when new was worth several times this amount; but it is an actual fact that now it cannot be sold for any price, because there is an American tariff upon it. While a few of the dredges and some other apparatus used by the French company have been repaired and put to work, the bulk of the machinery is lying along the sides of the channel, some of it overgrown by the dense tropical vegetation, while portions have been literally buried in the heaps of earth and stone taken from the excavation. Many of the locomotives and cars, also some of the dredges, which De Lesseps's company Purchased for the canal were brought to Panama and never used, being left to rot and rust at the mercy of the elements. Probably nowhere in the world can a visitor see so much costly machinery abandoned to ruin as along this canal.

The first thing which the American owners did was to make sure that the canal would be for ever on soil of the United States, so they purchased what is known as the 'canal zone,' being a strip of land extending five miles on each side of the ditch, or ten miles in width altogether. This strip reached from the Atlantic to the Pacific, and cost the United

States just ten million dollars, which it paid to the Panama Government. Once the canal was safely on the territory of the United States, the next thing to do was to make a region fit for living in. The climate has been so unhealthy in the past that in a single year thousands of the labourers employed by De Lesseps have died from fever and other diseases. So two million dollars more were expended in draining, in building hospitals and modern barracks, and in getting rid of the mosquitoes, which the medical men said spread diseases. A part of this sum was also expended in obtaining a supply of pure water. In short, the canal zone was transformed from a plague-spot into a healthy region, as is shown by the small amount of sickness which has prevailed since the United States took possession of it. The result of this step was to encourage skilled and unskilled workmen to go to Panamá, as their lives were not in so much danger as under the old régime; so that at the present time an army of fully twenty-five thousand men is at work upon this great hole in the world, attending to the giant dredges and steam-shovels, running the many trains needed to carry away the earth and stone from the excavation, blasting out the great masses of rock with explosives, supervising gangs of labourers, or employed in keeping the many accounts of this great enterprise in the various offices. About onefifth of the total number are men skilled in their various vocations, the majority of the unskilled labourers being negroes, principally from the island of Jamaica. In another year, however, the energetic President of the United States says, he expects to have fully fifty thousand men working on the big ditch, in addition to the steamshovels, dredges, and other powerful labour-saving machinery.

If a surveyor measured across the Isthmus of Panamá at the point where the canal is being built he would find that from end to end the land itself is forty-two miles. The waterway, however, is forty-nine miles in length, for the reason that if built in a straight line it would have to be dug through one of the highest portions of the Culebra Hills; so it takes a roundabout course, partly for this reason and partly because there is less danger of the canal being damaged by the great floods which occur on the isthmus during the rainy season.

Of these forty-nine miles, about thirty-five represent very easy work. If all the regions through which the canal is to be made were as low and level as these thirty-five miles, vessels would be passing through it perhaps within the next two or three years, and the surface of the canal would be nearly level with the surface of the Atlantic Ocean; but the Culebra cut, as it is called, which caused the downfall of the French company, is by far the greatest obstacle which the diggers have to overcome. An idea of the size of the hole which must be made through this rock ridge which divided the isthmus in two may be gained when it is stated

that in one place the hole will be no less than three hundred and forty feet from the top of the hill to the bottom of the canal; but for a distance of eight miles the workers must make an enormous trench which will average one hundred and forty feet in depth. Were this ordinary earth the labour would be very much simplified, but unfortunately Nature did not apparently favour the plans of men. When she threw up this backbone by the eruption of some great volcano or earthquake ages ago, she formed part of it of hard rock and another part of a soft shale which crumbles to pieces when pinched between the fingers. Other portions consist of clay which turns into ooze when the rain falls upon it, and of loose sand which will bury any heavy objects which may chance to fall upon its surface. Consequently, while much of the 'cut' must be made by means of powerful explosives to rend apart the great masses of rock, care must also be taken lest the shale and sand do not go down from above into the excavation in such quantities that they not only fill the cut but cover the men and machinery. Here an enormous amount of work is required in keeping the loose material from falling into the excavation, while the upper part of the opening must be made many times wider than if it were all composed of rock, in order to get room enough to build walls to hold up the loose material, and to lay railroad-tracks so that the trains of cars may carry away the débris. The fatal error made by De Lesseps was in working upon the lower portion of the isthmus, where the digging of the canal was merely child's-play compared with the excavation at Gulebra; but already the American engineers have made such progress in this immense gap in the country that they have dug it out to a depth of nearly seventy-five feet below the lowest point reached by the Frenchmen, although the latter were at work upon it over fifteen years, and the Yankees actually began operations less than three years ago.

After it had been decided to build the Panamá Canal, the next question which arose was whether its surface should be level with the Atlantic or the Pacific Ocean, or if it should be partly elevated through the higher region, such as the Culebra cut. Of course, to make it what is known as a sea-level canal would require more time and much more money. The leading engineers who have studied the project say that at least twelve years would be required for the sea-level canal, which would cost at least two hundred million dollars, or possibly more. When the idea of having a lock-canal was considered, one scheme proposed was to have the highest part of the waterway at least sixty-two feet above the surface of either ocean; another was to raise it to ninety-eight feet; but at the present time the scheme most favourably considered is that of making its highest level eighty-five feet. This means that vessels going through it will for a distance of several miles move through the waterway at a height of eighty-five feet above either the Atlantic or the Pacific Ocean, being raised to this elevation by a series of enormous lift-locks.

To understand clearly how all this will work, let us suppose that a steamship is to go across the Isthmus of Panamá by water on her way from San Francisco or Australia to Liverpool. She reaches the harbour of Panamá, and there must pass into the lock which will lower her into the canal, for the reason that the tides of the Pacific rise from fifteen to twenty feet in every twentyfour hours; consequently, if the canal were not closed by such a lock, the water of the Pacific at high-tide would pour in in such volume as to cause the channel to overflow and possibly damage it considerably, while it would be impossible for a vessel to be safely passed through. This tidal lock, as it is called, however, is simple in its construction compared with the immense works which will be used to lift the steamship to the highest point in the waterway. To return to the craft which is going eastward, she passes along the excavated ditch to what is known as Sora Hill. Here she enters a lock into which is poured enough water from above to raise its depth no less than thirty feet, lifting the vessel to the same height. Then the ship passes into another lock, and is lifted twenty-five feet higher in the same way, which allows her to float into what might be called a river, eight miles in length. Along this she can steam at full speed if desired to the end of the 'level,' where she passes into the third lock. Its gates being closed, enough water is poured in from above to add twenty-five feet to its depth, the steamship being raised with the water. This enables the captain to navigate his craft upon what will be really a lake twenty-three miles in length, where he can again go at full speed. At the Gatun locks, which are to be at the end of the lake, the steamship will go down three enormous steps, as the series of locks might be called; one of the steps lowering her twenty-five feet, and the others thirty feet each, bringing the ship nearly to the level of the Atlantic Ocean. From the Gatun locks she will pass through a waterway which will be about as low as the surface of the sea, and which will be open at the end.

Never before have locks been designed of such enormous size and power as those which will be utilised in connection with the Panamá Canal. But the engineers say that it is entirely practicable to construct these movable gates of steel, which will be over seventy feet long from top to bottom, and be strong enough to form an immense reservoir capable of holding a vessel and her cargo weighing in all fifty thousand tons. It is planned to have each of these locks at least nine hundred feet in length and one hundred feet in width, and to contain at least forty feet of water when the ship enters them, as when occupied by a vessel each must be of the same depth as the rest of the canal. But when a ship is being taken from a lower to a higher level, or vice versa, there are times when these compartments must hold fifty to sixty feet of water, which will give an idea of the enormous pressure they must sustain.

Next to building the great walls and gates which will form the locks, and providing enough power to operate them, the main problem which the engineers have to solve is how to keep the Chagres River from running over the big ditch. On the Pacific side of the Culebra Hills the water in the rainy season is carried away by numerous small streams, none of which is large enough to give the diggers trouble. On the Atlantic slope of the hills, however, flows the Chagres, which drains a very large area of the ground. In one year the rainfall has been so heavy on the Isthmus of Panamá that no less than one hundred and thirty inches of water have fallen upon the Atlantic side of the alope, or the country through which the Chagres river passes. This means that if the water did not flow off or sink into the earth it would actually stand upon the ground to a depth of nearly eleven feet. So it is that this stream, which in the dry season is little more than a creek in size, with perhaps less than two feet of water in its deepest part, may be swelled in a few hours to a river no less than forty feet in depth, carrying such a great volume of water that it could fill a section a mile long, three hundred feet wide, and thirty-five feet deep in five minutes. If we consider the size of such a section, this seems almost incredible; but the engineers and scientists have carefully calculated the sudden changes in the Chagres, and these figures are the result of their calculations.

It is obvious that the river must be prevented from flooding the canal, otherwise its volume of water and the force of the current might carry away the walls, and possibly do greater damage. By building a canal whose highest part is eightyfive feet above the level of the ocean, however, the Chagres can be turned into an ally instead of an enemy. This is to be done by constructing an enormous dam, which will create the lake already referred to. Here again is a great engineering feat, for the total length of the dam will be no less than a mile and a half, while its highest point will be one hundred and thirty-five feet above the valley across which it is placed. To prevent it from being washed out or carried away by the great body of water which will press against it, at the base it will be fully one thousand feet, or nearly a quarter of a mile, in thickness. The valley in the country which will be made into a lake by this dam is of such dimensions that, enormous as is the flow of water down the Chagres River during the rainy season, it is large enough to hold most, if not all, of the flood-water for an entire year. The lake being on a level with the highest point of the canal, its water can be utilised in keeping the ditch at the proper depth, as well as filling the various locks when it is necessary to lower or raise vessels passing through. In addition to this, however, the waste-water which will be allowed to flow over the dam is to be employed in generating electric current, which will be in turn used for illuminating the canal and possibly for operating the ponderous mechanism which moves the gates. The Bohio Dam, as this work is called, is without a parallel in the world, and its construction may be likened to such feats as the building of the Pyramids of the Nile and other great achievements recorded in history. The lake which it will create, however, will be employed to allow vessels to pass each other, so that it will not be necessary to make other parts of the canal large enough to allow ships to float upon it side by side. It is calculated that, including the time required in passing through the locks, not more than twelve hours will be needed for the slowest steamship or sailing-ship towed by a steamer to go from Panamá on the Pacific to Colon on the Atlantic, or in the opposite direction. Since this lake will cover nearly one-half of the distance of the waterway, it will provide ample space for ships to pass each other without delay.

The reader may ask, What is the principal advantage to be gained by spending one hundred and fifty million pounds to separate North and South America? The benefits to be secured are so many that only a few can be referred to in this article. The United States Government considers the canal of the greatest value for strategic purposes, since warvessels will be able to go from the Atlantic to the Pacific or from the Pacific to the Atlantic without the long and tedious voyage round Cape Horn which they now have to make. One of the reasons why the American Government has been so desirous of building the canal is because of its experience during the Spanish-American war, when one of its battleships was compelled to go from San Francisco right round South America before she could take part in the great sea-fight in Cuban waters. Had the canal been open, the battleship Oregon would have required to steam eight thousand miles less than she did in going to join the American fleet in the Gulf of Mexico. A vessel sailing from New York to any point on the Pacific coast by way of the Panamá Canal will shorten her voyage by no less than seven thousand miles.

The waterway will, of course, be beneficial also to such countries as Great Britain and the nations of northern Europe. For instance, the distance to Australia and New Zealand from such ports as London, Antwerp, and Bremen will be fully one thousand five hundred miles shorter than the present route through the Suez Canal; but the channel which has been made through the sands of the Arabian desert, and which connects the Mediterranean with the Indian Ocean, is but twenty-eight feet in depth, so that the largest ships cannot go through it. As vessels which extend nearly forty feet below the surface of the water will be able to float in the Panamá Canal, and its locks will be long enough to hold the longest liner which now crosses the Atlantic Ocean, it will have the advantage over the Suez Canal, not only because it will afford a

shorter route to the Orient from Great Britain, but because it will accommodate much larger craft. Its benefit to American commerce will also be very great, because steamships and sailing-ships loaded and bound for Yokohama will by passing through the canal save nearly four thousand miles of travel which they must cover by the present routes. The distance to the great seaport of Shanghai will be shortened to the extent of one thousand six hundred miles. The importance of the waterway to Europe, however, can be more clearly appreciated when it is known that the cities on the Pacific coast of the United States will be brought six thousand miles nearer this portion of the Old World.

The digging of the canal is comparatively simple. It gives the inventor, however, an opportunity to show to what extent he can design machinery which will save work with the pick and shovel. It is hardly necessary to say that the great steam-excavators will do most of the excavating. Shovels operated by powerful steam-engines are now at work on the isthmus, each of which will

dig out three cubic yards at a shovelful. This load will more than fill a wagon drawn by two horses; and as some of the shovels will take out two thousand yards in a day, the reader may realise the army of men which a dozen of them will equal in effort. A set of fifty of these great shovels have removed no less than two million loads of earth and stone in a single month. So great is the magnitude of their work that when the full force of men is employed which President Roosevelt expects to have on the work, they will be aided by no less than one hundred of these shovels, having the capability to dig at least seven million yards a month. But they are necessary if the waterway is to be finished within the time expected; for if the material were to be placed in a trench sixty feet wide and forty feet deep it would require a gap in the ground no less than five hundred miles in length, or as long as the distance from the city of Liverpool to the city of Paris. To remove this enormous amount of débris would require five thousand twenty-ton railroad cars for a period of ten years.

CHAPTER VII.

W could he make certain that Mirabelle should have heard of the sentence passed upon her lover before he saw her that evening? For a long time Vare pondered the question, turning over different plans

in his mind, and rejecting them one after the other as impracticable. Presently his wandering gaze fell once more upon the newspaper, and then the solution of the difficulty became clear. 'Of course,' he ejaculated; 'the very thing. How extremely stupid of me not to have thought of it before! It couldn't be better, and will rub it in well, especially if I add a few words on my own account.'

Taking from his pocket a flat little gold penknife as effeminate as the man himself, he carefully cut out the paragraph, and pinning it to a sheet of notepaper, took up his pen in his left hand—the old dodge of anonymous letter-writers—and wrote underneath, in large, irregular characters, 'Disgraced, nevertheless, in the eyes of all honourable men.' Then, putting it into an envelope, he addressed the shameful thing, always in the same sprawling hand, and putting it into his pocket, muttering, 'That ought to be a good move, even if she has heard about it from any other source,' went into his bedroom to finish his toilet for the day.

Immaculately turned out, his hat and boots vying with each other in the brilliancy of their lustre, he had hardly descended into the street when Rex was in the sitting-room again clearing away the breakfast-things. As he went about his work, the hole in the paper whence his abusive lodger had cut the paragraph caught his eye.

"'Ullo!' he exclaimed; 'that's a rum start. I never knowed 'im do anythink like that before. Now, I wonder w'at can ha' interested 'is r'yal 'ighness so tremenjous. 'Tain't a hadvertisement neither, 'cause 'e's cut it hout o' the noosey sheet. Now, I come to think hof it, 'e'd chucked that paper on to the floor when I comed in an' caught 'im cussin' an' swearin' like mad; it's odds but w'at 'e'd seed somethink w'at 'e' didn't like. An', Rex, my son, w'at Captain "Awe, demmy" don't like may be worth knowin' heven hat the cost o' one penny.'

And so it came about that a short time afterwards Rex made the very disappointing discovery that the mysterious cutting which Vare had so carefully extracted was nothing more interesting than the result of the court-martial on his brother-officer.

'An' quite a natural thing for 'im ter do, hin my opinion,' he said to his wife in his most lofty manner when discussing the incident with her a little later.

But the good woman could not agree—that is to say, would not, on principle; and remarking sweetly, 'Has you're halways wrong, Sergint Rex, hand I'm halways right, I'll take the liberty hof keepin' this 'ere paiper huntil time, the great 'ealer, solves the ministry,' she carefully folded up the sheet and locked it away with much ostentation.

'Oever Mr Time the great heel-catcher may be I don't know,' answered Rex with fine sarcasm; 'but I do know, Mrs Rex—Anne Drippen has was—that you're a first-clarse hold fool, an' halways a-tryin' ter make mountings hout o' sows' hears;'

HOPPY.

and with this brilliant retort, which he emphasised by upsetting the blacking-pot, he once more ascended to the upper regions to finish his morning's work

When Vare arrived at Grosvenor Square that evening he found Mirabelle and her father awaiting him in the small drawing-room. The girl, beautifully yet simply dressed in white, looked as lovely as ever, though, he fancied, a shade paler than usual; and the captain registered a vow, as he held her delicate hand a moment longer perhaps than politeness required, that, Hoppy or no Hoppy, she should become his wife, and that he would stick at nothing to attain his end. He could not tell from her demeanour, which was calm and composed, whether or not she had heard anything about the telegram concerning her lover; but Lord Idsworth, the moment that the butler had shut the door, did not leave him an instant in doubt.

'I suppose you've seen it?' he burst out. 'Most disgraceful piece of military bullying ever known. That fellow Ranger ought to be kicked out of the army. Just because he makes a fool of himself, forsooth! and, as usual with our Generals, thinks he's going to ride cock-a-hoop over a horde of niggers without any trouble and with half the number of men he ought to have, and gets thundering well thrashed for his pains, he must needs make a fine young fellow, who wasn't even outside the city, into a scapegoat to vent his ill-temper on, and trounce him for doing a plucky action for which he ought to have recommended him for a V.C. And then this court-martial of red-tape-ridden boobies sentences him to be cashiered—yes, by gad, sir! cashier him; and he would have been, too, if they hadn't been afraid of me and Sir Ralph at home. They knew I'd kick up the deuce of a row; and I'm going to, too, for all their cleverness in remitting the thing. As if that did any good,' he went on furiously. 'The boy's career is ruined, and he'll probably chuck the service, disappointed and soured for life. If it wasn't for Mirabelle here I shouldn't wonder at his blowing his brains out; but the thought of her will keep him quiet till he gets home, and then we'll have a marriage-eh, child? and show everybody what we think of the

Mirabelle's answer was lost in the announcement of dinner; but Vare noticed that, whatever its tenor, it was very low and faint, and given, as far as he could see, without the slightest trace of enthusiasm; and inwardly exulting, as he offered her his arm, he cried to himself, 'The poison works!'

During dinner the topic uppermost in all their uninds was tacitly avoided, until—the servants having retired, and Mirabelle also, to prepare for the theatre—the two men were left alone for a short space over their wine.

'I'll sever my connection with the party,' avowed Lord Idsworth. 'There is a split impending, and I have been very much inclined to go with the

seceders for a long time. This settles it. I've made up my mind, and I'll tell Wallshire to-night if I see him. The Government are bound to go to the country shortly, and without us they haven't a chance; and then we shall unite with the other side, and manage the affairs of this Empire as they should be, sir.'

But Vare urged him not to do anything rashly. He pointed out that the mischief to Hoppy was done, and that any such step as that contemplated by his irate host could not possibly do the unfortunate young soldier any good; and, unless honestly prompted by political convictions, it would be quite a false move. It was a purely military matter, he declared—he had no desire to see Hoppy cleared and would, if let drop, be soon forgotten; and, after all, Hoppy had only been reprimanded and had the sympathy of all decent men. 'Let it alone, sir; let it alone,' he cried. 'Hoppy will get leave, come home, and be married, and then, with such a charming wife and loyal father-in-law, will, in spite of this little contretemps, soon go ahead again like steam.'

But the discussion was put an end to for the present by the announcement that the carriage was ready, and shortly after the three playgoers were rolling away silently and smoothly towards the Lyceum, where his lordship, who was a great patron of the drama, had taken a stage-box.

Vare had no opportunity of speaking alone with Mirabelle until they found themselves sitting out, in a cool, palm-screened veranda, at Lady Havant's dance, and then only, and with extreme caution, did he begin to open the attack.

'I cannot tell you, Miss Melgrove,' he commenced, softly and sympathetically, 'how awfully upset I am at this abominable sentence on old Hoppy. I only heard about it at the club this afternoon, where all the fellows are full of it.'

'I'd rather not talk about it, please, Captain Vare,' cried Mirabelle in a distressed voice. 'It is too painful a subject at present; and until I hear more about it from papa, who is going to try and discover what it was that really prompted such a savage sentence, I don't wish to discuss it. But,' she continued, with true feminine inconsistency, 'when you say that all the men at the service clubs are talking about it, what do you mean? Do they take papa's'—she made a perceptible pause—'and my view?'

'Oh, as to that,' answered Vare, 'I shouldn't pay any attention to what fellows thought. Naturally, everybody who knows Hoppy is pretty sick about it, for they feel that—er—well, they say, ye know, that though he did quite right in going out after me, speaking from a humane point of view, a sentence like this, although it isn't carried out, means that it's pretty well all U.P. with him as a soldier. And then, you know, there are heaps of chaps who don't know him at all, and who talk an awful lot of rot about dishonourable conduct, deserting his post, and all that kind of rubbish. It's rather

awful for me,' he went on earnestly, 'of all people, to be telling you this, and sounds dreadfully ungracious; but you asked me—didn't you, Miss Melgrove?—and it's better that you should hear it at once, and from a friend, a devoted friend of you both, than from an outsider or beastly society paper.'

The beauty frowned slightly. 'I don't indulge in society papers,' she said coldly, 'though I believe one is taken in the house by my maid; consequently their opinions one way or the other do not interest me; but I certainly am glad to hear about this feeling among Hoppy's friends, though I am astonished at there being any officers who think him disgraced in the eyes of all honourable men.'

Vare drew a deep breath. So she had betrayed herself already? These were the very words he had written and sent her anonymously that morning. He had not used them in their conversation, so the phrase must have stuck in her mind, bitten deeply into her pride, to have enabled her to repeat it so faithfully. She could not have any suspicion, could she? he wondered. This was not a trap, set with such apparent artlessness, to catch him? No, no, there was little likelihood of that, he reflected; but he would take no risks, would put her off the scent in case any such idea should afterwards enter her head.

'My dear Miss Melgrove,' he exclaimed, with well-feigned horror in face and voice, 'surely not so bad as that! I have not heard anything approaching such severity of judgment, and I must have chosen my words awfully carelessly to have conveyed such an impression. But this is too painful to both of us; let us, as you so wisely suggested just now, leave it alone at present until your father has discovered the ins and outs of it all. And now,' he went on earnestly, appealing to her weak point, 'don't you think we had better take a turn? The room is fairly clear for a moment, and—you will forgive me, I know—but we'll hold our heads high—eh?—for the sake of our mutual friend.'

As he had intended, his partner's pride sprang to arms like a sleeping soldier who wakes to the first shot; and, with a grateful glance from her expressive eyes, the proud girl rose from her seat, and was presently bumping round the room with the inelegant step which was—much to their secret disgust, for they were both really beautiful dancers—strictly de rigueur in the select inner circle of London society to which they had the honour to belong.

'Carries it off deuced well, bai Jove!' drawled one of a row of gilded youths who were apparently busily engaged in propping up the ballroom walls with their faultlessly fitted backs, as they noted, with as much admiration as they ever allowed themselves to show, the splendid poise and bearing of the graceful heiress. 'Clean, thoroughbred; takes her gruelling like a queen. Hoppy's in luck there; you can see she means to stick to him in spite of the hash he's made of it.'

And at the other end of the room :

'My dear, I was at school with her, and am one of her oldest friends,' sweetly cooed young Lady Highbridge to her dyed and padded old lord, 'and I can see that she doesn't care tuppence about him, and will throw him over, now that she's got a chance. Dear Mirabelle, I am so fond of her, and I must really try and find a moment to-morrow to run round and have a quiet chat before we go to the Bankshires' dinner. Tommy's feeding there too, and he'll be so glad of something first-hand to put into the "Society Sniffings" column of the Lyre.'

'Don't forget your scalping-knife, ma mic. Dear Mirabelle, I'm so fond of her,' chuckled the old roué. 'Why, Red Indians ain't in it with you little darlings when you are really on the warpath.'

'What hateful and abominable things you can say, Bob!' flared out her ladyship. 'I'm sure that we aren't half so bad as you old men when you get together at your horrid clubs.' But then she remembered what her wise mamma had said to her when she had to decide a very momentous question.' Yes, I know he's over sixty, darling; but you are very young, and the Highbridges are none of them robust;' and the petulant lips resumed their habitual pretty curve, and the little pleat between the eyebrows rapidly disappeared.

(To be continued.)

RISE OF THE GREAT COCOA FIRMS.

NOTEWORTHY feature of our present industrial life has been the rise and great commercial success of many firms the founders or present members of which have come of a good Quaker stock. This is specially

so in the biscuit industry and in that of cocoa and chocolate, the development of which has been phenomenal during the past twenty years in the case, amongst others, of the Frys of Bristol (the oldest firm in the trade, established in 1728), the Rown-

trees of York, and the Cadburys of Birmingham. The world's present demand for cocoa-beans has been estimated at millions of pounds, in which Great Britain, France, Germany, and the United States, in ascending quantities, are the largest manufacturers and consumers.

We do not here describe the various processes of manufacture. It may suffice to say that for commercial or breakfast cocoa the seeds or beans are roasted, shelled, and then ground, the heat caused by the friction of the grindstones being

sufficient to cause liquefaction. For the cocoa of commerce the oil, or cocoa butter, as it is called, is pressed out; if for sweet chocolate, the butter is not pressed out, but sugar and flavours are added, and the material is still further ground, and worked up fine until it becomes a smooth and mellow chocolate. The hundreds of pleasant and attractive forms in which sweet chocolate is prepared for the public palate are familiar to every one. The analyst bears witness to its high food-values as a producer of energy and heat, and as a tissuebuilder. It is at once a pleasant and highly concentrated form of nourishment, containing a considerable amount of protein, and is supplied regularly to the German army. The late Queen Victoria's gift of chocolate to the army in South Africa gave an impetus to the trade. It was also supplied to the Boers in large loaves of about one foot square and a few inches thick.

For cocoa butter, the fluid cocoa obtained by grinding is placed in steam-heated hydraulic presses, when the butter flows off in liquid form, is caught in moulds, and hardens. It is used in ointments, toilet soaps, and bonbons, and is now of as much importance in commerce as cocoa. The Dutch method of chocolate manufacture is to roast and grind the beans between rollers, then powder in a hot mortar, adding sugar, when the whole mass is rolled and worked on flat stone slabs, and vanilla added. The dough is made into loaves and kept in a dry place for half a year, and then moulded into smaller cakes. Large quantities of cocoa powder without sugar are used in Russia and Poland.

At one time cocoa was exclusively the drink of the inhabitants of tropical America. We are told in Prescott's Conquest of Peru how 'the emperor took no other beverage than the chocolate, a potation of chocolate with vanilla and other spices, so prepared as to be reduced to a froth of the consistency of honey, which gradually dissolved in the mouth and was taken cold, served in golden goblets and spoons. The emperor was so fond of it, to judge by the quantity, that no fewer than fifty jars or pitchers were prepared for his own daily use, whilst two thousand were allowed for that of his household!' The word chocolate is of Mexican derivation, and originated in its resemblance to the clattering sound made by the native handmill used to grind the cocoa and mix it with sugar.

The Spaniard was naturally the first to discover its properties and cultivate the cocoa-plant. It was many years before other nations shared his knowledge, and Englishmen and Hollanders made little use of it when they took a prize at sea, 'not knowing its secret virtue and quality for the good of the stomach,' as an old writer regretfully remarks. It was first known in Europe in 1550. From Spain the monks introduced it to France; and the first notice of its arrival in this country appeared in the Public Adviser in 1657, where it is stated that 'in Bishopsgate Street, in Queen's Head Alley, at a

Frenchman's house, is an excellent West India drink called chocolate to be sold, where you may have it ready at any time, and also unmade, at reasonable rates.' It came first as a great delicacy, and erelong formed the raison d'être of those cocoa-houses which became as distinctive a feature of the seventeenth century as its gabled mansions or the literary essays of the Tatler and Spectator. In those old days London ladies would sip their chocolate at Don Saltero's, Chelsea, while the 'bloods' and 'bucks' frequented the 'Cocoa Tree,' White's, and the St James's, fashionable gathering-places which ultimately drifted into regular clubs. Already in 1702 cocoa had become as popular at Bristol as pine-apple rum, and chocolate-houses stood side by side with spirit-shops on Clifton Downs. It was shortly after that time that Mrs Elizabeth Montagu, that queen of blue stockings, wrote her friend Mrs Vesey from Bath: 'We take our chocolate every day at the pump-room. It is the best I ever tasted. There is nothing like it in London.'

Perhaps the exclusively temperance nature of this drink, at a time when beer was still the breakfast beverage in England, rendered its manufacture by Quakers peculiarly fitting. Be that as it may, the fact remains that our great cocoa manufactures had Quakers for their founders. the middle of the eighteenth century the Bristol Journal announced that a certain 'Mr Joseph Fry is removed from Small Street to a house opposite Chequer Lane in Narrow Wine Street, where he makes and sells chocolate as usual; ' and, later, that 'he has removed to Union Street, opposite the upper gate of St James's Market, where he keeps his shop for the sale of Churchman's Patent and other sorts of chocolate nibs and cocoa.' Now, at this time Bristol had become the emporium of Bath, and the date of Mrs Montagu's letter coincides almost exactly with the time when the Bristol Journal was concerning itself with the doings of Mr Fry and his increasing sale of chocolate nibs and cocea in a quaint old-world tenement of the city. This was the small beginning of Fry's firm, which at the present day occupies whole streets of the town, and has four thousand five hundred hands on its pay-roll.

Joseph Fry, the founder, was descended from an old yeoman stock then well known in the west counties. His grandfather, Zephaniah Fry, was among the younger and more devoted followers of George Fox, and his enthusiasm lived on in his grandson Joseph, who was destined not only to exert a wonderful influence on the fortunes of his city, but to help to make Bristol Quakerism the much-respected thing it afterwards became. For in his time history relates stories of the Society of Friends most incongruous and strange. Youthful Quakers would go to meeting in gay clothes and powdered wigs; drunkenness, gambling, and smuggling were not unknown; while some of the wealthier were engaged in privateering. In 1722 an Irish Quaker tried his skill

with a Bristol gladiator, and in the Jefferies collection there is a strange document showing that a family of Quakers enjoyed for many years half the tithes of the lordship of Tockington. Against all this Joseph Fry was not slow to make a firm stand, and ultimately succeeded in introducing the much-needed reform.

There were few branches of industry in the city of Bristol in which the 'ingenious' Mr Fry did not come to have some personal interest. The famous 'champion china' owed much to his knowledge of chemistry, while his technical skill was invaluable in the establishment of a soap and candle business carried on in partnership with a Mr Fripp. He was part-proprietor of the typefounding business of Fry & Pine, which, in time removed to London, became 'Letter-founders to the Prince of Wales,' and in 1788 began to publish some fine books which bear the name of the Cicero Press. But from the time he arrived in Bristol he had been engaged in the making of chocolate, having purchased Churchman's patent rights, and this undoubtedly was his greatest venture. His influence is still felt in the commercial and religious life of his city, though it is a century and a quarter since he was laid in the quaint little burying-ground of the Friends at Friars. The business was carried on by his widow under the style of Anna Fry & Son for some time, then by their son Joseph Storrs, who in turn was succeeded by his son Francis. The previous style had been Fry, Vaughan, & Company. Francis Fry (1803-86) inherited his grandfather's extraordinary energy and versatility of power, for he not only developed the business far beyond any dreams of its founders, but took a leading part in those movements which gave the city waterworks and railways and to England the parcel-post. He was an ardent anti-slavery man, and during forty years his name was closely connected with the social and philanthropic work of the Society of Friends. He was also a keen bibliographer, books and china being his hobbies. He collected nearly one thousand three hundred Bibles and Testaments, and wrote bibliographical treatises on the rarest of them. After the death of Joseph Fry in 1789, aged fiftynine, the succession has thus been Joseph Storrs Fry (1766-1835), whose three sons, Joseph, Francis, and Richard, joined with him as J. S. Fry & Sons, the name still borne by the firm. The chairman of the company is still a Mr Joseph Storrs Fry.

In 1795 the works had been removed from Newgate Street to Union Street, when a Watt's steamengine was erected, the first in Bristol, to work the machinery. A local editor remarked: 'Since the great improvement of the steam-engine, it is stonishing to what a variety of manufactures this susful machine has been applied; yet it does not a little excite our surprise that one is used for the trifling object of grinding cocoa. It is, however, a fact, or at least we are credibly informed, that Mr Fry of Bristol has in his new factory one of these engines.'

The business of the Messrs Rowntree, of York, is highly organised and well developed, the main manufacturing centre being on the Haxby Road The firm has cocoa estate, just outside York. estates in Jamaica and in the island of Dominica at Blenheim and Picard. Altogether some three thousand four hundred persons are employed by this firm. The Rowntrees are a Yorkshire family. John Rowntree, son of a Quaker farmer near Pickering, went to Scarborough and founded a grocery business. In turn his third son, Joseph, went to York, established a similar business, and married Sarah Stephenson. Their second son, Joseph, who married as his second wife E. Antoinette Seebohm, is the present head of the firm, and joint-author with Arthur Sherwell of The Temperance Problem. Henry Isaac Rowntree had bought a small cocoa business about 1860, employing but one clerk and one warehouseman. He was joined by his brother Joseph in 1869, and only two travellers were employed at this early stage of development Since 1887 the Rowntrees have steadily expanded. 'Elect cocoa' dates from 1886, and the gum goods and about three hundred varieties of chocolate confections, lemonade, and lime-juice now form a large

item in the present business. As in the case of the Cadburys, who have furnished ideal conditions at Bournville for their workpeople, the Rowntrees have done likewise on their Haxby Road estate. Mr Joseph Rowntree has given his testimony to the advantages which accrue from having a factory practically in the country, with proper light, air-space, and under thoroughly healthy conditions. The works are surrounded by gardens and shrubberies, and the amenity and social conditions receive special attention. In a 'sky-scraper' at Wigginton Road 'Elect cocoa' goes through its seven processes of manufacture, starting at the top and finishing at the bottom. The making of boxes of wood and cardboard for the various items is quite an industry in itself. The dining-rooms for the girls have accommodation for about twelve hundred persons, and here about that number of girls dine daily. The girls are paid by piecework, on the forty-eight hours a week system. Some six hundred of them attend a domestic school, where cookery, dressmaking, and hygiene are taught, so that when they marry they may be the better prepared for their new duties. The writer, after wandering over these works, agrees with what was said in the Yorkshire Herald, that it is difficult to know what most to admire. You leave the works impressed with the magnitude of the enterprise and the daring of the conception to build up a huge commercial business on lines unusual and untried. You recognise the far-seeing enterprise of the promoters, the splendid organisation and arrangement which prevail in every department, and the determination to produce, no matter the labour or expense, the very best article that can be made in every branch of the business. And, lastly, you are profoundly impressed with the regulations which are provided for the comfort, the recreation, and the education of the hundreds of young people who are employed in the various departments. You feel that peace and happiness, a wise benevolence, and mutual sympathy permeate the whole atmosphere of the place.'

In a remarkable volume of Essays and Addresses by the late John Wilhelm Rowntree (1868-1905) there are particulars about the origin of the Yorkshire branch of the Rowntrees, as well as much about the rise of Quakerism; for this member of the firm had collected about two thousand volumes of books and pamphlets for the purpose of writing a history of the subject. To the regret of all who knew him, this was an unfulfilled purpose at the time of his death. His brother, Mr B. Seebohm Rowntree, while actively engaged in the business, has also turned his attention to social and political work. It was he who published a study of York city entitled Poverty: a Study of Town Life, also Betting and Gambling, and he has other social and literary schemes in progress.

The late Richard Cadbury, of Birmingham, under the name of 'Historicus,' published a little book, Cocca: All About It, to which we have been indebted. We owe further information to the interesting and painstaking biography by his daughter, Mrs Helen Cadbury Alexander, entitled Richard Cadbury of Birmingham (Hodder & Stoughton), which depicts a strenuous and happy business career, as well as a successful and useful one. Richard Cadbury, who traced the family name back for many centuries, found a Cadbury in Somerset in the time of Henry II., while a John Cadbury fell at Bannockburn in 1314. The names of father and son can be traced for ten generations at least. The grandfather of George and Richard Cadbury was Richard Tapper Cadbury, of Exeter, who became a silk-mercer and draper in Birmingham. His son John, a publicspirited and philanthropic merchant of Birmingham, had a tea and coffee business at 93 Bull Street, when about 1835 he rented a warehouse in Crooked Lane, where he first experimented in making cocoa and chocolate with pestle and mortar. In 1847 he removed this branch of the business to Bridge Street. Richard Cadbury was twenty-five and George twenty-two when their father handed over the cocoa business to them in 1861. All that heredity, good example, and wholesome home influence could do was theirs, and they started in life thus well equipped. For five years the young men had an uphill fight. Some four thousand pounds which Richard put into the business melted away, until he had but four hundred and fifteen pounds. George thought of becoming a tea-planter in the Himalayas, and Richard a land-surveyor. tide turned in 1864, when the business began to show a small profit. By close attention, by the introduction of novelties, and by supplying a good article, the business increased so much that in 1879 the movement began, by the purchase of the Bournville estate, whereby the whole works

were planted down in ideal surroundings quite outside Birmingham.

The general impression of the cocoa works in their new surroundings at Bournville has been described as follows: 'Five tall chimneys and some acres of warehouses and workshops, divided by streets connected by bridges and intersected by railway lines, give some idea as to the extent of the works; but for all this our first impression on being taken through the porter's lodge was that of entering into a garden, with a welcome of the sweet breath of flowers and the song of birds; for we have to pass by the girls' garden and playground, which is well planted and bordered on three sides by trees and shrubs, while the plantations of Bournbrook Hall give the substantially country surroundings of which it boasts. One of the sights of Bournville is to see the girls in their white costumes, after dinner, sitting to read under the trees or enjoying in other ways a breath of fresh air.' The semi-detached brick villa residences, with front and back gardens, on the south side of the works are inhabited by employés of the firm at a comparatively small rental. In 1860 there were under twenty employes; by 1892 there were one thousand six hundred men, boys, and girls; and now there are over four thousand. As at Rowntrees', piecework is the order of the day. In Chambers's for 1902, under 'Bournville: a Model Manufacturing Village,' further particulars were given as to the Cadburys' establishment.

Richard Cadbury, according to his daughter, was 'a rare genius in the art of loving;' he was always busy either at business or philanthropic work, and had a keen eye for detail and also a genius for organisation. An adult school class occupied him on the Sunday morning, while every righteous cause in Birmingham or out of it had his interest or support. He designed labels for the chocolateboxes in the early days, and called on customers, and afterwards saw to the despatch of orders, and had a sharp word if there was any slackness in attention to these. Amongst his benefactions were over twenty-five thousand Bibles given to Board school children, teachers, and pupil-teachers in Birmingham; an Institute at Stirchley; Moseley Hall, given as a convalescent home; almshouses; and the starting of a saving fund, towards which the firm contributed handsomely. Mr George Cadbury, still happily with us, had a similar career to that of his like-minded brother, and his benefactions have also been many and important. We understand that Mr George Cadbury is proprietor of the Daily News, and that Mr Joseph Rowntree had a controlling interest in the Speaker, now the Nation.

The names of other firms will be familiar to the reader: those of James Epps & Co., and the great Dutch firm of Van Houten, at Weesp, Holland, which dates from the beginning of last century, and is well known in England for the excellence of its products. As long ago as 1828 Mr Van Houten discovered a method of reducing the superabundance of natural fat in cocoa, and produced his well-known soluble cocoa. The firm of De Jong dates from Wormerveer, and Driessens and Karstels from Rotterdam. The French and Swiss firms have long been active and successful in the manufacture. The names of Menier,

Suchard, Schweitzer, Peters, and others are household words. Canada has the works of Ganong at St Stephen, New Brunswick, described in the Canadian Magazine (December 1906). The continued growth and prosperity of the cocoa and chocolate industry in the United Kingdom and on the Continent is a matter for sincere satisfaction.

P. 10 ...

CONQUERING THE SANDS.

By DAVID MACRITCHIE.

of 'The Walrus and the Carpenter'
will remember that, as these two
strangely assorted comrades were
walking by the strand,

They wept like anything to see
Such quantities of sand.
'If this were only cleared away,'
They said, 'it would be grand!'

A kindred sentiment must inevitably possess the visitant to any of the miniature Saharas that stretch, sometimes for miles, here and there along our coasts. A little reflection, however, will not only convince him of the utter futility of the suggested remedy (worthy of a walrus) that 'seven maids with seven mops' should sweep it for half a year; but he will also realise the much more important truth that the sand need not be cleared away at all, and that, rightly treated, it may prove to be a blessing and not a curse. In some instances, no doubt, it has been a curse; for there are large tracts of fertile soil which have been overblown and smothered by sand-drifts, and what was once a rich agricultural territory, supporting a goodly population, has been transformed into a dreary and desolate waste. Such was the fate of the barony of Culbin, or Cowbin, lying to the west of the estuary of the river Findhorn, on the Moray Firth. Dr Robert Chambers, in referring to this great catastrophe, points out that an Act of the Scottish Parliament, passed in July 1695, relates how, 'within the preceding twenty years, twothirds of the estate of Culbin had been overwhelmed with blown sand, so that no trace of the manor-house, yards, orchards, or mains thereof was now to be seen.' On account of this, Alexander Kinnaird of Culbin 'represented to the Parliament that full cess was still charged for his lands, being nearly as much as the remainder of them produced to him in rent; and he petitioned that his unfortunate estate might, in consideration of his extraordinary misfortune, be altogether exempted from cess.' But his ruin was not consummated until 1698, when 'we hear of the remaining fourth part of Culbin as sold for the benefit of the creditors of the proprietor, and himself suing to Parliament for a personal protection.' Even this remaining fourth of the barony was unable to hold out against the incessant and relentless

invasion of sand, although 'it is said that an antique dove-cot, in front of the huge sand-wreath which enveloped the manor-house, continued to present the top of its peaked roof over the sand, as a foundered vessel sometimes exhibits its vane over the waves, until the year 1760.' To-day the quondam barony is a lonely and almost awe-inspiring wilderness of sand-hills, where the silence is only broken by the occasional scream of a passing sea-bird.

Now, the causes which have brought about this desolation, the means by which it might have been averted, and the way in which something resembling the former condition of things might be re-established are all matters well worthy of consideration. The chief cause of the catastrophe was never a mystery, for, in the words of the contemporary Act, it was 'mainly occasioned by the pulling up by the roots of bent, juniper, and broom bushes, which did loose and break the surface and scroof of the sandhills'-that is to say, the sandhills previously existing along the coast. These had been held in place by the binding effect of the plants specified, which had rooted themselves firmly over the surface of the hills. But when the peasantry tore up these plants to use for thatching and as fuel, every gale wrought increasing havoc, hewing deep furrows and gullies in the dunes, and blowing the sand in clouds over the arable land. Eventually, as already explained, some three square miles of once fertile territory became a billowy waste of sand, and the manorhouse and mains (home farm) are now outwardly immense mounds rising to eighty or ninety feet above sea-level, and each covering an area of about a hundred acres.

One very interesting reflection, apart from the considerations bearing upon the main theme of this paper, is that it is within the power of any millionaire of antiquarian tendencies to disclose to the world, at relatively little cost, the actual appearance of a Scottish manor-house of the seventeenth century, untouched by any architect of later date. But unless its covering of sand can be utilised to the profit of the remover this northern Pompeii will no doubt remain undisturbed for many years to come.

Too late to save Culbin and its lairds, but in order to avoid similar devastation elsewhere, the Scottish Parliament passed, in 1695, an 'Act for Preservation of Meadows, Lands, and Pasturages lying adjacent to Sandhills,' which prohibits 'the pulling of bent, broom, or juniper off sandhills for hereafter, either by the proprietors themselves or any other whatsomever, the same being the natural fences of the adjacent countries to the said hills.' The penalty for contravention of the Act is liability for resultant damage to property, besides a fine of ten pounds.

Of the three 'natural fences' specified, the sand-grass known as bent (or, in the Celtic forms, muran and marram) is the most efficacious. 'The peculiar property of this grass,' observes one writer on the subject, 'is that it will not flourish unless continually covered with fresh sand, and that where there is most sand the stronger and greater is its growth. With its far-spreading roots below ground, and its shoots above ground, it takes a firm grip on the dry sand, binding it, and holding it fast in the face of the winda'

The possibility of arresting the fluctuation of sand by such means has long been recognised, and systematic and successful efforts in this direction have been made in recent times in Denmark, North Germany, the Netherlands, Belgium, Gascony, and Atlantic North America. Wonderful success has been achieved in Denmark by a private society whose name, rendered into English, is 'The Heather Club, 'First they get heather to grow in the sand, then fir in the heather, and in course of time it is hoped that beech and other trees will follow. And they succeed. In one year the society distributed among the peasantry five million fir-plants and one million and a half of plants of other trees.' Mr D. MacLeod, M.A., from whose account in the Gaelic periodical An Deo Ghréine (April 1906) these words are quoted, further states that in thirty years this Danish society has reclaimed more than two hundred and thirty square miles of useless sand-heath and peat-bog-a truly remarkable achievement for a private society, and, primarily, be it noted, the ontcome of pure patriotism; for the impulse to increase the area of habitable Denmark did not arise until she had been deprived of Schleswig-Holstein in 1864. Denmark can now retain on her own soil, thanks to her Heather Club, many thousands of people who would otherwise have been forced to emigrate, and the Danish army can be increased by a proportionate number of soldiers.

Strict attention is paid by the Governments of other countries to the rescue of desert areas and their transformation into habitable country. Visitors to the Netherlands are familiar with the carefully fenced plantations of sand-grass at Scheveningen and elsewhere along the coast, to injure which renders the offender liable to four weeks' imprisonment. The barren Landes of Gascony are similarly watched and tended by officials known as gardes cantonniers. In Germany, fines up to eight pounds are exacted for any infringement

of the laws relating to the sand-dunes. In the British Islands, except for the Scottish Act of 1695, which has fallen into desuetude, there appears to have been no legislation bearing upon this matter. So far as I am aware, there was no similar enactment on the part of the English Parliament, and nothing seems to have been done in this respect by the United Parliament of the last two hundred years. As a matter of fact, Scottish lairds do as they please with the bent, broom, and juniper of their sand-hills, in spite of the Act of 1695.

Nevertheless, private enterprise has achieved something in the British Isles. A notable illustration is that afforded by the Earl of Leicester's Norfolk estate of Holkham, which prior to 1850 was bordered on the seashore by a stretch of sandhills three miles in length. To-day these dunes are covered with grass and pine-trees, the latter forty feet high, and this without the aid of any soil brought from inland. It is a mistake to suppose that sand affords no nourishment to vegetable growth-that is to say, what we understand as sand, which is really not pure sand, but contains nutritious ingredients obtained from the excreta of innumerable sea-birds and from the vegetable and animal matter thrown up by the sea. Moreover, every land-breeze bears to the seashore a certain amount of soil in the form of dust. Experience shows that our sand responds readily to treatment. Our Hebridean crofters, for example, obtain good yields of potatoes, carrots, and clover from what seems hopelessly barren sand by means of the fertilising aid of various marine plants.

Lord Leicester is not the only British nobleman who has transformed a sandy wilderness into woodland. The beautiful Binning Wood, in East Lothian, owes its origin to similar efforts on the part of the sixth Earl of Haddington, who in 1705 planted a great extent of what was then moorland and sand. Even the desert of Culbin has been successfully attacked by its modern lairds, so far as regards its inland fringe, from the year 1837 onwards. Those interested in the details of the Culbin reclamation may be referred to the account given by Mr Hutton, forester, in the Transactions of the Scottish Arboricultural Society (vol. viii. part 1, 1876). It is enough to quote his statement that a certain plantation reared on such unpromising soil 'cannot now be valued at less than twenty-eight pounds per acre, or altogether eight thousand four hundred pounds.'

From these references it will be seen that we have in the British Isles, and especially among the northern and western isles, large areas of desert land which could be rendered productive. Their reclamation would give employment to thousands, would increase the habitable area, and would add to the nation's wealth. The task is too great for individuals; but it could be accomplished by combined effort, as in Denmark, or by direct action on the part of the State.

MANY MEMORIES. OF TOWN BURFORD: A

By T. FISHER UNWIN.

ALF-ASLEEP upon the slope of its lonely down lies Burford, dreaming away the years. Gone are the days when kings and nobles rode up its wide street; the prosperity and importance of the gray old Cotswold

town have passed with the flight of the centuries. Now, far from railways and the rush and turmoil of life, Burford lies dreaming of the days of long ago. Peace broods over the place, only broken now and again by the noisy whir of a motor as it clambers up the steep, sun-baked street; ordinarily 'upstreet,' as they say in Burford, is occupied solely

by a few drowsy dogs.

Though now 'a haunt of ancient peace,' long ago the cloud of the Civil War hung over and darkened the little town, for it was here that Cromwell took prisoner the Levellers, and it was here that three of their number died for their ideal; they were shot in the churchyard in the presence of their comrades, who, powerless to help, were forced to watch from the tower. Roughly scratched on the lead of the font there yet remains the signature of 'Anthony Sedley; Prisner, 1649,' a message from

those far-off years. The church is one of the finest of the splendid Oxfordshire churches. It lies at the foot of the hill, with the Windrush flowing past the churchyard, and the wild roses which fringe the banks are mirrored in the quiet waters. The church is wide and airy, for its doors stand always open, and the winds from the broad uplands are ever blowing through; and it stands looking across the stream to the green water-meadows stretching to the distance and the corn-clad uplands which bound the view. Somewhere within the Tanfield aisle lie the bones of Lenthall, Speaker of the Long Parliament; for, according to his wish, there is no monument to mark the spot. The many side-chapels are full of the tombs of the departed burgesses of Burford, silent witnesses to its bygone prosperity. When the August moon sheds her silver light over the tower and reflects her face in the quiet stream, and the sinking sun sets in flames of scarlet and gold beyond the old gray bridge, it is a moment when the things of modern life seem but of little worth, and the only real life that lived at the heart of nature.

Outside the churchyard lie the almshouses, built on the site of those originally founded by some worthy burgess of the town, but for which that splendid robber, Warwick the King-maker, took Just beyond stands the Grammar School, where the famous Earl of Rochester was the credit.

The town is full of fine old houses. The Great House, overtopping its humbler neighbours in Witney Street, is perhaps the finest. At the corner of the road which leads to Cirencester stands the

Tolsey, once the place of toll, now converted into

On this side of the town lies the Priory. Shorn of a reading-room. all its one-time glory, naught but its shell remains. It belonged at one time to Lord Falkland, who fell at the battle of Newbury, and later passed into the hands of Speaker Lenthall, of the Long Parliament, a by no means estimable gentleman. The house stands on a hill surrounded by splendid trees; and from the window of the ballroom, which is the only room boasting a floor, one can look across the rivervalley to the old manor-house of the Bartholomew family crowning the opposite hill. The old chapel, connected by cloisters with the house, stands weatherbeaten and desecrated, empty of everything. It was from the steps leading to the garden that Waller painted his picture of 'The Empty Saddle.'

But, charming as are the buildings of Burford, the greatest fascination of the place lies in the pleasant waters of the Windrush. It winds placidly through the green water-meadows fringed with forget-menots and tall bulrushes and reeds; naught disturbs its peace save the cattle who come down to drink and gaze in mild-eyed wonder as a canoe drifts lazily down-stream, its occupant resting from his labours of paddling it. The fish sleep lazily in deep pools under the branches of the overhanging trees, or else swim hastily away as the shadow of the canoe and the swish and swirl of the ripples against the keel

But it grows late, and as we climb the steep road pass over them. which leads to Lechlade and the Thames, and look back over the gray roofs and green meadows towards the uplands and Wychwood Forest, we bid good-bye to Burford town with a sigh, for are we not returning to the busy world of men, where there is but little time for thought, when we have left the quiet places?

THE CUCKOO'S CALL.

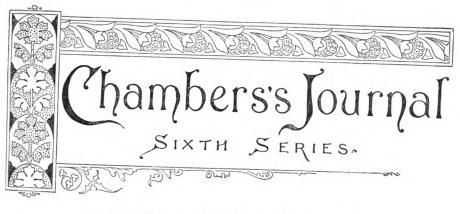

The Celtic superstition is that a long journey lies before you in the cuckoo first the difference of the cuckoo first in spring. in spring.

THERE'S a long good-bye for you and me, And a long good-bye for all; For I stood yestreen above the sea, And I heard the cuckoo's call!

And the shadows crept across the deep, The waves were hushed and still; And we looked where the loved ones lie asleep In the graveyard on the hill.

Oh, my heart grew like a house of dreams Where mournful echoes dwell, And a thought lay o'er the hills and streams That words can never tell.

Oh, the long road's waiting you and me The long road waits us all; For we stood yestreen above the sea, And heard the cuckoo's call! LAUCHLAN MACLEAN WATT.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, May 18.

OW and for the future the House of Commons is not to count for the same in the scheme of the London social season as it did in the halcyon days of a fashionable Government.

At such times, when the sun was shining, my lady who had nothing else to do would drive down to St Stephen's, hail from the Chamber one of her gallant belongings, and together they would sip tea and take strawberries and cream on the Terrace while they chatted about nothing in particular except life and pleasure, and lazily watched the barges coming and going through Westminster Bridge. But this kind of thing has been severely discounted since the majorities changed and the Labour man became a force. This Labour man himself has shown some disposition to extend parliamentary hospitality to his womenkind; but generally the spirit of the thing is changed. These are the most practical days. At the same time, there are sundry changes going on in the interior of the House which have for their object the making of it more comfortable for members and more the kind of place in which they will like to spend their time; for though it is wonderful in its appointments, it is a little doubtful whether it has been quite that abode of luxury and convenience which many constituents of honourable members have imagined it to be. The Commissioner of Works has been very busy lately, and one of the things that he has done has been to knock a number of small rooms into one, which has been established as a kind of general dining-room on a system that has not obtained in the House previously. Here a member may dine solus, or with his non-parliamentary men-friends, or with the womenkind of his circle. It is an innovation which is likely to be appreciated as time goes on; but the art and custom of parliamentary dining is another of those things which have to some extent fallen into desuetude. In conversation a member of the Kitchen Committee recently declared that in these No. 495. -Vol. X.

days M.P.'s never do really eat anything out of the simplest ordinary except when they are engaged in an all-night sitting, when, as one of the eccentricities of human nature, they come to fancy strange dishes that they have not tasted since the days of their youth, and ask for them to be made; while, as for quantity, on the occasion of such a sitting recently there were consumed at supper seven hundred eggs, two hundred pounds of bacon, and one hundred and eighty devilled bones; and at breakfast one hundredweight of ham and four hundred eggs; while the liquid refreshments that went to their destination included one thousand cups of coffee, five hundred cups of tea, three hundred and seventy whiskies-and-sodas, and four hundred and twenty bottles of beer. In a whole session there are about thirty-five thousand luncheons, fifty thousand dinners, eight hundred suppers, and seventy-five thousand teas served, so that the parliamentary catering is a very considerable quantity. But what the member of the Kitchen Committee just quoted really meant is that the consumption of the big dinner has gone out, the five-shilling and half-guinea affair that used to be popular, and members, having gone in very largely for the simple life, are eating in its place the shilling dinner, on which it is understood the House loses threepence at every serving, said threepence having, of course, to come out of the pockets of the country; while it is said, moreover, that only half as much wine is drunk in this Parliament as was in the last, the new bloods being very strong on temperance drinks, or, at the worst, beer. By the way, a recent menu of this shilling dinner was constituted as follows: 'Roast loin of veal, braised ham and spinach, roast saddle of mutton, potatoes (boiled, mashed, baked, or fried), cabbage, custard pudding, apple tart, Chaldar or Cheshire cheese, bread and butter,' so perhaps there may be held to be some reason for the M.P.'s preference.

one of the land In the matter of its gentle drinks, the House, after in these all, is only just the same as the clubs and the other [All Rights Reserved.]

May 25, 1907.

places where men meet to eat and be refreshed. No feature of this side of London life is more noticeable than the large and increasing proportion of men who sip only plain natural or aerated waters not merely at lunch-time but at their dinners. Sit down in the dining-room at your club and you will see these waters being served at table after table all around you, until the man who has the boldness to call for a pint of claret or a bottle of good hock may feel that he is in danger of condemnation for his bibbery. To such a state are things coming that whenever a suitable opportunity presents itself great efforts are made to give a fillip to the sales in this country of the different Continental wines. Thus, a year or two since, when King Edward went to Portugal and there were many manifestations of a long-standing friendship between His Majesty and King Carlos, the delights of port were extolled in every newspaper, and the wine was pressed upon you by every merchant. In the same way, since we have had such a personal interest in Spain we have been told that we should take more sherry for our stomach's sake; and all the time, as we are such good friends with France, it is being insisted that we are too neglectful of the advantages of claret as a general drink for meals. Claret, indeed, has made up some of its lost favour, chiefly at the expense of hock; but some day soon we shall have columns in the papers about a warm Anglo-German rapprochement, and then we shall be persuaded that there never was such a wine as Rhine wine, and some enthusiasts may even think it is a pity that they have not such heads and organs as would permit them to partake of the favourite beverage of the great Bismarck, which was a mixture of champagne and stout, and which upon occasion would even serve the Iron Chancellor for breakfast. This is a digression, but it serves the small purpose of suggesting that, after all, the House of Commons is merely falling into line with the times in the matter of its food and drink.

It is either falling from grace or achieving it, according to the point of view; and taste and temperament will also decide for each critic whether he is to regard the present half-indifference of the House to the clothes that it wears as to its credit for common-sense and simplicity, or against it for slovenliness. As has been said before, Parliament has gone through some transformation in the matter of its apparel during recent years, and even those who have only made a little study of it at close quarters for a decade notice the great difference. It is not so long since it was considered a terrible thing to go down to the House in a 'bowler' hat; now even Cabinet Ministers do so. Lord Randolph Churchill was the first to walk into the chamber wearing light-coloured boots, and his audacity in doing so created general amazement, and caused the Speaker to turn his head away from the sight in mingled sorrow and disgust. Now you may wear anything you like to walk to Parliament

in, and I am fairly certain that some honourable members have been in their places wearing golfshoes with huge nails in the soles thereof. Then Mr Gibson Bowles took to wearing white ducks, and others blossomed forth in cummerbunds when the May sun shone warmly at Westminster. The people who say that Parliament has not the 'tone' that it used to have do not, one understands, call for repetitions of any such feats of originality as these, for indeed has not the last possible word in such direction been said by certain of the Labour members who have turned up at St Stephen's in cloth caps? But this is just the time of the year when from the sartorial point of view Parliament in the old days always used to look its very best. When overcoats were thrown aside, then you should see how the M.P. had a most delightful regard for appearances, and the examples were set to the flock by the leaders. At such times Mr Gladstone used to be a picture of summery fancy, with a lightgray frock-coat, white waistcoat, and light-coloured hat. Disraeli, too, would be a buck in June. But now they don't care; it doesn't matter. Men go down to Westminster in their working clothes, and they dress themselves afterwards if they have anything special to do. C.B. is neat enough, and he is always tastefully and respectably dressed; but he has not a spark of the D'Orsay spirit in him, nor have his followers. This is a great Parliament without a doubt, and perhaps it is to be expected that it should look dull, as many great things do.

Irish matters being so much in the air just now, one was reminded the other evening, in discussing the lot of the present Chief Secretary, that when Lord Stanley once refused the post he did so with the remark, 'I'd rather sit naked on a nest of wasps!' The Minister whose special business it is to grapple with the immense Irish problems in these days finds a very different state of affairs at his Dublin headquarters from that which his predecessors found some fifty years ago. Mr Horsman, who was Chief Secretary from 1855 to 1857, once told the House of Commons in the course of a debate on Irish affairs that the day after his appointment he visited the office full of eagerness and energy at ten o'clock in the morning, and that he found it very much like arriving at an inn so early in the morning that there was no one up but the boots. The fires were unlighted and the rooms were unswept, and he was told that the one clerk might be expected to arrive about midday. He got the clerk to attend at ten o'clock, but was positively ashamed of bringing the man down at so early an hour when there was nothing to do.

An old proverb, the establishment of which ought to have been held as contempt of Court, having it that the law is an ass, it is natural that it should strain at a gnat and—— No, I don't see how an ass could swallow a camel after all. For months past, or rather for years, there have been general

complaints about the inadequacy of the arrangements for the administration of the civil law in the High Court of Justice, the number of Judges and the Courts being quite insufficient to keep pace with the number of causes that are presented to them. The expenditure of a very few thousands a year would completely remedy what has become very little short of a national scandal; but it seems to be a desperately hard thing for the Government authorities to make up their minds to take this step, although there cannot be a man in the world who would object to it, least of all the lawyers, since more Courts and Judges would mean more briefs. It is an astounding thing that when the Courts opened recently, after the Easter vacation, no fewer than eight appeals were placed once more on the list that were first set down for hearing more than twelve months ago, while two of them were two years old. Think of the wretched litigants waiting all this time; and little wonder that many of them get tired of this unconscionable delay and settle their grievances with each other, which means so much the less for the lawyers and so much the more for their litigants. That is the single consolation of it all. Where the straining at the guat comes in is in the fact that recently much earnest thought has been given by the heads of the law to that mighty question as to what should be done with the two refreshment-bars that have occupied prominent places in the corridors of the Law Courts ever since they were established in their present quarters. After much consideration it was decided to make representations to the Lord Chancellor with a view to their removal, and this being done, and the Lord Chancellor assenting, the bars have been abolished. So there is one more load off the legal mind, and the Courts feel a better sense of dignity than it was ever possible for them to do while those bars were in the corridor-fully licensed bars to which the man in the street might ask the friend whom he casually met to go with him to have a drink of some of the best beer that was to be got in the Strand-if it was some of the best beer. You could walk into the Law Courts and have your drink there just as you would-if you were one of that kind-walk into any hotel, and the only difference would be that in the case of the Courts you would have a fine-looking policeman to open the door for you on entering, and other policemen to direct you up the steps and along the proper corridors.

Now there is only one place left to obtain refreshments, that being in the crypt, where counsel and the public congregate at the luncheon interval. The Judges, of course, have their own common room, where they sometimes feed in company; but there are such epicurean eccentrics among them that the gathering is seldom representative, so I am told, certain of their lordships consistently spending the adjournment interval in their own private rooms. It is on record that the favourite lunch of

one Judge used to consist of cold pork, a piece of cold meat-pie, half a lobster, a quantity of hot pickles and chutney, and a piece of Dutch cheese, and that when his lordship had disposed of these items he would go back into Court beaming with the most profound satisfaction. At the other end of the scale, Lord Brampton, when Sir Henry Hawkins, did not generally take any lunch at all, and Lord Chief-Justice Coleridge used always to content himself with a mere cup of tea; while Mr Justice Grove, another of the eccentrics, had regularly a couple of boiled eggs, and a bottle of soda-water to wash them down. He sometimes spent five minutes of the adjournment by boiling these eggs himself, and it was once discovered as a coincidence that while he was doing so a learned brother in an adjacent apartment was holding his chop over the fire and giving it a little extra cooking which he considered that it needed. Such is a glimpse of the very human side of our Judges; how very ordinary they are in some matters nobody, seeing them only on the bench, would suspect. There is one of them who walks home down the Embankment every afternoon when the Courts rise; and on a fine morning Mr Justice Grantham may sometimes be seen riding up to the Courts on horseback. And I once heard a Judge of the High Court say that on one occasion when he had displayed some emotion in sentencing a man to death at a provincial assizes, the matter being duly reported in the public press, the wife of his bosom forthwith sent him a stinging letter thus: 'Dear Bill,-If this is the best you can do, you had better come home at once.' His name wasn't 'Bill,' but otherwise this letter was exactly what she wrote, and I am sure this is a true story.

* * *

And talking of the law reminds me of a curious circumstance which was discovered to me by a person of much high authority in the matters concerned. The other day there was great excitement in one of the Courts over a question of a whale, and a small piece of the said whale was produced in evidence. The whale had been found dead in the sea, and had been beached somewhere on the east coast, where it had been used for show purposes; and the local authorities, feeling that they had a grievance in the matter, went to law about it. The point is that though nobody knew about it at the time, or even know now, so far as I am aware, the Royal Family might have intervened in this suit with some effect, and their failure to do so may result in the loss through lapsing of one of their old-time privileges. This privilege, which is really very old, and used to be very positive, is that when a whale is caught off any of our coasts the head part of it belongs by right to the King and the tail part to the Queen.

It would be a happy relief to many weary people if during the present season the London theatre

were to display a little more soul. It gets worse, and the low-water mark of its inanity was nearly reached by some recent productions in the musical comedy department. In speaking thus one is, of course, describing in a word the general impression that would be formed in the mind of the man who made a tour of the theatres of the Metropolis, and whose most pleasant recollections of some performances would be overcome by the nausea suffered at succeeding ones. Good, honest drama is not in general favour apparently, though some actormanagers rarely make anything but a considerable success. When the critics rail against the decadence of the theatre, as they may well do, the managers generally put all the blame on the dramatists, who, they say, do not write good plays; and the dramatists in turn say that they do write such plays, but that the managers will not read them. But the explanation is probably, as the signs of the times suggest, that running a London theatre at a profit is an easier business than it used to be, despite the enormous expenses incurred, as, for instance, at His Majesty's, where, I am told, when there is something unusually handsome being produced the cost runs up to fifteen hundred pounds a week. It is true that a very bad piece is still upon occasion so utterly condemned that it dies quietly off in a week or a fortnight; but managerial influence and personality count for so much that there have been things which have had quite respectable runs though they have been condemned by every critic and by all sensible persons who have seen them. London stageland becomes such a desert sometimes that one looks

forward quite happily to the periodical visits of the French actors and actresses. When one goes to Paris one is frequently struck with the triviality of the majority of the prevailing theatrical attractions; but there is seldom anything trivial about the French representations that are made in London, and that they are appreciated is proved by the fact that when Mademoiselle Jeanne Granier was brought over to the New Royalty Theatre recently she was paid three hundred and sixty pounds for six performances. There must have been heavy bookings if there was to be any profit after such salaries were paid. In this connection a somewhat striking departure is to be made next winter. There is to be a French season at one of the theatres from October to March, and the gentleman who will manage it is inviting French authors to submit their original manuscripts to him for first production in London, and the best critics in Paris will be invited to the premiers. The best artistes that can be found in the French capital, so it is said, will be engaged for the production of these new plays. M. Tristan Bernard is the first French author to respond to this invitation. This is highly interesting from the English point of view; but it is surely a little topsyturvy. To appreciate it entirely we must try to imagine a new play of, say, Mr Henry Arthur Jones or Mr Pinero being produced, not in the west end of London, but in Paris, and in English, for the edification of our friends the Parisians, while the whole troupe of our dramatic critics would be assembled the night before on the deck of the Calais boat, sighing distressedly for the tunnel that was not and is never to be.

CHAPTER VIIL

IRABELLE left early, but before she went she had once more to hear some criticisms—quite innocently given— of her unfortunate lover's conduct. Somebody had 'brought'—that is to say, added without a previous

invitation—one more unit to the unfortunate hostess's already overcrowded rooms, a youthful warrior whose sun-tanned face, decorated with a white-patched forehead, suggested a late acquaint-ance with ardent Eastern suns. Somehow or other, an instant captive to Mirabelle's bright eyes, he had succeeded in getting introduced to the lady of his desire, and his frank, almost boyish admiration contrasted so pleasantly with the languid manners of the political and Foreign Office young men by whom she was surrounded that she then and there gave him the begged-for dance, greatly to his surprise and to the intense disgust of the partner she smilingly threw over.

But no sooner had the music ceased and they were ensconced in a couple of chairs in a corner

than up came the subject of her fiance's sentence, which appeared to the poor girl to be the principal topic of conversation amongst military London that night. Before the lad had said a dozen words, Mirabelle, who had at first been astonished at what seemed to her a woeful want of manners, had grasped the fact that not only was her partner completely ignorant of the relations between her and Hoppy, but had been at Rhanibad himself at the time of the trouble, and had witnessed from the battery on the wall the rescue of Vare by her lover. Her first impulse on making this discovery was to tell him at once that she was engaged to be married to the man whose gallant action he was describing; but, finding that he was his warm admirer and a staunch upholder of his cause, she felt that she might for the moment hold her peace without fear of hearing anything to hurt her feelings.

'You know, I hadn't joined very long, 'chattered the boy, 'and I was awfully sick at being left behind with the guns on the wall; but when I saw old Hoppy's run with that fellow in his arms, I tell

you, Miss Melgrove, it was just most frightfully exciting, and it was all I could do to prevent myself from attempting to jump down and cut off to his help. But I should only have broken my silly neck, you see,' he added naïvely, 'which wouldn't have done any good; so I just took it out of 'em with a rifle—we couldn't use the guns without risking hitting Hoppy—and made some pretty shooting, too, for a young un.'

'That was capital!' said Mirabelle, her eyes dancing with amusement. 'But how is it, if you have only just joined the Artillery, that you are back in England so soon?'

The lad looked confused. 'Oh, well, you know,' he said shyly, 'we all went out next day, when the other lot attacked the nigger camp, to do what we could to help, which wasn't much, there were so few of ns fit; and—er—I—er—oh, hang it, Miss Melgrove! one hates to say anything about one's self, but I got a little scrape that knocked the wind out of me, you see; and—well, I 've got some sick-leave home, like Vare over there.'

'I see,' said Mirabelle softly. 'I suppose you mean that you were badly wounded?'

Something like it,' grinned the boy; and his hearer, glancing at the older man with his scar and his little circle of adorers, felt her heart warm towards the youth at her side with a sudden burst of admiration. The gunner saw the look, and, mistaking its cause, once more reverted to the subject of his hero.

'Ah,' he exclaimed, 'you're wondering, like everybody else, why he did it. I hope Vare isn't a particular friend of yours, by the way, Miss Melgrove; but, you know, he's just the last fellow in the garrison, with his finicking ways and woman's tongue-oh, I say, I've done it now, but I can't help it - that Hoppy should have run such a risk for, when he oughtn't really to have budged from his guard without leave. At least, I mean, he blundered on, 'he had leave, he said, and of course we all believe him; but he's such a pig-headed old chap when he's got some idea or other in his head that he wouldn't say who gave it him, in spite of all the chances the president gave him; and so, you see, the court couldn't do anything more. The funny thing is that Vare hates Hoppy.' Mirabelle started. 'Some row about a girl at home, I believe, that Vare was going to marry, only Hoppy cut him ont. Oh yes, you may look incredulous, Miss Melgrove; but you don't know Hoppy. He's worth ten of the other little rat, and it's an open secret in the Sooties that Vare, who's adjutant, you know, is always dropping on to him whenever he gets a chance, and making things just as unpleasant for him as he dares.

'I dare say,' went on the irrepressible boy, 'that that's the reason why Hoppy went out for him—sort of beaping coals of fire on his sleek head, don't-cherknow? But I may be quite wrong. I was at the gate in the morning just after the column went out, and there was a Mrs—well, let's say Mrs Blank,

an awfully fetching little woman, who was always running after Hoppy, down below with a fellow. They were chaffing Hoppy—he was on the wall—and wanted to come up to him. I don't know much about it; but I believe "station" gossip associated their names pretty freely together—it always does out there if a fellow looks at a girl—and I shouldn't be surprised if Hoppy, who was mad at being out of the fun, hadn't been seized with an insane desire to shine in the lady's eyes—get a V.C. or some such tommy rot.'

Mirabelle's under-lip quivered and her colour deepened slightly; but she asked in the sweetest manner, 'But didn't you say that this Mr Hoppy, as you call him, was engaged to a girl at home?'

'Yes, rather,' laughed her companion; 'and to a jolly smart one, too, I believe. But you know—or p'r'aps you don't know—that fellows out there get awfully slack and bored, and—well—it's a long way from home, and everybody does a little firting more or less—quite harmless of course, though there are some cads about who get into hot-water sometimes; but old Hoppy was never one of that sort.'

'I see,' again answered his listener; but the light had died out of her eyes and her voice was cold. 'And now, tell me, please—no, nothing more about your flirtations,' she added hastily, as she saw the look of surprise in the lad's frank eyes; 'but what is your candid opinion about the effects of this court-martial on your friend's future? I am interested in knowing because—er—because I know the girl he's going to marry.'

Her partner looked very uncomfortable.

'Oh, I say, Miss Melgrove, that's not fair,' he exclaimed anxiously. 'I never dreamed of that. You won't say anything to her, will you, about my idiotic chatter? I didn't mean that there was anything really between Mrs-Mrs Blank and Hoppy, and it'd be awfully rough on him. As to what chaps think, if you won't mention it to his girl'----

Mirabelle gave him an encouraging smile.

'I'm afraid they think that he will have to send in his papers after such a cracking sentence; and though I simply love him—for I was attached to the Sooties' mess at Rhanibad, and he helped me like a brick in a little scrape with a nigger moneylender I got into—we none of us can hide the fact that it was a pretty feeble thing for him to leave his guard just when he did, especially to save a thing like Vare. For, don't you see, he had to have the gate opened for him when he came back with a crowd of natives behind him; and for all he knew there might have been a thousand of 'em, and then if they had got in, with everybody at sixes and sevens in the city, who knows where it might not have ended?'

'There is my father looking for me; I can see that he wants to go. Please take me to him,' hastily exclaimed Mirabelle, suddenly catching sight of old Lord Idsworth through an open doorway. She was glad of an opportunity of getting out of what was rather an equivocal position, for she felt that she had taken a somewhat unfair advantage of her admirer's loquacity, and now jumped at the chance

of putting an end to the conversation.

'I saw you hunting for me. I'm quite ready to go, papa,' she cried, as she reached her father; and the old lord, who as a matter of fact had not been looking for her at all, was too well trained to show any surprise, and quietly assented to his daughter's statement.

'Good-bye, Mr-er-good-bye.' She had totally forgotten the lad's name, if indeed she had ever known it. 'No, don't come down, please; there's Lady Havant looking at you. She wants you to dance, I'm sure. Call? Oh yes, certainly; only I'm-er-I'm leaving town to-morrow on a visit; but some time later, of course, delighted.' And the embarrassed girl swept away downstairs to her carriage, conscious that she had made rather a fool of herself should this pertinacious youth ever find out that she was the 'smart girl' who was going to marry his hero.

As the luxurious carriage rolled smoothly homewards, and her father dozed peacefully in a corner, certain rather disagreeable thoughts persisted in forcing themselves into her mind. It was very evident that the majority of those best qualified to judge—that is to say, the officers of the army—however much they admired Hoppy's bravery, one and all, with a few youthful exceptions, felt that he had been, nevertheless, guilty of a great breach of discipline. The sentence, though severe and partially remitted, was considered by them, she saw, necessary to the gravity of the case. From what both Vare and the artilleryman had told her, she gathered that 'the clubs' and 'the service' agreed that no lighter sentence could have been given, so grave and so open to possible disaster to the city had been the offence. 'Disgraced in the eyes of all honourable men!'-the refrain sang in her ears, mingling dully with the rumble of the streets, and she felt sure that the anonymous communication of the afternoon represented the real opinion of her lover's silent judges.

And then there was the other thing. Ridiculous and foolish as it was, she could not prevent herself from thinking about it. She was not jealous-certainly not; she had perfect trust in her fiance's devotion; but, as that wretched boy said, everybody flirted out in that horrid country, and her Hoppy, good-looking fellow that he was, was naturally 'run after'-those were the boy's very words-run after by all the abominable women who went out to India solely to get husbands, and who married the first fool out of the jungle that they could catch.

It wasn't Hoppy's fault, she felt sure; but it was foolish-nay, wicked of him to allow even a breath of 'station' gossip to attach itself to his name. There was never smoke without fire, and he had allowed this horrid, this 'fetching little woman' to flirt with him, and it was too bad, too abominable; and then there was this other business as well! Oh dear! it would serve him right if she wrote by the next mail and broke off her engagement altogether.

No, she wouldn't do that yet. She would tell him to come home, and hear from his own lips the truth of the matter. He was not a liar, whatever his other faults; and her bosom rose and fell with the violence of her emotions, and her breath came short and sharp through her clenched teeth as she thought of the wreck of all her hopes of wedding a distinguished soldier. Mr and the Honourable Mrs Apner! Faugh, it was dreadful! 'Hoppy, Hoppy,' she cried to herself, 'you will indeed have well and truly to justify your conduct, and my love for you will have to prove itself strong indeed, if I am to marry a man "disgraced in the eyes of all honourable men.";

And then, when her weary maid had been dismissed, and she snuggled her well-brushed golden head down into the depths of her pillow, the silent, long-kept-back tears slid softly down her cheeks, and she cried herself to sleep, to dream of Hoppy, niggers, and lost V.C.'s, but most of all of the unknown flirt, the 'fetching little woman.'

(To be continued.)

THE TALKING-MACHINE.

By A. LILLINGSTON.

·# Disc (

HEN it was announced, less than thirty years ago, that a machine had been invented which would record and reproduce the human voice, a ripple of wonder and admiration was evoked. Science was more

than satisfied, for though the sounds reproduced were weak in volume and unnatural in quality, perfected development would be but a question of time. The public, however, viewed the matter differently; it had waited for the invention too long to be put off with what seemed a travesty of the human voice. Disappointment was succeeded by laughter, the echoes of which vibrate even now. Then came indifference.

Meanwhile science, backed by capital, has been at work so silently, yet so thoroughly, that it is as though a huge industry had grown in the night. Scarce is there a good business thoroughfare in London or the provinces which does not boast imposing premises devoted exclusively to the sale of talking-machines. Every big store has its department. A talking-machine Press has arisen. Retailers engaged in the sale of machines and

records are counted by the thousand, while private buyers number millions. Obviously, an exact census of owners of talking-machines in this country is impossible; still, a working idea may be obtained from the following facts: A retail house, only one among many, will hold a stock of from one to two thousand machines, with an annual sale of hundreds of thousands of records. In England there are well-nigh a dozen large manufacturing firms with an aggregate capital running into seven figures. The scope of trade done may be gauged from the fact that within a period of seven months one firm recently sold one and a half millions of records, while last year another earned for its shareholders a trade-profit of more than two hundred thousand pounds.

The industry has of late developed certain characteristics. One is the largely increased demand for machines among folk of means and education, the other the growing popularity of records of a better class. Nor are these characteristics interdependent. An individual who has acquired a talking-machine, whether he be a man of letters or a mechanic, goes through certain stages. At first he buys records because they amuse him, the novelty of listening at will to song, speech, or dance being sufficient. The parallel may be found in the villager's enjoyment of an entertainment which the cosmopolitan votes tedious. In this primary stage comic songs, pantomine hits, stirring martial strains, and lively dance-music are the favourites, the buyer choosing his records much as a child would colours-for their vividness. Taste and judgment, however, come with experience. There are exceptions; but, as a rule, the record-buyer's standard alters considerably within the first few months, the change being always in an upward

If we take a comprehensive glance at the number of records published in Great Britain, there must be now on the market a selection of at least one hundred thousand from which to choose. These range from the last music-hall song to a speech on education by the Archbishop of Canterbury. Wellnigh every artist of note makes, or has made, records, the fees offered being sufficiently generous to attract the finest operatic talent in the world. Those who know say that at least one-third of the income made by many well-known singers is earned in the recording-room. One artist received four thousand pounds in two years from a certain firm for making records; another, whose name, familiar enough to record-buyers, is unknown to the general public, makes an average of five hundred pounds a year, and so on.

Collectors of records are by no means confined to one class. Sir Thomas Lipton, himself a keen phonoist, a while ago introduced the phonograph to His Majesty, who not only ordered one for use on board the Victoria and Albert, but showed considerable personal interest in the machine. Her Majesty owns a gramophone; so do the King

and Queen of Spain and many other European Royalties. Viscount Wolseley is credited with being an ardent admirer of the gramophone, and in connection with his machine Viscountess Wolseley once had a somewhat grim experience. Her ladyship had played over several records, and was actually listening to one of Tamagno's records when the news of the famous tenor's death reached her. The sudden dying away of the voice almost at the same moment—for her ladyship was unaware that the machine had to be rewound—produced quite an uncanny sensation.

In China, Japan, India, and other foreign countries numerous influential devotees to the talking-machine are to be found. The Shah of Persia has a gramophone, and is in addition the owner of some of the smallest and largest phonographs extant. The Sultan of Turkey, when he bought a machine, also ordered a big supply of cylinder blanks, these latter being, of course, for the making of private records. By the way, when, a few years ago, machines were first introduced into Turkey a serious discussion arose among the Faithful as to whether a man could be a good Mussulman and yet own such a profane thing as a talking-machine. Evidently the discussion was settled amicably, for there is to-day a very steady trade done with Turkey. In the Japanese navy every hospital-ship carries a first-class machine; the latter fact reminding one that not long ago a generous donor (Sir Tollemache Sinclair) gave a graphophone and three dozen records to one hundred and fifty metropolitan workhouses and hospitals.

At the present moment the aim of the majority of record-buyers is to have a numerous and representative collection. Melba's exquisite 'Lucia di Lammermoor' is found next to Florrie Forde's 'He's me Pal,' and a chance dip into a cylindercabinet is as likely to produce a rollicking song by Harry Lauder as a fine old ballad by Ben Davies. It is no unusual thing for wealthy private buyers to give an order for forty or fifty pounds' worth of records at a time. Collections of from five hundred to a thousand are frequent. I know of one man who, although now owning more than two thousand, is still a steady buyer. Another has had to use his stable as an extra depository, since his house is already full to overflowing. Yet another recently employed a mechanic for some weeks fitting special rooms for the accommodation of his treasures, upon which he has spent hundreds of pounds. Collections of a few hundreds are so common as not to be worth considering. Since one firm of manufacturers holds a selection of twelve thousand records, we may safely multiply this by ten to get an idea of the number of records now on the market; yet only here and there does one find an attempt made to specialise, for the art of collecting talkingmachine records is the hobby of to-morrow. Yet specialisation is inevitable, and when the buyer realises this he will add considerably to the

pleasure of his hobby. There is even now a fairly steady demand for records of particular composers such as Wagner, Verdi, Meyerbeer, Leoncavallo, and many others; nay more, special operas are asked for, and to meet the demand an increasing number of groups of records of various operas are issued. Since a very large number-experts put it at from three to five thousand-of each record must be sold before a profit is shown, the desire to collect operatic records is already tolerably extensive. Others prefer particular artists, such as Madame Kirkby Lunn, Ernest Pike, Lloyd Chandos, &c. So many Welsh customers of one firm asked for a cylinder record of 'Gwenith Gwyn' by Ben Davies that it was specially made. The record connoisseur has a wide choice in which to specialise. He may go in for specimens of famous bands, such as the Scots Guards, the Irish Guards, the Garde Republicaine, &c., or he may prefer English, Scotch, or Irish ballads; if instrumental solos, then he has violin, pianoforte, cornet, piccolo, xylophone, banjo, concertina, &c., many of them made by worldfamous artists. Of vocal records there are many fine soprano, contralto, tenor, baritone, and bass records on the market, without counting duets, quartettes, choruses, &c. Then there are national airs or specimens of music peculiar to the different countries; Turkish, Russian, Japanese, Chinese records, and many others, are all obtainable. Descriptive records alone offer a tempting field. If the quaint and exceptional specially appeal, then the collector may go in for pygmy records, seachanties, &c., or he may—as one collector I know does-endeavour to possess perfect specimens of the recording art. To this man the class of record is immaterial, his aim being only records which for clearness, volume, and quality of tone are absolutely faultless.

The Austrian Academy of Sciences has commenced a collection of records of every dialect and language in the world. The Bureau of Ethnology (U.S.A.) especially engaged a recording expert to go among the coloured population and take a number of folklore records. The Manx Language Society is industriously gathering records of the Manx language. Most privately made records have but a personal and family interest, yet to be able to recall the actual tones of relatives and friends when time and distance have dealt unkindly is sufficient reward for their collection. One of the most interesting collections of private records is owned by a gentleman who admittedly had exceptional opportunities. Here are to be found two or three by the late Lord Tennyson. One of them, made just before the poet's death, is the famous 'Charge of the Light Brigade.' Another cylinder contains a short address on 'Grit' by W. E. Gladstone, which was made specially for an audience of young men in the United States. The voices of H. M. Stanley and P. T. Barnum are also here. Another, spoken in French, is by the unfortunate Prince Louis Napoleon, whose tragic death in the Zulu war is still well remembered. Yet perhaps the most interesting of all in this collection is one by Florence Nightingale. It was made in July 1890, when an exhibition was being held for the benefit of the survivors of Balaklava. In pure, distinct tones, this brave woman speaks: 'God bless my gallant comrades of Balaklava, and bring them safe to shore. - Florence Nightingale.'

MAGGIE OF THE DUNES.

CHAPTER II. (continued).

HE flaming candle which stood between them on the table threw gigantic shadows of their figures upon the ceiling and walls. In Maggie's heart there burned not only a passionate spirit of resistance, but a scorn of

the man who gazed across at her with reddened, hungry eyes. What a brute to seek to take her at a disadvantage thus!

Still, with all her spirit and scorn, she realised that this half-maddened man was dangerous, and her woman's wit suggested temporising.

'You can't, Jim Rodway,' she said slowly but firmly, 'expect me to take courting like this, at midnight, and when the liquor's in your head. You should speak to a maid at other time than this, and softer. You'd affrighten the Poole wenches, I reckon. As for me'—and her breath came short, and there was a sense of almost despair in her heart—'I'm not afraid of what you can do. But you'd best be gone ere father comes in—and perhaps some one else.'

At the mention of Gutteridge, Rodway started. On the instant a more potent method of approach suggested itself to his clearing brain. He laughed unpleasantly.

'Ho! your father,' he said. 'You know as well as I do where he's gone. But, curse you! you don't know that if you play with me or thwart me you'll never see him again, 'cept with the handcuffs on his wrists and on his way to Dorchester. You don't know,' he went on rapidly and excitedly, 'that for all the old fox's plans there's a score of men behind the sandhills waiting for the boats from the Fortunate Maggie—very fortunate she'll be to-night, mark me—whiles you fancy that there's none of us 'cept me within five miles.'

He paused to see how his words had told.

So this was the turn of events, thought the listener. Under the surface of her proud and independent nature there glowed a devoted love of her father. In a moment's space she realised he was in peril. And not alone he, but Bob—

Bob with the good-humoured laugh and debonair ways, who kissed her as though there was nothing more pleasant in the world, and against whose shoulder she had leaned but that morning to gaze up at his face and see that strange, softened look in it and his eyes. She said not a word, however, although there was a catching of her breath in her throat, and she felt as though she must tug at the collar of her bodice for more air.

'Now, my fine lass,' continued Rodway, noticing the movement, 'you've never a very civil tongue for me, but I give you your chance. You are mine, and marry me you shall, or I'll see to it that your old father and that young cub Livesey, with the rest of the gang, are laid by the heels. It's all nicely planned; they're to run ashore near Sand Beach, between the two big dunes, and the horses are waiting away near the clump of hollies. Choose,

Rodway once more advanced. But there was the table between them. Little as he knew of the girl, he did know her love for her father and for Livesey; and the knowledge, to his mind, delivered her into his hands.

Through Maggie's mind rushed a bewildering series of thoughts; but out of them two resolved themselves clearly. There was only one price at which Rodway would sell his honour and her father's and lover's safety. There was only one way of escape for her.

'I'll not buy even my father's life at such a price,' she said with a motion of bitter scorn, though tears swam in her dark eyes.

'You won't ?'

He was about to continue, when a strong puff of air blew open the door and extinguished the candle. The two enemies—the woman and the man, the one who sought and the one who longed for escape—were plunged in darkness. At almost the same time the clock which stood in the corner of the room rattled and shook—as old clocks will-preparatory to striking. Then on a sonorous wire-coil it sounded the half-hour past mid-

In the darkness Maggie could hear Rodway breathe as though he were approaching her, and she shuddered her way into the corner of the room and groped for the door of the stairs leading to the upper floor.

But, although she knew it not, the chiming of the clock had sobered her assailant. He realised that even then his enemies, Gutteridge and Livesey, night be approaching some part of that deserted shore, and that they might escape him. For was he not to give the signal of their coming, without which the men who lay behind the heather-clad knoll of sand would not move?

There were other nights too, when, Gutteridge and his comrades confined at Dorchester, Maggie would be in his power. He could wait. That sudden darkness and the cool night-air which blew in upon him had sobered him.

Stumbling over a chair, he let drop a curse, and then called out raucously, 'Say your prayers, you baggage there! You've had your chance of saving your old fox of a father's neck, and that lover of yours, and now I'm off. In a couple of hours come down to the beach and see your pretty gentlemen by the heels in the sand, staring up at the stars and wishing they had never set foot aboard the Fortunate Maggie; and, groping his way to the door, Rodway passed out, slamming it behind him till the windows rattled, and thence away down the path to the

CHAPTER III.

AGGIE crouched and listened, half-fearful lest Rodway's departure were but a trick to lure her into his power. But as the minutes passed and he did not return,

she rose and relighted the candle.

During these terrible minutes of suspense, when she had scarcely dared to breathe, lest by doing so she should not hear the return of the enemy, an idea had formulated itself in her mind, prompted by a mingled desire for revenge and to save her father and lover. Should she be able to find Rodway in the darkness? That was the main thing. If she found him-well!

He had scarcely left the cottage twenty minutes before Maggie crept from it, after shutting and locking the door, but leaving the candle lighted.

Away down the path to the shore she passed barefoot and silent, cautiously peering into the gloom ahead lest she should come upon any one unawares.

When she approached the beach she turned to the right off the rough track, and made her way to the back of one of the dunes, which she climbed panting, for the slope was steep and the dry sand slipped almost like a quicksand beneath her

From the summit, in daylight, she could see the whole length of the beach right and left, to where it curved towards the chalky headland and ran northward to South Haven. Perhaps she might see him she sought even in the starlight.

She lay prone along the summit's ridge, for against the sky her figure might have been silhouetted, and peered down along the beach. At first she could distinguish nothing but the wide, curved stretches of sand on either side of her. Then at length, when her eyes became accustomed to the gloom, a dark spot resolved itself on the shore about a quarter of a mile to the right. Was it Rodway? The girl crept backward over the ridge, slid down the slope, and then made her way along at the back of the dunes, over rough ground and smooth, till she had reached a spot she judged to be immediately behind where the distant figure stood.

Climbing the dune, she once more crawled along

the ridge. Yes, there stood the figure gazing out seaward into the night. As she lay prone amid the grass and sand she saw a light flash for an instant far out at sea. Where the light came from was the Fortunate Maggie, she well knew. The figure on the beach moved across the sand until it was almost immediately below her, and close to the base of the dune.

As she peered down at him she heard Rodway mutter a curse and her own name. There was not much time to lose, for that far-away light was a signal to the boats which doubtless were waiting out in the bay ready to pull alongside the Fortunate

Maggie and land the cargo.

Maggie crawled nearer the edge and then com-Luckily, the wind had menced the descent. freshened, and there was a murmur of wavelets breaking on the patches of shingle amid the sand, and the noise smothered any sound of her bare feet in the soft sand. There was one supreme moment while she was within twenty feet of Rodway when all seemed lost. He whistled to himself and partly turned his head, as though listening intently. Maggie held her breath. Then, as he gazed seaward again, she slid forward, and with a bound clasped her strong arms round his neck under his chin, and threw the whole of her weight on to him to force him backward.

So sudden had been the attack that the man's fingers instinctively opened to grasp his assailant, and his pistol fell with a thud on the sand. The two swayed backwards and forwards, the man only half-conscious, from the terrible grip of the girl's fingers round his throat, of the identity of his assailant. Maggie was fighting for the safety of her father and lover; perhaps for her own, for Rodway was little likely to spare her if he conquered. If he did so, and found his pistol, his comrades could be summoned at any moment, though he would doubtless wait until the smugglers' boats were fast ashore.

The struggle between the untamed, hardy girl of the moorland and the still unsober 'preventive' was no unequal match. Maggie's sinews and muscles were of tougher sort than those of town-bred misses, and had been brought to their reasonable perfection by boat-sailing, rowing, and the hauling of an occasional net, kept in condition by a life of the open air and freedom from conventional restraint.

Braced by a passionate sense of the danger of those she loved, and a no less strong desire for revenge which had sprung to birth in her during Rodway's threatenings in the cottage a short hour before, Maggie inch by inch forced the struggling, choking man backwards. In the darkness of the warm autumn night, in a silence unbroken save for the low murmur of the tiny waves rippling on the shore, and the panting of the combatants, this struggle went on under the stars like some primeval conflict of bygone age, when marriage was by capture and often provocative of desperate conflict between the sexes.

Far out at sea-though unnoticed by the struggling, swaying man and woman on the beach -a gleam of light had come and gone several times, and had been answered by a masked light from a lantern along the beach between two dunes; whilst, loaded to their gunwales, two large fishing-boats had already left the side of the Fortunate Maggie, and with muffled oars were slowly creeping through the water shoreward.

Before Rodway's eyes everything was growing ruddy; in his ears there was a strange singing, increasing every moment to a roar like breakers foaming on the rocks away down the coast where the chalk cliffs give place to those of granite and stone. He was choking. All his endeavours to throw off his panther-like assailant, who swayed to and fro in unison with his struggles like an experienced wrestler who only seemingly yields to grip the tighter, were unavailing. His fingers only once or twice got any hold behind him, and then fragments of the girl's garments were torn away.

As for Maggie, she felt her strength ebbing whilst as yet Rodway was unconquered. She remembered the light she had seen, and that before long the boats from the Fortunate Maggie would be drawing in shorewards unsuspicious of harm. If Rodway escaped her, as soon as their keels grounded upon the beach he would give the alarm, and his comrades who lay awaiting the signal would rush over the heather, and in the struggle her father and Livesey might be hurt or even killed; and if taken, then she might not see them again for years.

Summoning her failing strength for one supreme effort, she threw all her weight backward, and tightened her tingling grip on Rodway's neck. There was a horrible choking rattle in the man's throat, and suddenly he seemed to collapse, and staggered backwards, almost crushing the woman beneath him; then there was a thud as his head struck heavily against a half-buried stone, and he lay still. Maggie had only just managed to roll clear of him as he fell, and now she lay dazed and panting, with blood streaming down her left arm and from her bare neck, where Rodway's nails had torn her flesh and her clothing from her.

For a moment or two her strong nerves, which had never before flinched, and had stood her in good stead that night, seemed as though about to give way. The underlying weakness of her sex struggled for the mastery over her indomitable spirit, but she raised herself and gazed out to sea.

No light shone now across the dull gray-black of the waters; but her keen eyes, when they had been cleared of the tears of pain her torn arm and neck called into them, could distinguish two blots upon the expanse—the approaching boats. Then she suddenly started when she remembered that Rodway might be only stunned, and at any moment revive and renew the terrible struggle or raise an alarm.

She crawled nearer, and bent over his body. His face, with its brown beard framing it, was turned upward and looked ghastly gray in the gloom. For a terrible moment she fancied he was dead. She bent over him until she felt the faint breath issuing from his mouth and fanning her cheek, and by opening his coat could detect the equally faint beat of his heart. Then she tore strips off her skirt and quickly bound his hands and legs with knots she had learned from her father—knots which would but become tighter should he struggle. Then she rolled a portion of the material into a cone-shaped gag and stuffed it into the unconscious man's mouth. Rodway, she thought, might 'come to' now without danger to those she loved.

Her own wounds she thought nothing about; she merely brushed with a gesture of impatience the disordered tresses of her hair out of her eyes. Then she rose and went down to the water's edge, and gazed out to sea and listened. The two black blots she had seen dimly before upon the face of the water were now distinct shapes—two boats, which were heading for a spot about five hundred yards farther up the beach. She ran along the sands, with the water now and again lapping against her bare ankles as a wavelet bigger than its fellows ran up over the shingle. When she reached the spot the boats were within a hundred yards of the shore, moving through the water like black beetles with rhythmically agitated legs.

The first boat grounded and Livesey sprang

'What's the matter, Meg?' he asked in a hoarse whisper; and then, as the light of a half-concealed lantern for a second flashed in her face, he started back.

'My God!' he cried out, 'what's the matter? You're all bloody, lass, and '—he caught at her arm and steadied her—'something's wrong.'

The other boat grounded noiselessly in the soft sand, and Gutteridge sprang out.

'Meg!' he exclaimed, 'what are you doing here?'
Then he caught sight of her torn garments and bleeding arm and neck. 'What's come to you, lass? Speak up.'

Maggie pulled herself together with an effort. With Livesey's arm round her, sex had once more almost conquered spirit, and the world had begun to spin round; and the boats, and the men standing beside them hastily lifting out the kegs, had for a moment begun to smear themselves in an endless, moving blackness along the shore.

'Nothing,' she whispered rather feebly. 'See to getting the kegs ashore. The "preventives" are away at the back of the knoll near the Long Drain, waiting for Rodway's signal. He's along the beach, safe from harming you, till they find him in the morning.'

Whilst she was speaking a troop of men and horses, silent as phantoms, wended their way between the two dunes, summoned by one of the smugglers; and the kegs and bales were loaded up with swift, accustomed hands. Gutteridge and Livesey threw a glance at Meg, and the younger man murmured an oath which boded ill for any one who had injured her, and then they turned to the task of unloading the boats.

Then, as the last bale was strapped on the rear horse, Maggie turned to her father and said, 'I'm off, father. Good-night!'

'Good-night, my lass,' was the reply. 'Best let one of the lads go with you.'

'No; I can find my way.'

Maggie had not got far ere a hand was upon her shoulder, and she swung round to find Livesey beside her.

'Meg! Meg!' he cried, 'you're not hurt, are you, lass? Rodway didn't harm you?'

'No, no, Bob,' was the response. 'He only scratched. You must cut his nails;' and the girl laughed.

'Yes, of course I will,' said the man. 'Trust me for that. But, Meg, if we get clear to-night it'll be a visit to the parson; and you shall have the finest silk dress and the best lace of any girl hereabouts.'

'As soon as you like, Bob,' was the reply.

For a moment the speaker's face was turned up with glowing eyes to his; and then, with a light though unashamed kiss, Maggie of the Dunes fled away silent-footed along the shore, and her companion cut inland through a gap in the dunes to rejoin his companions in adventure.

THE END.

FALLACIES IN STATISTICS.

was indeed a wise man who remarked that there was nothing more deceptive than facts, except figures. Nor was that other sage deficient in observation of the world who classified the statistician with the mining

fied the statistician with the mining expert. Statistics are easy enough to compile, no other qualifications being needed than considerable diligence and a knowledge of the elementary rules of arithmetic. It is the use of them in argument that tests intelligence and discrimination, to say nothing of honesty.

In almost all cases where false conclusions are drawn from true figures it will be found that the source of the error is the overlooking of some element that is essential but not obvious. This is especially to be noticed in international comparisons. For example, much surprise was recently expressed in some of the American papers at the expenses returned by candidates at our last General Election. It was suggested in consequence that electioneering in the British Isles must be more corrupt than in the United States. Apart from the fact that no man who bribed would be so stupid as

to enter his bribes among legitimate expenses, the bottom is knocked out of this argument by the fact that the comparison is not of the same things. With us the expenses of the several candidates include the cost of the election itself, which in America is defrayed out of the public funds. In the same way, there is little value in some of the comparative estimates made of the cost of government in England and in America, for the reason that many functions which here are discharged by the Imperial Government are not correspondingly centralised at Washington, but are within the province of the separate states.

A curious instance of the possibility of misreading statistics was afforded a few years ago by a Government return on Egyptian affairs. It was shown that during the British occupation the expenditure on education had quadrupled, but that application had been made for the building of several additional prisons. Here was a fine text for those who believe that schooling is harmful to morality. Unluckily for their contention, it was explained shortly afterwards that the increase in prisons was by no means owing to increased criminality, but was simply due to the fact that the days of backsheesh are now past. Under British rule the offender actually goes to jail although he may possess a sufficient number of piastres to square the cadi.

The disturbing ingredient would sometimes be eliminated if it were possible to repeat the inquiries on which the statistics are based. It is stated that some years ago a census of the City of London was taken on the morning of the day when an important cattle show was to be held at Smithfield. The hotels and lodging-houses of the neighbourhood were naturally filled with farmers, cattle-dealers, graziers, drovers, &c., and the returns consequently showed that a large proportion of the inhabitants of that part of London were engaged in agricultural pursuits! What a treasure-trove will this record be to some antiquary of the twenty-fifth century ! The chance of any misunderstanding would, of course, be avoided if it were possible to repeat the census, say, five or six times a year, when the agricultural character of the local occupations would be seen to be accidental.

There is no question on which statistics are more eagerly studied by the general public than that of health and disease, and there is perhaps no subject on which one is so liable to err through neglect of some modifying circumstances. In 1904 Dr J. M. Rhodes, chairman of the Manchester Asylum Committee, called attention through the British Medical Journal to the lack of sound foundation for a somewhat widespread alarm at that time as to the increase of insanity in the United Kingdom. It was true, he said, that on the face of the returns there appeared to be an appalling increase in the number of nervous and mental diseases, including insanity, under treatment in public institutions throughout the country. But he pointed out that within the previous twenty years there had been a

great change in popular feeling toward hospitals and asylums, with the result that patients were more readily sent. Further, the number in the asylums had been largely augmented by the general migration into towns, where it is impossible for working people to keep the mentally afflicted in their homes as they might in the country. As a matter of fact, the deaths from nervous diseases, Dr Rhodes stated, showed a steady decrease during the period under consideration.

This comparison of town and country suggests another important point commonly overlooked in discussions of the healthiness of urban versus rural life. The mortality figures of many large towns are abnormally swollen by items which should properly be set down to the account of the country. Many fatal cases in the town hospitals are those of country residents. Their accidents or illnesses are incurred in the country, and they are taken to the towns for treatment because it is only there that the best surgical or medical facilities can be found.

On all questions of health particular caution must be exercised in dealing with percentages. The late Sir Wilfrid Lawson used to tell a story of a regiment in India whose mortality record had been quoted as convincing evidence of the unsuitability of total abstinence to life in the tropics. No less than 50 per cent. of the abstainers in this regiment had died during one year! When details were examined, however, it was found that there were only two abstainers in the regiment, and that one of them while going through the jungle unarmed had been so unfortunate as to meet a tiger. In fact, it might be argued from percentages that it is far more dangerous to go to bed than to travel by rail or steamer, inasmuch as the large majority of persons in all classes of society die in bed.

In the competitions which many newspapers nowadays arrange among their readers there is one occasion of false inferences which is not generally noticed. Readers are invited to fill in coupons with the names of the leading novelist, poet, politician, actor, &c., and the prize is awarded to the competitor whose list tallies most nearly with the names that have received the largest number of votes. The figures of these competitions are sometimes quoted as indicating the popular preference, but this conclusion is not altogether justified. In the first place, we are not warranted in supposing that such readers as think it worth while to send in coupons fairly represent the opinions of those who do not, or indeed that the whole body of readers of that particular paper may be taken as representing the general public. Again, the conditions of the award being known, each person who is anxious to win a prize asks himself not Whom do I consider the leading novelist?' but 'Whom will the other competitors most likely consider the leading novelist?' or rather, 'Whom will the other competitors suppose that other competitors will suppose that' - &c., ad infinitum. It is evident that this does not quite come to the same thing.

Another notable opportunity of error in the use of statistics is to be found in the reports of circulating libraries as to the frequency with which various books are taken out. Does this indicate the comparative popularity of the books in question? Not necessarily. What happens in the case of a novel on which there is a great run? A reader who is lucky enough to apply for the book just after it is returned by some one else takes it home for a week. He gets through it in a few hours, and then he sub-lends it to friends who have themselves tried for it at the library in vain. When it goes

back there is only a single entry made of it, though it has actually been read by four or five persons. It thus counts for less in the library statistics than a book for which there is a more moderate demand, and which has been taken out by two successive readers in the same period and read by them only.

Perhaps the moral of this whole paper may be expressed thus: That the problem of statistics is in the application of them, and that one cannot use them aright without knowing a good deal more than the statistics themselves.

THE MONTH: SCIENCE AND ARTS.

THE CONQUEST OF THE STARS.

HE huge telescope presented by the late Mr Yerkes to the Williams Bay Observatory is still the most powerful instrument of the kind extant; but a much larger telescope still is to be built for the Solar

Observatory of the Carnegie Institution on Mount Wilson, in California. This telescope, for which the funds are being provided by Mr John D. Hooker of Los Angeles, is to be of the reflecting type; and some idea of the immense stride in telescopic construction which will be made by this new addition to the astronomer's resources may be gathered from some notes supplied to Engineering by Professor Hale of the observatory on Mount Wilson. The largest reflector hitherto made has a sixty-inch diameter silvered glass mirror, of which the glass has a thickness of eight inches and weighs one ton. In the proposed new telescope the mirror will be one hundred inches in diameter, necessitating a thickness of glass of thirteen inches and a weight of four and a half tons. The herculean task of casting and annealing this huge mirror has been entrusted to the Plate Glass Company of St Gobain; the equally formidable task of grinding, figuring, and testing will be undertaken in the workshops of the observatory itself, under the direction of Professor Ritchey; and, lastly, the mounting of the instrument is to be entrusted to the Union Ironworks Company, a firm which is well known as the builders of battleships and cruisers for the American navy. It is estimated that the making and mounting of this telescope will take about four years. The question of its behaviour when finished will arouse considerable interest, for undoubtedly, if its performance be satisfactory, it will be a great gain to astronomy. Its huge aperture, combined with comparatively short focal length, will make it extremely valuable for spectroscopic work of the fainter stars; but as telescopes of increasing size are taken into use very great difficulties are encountered. The question of temperature is a grave one, for a very slight difference in the warmth of

the air in one part of the tube will spoil the chances of successful observation. In the case of this new telescope it is proposed to keep the observatory always at one constant mean temperature as near as possible that of the night.

ANTITOXIN FOR OLD AGE.

Truly the science of inoculation against disease is making big strides when it becomes even remotely possible to make the suggestion contained in the heading of this paragraph. Yet to treat that widespread and always fatal disease of old age by means of an injected antitoxin is the logical result of some most curious experiments recently performed by Dr Wolfgang Weichardt, a German physician. These experiments, although revolting in themselves, as all such experiments are, may prove to be of extraordinary value to mankind. A number of guinea-pigs were made to work continuously on a kind of miniature treadmill until they dropped dead through exhaustion; then, from the fagged muscles of these animals, a kind of juice or sap was extracted; and when this substance was injected into the blood of healthy guinea-pigs they began to show all the signs and symptoms of extreme exhaustion, and died in from thirty to forty hours, as though from overwork. The analogy appears to be complete between this peculiar experiment and that proving the transmissibility of disease by inoculation, and the corollary is scarcely surprising after all that has been heard of inoculation against certain diseases by a very diluted dose of the very poison which causes those diseases. Dr Weichardt followed up his experiments on these lines, and proved that a very small quantity of this 'fatigue' poison, as he calls it, when injected into the veins of a healthy animal acts as an antitoxin against fatigue. If it be true that old age, as Metchnikoff says, is the work of certain cells, which he calls microphags, which attack the cells of the brain, liver, kidney, &c.; and if, again, it be true, as Dr Snyder remarks, that old age is in some sense merely accumulated fatigue, then the possible bearing of these experiments upon the future of the human race becomes vaguely apparent.

THE UVIOL LAMP.

The value of ultra-violet light in the treatment of various diseases is coming to be very generally recognised, and several methods of producing it are ready to the hand of the progressive physician. Ultra-violet light, it is hardly necessary to explain, is that constituent of ordinary sunlight which is of extremely short wave-length, shorter than the shortest rays of visible light. In the solar spectrum these rays take their place beyond the extreme violet end; and, as everybody knows, it is to the blue and violet rays and the ultra-violet rays that the chemical action of light is due. Finsen of Copenhagen, who originated the use of ultra-violet light, notably in the cure of lupus and other skin complaints, produced it by means of a very powerful arc light robbed of its heat-rays by special cooling devices. This was a very expensive and cumbrous method, for the amount of ultra-violet light so produced is very small in proportion to the energy expended, which principally finds its outlet in visual light and intense heat. actinic light is produced in large quantities, however, in the mercury vapour-lamp, whose heat-rays are practically nil, the radiation consisting almost entirely of blue, violet, and ultra-violet rays. In the ordinary mercury vapour-lamp the ultra-violet light is almost entirely absorbed by the glass tube forming the lamp, for glass is practically opaque to these invisible rays. In the uviol lamp this difficulty is overcome by forming the tube of a special uviol glass which is as transparent to ultra-violet light as to the visual rays. The lamp is especially applicable to the treatment of skin disease covering a considerable surface, because, unlike the concentrated radiation from the Finsen arc, the light is spread over a large area.

STEERING BY GYROSCOPE.

The mariner's compass occasionally fails of its purpose in these days of iron ships and cargoes of a magnetic nature. This is especially the case in warships, where the huge masses of iron and steel in guns and gun-turrets, &c., are very liable to affect the reading of the compass. It is the usual practice to make all possible corrections; but gun-turrets have to be moved around, and the corrections cannot always be relied upon. Again, the shock due to the firing of big guns is extremely bad for the compass. Dr H. Anschütz-Kämpse has invented a new form of steering standard dependent for its operation upon the principle of the gyroscope, which, as used for steadying ships, is dealt with in the July issue of Chambers's. This apparatus has been subjected to exhaustive tests on a battleship, where, amid the firing of big guns, the movement of the turrets, and such other disturbing influences as would effectually have disposed of an ordinary compass, it behaved with remarkable precision, and came out of the trials quite uninjured. The apparatus consists essentially of an electrically operated gyroscope, carrying an indicating needle and pivoted

within a divided arc or rose similar to that of the ordinary mariner's compass. The instrument, of course, does not necessarily point north and south, but it tends continually to point in any direction in which it is set, and thus to indicate any change of direction of the ship. It is not proposed to displace the mariner's compass by means of this instrument, for its readings would tend to become inaccurate after long spells of use without re-setting by some standard. It will be useful rather as a supplement to the compass; for although both instruments have their faults they are not of the same nature, and the perfections of one cover the imperfections of the other.

ELECTRONS.

The brain-racking speculations as to the inherent nature of electricity, involving as they do still more disturbing questions regarding the nature and very existence of matter itself, can hardly be followed by the ordinary mortal. That all matter of every kind whatever is really composed of corpuscles which are all alike, and which are nothing but a 'disembodied electrical charge' containing in themselves nothing material, is a conception beyond the grasp of the ordinary intelligence. Yet it is to a conception like this that modern physicists appear to be trending. A recent book by Sir Oliver Lodge, entitled Electrons; or, the Nature and Properties of Negative Electricity, will be of interest to those who wish to obtain a grasp of this complex subject.

RAISING OF THE ASSOUAN DAM.

Sir William Garstin has recommended that the Assouan dam should be raised by seven metres, or approximately twenty-three feet, at a cost of about fifteen hundred thousand Egyptian pounds. He observes that there can be no doubt of the enormous benefit which the Assouan reservoir has conferred on Egypt, the sale value of lands already provided with perennial irrigation having been increased by twenty-four and a half million Egyptian pounds, while when canals now in course of construction are completed this figure will rise to over twentyeight million pounds. In addition to this, the cotton crop, the value of which was estimated last year at twenty-eight million pounds, has been secured. It is estimated that the reservoir now supplies about a quarter of the water which will be eventually necessary for the needs of Egypt. If the dam is raised the water-supply will be more than doubled, and nine hundred and fifty thousand acres of land brought under cultivation.

GRADED ILLUMINATION FOR PAINTING.

One of the greatest difficulties which an artist has to contend against is the absolute impossibility of correctly rendering the contrasts of light and shade met with in nature. While the difference between a deep shadow and the light of a clear sky, with all the various tone-values in between, may be represented as from 1 to 100, the greatest contrast

between pure-white paint and the blackest pigment is probably not more than from 1 to 10. An interesting experiment has been made by R. W. Wood, and described by him in a recent number of the Scientific American. He had observed when sketching from nature that a ray of sunlight falling by accident upon a certain part of his picture produced on it a wonderful effect of luminosity. Following out the idea suggested, he tried the effect of increasing the brightness of light portions of various pictures by means of local illumination. Results of quite a startling nature were secured by making a photograph on an orthochromatic plate of a painting, and then projecting by a magic lantern a positive transparency of the picture upon the picture itself. Thus the dark portions of the picture received little or no light from the lantern, while the brightest parts were brilliantly illuminated. It is said that the results obtained were of a very remarkable nature, and pictures so illuminated were quite startling in their brilliancy.

OZONE IN BREWING.

The proprietors of a simple electrical machine for the production of ozonised air in quantities-Messrs Ozonair, Limited—have issued a pamphlet dealing with the utility of ozone in breweries. It is stated that ozonised air, owing to its germicidal and disinfecting properties, has a very important effect in preventing contamination, and that it also aids very considerably in many of the processes. The ozone is said to have a marked effect in invigorating the fermentative action of the yeast. Ozone is produced by the action on air of what is called the silent discharge of high-tension alternating electricity in air driven through and among the electrodes by means of a fan. A large quantity of ozonised air is produced in this manner at a very small expense for energy.

SOLDERING OF ALUMINIUM.

The autogenous soldering of aluminium or welding by means of the oxy-hydrogen or oxy-acetylene blowpipe has occupied the attention of various experimenters since aluminium first came to be recognised as a very important metal of the future. Hitherto the great difficulty has always been that as soon as the metal was hot enough to flow, it immediately became covered by a film of oxide extremely thin, but yet sufficient effectually to prevent the union of one piece of metal with the other. The problem has been to find a substance which would dissolve or otherwise remove the covering film of oxide; but until lately experimenters in this direction have been baffled. A great many different processes for soldering aluminium with other metals have been introduced from time to time and patented, but the great objection to them all is that electrolytic action is almost invariably set up when aluminium is intimately associated with a different metal, and the resulting corrosion weakens and perhaps destroys the joint. Mr M. U. Schoop, in an interesting article in the Scientific American, describes and illustrates his own process for the autogenous welding of aluminium. From the description given, the process appears to be a simple one; being, in fact, precisely analogous to that of lead-burning, except for the application of the Schoop reducing liquid, of which no particulars are given. This liquid has the effect of preventing the formation of the film of oxide, and of rendering quite easy the junction of the two metals when heated sufficiently under the blowpipe.

A NEW CASH REGISTER AND AUTOMATIC CHANGE-GIVER.

The public are now so used to seeing and hearing of new inventions of marvellous ingenuity, mechanical exactness, and reliable action, all tending towards the saving of time and labour in every path of life, that it may therefore not be surprising to learn that another remarkable mechanical marvel in the shape of a new cash register has just been invented. One of the many unique features in this machine is that it not only does the essential things that the registers so well known to the public accomplish, but in addition actually handles the money, and by instantaneous mechanical action calculates and gives out whatever change is required. It achieves what has up to the present been declared impossible by the world's mechanical engineers, and as a cash register stands unique and by itself in this particular class of machinery. There are no cashdrawers to be manipulated, the money in the machine being contained in columns, the coins finding their way automatically into these columns irrespective of their size or value. This is accomplished by means of slots in a slide placed at an angle in the machine, by which they fall into their proper places, the weight of each individual coin being sufficient in itself to carry it along this angled slide until it finds its home. The coins for the required change, as given out from the bottom of these columns, fall on to their edges and roll down an inclined plane into a receptacle, from which they may be taken by the customer direct if desired. In manipulating the machine to gain these results, keys are depressed in the usual manner, and a feature of this register is the fact that unless each individual transaction is recorded by this means, it will not give out the change required. By the action of the depression of the keys the mechanism automatically calculates the exact amount required for change from any given amount, and instantaneously gives out the No calculation of any necessary amount is needed, the machine doing all this by means of two sets of keys, the one set representing the amount of a purchase, the other set the amount of coin tendered, the difference between these two amounts being the change required. The amount of every purchase is shown at the back of the machine to the customer, and at the front

to the operator; and continuously, with the working of the machine, it is automatically adding together every individual purchase, giving the grand total, which is to be seen only by the proprietor or those so entitled. Again, it is at the same time printing on a tape every individual amount, giving a most complete check upon the transactions, while the total of such impressions must of necessity tally with the grand total. This automatic cash register and change-giver is of a very compact size and somewhat resembles in style the cash registers in use, and the manufacturers of this machine have undoubtedly taken a great stride forward in this class of public commodity. Another machine made by the same company is an appliance by which, on the machine being filled with a certain amount of money, any desired sum from it is automatically given out, such as is required in the paying of wages; this machine, in its mechanical action, being an adaptation of the cash register, its mechanism being similar with regard to its automatic sorting, adding, and printing apparatus. This machine will unquestionably be the means of an enormous saving of time and trouble to the employers of labour, seeing that the machine accomplishes what can at present only be done by a staff.

THE BEST BUTTER IN THE WORLD.

The discussions in the press on butter blending and adulteration are educating public opinion as to what to use and avoid in the various brands on the market. Country Life has taken the practical step of submitting various brands of butter-English, Danish, Italian, Brittany, and others—to an analyst, who kept them for a certain period. The analyst knew nothing about the country of origin of the butter. In the result, the Italian was the worst, and the English proved the cleanest and best sample; it was the richest and the best-made butter. The result, as far as it goes, proves that the best butter in the world is obtained from Jersey cows fed on English pastures; no foreign or colonial butter is quite equal to the best made in England. There are butters made in Normandy and New Zealand equal to that found in any other part of the world; but then these never reach the consumer exactly as they leave the dairy. The choicest samples are mixed with those less good. English and Scottish dairies, too, are now turning out butter superior to that which is sent out from Normandy or Denmark. The cheap butters are often made, under insanitary conditions, of inferior fats and other substances, with colouring matter added to hide defects.

FALLS OF IGUAZU.

Attention has been called in Cassier's Magazine for April to the wonderful cataract of Iguazu on the Upper Parana, at the junction of the three great states of Argentina, Brazil, and Paraguay, as a possible source of natural power in South America. It is about twelve days' journey by rail and river from

Buenos Ayres. As Niagara has been harnessed, and the Victoria Falls of the Zambesi may be exploited, Mr Henry Harley points out that there is here as great a possible source of power, which might be carried for hundreds of miles, while there are other lesser waterfalls in the district which could also be harnessed. The cataract of Ignazu is more than double the width of Niagara, and about one third higher. There is a plan for the conversion of the surrounding country into a park.

国際がある。

DECORATED PREHISTORIC CAVES.

News has come from explorers that yet another prehistoric cave has been discovered in the French Pyrenees of Ariege. This time the mural drawings which form the special interest of the find have been discovered in the very heart of a mountain, eight hundred feet from the entrance and from the light. They were discovered by accident by two travellers, who fortunately drew a plan of the cave and warned M. Cartailhac and M. Salomon Reinach, the French authorities on prehistoric matters. The cave is ornamented with designs of thirty bisons, with horses, stags, and wild goats, all drawn in black and with considerable talent in the now recognised Palæolithic style. The tone of colour is exactly that of other caves known as prehistoric, of which this is considered as perhaps the most ancient. The curious red signs found elsewhere are not lacking here too. Arrows black and red are to be seen drawn on the flanks of seven bisons. It is believed that the images played a supposed magical part in these caves.

ALMOND BLOSSOM.

A RONDEL

A CAPTIVE I, whom winter bound doth keep In a dull square, where smoke grimed branches sway, And here I weary for the longed-for day When Spring shall stir and waken from her sleep.

So, every morn, when on the sordid town The cold day breaks, I eager gaze to see If the Deliverer comes; but, woe is me! Nude Nature shudders 'neath the tyrant's frown.

Yet once again I to my lattice creep, And, lo! a miracle. There stands a tree Rosy as Hope, rosy as Love; and, see! White cloud-sails on a glorious azure deep, For Spring has risen exulting from her sleep. BLLA WRAY COX

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

RUTH; OR, THECLOTHES-PINS.

By LADY ROLLESTON.

CHAPTER I.

OME years ago I was seated in the old wainscotted library of a remote country house on the confines of Worcestershire, closeted with Mr Archibald Tite, of the firm of Tite

and Mortmain, my late uncle's solicitors, and passing what the French call a very unpleasant quarter of an hour. Mr Tite, like myself, was habited in a complete suit of black, and a huge mourning-cloak, which hung over the high carved back of his chair like a sable catafalque, would have given him a very lugubrious appearance had it not been for the prosperous plumpness of his figure, which, together with a somewhat rubicund complexion and a pair of sharp, twinkling eyes, contrasted strikingly with these solemn surroundings.

'Well, I confess your case is peculiar,' said Mr Tite, regarding me complacently over his goldrimmed spectacles; 'but you see, my dear sir, whatever your respected uncle's intentions may have been towards you, this'-and he laid a fat forefinger on a document spread on the table before him-'appears to be the only will extant; and, as you perceive, it bequeaths to your late father no more than the sum of one shilling, to which you, as his lawful heir, will become duly entitled; while the residue of the property is devised in its entirety to certain charities in this and the neighbouring county of Warwickshire.'

Mr Tite spoke deliberately, dropping each word as if mentally appraising its exact weight and value, much as a banker weighs his money before passing it to a customer; nor was this to be wondered at, insomuch that each expression of Mr Tite's opinion had the average market-value of six and eightpence in sterling coin of the realm.

Seeing that I vouchsafed no reply, he presently continued: 'I may mention that your uncle left this shilling enclosed in his will'—and he pushed the coin, neatly wrapped in silver paper, towards me-

No. 496. -Vol. X.

'which, I presume, I may as well deliver to you at once; unless, of course, you propose to contest the inheritance.

'No, I have no such intention,' I replied. 'There is something revolting to my mind in the idea of relatives fighting over a dead man's property, like vultures round a carcass. Besides, I suppose my poor uncle had a perfect right to do what he liked with his own. Though, lest you should give me undue credit for my forbearance, I may as well frankly admit that even if I had the will to go to law with these wealthy charities, I should not have the means; for, when my debts are paid, I fancy this shilling you have just given me will, with a few suits of clothes, be all that remains of my real and personal estate, as you would call it.' I spoke rather bitterly, and thought that Mr Tite glanced up a little uneasily, as if he anticipated that I was going to ask him for a loan.

However, he hastened to say, with an air of cordiality which really did him credit, as he rubbed one fat hand placidly over the other, and smiled the smile of a man with a comfortable balance at his own banker's giving prudent advice to his less pecunious brother:

'Come, come, Mr Chesney, you must not look at your prospects in that way. There are many things a young man can turn his hand to; and if we can be-I speak for Mortmain and myself-of any service in recommending you to some mercantile firm, for instance, where you might obtain a junior clerkship-we must not be too ambitious at first, you know-why, it will afford us great pleasure to give our late client's nephew the assistance of-of, in fact, our recommendation.'

There was something so patronising in the way Mr Tite, the obscure country attorney, came to the climax of this little speech that I began to wonder whether I was really the same individual whom he had treated with so much deference when I was the presumed heir of Pixley Hall; and this vague feel-[All Rights Reserved.] JUNE 1, 1907.

ing of a changed identity clung to me whilst I took my leave, and wandered for the last time through the silent house which was no longer to be my home. It was only when the old butler waylaid me at the front door with a sorrowful face and a respectful request that I should take a glass of wine before venturing into the cold air that I began to feel like myself again. I did not accept the honest fellow's offer, but his little attention did good to my ruffled feelings; and as I threw myself into my carriage and bade the man drive back to the station, I made an effort to collect my scattered thoughts and face my position.

That morning I had arrived from Heidelberg just in time for my poor uncle's funeral, and had been received with all the attention due to the heir of a wealthy country gentleman; but when, after the ceremony, Mr Tite proceeded to read the will, it was found to be dated some ten years previously, and that my name was not even mentioned in it, the whole of his estate being bequeathed to certain large county charities; so that I left the house

practically a beggar!

Of course I had heard, in the vague sort of way children learn such family stories, that my father and uncle had quarrelled desperately in early life about a young lady possessed of great personal beauty, to whom for a long time my uncle had been deeply attached, though some peculiar diffidence or reserve in his disposition had prevented him from ever being able to bring himself to make her formally acquainted with the fact. As, however, she freely admitted him to a very frank intimacy-a circumstance which to a more far-seeing man might have been the surest warning that her heart was not touched—he foolishly assumed that she would marry him, as a matter of course, whenever he felt himself in a position to offer her a home; and to further this end went to London to study at the Bar. Unfortunately, during his absence, my father, who was the elder brother, chanced to visit a property he possessed in the young lady's neighbourhood. An acquaintance sprang up between them,

and in a very short time my father, who was a less diffident suitor, succeeded in winning her hand and heart, totally unconscious that in so doing he was cutting out his own brother, to whom he wrote the news in a strain of pardonable exultation.

71

Naturally, my poor uncle was dreadfully disappointed; nor could he see that his own reticence was alone to blame, but, blinded with rage and jealousy, flew to my father, and upbraided him in the bitterest terms with having deliberately taken a base advantage of his absence to supplant him in the regard of the young lady, who he declared had only been won by means of false representations and the glamour of his superior wealth and position. This cruel and unjust taunt against his promised bride at last kindled my father's wrath, and the interview became so violent that it might even have led to a fratricidal duel had not the entreaties of my mother, who fortunately happened to enter the room, averted so dreadful a calamity.

My uncle strode from his brother's presence with heaving chest and flashing eye, and as he turned in the doorway to cast a last glance at the grieved and agitated lovers, he swore solemnly that he would never set eyes on them again or be beholden to my father for one farthing of the allowance he had hitherto received from him. In spite of every effort to trace his whereabouts, he then disappeared entirely from his friends, and it was only a twelvemonth later that they learned he had enlisted in a

cavalry regiment and sailed for India.

Two years passed, and the Gazette announced that my uncle had obtained his commission for distinguished bravery in the field; but soon afterwards he sold out and devoted himself to indigo-planting, in which peaceful occupation he spent the best years of his life, till at length he had shaken the pagoda-tree to such advantage that at the age of fifty he was able to return to England with a curious taste for hot curries, a yellow complexion, no liver to speak of, and a fortune of some eighty thousand pounds.

GARIBALDI: A CENTENARY TRIBUTE.

By GEORGE PIGNATORRE, Rome.

PART I.

IE name of the great warrior-patriot of Italy will go down the stream of history with those of Wallace and Herman, of William of Orange and Washington, as that of a dauntless soldier and champion of

freedom; of one who, without a thought of self, devoted his life to what must have appeared the well-nigh desperate task of freeing and reuniting oppressed and dismembered Italy, the achievement of which would have to be accomplished under

unprecedented difficulties, springing from the presence in the land of a powerful foreign for and from the seeds of disunion among the people themselves, which had hitherto prevented their combining against their national enemies.

Italy at the peace of 1815 appeared fated to remain for long a geographical expression, as Metternich had not inaptly termed her. Great must have been the faith and unflinching courage of the young patriot, who hoped, in 1833, to create a free and independent country from the Alps to

Cape Passaro in Sicily. All those who had dreamed that glorious dream and striven to realise their aspirations had hitherto failed. The schemes of the valiant Manfred of Naples (the Harold Infelix of Italy), those of the dark and terrible Visconti of Milan, the far-sighted conception of Lorenzo the Magnificent of Florence of a federation of the Italian states towards the end of the fifteenth century-which, had it been realised, would in all probability have preserved Italy from her threecentury vassalage to Spain, Austria, and Franceall came to naught. Even as late as 1814-15, the successive attempts of Eugène Beauharnais and of Murat had failed signally, quite as much through. the apathy of the population as through the arms of Austria. The Liberal risings of 1821 in Piedmont, Naples, and Sicily, like those of 1831 in the states of the Church, had been sternly and promptly repressed by the help of Austria; moreover, they had proved once more the lack of concert and unanimity among the Italians.

Indeed, the outlook had never seemed darker than in that year 1833, when young Garibaldi struck the first blow for Italy. Northern Italy, save Piedmont, was in the hands of Austria; Central Italy was governed by princelets who were really the satellites of the great northern empire, or, worse still, misruled by the Roman pontiffa. The whole of the south was groaning under the tyranny of the faithless and despotic sovereigns of Naples, and was seemingly, as ever, hopelessly divided in opinion and feeling. But Garibaldi possessed that belief in ultimate success which is the distinctive trait of men of his stamp. He was ready to brave failure and encounter adversity in his country's cause, believing that success must crown his efforts at last.

Born in Nice, 4th July 1807, then as now annexed to France, but at that time a purely Italian city, he was but twenty-six when he joined the Society of Young Italy, founded by Joseph Mazzini, another illustrious son of Italy. From the very outset his fearless and adventurous character brought him to the fore. He was forthwith chosen to execute the bold stroke of seizing a Sardinian man-of-war which lay in the port of Genoa, and this done, to promote a rising in the town itself on behalf of the Liberal and patriotic party. The attempt miscarried, and young Garibaldi was condemned to death for high treason; but ere he could be arrested he had made his way out of the Sardinian kingdom to Tunis, whence he embarked for Rio de Janeiro. Some fifteen years later Charles Albert granted a constitution to his people, and alone of all the Italian potentates maintained the liberties he had bestowed.

Meanwhile the future conqueror of Sicily and Naples, the victor in many a stricken field, was earning his living as the master of a small coaster; for, like his father, Garibaldi was a fine seaman and had studied navigation. He continued thus to be peacefully employed until 1836, when, an

insurrection having broken out in the province of Rio Grande against the central Government, Garibaldi threw himself with characteristic fervour into the struggle, and, arming a small craft, captured a Brazilian vessel. He was pursued by a vastly superior force, and was wounded, but escaped. Captured on another occasion by the Brazilians, he was shamefully ill-used and even tortured by his captors to make him reveal the names of those who had assisted him in his first escape. Garibaldi was, of course, proof against coercion, no matter how exercised, and magnanimous enough when the fortune of war threw his barbarous enemy in his power to disdain to retaliate. His generosity was only equalled by his valour, and this again has rarely been matched and never surpassed.

During the whole duration of these desultory and protracted hostilities, which lasted from 1836 to 1842, Garibaldi's feats of arms seem to belong rather to romance than to sober modern history, and would have sufficed to raise to fame any other man, yet in his case they were but the prelude of even greater marvels. On one occasion he was attacked unexpectedly by a band of one hundred and twenty men, and though he had but eleven of his followers with him at the time, he beat off his assailants and put them to flight. He captured or assisted in the capture of several fortified places; but the overwhelming odds and internal discord rendered the struggle of the inhabitants of Rio Grande hopeless, and made fruitless all the exertions of Garibaldi, who on this occasion, as always, had taken the weaker side and had championed the cause of the oppressed, or of those whom he considered such.

Garibaldi, on leaving Rio Grande, repaired with his wife—a Spanish lady whom he had met during one of his campaigns, and who was to follow him in adverse fortune and share his dangers and privations—to Montevideo, then subject to the Argentine Republic. Here he earned a precarious livelihood by giving lessons in mathematics. When Montevideo rose in its turn to throw off the Argentine yoke and establish its own independence, Garibaldi once more drew his sword for the good cause. He raised an Italian Legion of eight hundred men, who were the first wearers of the Red Shirt which was to become so well known on many a hard-fought battlefield, and a national badge like the Greek fustanelle.

At the head of his partisans he won repeated successes over the Argentine commander Oribe. His greatest achievement during this war was in the action of St Anthony, where he engaged with only one hundred and ninety men a force of one thousand two hundred, whom he defeated with immense slaughter, while he lost only thirty-six men as compared with five hundred of the enemy.

While this somewhat obscure contest was being waged between two South American states events were occurring in Italy which opened a way for the return of the exile and gave him an oppor-

tunity of displaying his rare gifts as a leader of men. Rejecting all the offers of the Uruguayan Government-who, loath to lose their redoubtable champion, had voted him a grant of money and lands-he was so straitened in means that he was compelled to delay his departure, and was only able to set sail in May 1848, to the great detriment of the cause he had returned to defend. His presence at the outbreak of hostilities would have been of incalculable benefit, through the impetus he would have given to the popular movement by arousing the enthusiasm of the people, and through the damage his active partisans would have caused the foe by cutting their communications and harassing them incessantly on their retreat. But owing to the obstacles thrown in the way of his departure by the authorities at Montevideo, and to his own lack of funds, he was unable to reach the shores of Italy in time to share in the first victorious advance of Charles Albert. When he arrived the tide had already turned, the battle of Custozza had been lost by the Sardinian army, Milan had been reoccupied, and the national forces were in full retreat. Garibaldi nevertheless succeeded, in spite of all these untoward events, in raising a body of volunteers, with whom he advanced against the oncoming Austrians, whom he worsted at Luvino and Morazzone; but, unsupported by the main army, which continued to fall back, he broke through his encircling enemies and crossed the Italian frontier into Switzerland.

From Switzerland re-entering Italy, he hastened across Tuscany, everywhere greeted by the population, whose idol he was fast becoming, to join in that defence which he rendered for ever memorable by his deeds. The newly established republic was threatened on all sides by the Neapolitan forces advancing through Velletri from the south, by the Austrians coming from the north, and lastly by the French Republican host under Oudinot, which was marching on Rome to subvert the Liberal

régime and restore papal misrule. Endowed with that personal magnetism which some few gifted spirits have possessed, but none in greater degree than Garibaldi, he soon inspired his raw levies with some of his own enthusiastic love of country and with unbounded faith in their leader. In this respect no man in modern times can be compared to Garibaldi save Napoleon, whose landing at Cannes with a thousand men to reconquer France offers a parallel to the expedition to Marsala undertaken by Garibaldi with a like number. Had the odds been less heavy the heroic defender of Rome might have been successful. But Garibaldi had to deal with foreign foes and his own countrymen. He had first to encounter Oudinot, who had attacked Rome on the 30th of April 1849, but was repulsed after seven hours' fighting with the loss of many men killed, wounded, or taken prisoners. The French general fell back on Civita Vecchia to await reinforcements. Secure on this side, Garibaldi fell

on the Neapolitan army, who, to their eternal disgrace, were assisting in riveting the chains anew on their fellow-countrymen. They had perhaps little heart in the cause; they certainly fought badly in a bad cause, and were utterly broken at Velletri by an inferior force, and again at Monte Fortino in the Marches. Notwithstanding these successes, which shed a lustre on the fall of Rome, though they could not avert the final catastrophe, the toils were closing Bologna after eight days', and Ancona after three weeks' resistance, had surrendered to the Austrian forces. The reactionists were triumphant in France, and Oudinot, being strongly reinforced, was ordered to renew the attack on Rome with thirty-five thousand men and sixty heavy pieces of siege artillery. To this army the Italians could only oppose nineteen thousand in all, inclusive of volunteers. The siege lasted a month. The Italians, albeit overmatched, fought stoutly under the guidance of Garibaldi, Medici, and other subordinate leaders. The decisive struggle was obstinate and prolonged; but, outnumbered and outranged in artillery, the patriots were obliged to yield at last. On the 3rd of July General Garibaldi evacuated the city with some four thousand men, who chose to follow his fortunes, and to whom he addressed these words: 'I have nought to offer you save hunger and peril, the earth for a bed, the sun's heat for refreshment; but let those who still hope for their country come with me.'

118

Eluding or fighting his way through the serried arrays of white-coated Austrians, he effected his retreat to the coast. Bidding his followers disperse and reserve themselves for happier days, he himself took refuge with a few adherents and his devoted wife in the marshes or fens of Comacchio, where the greatest bereavement of his life befell him in perhaps the darkest hour of his chequered career. His wife succumbed to the hardships of the retreat, and died. In that summer so fatal to Garibaldi's hopes he lost the dear companion who had always been at his side in danger and distress, who had loved him devotedly, as he deserved to be loved, who had stood by him in adversity, but was not fated to be with him in his triumph. We may imagine his grief; we cannot describe it, nor would it be meet to attempt to portray the sorrow of that great

That ill-omened summer closed with gloom. The heart. revived hopes of Italy had been doomed once more to disappointment, and the cloud of despotism had settled down once more on the land; and save for one bright spot, one break in the overcast sky, it would have appeared incapable of lifting any more. But that bright spot, Piedmont, under its honest king, was destined to spread and light up the whole horizon.

Garibaldi returned to Italy in 1854, and retired to the isle of Caprera, which has become famous on this account and is visited by thousands of admirers of the hero of Italy, who repair thither each year on the 2nd of June, the anniversary of his death, as to a shrine. The island, which is about eighteen miles in circumference, lies off the north coast of Sardinia, and, though rocky, is very fertile where the loam has accumulated. Here Garibaldi built himself a modest dwelling with his own hands and the assistance of a few friends; here he dwelt quietly, eking out his daily bread with the fish he caught himself or the game he snared or shot; and here the tidings were brought that the tricolour of Italy was once more aloft and waving by the side of that of France.

The real dawn was breaking at last, dispelling once and for all the long night of centuries. The times were ripe at last. Slowly but surely the feeling of nationality had been growing up during the first half of the century. The Italians had at last taken to heart the lessons of experience, especially those taught by the vicissitudes of the struggles of 1848-49. But they knew also the gigantic power of Austria and the impossibility of combining against her without having a nucleus round which the elements of national resistance might aggregate. Even Piedmont unaided had not proved equal to the task. But in 1859 the alliance of the French Emperor (then at his zenith) with the King of Sardinia, Victor Emmanuel, provided the required initial force for a general movement. Moreover, at that critical and turning point of her history Italy possessed in Count Cavour a great statesman, who had been scheming for an alliance with France as a preliminary to the liberation of Italy. So ably had his plans been laid, so completely had Austria played into the hands of her adversary, that a French army crossed into Italy to assist the Piedmontese in repelling an Austrian invasion; in other words, Piedmont was no longer the aggressor. Garibaldi was summoned to take the field again against the hereditary foe, and placed in command of the Cacciatore delle Alpi. At their head he won two battles, at Varese and San Fermo, which were purely Italian victories gained by Italian soldiers under an Italian general; in the battles of Magenta and Solferino the honours were divided between French and Italians. The unexpected conclusion of the armistice of Villafranca arrested Garibaldi's victorious career, and shortly after peace was signed between Austria on the one side and France and Piedmont on the other, by which Lombardy was ceded to the latter. This seemed at first a meagre result, but the impetus had been given towards national unity. The expulsion of the petty sovereigns of Central Italy, Tuscany, Modena, and Parma, followed by the unanimous

vote of the people, gave these provinces also to Italian unity; the Legations followed suit and declared for Victor Emmanuel. This unforeseen, though very foreseeable, enlargement of the new kingdom caused Napoleon to deniand the cession of Savoy and Nice, provided the people gave their consent and Parliament ratified the public The Savoyards and Nisards voted for annexation to France; but the debate ran high in the sitting at Turin, and General Garibaldi strongly opposed the measure. Doubtless the great patriot had on his side the sympathy of the House when he pleaded for the retention of But the fiat had gone Nice, his native town. forth; it would have been highly impolitic to offend the French Emperor, and even the opposers were somewhat embarrassed by the assent freely given by the inhabitants of the ceded provinces. But save for the natural pang which Garibaldi would feel on seeing his birthplace passing under the domination of France, he must have rejoiced at the brightening prospects of Italy at the close of that memorable year. He must have felt that half the great work for which he had toiled for years was already accomplished, that its completion could not be long delayed. All Italy, save the Venetian provinces and an insignificant district round Rome, was now free, from the Alps to the confines of the Kingdom of the Two Sicilies; and Garibaldi had resolved that these dissevered members should not long remain outside the pale of Italian unity. So the expedition to Sicily was planned; for as Venice and Rome were guarded by Austrian and French troops, any movement in that direction would mean war against these Powers, and would be not only discountenanced but actively opposed by the Italian Government, while an attack on the Kingdom of the Two Sicilies would be resisted by the forces of that kingdom alone, and the attempt, if successful, would add far more in extent of territory and population to the new State than would the acquisition of the Veneto and of the province of Rome. Still, even thus, the task before him was formidable enough; to most men it would have seemed an impossible one to undertake the conquest of a realm of nine millions of inhabitants-defended by a numerous, well-trained army and a considerable fleet—with a few hundred volunteers. It seemed an enterprise beyond the powers even of Garibaldi. But he, fortunately for Italy, thought otherwise, and brought over others to his way of thinking.

(To be continued.)

норру.

By Captain CECIL NORTH, Author of The Moorish Treasure, The Hermit of the Irati, &c. CHAPTER IX.

HE sick man tossed restlessly on his camp-bed; he was living once again through the heart-breaking run for the gate. Oh, what a weight that fellow Vare was getting! It was like carrying a baby-elephant! Horror!

it was an elephant, and its trunk had twined itself round his neck! He couldn't throw it off, and all the time the enemy were coming closer and closer behind him! Oh, why doesn't Rex shoot it? Why does he stand grinning on the wall with a great packet of blue papers in his hand instead of a Martini-Henry rifle? Why does he keep crying out, 'To be cashiered, to be cashiered'? But it is not Rex after all, it's an officer, and he refuses to let him blow out his brains because he cannot find Mirabelle.

Ah, Mirabelle, his darling, she is lost, lost! How hot the court-martial room is getting; and how queer the president is looking, as dark as a nigger! Why, it is a nigger-his own man, too, Tilloki Ram! How thirsty he is! Surely the court will let him have a drink? Why is there a punkah waving over him, and why is he in bed? 'Tilloki, get me a drink,' he says feebly; and Tilloki, answering with a start, says, 'No can do, sahib,' and bolts out of the court-room. No, it's not the court-room, it's his own, surely? How his head aches! Ah, here comes Tilloki, and Jones the

'Drink this, old boy,' says the latter. 'Don't talk; you've been seedy. It's all right now. Keep quiet, and try to have a snooze.'

Jones has a cool hand, and the liquid he gives is refreshing, and Hoppy, closing his burning eyes and vaguely wondering what has come to him, drops off to sleep, and this time no awful shapes and horrors haunt him.

'Yes, it's been a short but sharp bout, Hoppy,' says, two days later, his friend the officer who had come into his room at so opportune a moment on the morning of the reading of the court-martial. 'It's been pretty bad with you, old chap, while it lasted; but now you'll mend like steam. Don't excite yourself, but listen calmly to me. This is a wire that came for you a couple of days after you went down. I took the liberty of opening it in case it was anything of importance.'

Hoppy took the paper in his thin hand and read, 'Get leave. Must see you at once.—MIRABELLE.'

'But this must have come ages ago, and must be answered at once,' he exclaimed quickly, 'unless you've done it, and told her I was seedy, Billy.'

'Well, I didn't know quite what to do,' answered the other; 'but on consideration, and knowing all about it, you see, I thought the best thing would be

to wire back, "Applying leave at once," as I knew you would do it directly you came to your senses, and it was no use upsetting your girl by telling her you were sick.'

'Clever Billy!' gasped the invalid. 'You did just right; and now, as soon as I can manage it, I'll send in my papers and get leave for Europe, either

"sick" or "pending resignation."

And so it came about. In spite of the rather faint protests of his brother-officers, Hoppy was resolved to quit the army; and his application for leave having been granted, he in due course found himself installed for a day or two in Bombay, awaiting the sailing of the great white 'trooper' in which he had been granted an 'indulgence passage'

As he lay one evening in a long chair in the home. veranda of Watson's Hotel, lazily smoking a cheroot, he heard behind him a familiar voice whose fair owner he had imagined was at that moment enjoying the gaieties of far-away Simla. Quickly scrambling to his feet, he saw, to his astonishment, the fetching little woman'—the knowledge of whose existence had so dreadfully disturbed his Mirabelle -coming towards him, followed, as usual, by a couple of faithful admirers.

'You didn't expect to see me here, Hoppy, eh?' she cried in the loud, shrill voice affected by fashionable women. 'But I really couldn't stand the Hills any longer; and Tom, thinking that a few months at home would do me good '-Tom was her husband, who never bothered his head about anything concerning his wife so long as she left him in peace to his whist and whisky-'got me a passage in the Himalaya, and here I am, you see. I'm with Sir Charles and Lady Bray, you know, she babbled on; 'they're off home too. And let's see, I think you know Captain Fox, and Mr Guy of the Piebald Parkers?' indicating her two scowling cavaliers, who produced a couple of automatic jerks by way of acknowledging the introduction: 'Mr Hoppy Apner, Sooties.—They're coming home too, so we shall have a jolly high old time-eh, what?

'Bother the woman!' thought Hoppy. 'Although it's rather nice to know somebody on board, I'd sooner she hadn't chosen this particular old hulk to come home in. She'll grate awfully on Mirabelle if they should happen to meet.'

But he showed no trace of his annoyance in his greeting, and the 'fetching little woman' went to bed that night perfectly happy in the conviction that she would certainly be the only lady on board the ship who would be able to exhibit three such preux 'tame cats' ready to do her slightest bidding.

Aden, with its diving-boys and sharky harbour;

HOPPY.

the Red Sea, bristling with the ribs of wrecks; the Canal, gay Malta, and gun-sown Gib.—all the old familiar sights and smells were left behind at last; and as the stately transport drew up alongside the jetty at Portsmouth, the first people upon whom Hoppy set his eyes were the Honourable Mirabelle Melgrove, her father, and Sir Ralph. They were soon on board, and affectionate indeed was their greeting of the wanderer from over the seas.

As he had been credited with sick-leave, he had escaped any military duties during the voyage; and thus, being in plain clothes and almost a civilian passenger, so to say, he was quietly allowed to go ashore when he liked, with all his bag and baggage. Catching a fast train from the harbour station, the party were presently speeding through the pleasant Hampshire country, whose hanging woods and green beauty were gladsome to sun-baked eyes. Three hours later they had reached London, tired, hungry, and happy.

But was Mirabelle happy? She hoped so, wished to be so, and yet in her heart she felt that there was something awry. Her lover, she knew, was a universal favourite, and she was proud of it, and yet she almost wished that it were not so. Who was that woman, for instance, who had flung such a loud farewell to him as they left the ship? She knew that in the confinement of long voyages people became friendly in a few days to an extent almost impossible in the same time on land; but surely it was a little too strong to call out, in a voice a kitchen-maid would have been ashamed of, 'Au revoir, you long-legged flea; mind you look me up in town next week.' Of course she was some vulgar 'grass widow,' though she was refined and pretty to look at, and really it was too bad of Hoppy to have laughed. And then there was that 'fetching little woman' left behind in India! She wished now that she had never gone down to meet him. She hated that sort of thing and that sort of people. No, decidedly, poor Mirabelle was not very happy.

By tacit consent all unpleasant topics of conversation were ignored for the moment, and it was not until after dinner—they had all dined together at the Idsworths—that Sir Ralph discovered that his son had thought fit to resign his commission without first of all asking his advice. The news came as a terrible shock to the old soldier, and he sat for an instant so stricken and silent that his host at first feared that he had received a stroke of paralysis. But presently the blood flew to his head; he worked himself into a tremendous rage, and raved and

stormed at Hoppy with such violence that the two men trembled for his sanity. However, such a terrific explosion of temper could not endure long, and soon—the centre of the cyclone having passed —the delinquent was able to place before him his reasons for the step he had taken, and tried to induce him to look at the question from another point of view. But it was perfectly useless.

'Disgrace be d—d, sir! Opinions of your friends be blowed, sir! Feeling in the service be hanged, sir! What do you young jackanapes know about it, I should like to know?' he cried. 'I'll go to the Duke to-morrow, my lad, and beg him to refuse to accept your papers, sir. Yes, by gad! I will; and as I've never yet asked him for anything except your nomination to the Sooties, he'll do what I want, sir, as sure as eggs are eggs.'

'I must say that I think you have put yourself in the wrong by this ill-considered step, Hoppy,' put in Lord Idsworth; 'and, besides, looking like running away, it is an unpleasant slap in the face for me. I don't mind telling you,' he went on, 'that I took up your case with a considerable amount of vigour, and separated myself from my party, in a great measure though not entirely, on account of their allowing you to be tried at all. I have good reason to think that the alteration in the sentence was made entirely with a view to conciliating me; and now this unexpected resignation of yours will undoubtedly give the laugh to what have now become my political opponents.'

Hoppy finished his claret.

'Very well, sir,' he slowly said; 'if you and my father are so much against it I have nothing more to say. I don't, Heaven knows, wish you to stultify yourself for my sake; and if my father can arrange with the Duke, there is an end of the matter as far as I am concerned.'

'That's the right spirit, my boy,' cried his lordship, apparently much relieved. 'And now, General, if you won't take any more wine, suppose we join Mirabelle in the drawing-room?'

It was not until the afternoon of the next day that the lovers found themselves alone together in the pretty little boudoir in Grosvenor Square that was Mirabelle's special sanctum. Hoppy had lunched at the house, and Lord Idsworth having afterwards gone out, the pair settled down to a long confidential chat, which the lady on her part had resolved should develop into a severe cross-examination, on the result of which, she told herself, her happiness depended.

THREE DEVONIAN TOWNS.

I. --- TOTNES.

HRONED amongst the fair Devonian hills, the lovely river Dart washing its feet, the notable old town of Totnes, with its early history lost in the mists of ages, is a quaint and delightful place not as yet overrun

by the almost ubiquitous tripper.

Compared with our swarning northern burghs, Totnes looks very small for its age, but every quarter of it teems with interest. Its antiquity is undoubted, for, setting aside the legend which ascribes its foundation to a Trojan hero, by name Brutus, who drifted hither after the ruin of his city, it is an ascertained fact that, before the earliest authentic records of the district, tin from the long-disused mines on Dartmoor was here shipped for exportation; and it is highly probable that Phænician galleys rode at anchor in the Dart close to the present landing-place, or possibly where it is now spanned by the fine bridge built in the twenties of last century.

In those distant days it is probable that the town was little more than a cluster of wattled huts huddled together on the mound to the north of the town which is now crowned by the majestic ruins of a Norman keep. History relates that before this castle was built the inhabitants of the thriving Anglo-Saxon burgh 'made here a defence for themselves and for their town, when, before the Conquest, the Danes and other foreign enemies used invasions and exercised great cruelties in this west country.' This ancient British stronghold was certainly utilised by Vespasian when he rested in Totnes, even at that remote period a trading centre, on his way to the siege of Exeter. That the great soldier-emperor fully realised the importance of the place is fully proved by walls with which he surrounded it; fragments of the ancient building thereof are still in existence. The more modern walls are still standing. Originally there were four gates, but two of them only remain. north gate, close to the old Norman keep, is very perfect, a beautiful Roman arch, which forms a striking feature in a lovely landscape. The luxuriant ivy of this soft climate has flung a web of glistening green over the ancient masonry, and a group of bright-haired young Devonians play in the sunshine at its base.

The conquerors of the world left yet another mark behind them in the old Fossway, the great road running through Devonshire and Somersetshire to Cirencester, which commences here on a hill at the head of the town. Traces of this noble highway are still discernible; half a century ago they were plainly to be seen. Roman coins, bearing the image and superscription of the soldier-emperor, have been found in various parts of the town.

There can be no doubt as to the builders of the ruined castle that stands to the left of the Roman Arch. It is Norman in every line, and was probably the work of that Norman baron to whom William I. granted the town. It must have been a very strong place in olden times; it commands a whole view of the district, the lovely valley of the Dart-a typical Devon prospect, rich in the local colouring which is unlike anything known farther north. The red earth of Devon is here seen to perfection in its varying shades. It has gradations of colour that delight the eye, from the deepest russet-red to a soft terra-cotta, all combining with the rich and vivid greens of the country to make a perfect chord of harmonious colouring. The hills that stand about Totnes are in themselves a striking feature in the scene; they fold and enfold one over the other with flowing slopes of a grace and beauty which is distinctly feminine in softness. Milton's 'hedgerow elms' are here in perfection; nor are Wordsworth's 'little lines of wandering woods' absent-those sylvan features peculiar to the British Isles. Over all hangs a sky of Italian blue, a glorious canopy, under which larks are soaring and singing, while blackbird and thrush and 'all the family of finches' answer back from the woodlands. A little later and the orchards will be a sheet of rose and white blossoms 'for other eves than mine.'

But back to hard historic fact and the dear old town rather than its fair surroundings. At the time of the Conquest, when William the Conqueror was flinging away English lands and boroughs amongst his followers, this very flourishing town of 'Totenaise,' as it is called in Domesday-book, was bestowed upon a certain Judhel, together with a hundred or more rich Devonian manors. The record may be freely translated thus: 'This fortunate Baron Judhel held of the King the borough of Totenaise, which King Edward the Confessor held in his demesne. There are within the borough one hundred burgesses (less five), and without the borough fifteen working the land.' A flourishing old town this nearly a thousand years ago, possessing a goodly trade, and paying a goodly sum 'in geld' to the Crown. Also, it was rated for service 'either by sea or land' at one-third the amount in ships and men exacted from the city of Exeter, then, as now, the capital of this beautiful county of Devon.

There is one little fact which tells of the importance of the town in Anglo-Saxon days: it made its own money, and coins from the Totnes mint, beautiful coins, and in very good condition, are amongst the treasures of the Royal Museum of Antiquities in Stockholm, of all places in the world. Totnes is very easy of access. It has a station on the main line of the Great Western Railway between London and Plymouth, and a steamer plies daily on

the river between the town and its twin-sister Dartmouth. There are also big motor omnibuses which run between the town and Paignton-a lovely drive. These lumbering vehicles link it with the young and smart town of Torquay and bring it very near our modern life.

But the town belongs to the England which Shakespeare knew. Up the steep street which ascends the hill from the bridge the eye cannot detect a single house like unto its fellow, and yet the diversity in form and colour makes a charming whole. The East Gate, altered to suit the exigencies of modern times, spans the street, and makes a very charming feature in the vista. The street mounts a very steep hill, so that the striking diversity of the houses rising one above the other makes a unique whole. Here is an ancient house, dating from the late sixteenth century, with peaked roof and overhanging gables; there another, quite two centuries younger, with rounded front abutting upon the pavement; and here, drawn discretely back from the street, with a certain air of aristocratic privacy about it, an early Georgian abode, stone-faced, and with pillared entrance, primly protected by a little bit of garden from the encroachment of the vulgar. The lavish productiveness of the soil and the softness of the climate fill these little patches with rich green of many shades and a glory of golden daffodils. Formerly the East Gate consisted of one archway enclosed by gates which were large enough to admit vehicular traffic, and beside them a 'needle's eye' for foot-passengers, only sufficiently wide to admit the travellers in single file. In the room over the gateway there is a fine, coloured, carved frieze, and over the chimneypiece heads of Henry VIII. and the unfortunate Anne Boleyn. The windows looking up and down the street are of the Tudor period, when doubtless the arch was

In the pavement, on the right-hand side as you approach the archway, is an ancient relic highly venerated by the inhabitants. This is the 'Brutus Stone; and while the childish legend associated with it is certainly not to be credited, the fact remains that this great pebble, now level with the footway, has its associations and its place in the story of the borough. Here, for hundreds of years, all royal proclamations have been read by the civic dignitaries. Here, not so long ago, the name of Edward, by the Grace of God, King and Emperor, was shouted abroad; and right loyally did his faithful subjects in the old Devonian town keep holiday on the day when he was crowned our King, some nineteen months afterwards.

In several of the houses in this street there are ceilings which would do honour to any great abode stucco-work of the Stuart, or even an earlier, Period; elaborate patterns, including in their scheme of decoration the heavy beams with which the old timbered houses are constructed—absolute treasures of an art no longer cultivated to such perfection.

A little above the East Gate the superb tower of

the old church breaks upon the traveller's sight like a sudden burst of sacred music. It is a very ancient church. It must have crowned the hill proudly in the days when Totnes had its mint and its earliest charters, although the first actual mention of it occurs in Domesday-book, and also in a charter of that 'Baron Judhel de Tottenaise' to whom William gave the town. By this deed the church referred to in William's gift (vide Domesday-book) as Sancta Maria de Toteneo is granted to the great Benedictine Abbey of St Sergius and St Bacchus at Angers - a fate which befell too many English churches after the Norman Conquest.

The church was rebuilt and consecrated by Bishop Bronscombe in 1259, when the bells were recast, renamed, and rehung with great ceremony. But the body of the beautiful church which we now behold was erected in 1432 by Bishop Lacy, whose original indulgence of '40 Daies' to all who contributed to the work is still in existence. The tower, erected by this worthy bishop, and of which he appears to have been exceedingly proud, is, like the rest of the church, built of the red sandstone of the district, faced with Caen stone. It is crowned by four crocketed pinnacles of the white stone, and string-courses of the same mark out the various divisions and subdivisions of the erection. There are three little niches of the white stone about halfway up the tower, the centre one supposed to represent Bishop Lacy, whose anagram is introduced into many of the decorations. Under the little Episcopal figure was an inscription, now preserved inside the church: 'I made thys tore.' The old letters are very beautiful and clear cut; and we can forgive the old man whose heart appears to have been in the work of restoration and of making beautiful the House of Prayer for any little vanity or pride in the task he had undertaken, seeing that the object of it was such a worthy one. A machicolated battlement, also of Caen stone, like a turreted corona, finishes the top of the tower, and is continued round the whole church. The effect of the white and red stone is remarkably good, and strikes the eye at the first glance. An ancient sun-dial, which absolutely fell to pieces with age, was in 1904 replaced by a new one. There are three halfdefaced escutcheons over the south door: one of them is that of the town, the tower, and keys, which is often repeated elsewhere.

The church was thoroughly restored under the care of Sir Gilbert Scott in the seventies of last century, at a cost of fifteen thousand pounds-a large sum, most of which was contributed by the townspeople, who are as proud of their restoration as Bishop Lacy was of his. The chief feature of the interior of the beautiful church is the chancel screen, which is the original work of the artists who wrought for Bishop Lacy in the fifteenth century. But as it was falling to pieces at the time of the restoration by Sir Gilbert Scott, a lady-resident placed one thousand five hundred pounds in the vicar's hands for the purpose of its complete renovation, as a memorial

of her father, a well-known citizen of the good old town. It is a very beautiful piece of stone-work. Those old workers knew how to give to the heaviest of all material the lightness of lace-work or of the tracery of leafless branches against a vivid sky of early spring. Lines of deep colouring and of gilding are still remaining on the delicate work—colour and gold that have outlasted the changes of old time for close on five hundred years.

On the north side of the church stands the remains of the old Priory of St Mary's, now altered into the Guildhall of the ancient town. It was granted to the Corporation for this purpose by Edward VI. in 1553, which date appears proudly over the Mayor's canopied chair. One or two quaint, old-world relics remain in the ancient hall, which has its prison-cell close by—a gloomy cellar of old monkish days, with an iron-barred window that looks grimly out upon the seat of justice. Here is a portrait of a certain Captain William Short, a worthy benefactor to the charities of the borough, a notable-looking Georgian gentleman in a fine red coat. Near by hangs a portrait of that Mayor of Totnes who went down to Brixham on a certain chill day in November 1688 to welcome the Deliverer, William of Orange. A fine, resolute face has this Christopher Farwell, and a noble aspect he possesses; he looks like a man who knew his own mind and held to his own opinions, one who lived in strenuous days and bore himself well in time of need. There are good old engravings of other Totnes worthies, and in the council chamber there are very interesting relics of a brave time. Here are two rousing proclamations under the hand of 'Oliver, P.' One is against that semi-legalised piracy called privateering—that sailing under letters of marque which was such a fruitful cause of irritation on the high seas. Oliver will no more of it. The depredations of these half-legalised pirates had grown over-bold, and must be subdued with a high hand. The other is against 'Popish priests and Jesuits'—a most bitter document. Both papers are old and frayed. Careful hands have pasted them together, but some lines are missing; still, in their decayed condition, the vigorous words stand out strong and clear. This Oliver will tolerate no misunderstanding of his meaning. His words are earnest, soul-searching ones that admit of no double construction, and he will have them obeyed. Even now their strong vitality seizes the imagination.

But in the smaller committee-room adjoining there are matters of a lighter sort, also proclamations, but those of feasting and merriment. They both relate to the annual Town Holiday and how it was to be honoured: first, on the great Peace, July 1814, when Europe was breathing freely because the Corsican troubler of her princes was, as every one thought, safely caged in Elba, little dreaming that Waterloo was yet to come. Right joyfully did the faithful lieges of Totnes keep the day. There was a great procession (a naval and military triumph), leading off with

flourishes of trumpets and roll of drums. One special feature of the gay scene was a 'Triumphant car, drawn by four horses, with Britannia, Minerva, and Neptune in a boat, surrounded by British tars' -a noble sight upon that brilliant summer day ninety-two long years ago! It was a popular festivity, in which all the neighbouring gentry took part. The list of notables attending is a long one, and reads like a page out of the peerage of the day. These carriages of the great ones of the earth, with their retinues, must have made a brave show; and then the events of the day terminated very early, if judged by our modern ideas, in a 'banquet of John Bull fare at two o'clock,' said banquet being 'spread for two thousand five hundred persons.' Be sure, according to the menu of the day, that banquet must have been of Gargantuan proportions.

The second bill relates the 'Order of Procession' for the Totnes Holiday of 1832, and is really very amusing, giving us, as it does, an insight into the everyday life of our ancestors. This pageant was certainly an elaborate one. It was headed by music, the church organist, on horseback, leading, while all the trades that flourished in the town had their representative cars. Indeed, some of them had more than one. Agriculture had a shepherd and shepherdess with sheep in one vehicle, and after this followed the triumph of the woollen traders, a very important industry in the town, when 'serges of Totnes and hose' of the same held a very high place in foreign markets. Jason, with the Golden Fleece, had a car all to himself, and the other industries of the town were each ideally portrayed after a fashion that must have obtained in Shakespearian times. The tailor's craft was well represented, as being allied to the local wool-manufacture. First came a car with 'Adam and Eve in a state of innocency'-surely a period of their existence when one would have thought the sartorial arts unnecessary. This pageant was followed on foot by the same personages in 'coats of skins,' and so on, until the climax of the craft was reached by 'Two Dandies' of the day—the day of the dandies, the thirties of last century-when men dressed in all colours of the rainbow, and garments were cut in the most eccentric style. Of course the inevitable great feast followed, but the notables of the neighbourhood did not crowd to this show. It was Reform year, and party feeling ran high; therefore the peerage held aloof.

Close by this old broadsheet hangs the record of what was done here on the day of Edward VII's coronation, and over against this loyal document the wall is decorated by a quaint collection of constables staves, rare old things, emblazoned with the Royal Arms and those of the loyal borougheries of times that are no more, and of the old orders that have changed and given place to new.

Descending the stairs and passing out through the hall of justice, we may pause for a moment beside the ancient stocks, the rude and, in many cases, horrible mode of punishment with which our forefathers were familiar. By the side of the worm-eaten relic of old-time cruelty there stands yet another, being no less a thing than the old bull-ring, a relic of that brutal and cruel sport, quite as horrible as the Spanish bull-fights of to-day. Well, we have improved since 'killing of dogs was sport for ladies,' and a horrified gentleman of the Court saw a mangled and bleeding dog tossed into the lap of a fine lady.

But we are out again into the delicious sunshine of this soft southern climate, and here is the old Market Place with its Butter Walk and the quaint piazzas that distantly resemble the famous Rows of Chester. It was here that in old days the 'serge,' cloth of Baize,' and 'hose' of Totnes—or, better still, 'of Fine Totnes'—were sold to eager buyers from overseas. A very bright and busy place this Devonian town unto this day, although the woollen trade and the 'hose of Fine Totnes' fill its shady piazzas no more, and no longer do the purchasers from beyond the Channel do 'fair trading' with the good folks of the town, a little weakness to which

all these coast towns were addicted in the good old times.

Just a word as to the real notables whom Totnes claims for her sons. The list is a long one, but a few names will suffice. Two great masters of ancient lore, Benjamin Kennicott, the great Hebrew scholar, was born here; as was also Edward Lye, who compiled a Saxon grammar and also a dictionary of that language. Charles Babbage, who invented the calculating-machine, makes a third; and in modern days a young Totnes man fell a victim to his zeal for Empire. A granite obelisk close to the bridge at the foot of Fore Street, just where the first glimpse of the picturesque town breaks upon the eye, perpetuates the memory of William Wills, who perished with Burke, the first pioneers who dared to penetrate the Australian interior and lost their lives in the attempt.

Good-bye, notable old town, the proud possessor of the oldest municipal charter in the land, whose Mayor, in virtue of that fact, took precedence of all other English Mayors at a recent function in London

A REMINISCENCE OF THE JAMAICA EARTHQUAKE.

By H. F. ABELL.

ROBABLY no mail-steamer ever discharged at Kingston wharf a happier and more hopeful crowd of passengers than did the *Port Kingston* on January 11, 1907. We had a

pleasant, if not a very quiet, passage from Avonanouth, marred only by the loss overboard of a poor boatswain's mate in the performance of his duty. The greater number of our party were the guests of Sir Alfred Jones, who, with a delegation of noblemen, members of Parliament, and representative men of business from Lancashire, was making the visit with the view of extending the cotton-growing industry in Jamaica. Most of our passengers had never been in the West Indies before, so that, with only ten days at disposal, there was a general resolution to make the best use of the time.

Of this privileged band, we—that is, my wife, her sister, and myself—were only members by virtue of board-ship camaraderie, being mere fugitives from the rigorous climate of East Kent, and this being our fourth visit to the islands. So, when Kingston greeted us with band-playing, speechmaking, and flag-flying, we felt full of holiday spirit, and determined to have the very best of times in this lovely land of sunshine.

To the pleasant Constant Spring Hotel we went as soon as the custom-house formalities had been compiled with. This hotel, which occupies the site of an old sugar estate 'great house,' stands about five miles from Kingston, in a charming plain at the foot of the mountains, here of no great

height but of most picturesque outline. It consists of a large central stone-built block, from which stretch east and west two-storied timber buildings, to stone towers, from each of which more timber buildings extend. I am particular in detail with a purpose. A broad verands surrounds the whole, and at one end is a goodly swimming-bath in a separate building. The hotel is surrounded by its own domain, variously arranged as garden, golf-links, and tennis-grounds.

Monday, January 14, a perfect Jamaica day of bright sunshine and cool breeze, we purposed to spend in Kingston. I knew Kingston well; and its quiet by-streets, with their lingering shadows of the prosperous days of old in the shape of fine old Georgian houses, always had a fascination for me. So, whilst my ladies should do their shopping, I purposed to wander about revisiting old haunts. An attack of fever, however, upset the plan so far as my wife and her sister were concerned, and I went into town alone, little thinking that it would be my last visit to the Kingston of Tom Cringle's day, and intending to lunch either at the club or at the Myrtle Bank Hotel.

Accordingly, I passed a long morning in the city. I went to delightful old jasper and marble halls, once the town residences of merchant-princes, now the dilapidated abodes of dusky people; I spent some time watching for sharks at the pier of the Myrtle Bank Hotel; I went to the Museum; I was a long hour in the old parish church, reading anew fine old Benbow's epitaph, which records how

this 'pattern of true English courage' died from the effects of a wound which he had received in his 'legg' in action with Monsieur Du Casse, and discovering that a fine old brass candelabra which had been presented to the parish in Queen Anne's reign by a 'merchant' of Kingston had been sold for old metal; and I wound up at the club. In less than three hours each one of these buildings was to be a shattered ruin!

Then, instead of remaining in town to lunch, I returned to Constant Spring to see how my ladies were getting on-a providential change of plan. At 3.25 P.M. such of the hotel guests as were not in town or away on country expeditions were variously whiling away a day which had gradually become almost airless, but which was still radiant with sunshine. Two energetic men-Britons, of course-were playing tennis. Towards them I strolled across the lawn, when suddenly I was staggering about and fancied I had been sun-struck. But when I saw the stretch of lawn in front of me violently agitated into waves exactly as a carpet is moved by wind under it, and at the same time a muffled roar like distant artillery filled the air, and when, a second later, I saw a huge rent spring, as it were, from the bottom to the top of one of the stone towers of the hotel, and then followed a deafening crash and the rising of a cloud of dust, it needed no experience of Japan in past days to tell me the terrible truth.

At once I ran at top speed into the hotel and up two flights of stairs to our rooms where my ladies were. I believe there was shaking and crashing all around me, but I neither felt nor heard; and, to my intense joy, I found my wife and her sister unhurt, but, although perfectly calm and collected, naturally in the greatest alarm. I need not say that a very few minutes sufficed to lead them, half-dressed as they were, into the compara-

tive security of the gardens.

The shock, which lasted about fifteen seconds, had played strange freaks in our rooms, although it had not been spiteful and devastating as in rooms adjoining. Every article of furniture had been shifted from its place; clothes had been lifted bodily from walls to floor; securely fastened trunks and bags had been wrenched open and their contents scattered. The passage outside was strewed with fallen plaster and shattered glass, and in one case a door had been torn off its hinges, whilst a staircase corresponding to that by which we had escaped was blocked with the fallen roof. Only the fact that the wing of the building which we occupied was of wood saved us; and if the shock had taken place in the night, when the hotel was full of guests, the loss of life must have been awful. The main block, forming the large entrance-hall, with three stories of rooms above, was badly shaken and cracked, whilst the stone tower up which I had seen the rent run was a tottering wreck.

In the garden every person, white and black, stood silent and wondering what next would

happen. And here let me place on record the splendid conduct of the hotel staff generally, and the black servants in particular. I saw much terror and some panic among the whites; but the poor black people kept their heads to a degree not usually associated with their racial character.

Of what had taken place in the outside world we knew nothing; but the rising of a dense black cloud over Kingston proclaimed catastrophe there. Little by little, as the non-recurrence of bad shocks established calm, the ladies, who had been tumbled out of their rooms in every variety of deshabille, began to care for appearance; the black servants were sent into the hotel for trunks and bags, and in no case did these good fellows refuse, although another severe shock would have brought the whole

building down upon them.

About an hour after the great shock I drove into Kingston with the Bishop of Barbadoes, on the double errand of ascertaining the fate of his daughter, newly married to an officer in the West India Regiment, and of helping in the city. Directly we emerged from the hotel grounds we saw signs of trouble. A dam had burst somewhere in the hills, and a swift torrent ran down the roadway. Great cracks were visible in the road itself, and as we passed from the country proper into the zone of human habitations, signs of ruin and destruction multiplied. Every structure of brick or stone had suffered more or less, with the result that while the houses of the well-to-do were wrecked or badly damaged, the mud-and-timber cabins of the poor were comparatively untouched. The destruction wrought during the few seconds of the earthquake's duration was incredible. Whole sides of houses were lifted away and shattered; a ground story would be wrecked and the upper left intact, and vice versa; one brick gate-post and iron gate would be overthrown and the companions remain whole; lines of palisading were as clean shaven off the supporting walls as by a machine. We passed the electric-car which runs between Kingston and Constant Spring standing just as its course had been abruptly stopped by the destruction of the dynamo-house in Kingston. Then we began to meet fugitives. We stopped a buggy containing fellow-passengers by the Port Kingstondishevelled, dust-begrimed, and one with head in bandages, all with the grave looks of those who had seen terrible things-and learned that Kingston was practically level with the ground. Then came a cart full of maimed and bleeding people, followed by another with still, draped forms lying in it; then families of blacks carrying their household gods, and groups of praying, screaming women.

We entered the stricken city. We had to thread our way between masses of fallen roofs and walls, shattered palisades, entanglements of telegraph and telephone wires, crushed buggies, and notably groups of distracted people who rent the air with cries of lamentation, hymns, and entreaties for help. As yet no idea could be formed of the number of

victims; but so many people implored us to help in removing heaps of ruin beneath which lay relations and friends that we knew it must be very great.

Down the comparatively broad thoroughfare of King Street, above the masses of ruin, we could see the flames and dense smoke of the fire which was consuming all that quarter of the city which lay parallel with the shore, as well as the coal-stacks of the shipping companies. We reached the great public garden which marks the centre of the city. Our wheels brought up sharply against something, and I saw that it was a marble hand holding a marble tall hat belonging to a shattered statue of a former governor. We could not get round to the side on which stood the parish church, but over the trees I could see the spire apparently on the point of toppling over.

The club was a shapeless ruin, and a large church near it was completely destroyed; yet one of the worst-built edifices in Kingston, the hall in which the delegates of the Cotton Conference were assembled at the moment of the earthquake, seemed unharmed. At last we could make no further progress, and turned to get out as best we could.

Passing by the racecourse, on which hundreds of refugee families were already assembled with their furniture, we saw a great mass of smoke rising above Up Park Camp, the station of the garrison, and learned that the hospital was on fire. It was known later that more than forty soldier-patients were burned here. So we returned to Constant Spring. Here we found that most of our party had returned from the city and the country. Those who had been out at Spanish Town had been obliged to return by road, for the railway was wrecked, and the greater part of the Kingston terminus had fallen.

As evening gathered over us, and the beauty of the starlit sky was only blurred by the ruddy glare and the dense smoke-cloud of the fire in Kingston, whilst the hotel people did their best to prepare for us some sort of meal in the open, a general recounting of adventures took place. Some escapes were remarkable. One young Scots lady was in a shop in Kingston when the earthquake occurred. The whole front of the shop fell into the road, burying two people. She had just time to spring out of the window and catch at a tree, to which she hung suspended until released. Two elderly ladies were on the first floor of a house; it sank with them, and they walked out into the street unharmed. Two men had been lunching at the Myrtle Bank Hotel, and had just stepped from the veranda into the water-side garden behind, when the whole building fell, burying ten men. Two men were playing billiards at the club; one ran, and was instantly killed by the fall of an iron pillar; his companion, too paralysed with fear even to run, remained, and was unhurt. The companion of Sir James Fergusson, when the latter was killed in Harbour Street, escaped. And so the narratives

continued until we sought rest on chairs and couches and garden benches; but sleep came not to many of us, and many times during the silence of the night more or less severe shocks of earthquake would rouse the recumbent company into movement.

All next day we remained in the hotel grounds; but as courage became restored by the non-renewal of shocks, we entered the hotel, packed our baggage, and had it carried out into the open. All the same, so suspiciously alert had our senses become, that the smallest fall of plaster or the sound of an unusually heavy trunk being dragged along a floor sufficed to send all but the calmest helter-skelter over the veranda railings into the garden. So frequent, indeed, were these little panics that openings were cut in the railings to facilitate egress.

The second night in the open was more peaceful than the first, for a great proportion of our party had chosen to go down to the *Port Kingston*, despite the fact of its having been turned into a hospitalship, rather than risk more earthquake ashore. Moreover, we had mattresses and pillows, and could choose our locations.

On Wednesday we came across the island by rail to this beautiful Port Antonio, on the north coast, whence this description is written. Thanks to the intervention of the Blue Mountain range, Port Antonio suffered less than other parts of the island, and of course much less than the neighbourhood of Kingston. All the same, had there been no earthquake elsewhere, the half-ruined Town Hall here would have figured in the illustrated newspapers of the world; and, although the magnificent Titchfield Hotel, being constructed of timber, was not seriously affected, there are cracks in the wall of the room in which I write which would be photographed at home as fearsome.

Apart from its significance as a calamity, the occurrence of this earthquake is lamentable for another reason. Jamaica, after long waiting for a turn in the tide of her lack of prosperity, has at last become recognised as one of the happiest of health and holiday hunting-grounds, if not by us who own her, by Americans, and the winter season of 1907 had been looked forward to as one of real brilliancy. Good hotels-thanks largely to American example and enterprise-abound, and the authorities have been active in remedying many of the detriments and drawbacks which for so long have closed the gates of what is, on the whole, the most beautiful island in the world to pleasure tourists. A few seconds of earthquake have undone all this, and not only have driven away hundreds of visitors who came to stay, and deterred many other hundreds who intended to come, but have dealt the island a blow from the actual and moral' shock of which it must take time to recover. How long this time will be must depend largely upon the sense of people at home and in the United States in refusing to receive as gospel much that is said and written by ignorant or malevolent alarmists.

ENGINEERING NOTES.

By W. O. HORSNAILL, A.M.I.E.E., &c.

WATER-POWER AT NIAGARA.

HE utilisation of Niagara is so little heard of in these days that few people realise the enormous developments which have been carried out since water-power was first used at the Falls. At the present time four

large power-companies generate electricity and sell the current for industrial purposes; and when all the projected extensions to the machinery of these undertakings are made the horse-power developed will reach the huge figure of six hundred and fifty thousand.

A few years ago, when the idea of harnessing the Falls aroused universal interest, the scheme was subjected to much opposition on the ground of injury to the beauties of the surrounding scenery and the possibility of taking off so much water to work the machinery that little would be left to pass over the Falls. It was then admitted that industrial concerns would spring up at Niagara; and with a view to conserving the grandeur of the spectacle some attempt was made to confine the factories to certain areas. But the diminution of the flow of water resulting from the first power-scheme was so infinitesimal a proportion of the amount passing over the Falls that opposition on this score was easily silenced.

In the meantime developments have been quietly going on, and it is now estimated that when all the new power-machinery is working, and some proposed canals farther up the river are completed, well over a third of the water will be utilised. It is to be feared that unless the extending use of the water-power is limited by the Canadian and United States authorities there is a very real danger that Niagara Falls will ultimately run dry. If the power could only be distributed over a small area a limit would soon be arrived at; but current is now being sent eighty-five miles to Toronto, so that no check on future developments is likely to arise through lack of demand. Perhaps a compromise may ultimately be reached involving the partial stoppage of the machinery on Sundays and holidays, when the Falls will be allowed to perform with their customary vigour, this magnificent natural display being thus saved from utter extinction.

The latest developments consist of thirteen turbines of ten thousand horse-power each, which will drive an equal number of large dynamos. The power-house containing this machinery is situated at the base of the river-bank below the Falls, the water being brought to the turbines in the following manner: A large reservoir has been constructed at the top of the bank above the power-house, and this

reservoir is fed by a canal one hundred feet in width, which joins the river above the Falls. Pipes nine feet in diameter convey the water from the reservoir to the power-house two hundred feet below, and some idea of the magnitude of the works may be gleaned from the fact that an electric motor of twenty horse-power is required to open and close the regulating-valve in each pipe. Immense gratings cover the mouths of these pipes; and so great is the quantity of weeds and débris caught by this means that a special railway has been laid down to carry it away. Elaborate arrangements have also been made to catch the ice coming along the canal, and to run it down a chute into the river below.

The American character is of such a practical description that regard for the beauties of nature is not generally thought to enter into their calculations when dealing with business matters. It is interesting to note, therefore, that the company above mentioned are going to very considerable expense to make their works harmonise as far as possible with their surroundings; and with this end in view the pipes to the turbines are to be encased in concrete, having arches at the top and being otherwise given an ornamental finish.

THE DISTRIBUTION OF GAS FOR POWER PURPOSES.

Electrical power schemes are kept so constantly before the public by their advocates that the possibility of distributing power over a large area by any other means is apt to be overlooked. Not only is it commercially possible to convey gas over long distances, but this is actually being done on a large scale.

Ordinary 'town' gas is, however, unsuitable for this purpose, as it costs too much to manufacture; but if the gas be required only for power and heating instead of for lighting, a much cheaper quality will do what is wanted. It is customary to use what is known as 'Mond' gas for power and heating purposes, this mixture being produced by passing steam and air through a glowing furnace. After leaving the furnace the gas is cleaned from dust, and the tar and sulphate of ammonia are taken out, and it is then ready to be pumped into the distributing pipes. This type of gas costs very little to make, as the coal used in the furnace is of a cheap quality, and the value of the sulphate of ammonia nearly pays for the fuel. The South Staffordshire Mond Gas Company distributes gas for power and heating purposes over an area of one hundred and twenty-three square miles.

Many advantages accrue to the consumer who can purchase a supply of this gas, as it is very much cheaper than the ordinary 'town' variety for heating or for use in a gas-engine; in fact, for the latter

purpose the cost is less than if a private producer were used, and it can be turned on and off in the same way as town gas without requiring any more attention.

The first generating station laid down by the above company has a capacity of sixteen thousand horse-power, and the main pipes for distributing the gas measure thirty-five inches in diameter where they leave the station. Some thirteen miles of pipes are already in position, passing through the towns of Bilston, Wolverhampton, Wednesbury, and Walsall, besides a number of smaller towns and villages, and it is estimated that three hundred thousand horse-power are used in the district for various purposes, so that plenty of scope exists for the operations of the company.

EXACT MEASUREMENTS.

Most people are familiar with the fact that spare parts for bicycles, motor-cars, gas-engines, and similar machinery can always be obtained when a breakdown occurs, and that these spares may be relied upon to fit accurately into their proper places. This state of affairs has only existed for a few years, and it may be interesting to consider how the interchangeability of parts has been made possible.

Fifty years ago, or perhaps less, such simple parts as nuts for bolts were each made specially, and one nut would only fit the bolt for which it was intended. This state of things was found to be very inconvenient, and it is probable that nuts and screws were among the earliest machine-parts to be made alike, so that any nut would fit any bolt or screw of the same size. The next step towards the standardisation of parts consisted of the gauges invented by Sir Joseph Whitworth and called by his name. These gauges were simply a number of round plugs fitting exactly into an equal number of rings. Thus, when a workman wished to bore a hole a certain exact size he enlarged it until the plug-gauge would just go in; similarly, if a spindle or shaft were being made to fit into this hole one of the ring-gauges was tried until it would pass over.

This system was a distinct advance over the previous methods, by means of which the sizes were obtained from calipers set to a rule, but sufficient accuracy for the manufacture of interchangeable parts was not obtained unless the workmanship was of a very high order. The reasons for this can be easily understood: the workman enlarged the hole until the plug-gauge would go in, and unless he exercised great care it entered too loosely and the hole was too large. Then, again, another man making the part which was supposed to fit the hole in question very likely reduced the size until the ring passed over too easily. In this manner we have a double error: the hole is too large and the spindle or cylindrical part is too small; hence, when they are tried together the difference between them is too great to allow of a good fit.

To ensure that holes shall not be made too large

or spindles too small, a system of 'limit-gauges,' as they are called, has been introduced. The workman making a hole is given two plugs, one of which must be able to enter the hole, whilst the other is too large to do so. Cylindrical parts are made to an exact size in a similar manner. Two rings are tried, one of which must pass over the other part in question, whilst the latter will not enter the smaller ring. By this means the hole and the spindle must be made within certain limits of size; nothing is left to the workman's judgment; therefore a less proficient man can do work which he would otherwise be unable to undertake, and in this manner interchangeable work as regards the size of holes and shafts can be turned out cheaply.

THE GYBOSCOPE AND THE STEADYING OF SHIPS.

Most of us have experienced the very unpleasant effects caused by the rolling of a ship in a heavy sea, and any appliance which will steady a vessel under such conditions will be welcomed by all whose business or pleasure takes them across the ocean. With a view to the prevention of rolling in a seaway, a German naval engineer named Schlich has been experimenting for some time past with a gyroscope fitted into the hull of an old torpedoboat, the results proving that almost perfect steadiness can be obtained by this means. For the benefit of those who are not familiar with the action of gyroscopes, a brief explanation will make their application for this purpose more easily understood. The main feature consists of a flywheel revolving at a high speed, and mounted in a frame carried on gimbals, the latter being arranged at right angles to the spindle; that is to say, if the axle of the flywheel be vertical the gimbals will be horizontal. Now, if it be attempted to rock the gimbals up and down whilst the wheel is spinning, great force is required to do this, and advantage of this peculiarity is taken to prevent the rolling of a ship at sea. A flywheel of considerable weight is placed in the centre of a vessel, the spindle being vertical, and the frame carrying it is pivoted on gimbals at each side of the ship, the result being that rolling is prevented, as it cannot take place without rocking the gimbals, which we have been already shown cannot be done when the flywheel is rotating. Our explanation may be much more easily understood by readers purchasing a toy gyroscope and trying the experiment described above. Unfortunately, no gimbals are provided on the frames of these toys; but the ring passing round the edge of the wheel may be held loosely between the finger and thumb at each side, when it will be found almost impossible to rock the gyroscope as a ship would attempt to do in a heavy sea. Care must be taken to hold the frame loosely so as to imitate a pivot or gimbal at each side, as the frame must be allowed to rock in the other direction; if it is held rigidly the effect indicated will not be produced. The torpedo-boat upon which Mr Schlich has been experimenting is a vessel of about one hundred and sixteen feet long by nearly

twelve feet in breadth, a flywheel weighing over one thousand one hundred pounds and running at one thousand six hundred turns a minute being used to prevent rolling. This wheel is forty inches in diameter, and is kept spinning by a steam jet much after the fashion of a steam turbine. The first trials were made in smooth water, the ship being artificially rolled by pulling on a rope tied to the mast; the results of these experiments having proved satisfactory, the vessel was taken out in a rough sea to give the apparatus a practical test. The effect of the gyroscope was most remarkable, the arc of rolling being reduced from thirty degrees to one degree when the flywheel was put into action, thus producing a practically level deck, excepting as regards the pitching motion. The usefulness of this invention can hardly be overestimated, as, apart from the comfort obtained by such means on passenger-ships, a steady gun-platform will be provided for battleships and cruisers, resulting in greater accuracy in aiming the weapons. system is to be tried in a German coasting-steamer, and there is no doubt that we shall hear more about it in the near future. Steering by gyroscope is dealt with in the preceding issue of Chambers's.

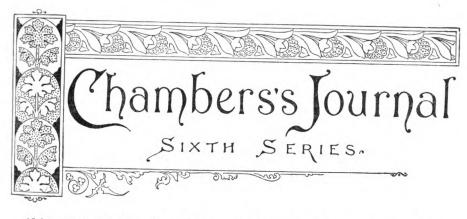

GAS-PRODUCERS FOR BOATS AND SHIPS.

Few people, apart from those especially interested in the engineering industry, realise the changes which are taking place and projected in the means for propelling ships of all kinds. The steam-launch may now be considered obsolete; no one intending to build a small self-propelled boat would contemplate steam for this purpose, petrol or paraffin having entirely superseded the older method of producing motive-power for small pleasure-craft of all descriptions. For somewhat larger vessels, such as canalboats, small coasters, and fishing-smacks, suction gas-engines are making steady headway, the system being advocated by several leading authorities, including Sir John Thornycroft, and recently this form of motive-power has been put forward for the propulsion of the largest ocean-going vessels and battleships. The ordinary gas-engine driven by town gas is a familiar object and needs no explanation; but the independent gas-producer may require a brief description for the benefit of those who have never come in contact with this ingenious contrivance. The gas is manufactured by passing a mixture of steam and air through a glowing fire, and after being cooled and freed from dust it is ready for use in the engine. The latter, when it is once set going, sucks the gas from the cleaning chambers, thus causing the steam and air to enter the fire, which is thus kept burning, fuel being fed into the top of the producer through an air-tight hopper. This system of driving a ship offers several important advantages over steam : for instance, only half the amount of fuel is required, and the coal may be fed into a large bin over the producer by mechanical means; hence, instead of having a number of stokers continually shovelling

coal on to the fires, this work is all done by a machine, and the only handling of the fuel occurs in the bunkers as at present, and even here only half the amount has to be dealt with, thus introducing a further saving of labour. What are called the stand-by losses are also much reduced in the gas system. In steamships it is often necessary to keep the fires alight and steam up in the boilers for many hours when the engines are standing idle, and a great deal of coal is burnt in this way; also, in a large vessel at least twenty-four hours, and often double this time, will be occupied in raising steam in the first instance. With gas-producers the amount burnt with banked fires is exceedingly small, and gas can be produced in a comparatively short time after the fires are lighted. Other advantages include the absence of pressure and consequent risk of explosion, the saving in space, and, for battleships, the absence of funnels, thus leaving the decks clear for gun-mountings. A good deal of work has already been done in the way of applying gasengines to marine propulsion, notably on the Continent, where many river and canal boats are driven by these means. In this country, Messrs Thornycroft have fitted up a barge with gas machinery, which has made a successful tour of the canals extending over a thousand miles, and it may be mentioned that the length of the engine-room was reduced by three feet and the weight of machinery by four tons as compared with a steam-engine and boiler of similar power. Other experiments are being carried out by Messrs William Beardmore & Co. with a five hundred horse-power engine, and by Messrs Crossley Bros., who have fitted one of their gas-engines into a canal-boat. Difficulties have to be met in all new enterprises, and the propulsion of ships by gas-power forms no exception to this rule. Particularly is this the case as regards the starting and reversing of the engines; but there is no doubt that the weight of experience now being brought to bear on this problem will eventually overcome all obstacles, and we may expect to see steam-power entirely superseded for marine purposes in course of time.

SUMMER.

HER child the Spring, wild wayward thing, With steps of joy and cheer, Has run before, to ope the door Of the icy, arctic year. Now Summer sweeps o'er the northern deeps, In her robes of golden light; Her shining eyes fright from the skies The lingering shades of night. The year's bright queen with pearly sheen Bedecks each sparkling rill; The tempest's roar dies on the shore; The wanton waves are still. To the sad heart thy peace impart, Queen of the rolling year; With thy fair hand, fling o'er the land Thy gifts of joy and cheer. J. J. HALDANE BURGESS.

MORE ABOUT ORCHARDING IN NOVA SCOTIA.

By R. F. DIXON, Wolfville, N.S.

HAVE received so many personal inquiries from individuals residing in all parts of England and Scotland who have read my article entitled 'Orcharding in Nova Scotia' (Chambers's Journal, January 1907),

asking further information, that I have decided to supplement it by another article, which will be mainly taken up with replies to the various questions asked in these letters, and some further information which may have been omitted in the previous article. Of course, to deal fully and exhaustively with a subject like this would necessitate the writing of a bulky pamphlet, and there are details which can only be learned by a personal visit to the country or even by actual experience in orcharding. However, after the perusal of these letters I feel that there are some points which, if not entirely ignored in my former article, are susceptible of further elucidation, and this, I think, can be satisfactorily accomplished within the limits of the space usually accorded to a magazine article.

First, as to the question of climate, about which I did not speak very fully. All my correspondents, if I mistake not, refer to this. Generally speaking, the climate of the Annapolis Valley, so far as actual cold goes, is probably, outside of British Columbia, the mildest in the Dominion. At all events, it is the mildest in Nova Scotia, which, according to official meteorological returns for the Dominion, boasts the highest mean average temperature in Canada, British Columbia excepted. Taken all round, the climate of the Annapolis Valley may fairly be called enjoyable. Of course it has its weak points, like every other climate between the two poles. The especial weak point of our climate is the spring. Winter with us dies hard and slowly, and does not stay dead. By the middle of March, winter, for all effective purposes, is gone, the sleighing has disappeared, the rivers have broken up, the frost is daily receding; but there it unfortunately ends. Not until at least a month later are there any signs of vegetation; and all through April—probably, with its No. 497.-Vol. X.

alternations of bitter and balmy weather, the most trying month of the twelve-we are subject to sudden snowstorms and fitful returns of wintry temperatures. Not until the middle of May can the vegetation be said to begin in good earnest. Having said this, I have said the worst that can be alleged against the climate. Our summers are delightful, bright, cool, not unduly showery, and as a rule free from alarming thunderstorms. Very seldom can they be described as unpleasantly warm. Such, at all events, is the result of my own experience of twelve years. Nova Scotian summers, in this respect, contrast strikingly with those of New Brunswick, Quebec, Ontario, and the other inland provinces, in which the heat is very trying, especially to Old Countrymen. Our summer nights are nearly always delightfully cool, and compare very favourably with those of the other provinces, where the oppressively hot nights often make sleep impossible, and of which I speak from nearly twenty-two years' experience. Summer lasts here until the middle or end of September, and is almost invariably succeeded by six or seven weeks of glorious autumn weather, the most enjoyable of the year, during which apple-picking takes place.

Toward the end of November come the premonitory signs of winter-sharp frosts and occasional snowfalls. In the early part of December, as a rule, winter apparently sets in, and we have between two and three weeks of hard weather, usually accompanied by snow. This is almost invariably succeeded by a 'soft' spell, which lasts until the beginning of the New Year; the snow disappears, and occasionally the land becomes free from frost, and ploughing recommences. During last winter (1906-7) ploughing in this neighbourhood was carried on in both Christmas and New Year's weeks. In twelve years I have only seen one genuinely 'white Christmas' in Nova Scotia. The typical Nova Scotian Christmas Day is mild and soft, and oftener than not rainy and 'muggy.' Then winter, as a rule, resumes its sway, lasting in an irregular fashion till about the first or second week in March. In this part of the province JUNE 8, 1907. [All Rights Reserved.]

our winters are apt to be 'punctuated' by frequent thaws, which often, to the very general disgust, cause the disappearance of all the snow. From time to time we get zero weather, which, however, never lasts for more than two or three days. Very occasionally the mercury touches twenty degrees below zero. Ten below is considered very extreme in this province, while in New Brunswick and Quebec thirty and even forty below is a comparatively common experience. The temperature always rises with the sun, and I cannot call to mind one single day in this province during which the mercury has not risen by noon above zero. With the exception of a month or six weeks' gloomy weather, from the beginning of December to about the middle of January, sunshine predominates throughout the whole winter. Taken as a whole, our valley climate may be described as one of the most temperate on the continent. Its healthiness may be inferred from the excellent physique and longevity of the people, the death-rate being exceptionally low. Since I knew Halifax, twelve years ago, at least four centenarians have died, and the number of vigorous octogenarians to be met with in every part of the province is very remarkable. One, and only one, class of persons the climate does not suit-namely, those with any predisposition to lung weakness. Although close to the Bay of Fundy, the valley is almost entirely free

from fog. The number of apple-trees to the acre averages about forty. Formerly they averaged about as high as fifty, but the tendency of late has been in the opposite direction. With the modern plan of planting, the trees have more room to grow and can be more scientifically and effectively pruned, the interlacing of boughs is avoided, and the sunlight, essential to the right colouring of the fruit, is more freely admitted. It has been found by experience that one large, well-pruned tree will grow proportionately more apples, and of vastly better quality, than two moderately sized ones, and of course with less expenditure of labour and fertilisers. The up-todate orchardist, instead of crowding his land with undersized trees, goes in for large umbrella-shaped trees, whose branches as a rule just clear each other. While the trees are growing the land can be utilised for various crops—potatoes, beans, turnips, parsnips, &c.; but this of course necessitates very heavy manuring. Many fruit-raisers grow heavy crops of clover or buckwheat, which they plough in as a The common barnyard manure is of fertiliser. course widely used, and also chemical fertilisers. Very few apples are grown on permanent sod. When this is occasionally done heavy annual topdressing is necessary, and the grass is cut during the summer and allowed to lie on the ground until it rots into the humus. As a rule, however, orchards are continuously cultivated and kept clear of weeds. It is a common practice in the case of young orchards to plant plum, peach, and pear trees, and gradually to remove them as the apple-trees come into bearing. These temporary trees are called

'fillers.' In some cases they are allowed to remain permanently, especially in the modern and more

175

thinly planted orchards. The price of unplanted land varies widely, and ranges from two or three to, say, eighteen or twenty dollars per acre. The price of land depends so materially upon location and innumerable other minor and indefinable conditions that it is very difficult, practically impossible in fact, to strike an average. As to the advisability of buying and planting, as compared with purchasing an orchard in full bearing, it is somewhat difficult to decide. To buy and plant means a wait, so far as any direct return from the apples is concerned, of from at least ten to twelve years; but, of course, the initial outlay will be much smaller. To buy an orchard in full bearing involves a much larger initial outlay but an immediate income. On the whole I am inclined strongly to recommend the latter course. A man who is nursing an orchard into bearing is more likely to throw money away in unremunerative experiments than in paying an excessive price for an orchard which is a 'going concern.' But buying under all circumstances is a very ticklish business, and should be entered upon not 'wantonly, unadvisedly, or lightly,' but with all due precaution and circumspection.

As I have already made clear, I do not recommend farming to the British emigrant; but if a man is bent on trying it, and has some practical knowledge of agriculture, a start can easily be made in Nova Scotia on a few hundred pounds, or even less. As I have said, the price of land cannot be given with anything approximating exactitude. The price of farm-land will vary according to the owner's anxiety to sell. This I may safely say, that hundreds of excellent farms, with fairly good dwelling-houses and outbuildings, can be bought in this province for the price of western prairie-land. The attractions of city life in the United States and of our own Canadian North-West are very strong for the Nova Scotians. Like the Old Country Scot, they are of a roving turn, and are found in the remotest corners of this continent, and, in fact, in all parts of the world. There are, therefore, hundreds of Nova Scotian farmers ready to 'pick up' and sell at twenty-four hours' notice, and generally on favourable terms for the buyer. This really constitutes no reflection on the country, but it is simply a national trait that would manifest itself in the

Apple-tree pruning here is an annual operation Garden of Eden. and of vital moment. For any one possessed of the average judgment and application it is not difficult to learn. The general time for pruning is in March and April, or as early as the weather will permit. Occasionally pruning is done in February. is a saying here that 'the time for pruning is when ever the saw is sharp; but I must confess I have never known it acted upon. It is wonderful how

the fertility of an apple-tree is stimulated by skilful

pruning, and how it can be gradually transformed

in shape by the dexterous and persistent removal of certain superfluous branches. In this respect pruning almost approaches the dignity of one of the fine arts. An unpruned orchard, on the other hand, is a woeful and depressing sight, and rapidly deteriorates. A week or a fortnight's annual pruning by two good, experienced hands will suffice for an orchard of three or four hundred trees, the cost of which will average, say, five pounds. Skilful and reliable pruners can always be obtained in any part of the country.

A correspondent, who could not conveniently arrange to work with an orchardist, as suggested in my last article, asks if it would not be possible to engage some one to superintend his orchard for him for a year or two until he had acquired the necessary experience. Undoubtedly this could be managed. Almost every labourer of the more intelligent class in this neighbourhood has a good practical knowledge of orcharding, and could be trusted to conduct its working. I feel perfectly justified in saying that the man who could not pick up a good practical knowledge of apple-raising in the course of a couple of years, working with an experienced orchardist and acquiring all available information from external sources, is not fit to own an orchard. But, of course, the first plan is much the cheaper, and on the whole, I think, more effectual.

An apple-tree will begin to bear profitably at from about ten to twelve years, sometimes in exceptional cases earlier, often later. This will depend entirely upon the thoroughness and efficiency of its culture. The apple-tree reaches its full bearing capacity at twenty years, and will go on bearing, if properly handled, for a practically unlimited time. For the first twenty years of its life an apple-tree is said to add one dollar annually to its value. Thus the planting and cultivating of an orchard is often a good investment, even if the owner never picks an apple. Five hundred trees worth five hundred dollars, say, the second year, will be worth one thousand dollars the third year, and fifteen hundred dollars the fourth year, and by the eighth year will be worth, exclusive of the land, three thousand five hundred dollars (seven hundred pounds). Land bought at twenty dollars per acre would be worth at this rate, with forty trees to the acre, at least two hundred and twenty dollars per acre in five years.

The average yield of a tree in full bearing will, of course, vary greatly. Some varieties, such as Ribstones, Blenheims, and Gravensteins, may be depended upon to bear pretty nearly every year. In my own orchard I have had a fair yield from these three varieties annually for seven years; some, again, will average a crop two years out of three, the great majority every alternate year. The best bearing trees, however, are always apt to take a year's reat. Certain kinds of apples will do exceedingly well in certain years, and others will fail utterly. But with a judiciously selected orchard of many varieties an annual yield can always be secured. Again, the general yield of all varieties will vary

with certain years. Some seasons are undoubtedly more favourable to an 'all round' crop than others. There will be more sunshine, fewer periods of drought, an absence of storms and cold rains and muggy weather. The climatic dangers which threaten the apple crop are protracted spells of cold rains in June, during the pollenisation of the blossoms; moist, warm weather; and heavy gales in the autumn. Late spring frosts, as in Great Britain, occur almost every year, but have little effect, except possibly in thinning the crop, which may be reckoned as a blessing in disguise. Of living pests we have the caterpillar, canker-worm, and budmoth, whose ravages by diligent spraying can easily be reduced to a minimum; and these pests, under the systematic war waged upon them year by year with ever-increasing pertinacity, will probably eventually entirely disappear, or at all events become a negligible quantity. To come back to the subject of the average yield per tree. For an apple-tree in full bearing, a yield of from five to seven barrels may be called a fair average. This should be halved to get the average annual crop. Each barrel contains a few pints less than three imperial bushels. Of course, exceptional yields go far beyond this. I have been shown a tree (a Nonpareil) in this neighbourhood from which it is said twenty-two barrels (over sixty bushels) were once picked, and fifteen and twelve barrels are no uncommon yield from exceptionally productive trees. But an average annual yield of three barrels per tree, with fair prices, will bring very satisfactory returns.

What, it will be naturally asked, is a fair price? The general opinion here is that a gross profit of two dollars (eight shillings and fourpence) per barrel, one year with another, is about the minimum paying figure. From this two dollars there must be made a deduction, on a liberal calculation, of fifty cents (two shillings) per barrel for working expenses of orchard, leaving a net profit of one dollar and a half (six shillings and threepence) per barrel. To ensure this gross profit apples should fetch in the British markets about fourteen shillings per barrel.

An orchard with a capacity for annually averaging one thousand barrels, it will therefore be seen, should bring in a net income of something like three hundred pounds per annum, and this for apples alone, and quite exclusive of small fruits such as plums and pears or root crops. Such an orchard would contain between four and five hundred apple-trees and comprise about ten acres, and should be purchasable for about fifteen or eighteen hundred pounds. At two thousand pounds it would pay 15 per cent, on the investment. But, of course, such returns as these postulate the very best methods and management and direct personal application, and a beginner would probably have to content himself with a lower percentage.

Pears do splendidly in Nova Scotia, and in some respects are more easily raised than apples, being absolutely free from disease and perfectly proof against pests, and require no pruning. Two superb

varieties are grown here, the Bartlett and Clap's Favourite, for which there is a fair local market, but they mature too quickly for export. The hard winter kinds can also be successfully raised, but as yet have received little attention. Plums of every kind do equally well, but are sadly handicapped by the 'black knot,' for which no antidote but removal by cutting has as yet been discovered. In spite of this, however, many thousands of baskets are annually raised, and a good deal of planting goes on every year. A plum-tree will come into bearing in about four years, and as a rule will continue to bear every year. The quality of our Nova Scotia plums for table use and for canning or preserving is excellent, and, as a subsidiary industry to applegrowing, their culture is often successfully carried on.

A correspondent asks for information in regard to taxation. We have no direct taxation in Canada, Dominion or provincial. Our taxes are all indirect, and are paid by the consumption of dutiable goods. Of course we pay municipal rates, for which we receive direct value in the upkeep of our roads and

schools, police protection, &c.

Full information regarding properties for sale may be had by writing to the 'Provincial Secretary, Halifax, N.S. The best time to 'look through the valley' would be the last week in May or the first half of June, when the orchards are in blossom, and in September and October, during the apple-

picking. I have now, I think, met all the points raised by my correspondents; but the only really satisfactory course for any prospective settler is to see and judge the country for himself. Nova Scotia has the advantage of being the gateway of the Dominion, and

it can be visited en route to any portion of Canada. That hundreds of desirable settlers have made a serious mistake in rushing west without even a passing glance at the good old province, few who have seriously investigated its claims as a place of settlement will, I feel sure, attempt to deny; and at least 95 per cent. of our immigrants never dream of doing this.

Before I close this article I may say that the province offers excellent openings for sheep-raising. The quality of the wool grown in Nova Scotia, it is said by experts, is from some cause the finest on the continent. A very large proportion of the province seems to me ideally adapted for sheep, closely resembling as it does portions of Scotland and the north of England. According to carefully worked out calculations, sheep can be raised at a handsome profit in Nova Scotia. Almost unlimited quantities of 'mountain land' can be secured at prices not exceeding fifteen or eighteen shillings (three to four dollars) per acre. This is a matter, I am persuaded, well worth the serious consideration of English and Scotch sheep-raisers, especially as the demand for wool in Canada, which now stands at about seventeenpence per pound, is sure to increase rapidly. However, this is a subject that cannot be adequately treated at the tail-end of an article.

Mr J. B. Oakes has been appointed immigration agent for the province of Nova Scotia, and will gladly supply reliable information about orcharding or farming to any applicant, and will, when practicable, arrange for personal interviews. Address care of J. Bruce Walker, 11, 12 Charing Cross, London, S.W.; or John Webster, 35, 37 St Enoch

Square, Glasgow.

CHAPTER X.

OPPY, poor youth! had no suspicion of what was preparing for him. If he had at first harboured a faint notion that the resignation of his commission would be very distasteful to his fiancée, his mind was now

quite at rest on that point; for his father, as he had said he would, had gone to the Duke that afternoon to arrange for its cancellation. As regards anything else, Hoppy had a perfectly clear conscience, for whatever little flirtation he may have been tempted to indulge in, to while away the weary hours in cantonments and on board ship, he was well aware had been a perfectly mild and harmless one, both as regards the lady and himself. For his part, he knew that he was as devotedly attached to his Mirabelle as ever; and as for the grass-widowwell, her heart was acknowledged from Calcutta to Cawnpore to be as hard as the nether millstone.

Their conversation had progressed comfortably for some time in that wonderful language which

only really belongs to amorous youth, when, with out warning, Mirabelle, having lulled her lover into a state of blissful stupidity, suddenly sprang to the attack.

'Who,' she demanded sharply, 'was that woman on the Himalaya who seemed to know you so well,

dear ?'

What woman? Oh, I know whom you mean, said Hoppy. 'That was Mrs Tom, a jolly little soul and a very good sort. Awfully pretty, too, don't you think? Everybody does.' Oh, foolish Hoppy!

'I really didn't notice her looks,' answered Mira belle coldly; 'I only thought her remarkably loud and vulgar, and extraordinarily familiar, to say the

least of it, with you.'

Bless your dear little heart!' cried the fatuous one; 'why, I've known her for years. She was at Rhanibad when the row was on; came to see me, I remember, the morning I made such an ass of myself, and wanted to come up on the wall with me, only I wouldn't let her—against orders, you know.

Mirabelle's eyes blazed.

'What!' she cried; 'is that the same woman? And she came home in the same ship with you—the woman whose name was shamefully linked with yours all over India—the woman for whom you made "an ass of yourself," as you so rightly said just now? The woman for whom you disgraced yourself would be more appropriate. I wonder she didn't "come up upon the wall with you"—mimicking him—'even if it was against orders, for you don't seem to have been very particular about obeying them afterwards.'

Hoppy sprang to his feet with a cry. His face, even to his lips, was livid, and his blue eyes sparkled dangerously.

'My God!' he panted, 'you must be mad, Mirabelle; that's the only thing I can think about you—stark, staring mad with jealousy or something. That you, of all people, should say that I disgraced myself; and as for your abominable stories and insinuations about Mrs Tom and me, you ought to be ashamed of yourself. Yes, indeed, you ought.'

And now truly, to use a homely expression, 'all the fat was in the fire.' If Hoppy was in a great temper, Mirabelle had flared up into a greater, and no longer was her behaviour marked with the 'repose of Vere de Vere.'

'I know all about your wicked goings on, sir,' she cried. 'I have heard about you and your Mrs Tom from at least a dozen people.' Oh, naughty 'You have insulted me before the whole world, you who ran away from your guard and opened the gates to the enemy, to show off, for sooth! in the eyes of another man's wife. Oh, it's useless, quite useless, to attempt to deny it; everybody is talking about it,' she went on, frustrating with a very torrent of words her angry lover's attempts to put in his oar; 'and I for one will never-no, never-consent to marry a man who cannot obey orders, and though he does escape his well-deserved punishment through backstairs influence—a thing patent to everybody—is disgraced in the eyes of all honourable men. That is the opinion all over England, and you will find it out for yourself if you dare to put in an appearance at your

This unjust and unexpected assault did not, as may be surmised, do anything to diminish Hoppy's anger.

'And I, for another,' he burst out when Mirabelle paused for want of breath, 'would never dream of marrying a girl who can—who can'—He stuttered in his efforts to find a fitting expression. 'No, Miss Melgrove, I'll take myself off for ever before I'm tempted to lose my temper. I wish you a very good day, madam;' and with this stately and ridiculous adieu he stalked out of the room like a transpontine tragedy-king.

This unfortunate lovers' quarrel would, no doubt, have settled itself in the usual manner of these things, after a few days' dignified silence, during which the two fiery young people would have had

time to calm down, if Hoppy had not, on reaching his father's house encountered, that choleric old gentleman also in a state of suppressed fury, and the meeting was of the match to gunpowder. Another violent scene took place; for it appeared that the Duke, friend as he was of the old soldier, had very decidedly refused to take any but the usual course when Hoppy's resignation, of which he had not yet heard—for the document had many a slough of routine to wade through ere it finally reached him—should in due course be brought to his notice.

'Sorry I can't help you, General,' he had said; 'but a youngster who feels like that had better go. I did as much as I dared for the Prime Minister, who was afraid of Idsworth, and I can't do anything more. If your son hadn't the grit to go on and face it—well, he'd better do the other thing. You'll thank me for it some day. Goodbye. I'm very busy to-day.'

His blood boiling at this quite unexpected treatment, Sir Ralph had driven home, nursing his wrath against his son; and the latter, also in a state of fury, coming in a few minutes later, the result was a tremendous row, in the course of which the younger man heard some very forcible expressions of opinion as to his behaviour at Rhanibad and the conduct of his affairs in general.

'And let me tell you, sir,' ended Sir Ralph, 'that if you'd disgraced yourself—yes, sir, I repeat, disgraced yourself, for that's what everybody, from the Duke downwards, thinks—and I had been in command, I'd have tried you by a drumhead courtmartial then and there—ay, and shot you within twenty-four hours if that had been the sentence awarded you.'

That night Hoppy did not put in an appearance at dinner, nor was he in his bedroom the next morning when the valet brought up his tub. Then, presently, it was whispered abroad that 'Apner, the Rhanibad chap, yer know,' had mysteriously disappeared, leaving no trace behind him; and 'quite right, too,' said the cunning ones. 'Nothing like lying doggo for a bit until things have blown over. His people are in the know all right.'

But for once these wiseacres were wrong. The General and Mirabelle knew nothing, and not a sign came from the missing man, who had apparently gone away in a violent hurry, taking with him but a small bag.

'He will soon get over it and come back,' they said to each other when they met, which was now almost daily; but the weeks ran into months, and the months into years, and the expected Hoppy came not.

The world, naturally, did not give him another thought after the terse notice, '161st Rifles.—Lieut. F. L. E. Apner resigns his commission,' had appeared—within a few days of his disappearance—in the Gazette, and with the exception of the Idsworths and his father, and perhaps a dozen others—Vare amongst the number—the once popu-

lar soldier was as completely forgotten as if he had never existed.

The Minister for Foreign Affairs brought his hand sharply down upon the map of North Africa which lay open upon the table before him with a bang that caused his colleague, the Minister for War, to jump with the unexpected noise.

'May the devil fly away with these indefatigable English!' he cried irritably. 'They give us more trouble with their everlasting expeditions than all the rest of the world put together. And the worst of it is,' he continued disgustedly, 'one never can be sure of what they are going to do from one day to another. They don't seem to be able to behave like other people, but blunder along seemingly without plans or anything else, and upset the most carefully prepared schemes by sheer John Bull rosbif ignorance. Look at that business at Rhanibad three years ago nearly! Our good friends, who had secretly provided the Ameer with guns and leaders, meant to let the two English columns unite, and then crush them together in one big battle. But the man in command of the one in the city wouldn't wait for the co-operating force, and made an attack on the Ameer alone, a couple of days too soon. He got badly beaten, you remember, as was natural; but what was the ultimate result? The natives, intoxicated with joy at their success, wouldn't listen to their leaders or take any precautions, and, being caught napping by the second column, were utterly smashed, and all Sobenoffski's careful plans came to nothing, and nearly led to a rupture between the two Powers,'

'Are you sure that in this present case your information is to be relied on?' asked the other.

'Quite, as far as it goes. It comes from Madame. There is no doubt but that we must act at once; but read the report yourself and see what you make of it.'

The War Minister adjusted his pince-nez and carefully studied the paper which was almost thrown at him. 'Yes,' he said presently, 'you are right; this expedition, if our ideas are correct, will inevitably cross and perhaps attempt to occupy the country to the south of Bouc-al-Aran. Of course it is only a strictly scientific one-they all are; but we must forestall it with one of our own, with an adequate escort and a good supply of tricolours, you know;' and he smiled across the table at his friend. 'I will telegraph to the General at Algiers,' he continued, 'and tell him quietly to make the necessary arrangements, and that orders as to the objective of the force will be sent to him later. I need only say at present-for least said soonest mended—that Bouc-al-Aran will be the jumping off place, so that he can collect the men in that neighbourhood.'

'Whom do you propose placing at the head of it?' queried the Foreign Minister.

'Escheaux. He's the best man for the job, and not being Anglophobe, can be trusted not to make

a fool of himself should there be any friction with the English.'

Then the two men set to work to discuss other details, which, as they have no bearing on this story, need not be recounted here.

Thus it came about that a few months afterwards, a weary string of men straggled into the centre of a native village several hundred miles south of the limit of French occupation in Northern Africa, after a long and toilsome march. The country into which they had penetrated was unknown and unmapped. They had journeyed by compass and such native guidance as they could obtain; and, as their leader ordered a halt, he consulted his subordinates and a well-dirtied document which he took with great care from his pocket.

'Yes,' he finally exclaimed, 'we shall not do better than this; it answers well enough to our instructions. And so we had better pitch our camp here for good—or until we receive further orders,' he added, with rather a doleful grin.

So the porters were ordered to dump down their loads, and the escort—native troops all, with a sprinkling of white non-commissioned officers, the latter picked soldiers of the Foreign Legion sent especially from Algiers—were drawn up round their chief.

'Comrades,' he said, 'my children! you have reached your goal. Here we shall remain to guard the flag until we receive orders to go north again. The natives of these parts, as you have found, are peaceful and friendly towards us. See that you do not give them any reason to change their attitude.'

Then a tall, straight tree was felled, and after being stripped of its branches was set up as a flag-staff, and, the headman and elders of the village attending, the flag of France was hoisted to the breeze amid cheers and volleys of musketry. A great feast was then arranged, presents were given and received, and the members of this strange scientific expedition settled down to a peaceful occupation of the country, patiently to await the coming of the Englishmen, whose little game they piously hoped they had frustrated.

But alas for human ambitions! The English mission, taking a totally different direction from the outset—that is to say, directly it had lost touch of civilisation and its attendant disadvantages of publicity-never came anywhere near them at all, the perfidious ones! And a wave of military trouble sweeping over France shortly afterwards, that country was divided into two hostile camps, Ministers and Generals were changed, and in the confusion, which almost at one time threatened to develop into civil war, Escheaux and his men were forgotten. Swallowed up in the great, mysterious continent out of which all things evil are said to have originally come, but one white man, of all that gallant band, ever saw his native land again.

(To be continued.)

GARIBALDI: A CENTENARY TRIBUTE.

PART II

HE insurrection of Palermo in the early spring of 1860 gave Garibaldi the signal he was awaiting, and on the 5th of May he set sail from Genoa with his famous 'thousand' red-shirted volunteers; and after

overcoming many minor difficulties in the matter of provisions and arms, of which he was able to obtain but a scanty supply from the commander of a small fort near Orbetello, the small flotilla, composed of two transports, the Piemonte and Lombardia, sighted the coast of Sicily on the 10th of May. Eluding the Neapolitan squadron, which was cruising in the offing, the volunteers effected their landing at Marsala on the following day, unopposed by the British men-of-war, though our Government was officially adverse to what they considered a hopeless enterprise, which would only cause a wanton effusion of blood and the useless sacrifice of noble lives. And hopeless indeed must the enterprise have appeared from a common-sense standpoint. For never were forces seemingly so ill-matched as those arrayed against each other at the commencement of the marvellous campaign. On one side the disciplined forces of a considerable kingdom, consisting of about one hundred thousand trained soldiers provided with copious artillery and occupying several fortresses of great strength from Palermo to Gaeta, or guarding the many passes and other defensible positions which abound in Sicily and Calabria, and some well-equipped and tolerably efficient warships more than sufficient to give an account of Garibaldi's flotilla even had it been tenfold greater than it was; a kingdom, moreover, which could count on the secret sympathies of three Great Powers at least, and on the possible armed intervention of France, and which was safe from any general insurrection on the part of a disaffected but unstable and cowed population, provided the army remained loyal and was able to give an account of the enemy, of which there appeared little doubt. On the other side was the scanty band of young men, some already bronzed by campaigning, others beardless youths; but, whether in the prime of life or mere striplings, all animated with one spirit: to do or die under their beloved leader, the legendary hero of so many fights against odds, of so many deeds of derring-doe, whose presence had always been a tower of strength on the battlefield, and who above all believed thoroughly not only in the righteousness of his cause but also in its final

Still, history has left on record so many examples of the superiority of trained troops over untrained levies, however brave, and even when more numerous, that the chances seemed a thousand to one against the invaders. But the commanding

personality of the hero who led them redressed the balance, and caused the one thousandth chance to come off. Hitherto all similar attempts had failed. The call to arms of the brothers Bandiera at Cilento in 1831 had met with no response. The cause had been the same, the probability of foreign intervention no greater; but neither the hour nor the man had then come. They had both come now. But the paucity of the invading force and the instinct of discipline nerved the Neapolitans to make a stand at Calatafimi, entrenched in a good position, where, some eight thousand strong, they encountered the Garibaldians. The Red Shirts charged uphill, carrying line after line of entrenchments, capturing a gun, and putting to flight the first army of King Francis they had engaged. There had been a critical moment when the fight seemed going against the assailants, who, exhausted and thinned in numbers, had halted before the last position of the enemy, unable to advance, unwilling to retire. Bixio, the second in command, counselled a retreat; a moment's hesitation on the part of Garibaldi would have lost the day. As he turned to his men, his voice rang out loud and clear: 'My lads, I must have one last charge home. Five minutes' rest, and we shall all go together.' The wearied men gathered themselves up for a final effort; and when Garibaldi pealed out, 'Fix bayonets! Charge home for Italy!' with loud shouts of 'Viva Garibaldi!' they dashed forward, one serried line of flashing steel, and the battle was won.

Calatafimi decided the fate of Sicily and of the whole campaign. Strongly reinforced by the arrival of two bodies under the command of Medici and Cosena, which raised his force to six thousand, Garibaldi divided his little army into three brigades. One he sent to seize Girgenti, the second to occupy it, and the third he led himself on to Messina. He met a Bourbon force at Milazzo, strongly posted and more numerous than his own, which he dislodged after a sharp conflict.

The next day was employed in preparing for the passage of the Strait of Messina, a difficult undertaking to effect under the guns of two large frigates and in the teeth of an army of thirty thousand men well provided with cavalry and artillery. Here Garibaldi was strengthened by the very opportune arrival of nine thousand volunteers, who had been raised for an expedition against the papal power, but who had been hindered by the Sardinian Government from crossing the borders into the pontifical territory. Finding their purpose balked, and having heard of the successes of Garibaldi, they had sailed for Sicily and brought him a very welcome reinforcement. The strait was crossed somehow, and Garibaldi stood on Calabrian ground

with four thousand men. He marched swiftly on Reggio, which at once surrendered, the garrison evacuating the town without striking a blow. There was still the royal army encamped at Villa San Giovanni, twelve miles from Reggio, to be dealt with. But that army had no stomach for fighting; the victories at Calatafimi and Milazzo had completely demoralised the soldiers, who cared little for the cause they were defending, and had very little confidence in their commander. The army melted away on hearing that the redoubtable leader-or Liberator, as he was now called—had taken Reggio.

Thenceforth the progress of Garibaldi was assured. His success had given him a kind of legendary fame, which was continuously increasing among the imaginative and impressionable southern Italians; the disbanded soldiers helped to fan the flame of insurrection by disseminating stories of the irresistible prowess of the invaders, and soon the whole of Calabria and Basilica was in a blaze, which, spreading rapidly all over the kingdom, enabled Garibaldi to pursue his triumphant course not only unopposed, but welcomed with joyous shouts by acclaiming crowds.

On the 21st of August the Liberator had disembarked at Melito, on the mainland; and on the 7th of September he entered Naples, whence King Francis had fled on the previous day. A fortnight had sufficed to overthrow the power of the Bourbons on the mainland, who only retained the two fortresses of Capua and Gaeta, under the protection of which the royalist leaders arrayed their still formid-

able force of forty thousand men.

Garibaldi's entrance into Naples was very characteristic of that great man. Though perfectly aware that bodies of the defeated Bourbons were still occupying the forts, and that among them were many foreign hirelings hating Garibaldi and his cause, he did not hesitate to enter, accompanied by nineteen followers, leaving his army at Salerno. His calm self-confidence, the sight of the brave, honest face in which courage and kindliness were so happily blended, wrought their wonted effect on the easily moved southerner. Even the stolid mercenaries caught the contagion. Not a bullet was fired, not a bayonet was levelled; but the sentinels everywhere presented arms. From the Palazzo della Foresteria, where he took up his residence, he addressed the immense crowd of eager, flushed faces thus: 'In placing my foot in this fairest of all Italian cities, my heart is filled with joy. This is a solemn day for a people who, having shaken off the yoke of so many tyrants, is reborn to a life of freedom and has won a fatherland. You had a right to this redemption on account of your long sorrows and sufferings. Your deliverance causes all Italians to rejoice, and comforts humanity. From the exulting throng cheer followed cheer as Garibaldi ceased speaking. Such cheers as Naples had never heard yet rang out through the square. At last, exhausted with physical fatigue and the emotions of the day, he retired to rest; and this

being made known to the people, they quietly dispersed, with their right hands raised above their heads, the first finger alone extended to symbolise the cry which was now repeated through Naples: 'Italia è una' ('Italy is one').

The next eight or nine days were devoted by Garibaldi to reorganising the machinery of government, thrown out of gear by the change of polity. Having appointed a working Cabinet, he decreed that the Neapolitan squadron-composed of two ships of the line, fourteen frigates, and about twenty smaller craft - should hoist the national colours and unite with the fleet under Admiral Persano. The decree was obeyed by all the Neapolitan commanders save three or four, who sailed

Having thus provided in a measure for the to Gaeta. administration of the liberated provinces and for the prosecution of the war by sea, he led his forces on the 19th of September against the Bourbon army, which lay along the Volturno, and had somewhat recovered from the effects of the disastrous campaign. They were still forty thousand strong, and more efficient on the whole than the former forces, which had been so easily routed or dispersed in Calabria, for only the staunchest men and foreign mercenaries had remained faithful to King Francis, and they and their commanders were eager to redeem their military reputation, from a purely professional point of view. Thus it came to pass that Garibaldi met with a stouter resistance from the Bourbon soldiers than he had yet experienced. Indeed, the first encounter at Caiazzo was favourable to King Francis. His Generals scored a decided success, which had the effect of raising the courage of the rank and file to such a degree that the Bourbon Commander-in-Chief resolved to take the offensive and attack the Garibaldians in their lines. The decisive battle was fought on the 1st October, and was stiffly contested on both sides. The Garibaldians were skilfully posted, and full of enthusiasm and of faith in the holiness of their cause; and though but twenty thousand strong, against perhaps double that number, felt confident of the result, for they had won against greater oddsodds of position as well as of numbers. The royal army of Francis, possessing the advantage of numbers and of guns, felt not a whit less assured of victory.

Both sides displayed great valour in this last fight of the war. The Neapolitans delivered assault after assault against the positions of the Garibaldians. The Royal Guard, under General Tabacchi, especially signalised themselves, and pierced the enemy's lines; but Garibaldi, who was present wherever the fight was hottest, brought up the reserve and saved the position at that point. Several partial successor cesses were achieved by the Neapolitans in other parts of the field; but Garibaldi's presence never failed to rally his men where they were broken or hard pressed. The timely arrival of some companies of Bersaglieri (sharpshooters or riflemen of the regular Sardinian army) in the afternoon was of much material help. At length, repulsed at all points, the Neapolitans sullenly retired, falling back on Capua and Gaeta. The losses on both sides were very severe in this obstinate and protracted struggle. The victors owned to a loss in killed, wounded, prisoners, and missing of three thousand five hundred men out of twenty thousand; that of the vanquished was not given, but must, of course, have been more severe in killed and wounded.

The war of liberation was now virtually over. The final operations of the two sieges of Capua and Gaeta were mainly conducted by the Sardinian troops, which, marching southward through the Marches under King Victor Emmanuel, effected a junction with the Garibaldians on the 26th of October, on which day the valiant, patriotic King met the Liberator on the high-road between Fratte and Teano. They were both accompanied by their staffs, and as they came into each other's presence, Garibaldi, uncovering, hailed Victor Emmanuel as King of Italy. The King in return grasped the General's hand, saying, 'And I hail in you the first of all Italians.'

Both were strangely moved as the cry of Garibaldi was taken up by the officers of the two escorts, white-mantled and plumed horsemen of the King and red-shirted, bearded volunteers; and the shout of 'Viva il Re d'Italia!' rang out for the first time on that solitary road, and for the first time since the death of Theodoric the Great had that cry borne its full meaning. For since the great Goth's death in 526 A.D. there had been no real King of Italy. Those who had borne the title had been mere shadows or kings in name, but not in reality

The two foremost champions of Italian independence and unity who had clasped hands on the Teano road had many traits of character in common. Both were brave, honest, single-minded, as gentle hearted as they were brave, and could not refrain, even when they differed, from respecting and admiring each other's motives. The King was sometimes compelled to temporise, to hold his hand in order to strike more surely, and his wonderful good sense always taught him when to forbear and when not. Garibaldi was not forced by the exigencies of his position to consult others on the advisability of a certain course of action, and he was too adverse to the delays of statecraft and the devious paths of politics to seek or accept the advice of those who advocated the postponement of his daring schemes. An anecdote related by Guezzoni, his aide-de-camp, shows this characteristic in a strong light. In 1864, on his visit to England, he had an interview with Lord Palmerston, who purposely brought up the subject of the Venetian question, still at issue, and endeavoured to persuade and convince Garibaldi of the necessity of waiting for the proper moment, of observing existing treaties, avoiding complications, and so forth. But he was cut short by Garibaldi, who, flaring up suddenly, said, 'What are you

saying? It is never too soon for slaves to break their chains;' and thereupon he left the Minister rather abruptly. Thus it fell out that, from the diversity of means employed towards the same end, Victor Emmanuel had to oppose and frustrate some premature or at least over-hazardous attempts of his heroic subject.

On the 9th of November 1860 Garibaldi handed over to King Victor Emmanuel the plebiscite of the Two Sicilies, and then, bidding farewell to his comrades, he quietly embarked for his beloved Caprera, where he resumed his homely life as naturally and as unostentatiously as if the glory and pageantry of the last seven months had not existed. The hero of Calatafimi, of Milazzo, and of the Volturno, the Liberator of nine million Italians, the chosen dictator of a realm, refusing rewards and honours, might have been seen planting, sowing, and tilling, or at times fishing among the many creeks of his island-home to eke out the slender supplies of food which it offered. Content as he was with his present life, he would have been satisfied to remain there for the rest of his days had it not been for one thing, which was quite enough to disturb his equanimity and prevent him from enjoying his well-merited repose. This was, I need hardly say, the ever-present thought of Rome and Venice still enslaved, still separated from free Italy. He chafed at the irritating delays and tortuous paths of diplomacy, the evasions and double dealing of some, the caution of others. He grew more and more restless as time went on and the goal seemed as far off as ever. Suddenly the news spread that the Government had put down the movement in Lombardy for the liberation of Venice. This action of the Italian authorities confirmed Garibaldi in his opinion that nothing would be done by the constituted authorities or by negotiations unless he put himself once more at the head of his volunteers. He was mistaken, perhaps, in his estimates, but they were such as any man in his position might have made. We must remember the marvellous success which had hitherto attended Garibaldi's operations in the field, both in the New World and the Old, whether fighting against undisciplined South Americans or against the veteran soldiery of France and Austria, or whether, lastly, opposed by tenfold odds, as had been the case in the last wonderful campaign, which had commenced at Marsala and ended at the Volturno. He had not stayed to count costs: why should he now? True, there was France to reckon with; but he would be able to number his volunteers by scores of thousands, and there were now twentytwo million Italians to back him. He had engaged heavier odds before. Anyhow, his duty lay plainly before him, and he would not be stayed by King or Kaiser. Lastly, no one could have foreseen then the momentous events of 1864-70 which were to change the map of Europe and give both Rome and Venice to Italy.

Sailing from Caprera, Garibaldi made for Sicily,

where a first disappointment met him. His call for volunteers was not responded to with the ardour he expected. The Sicilians, generally speaking, were lukewarm in a cause which did not affect them closely, and could not feel on behalf of the Romans, whom they had been accustomed to look upon almost as aliens, the same enthusiasm as they had felt two years before on behalf of their own hearths and homes or for their neighbours on the mainland, or the same readiness to combat the Pope of Rome as to fight against the King of Naples. The one was the head of the Church, the common father of the faithful; the other was a temporal potentate, and had, moreover, been a very bad one. And this consideration weighed with many. There were numbers, doubtless, among the more intelligent and better educated who felt, like Garibaldi, that Romans and Sicilians were brethren, and that the Pope had no more right to misgovern or oppose the desires of the people than any other temporal monarch, perhaps less; but they, again, must have foreseen complications, perchance endangering the newly cemented union of Italy. Hence Garibaldi was only able to collect a scanty force, which, far

from increasing like a snowball on the march, remained stationary. Crossing the Strait of Messina, he came into collision with the royal troops at Aspromonte, in Southern Calabria, and was, sad to say, wounded by an Italian bullet, taken prisoner by his own countrymen, and confined for a month in a fortress, when a free pardon was granted him, and he retired again to his retreat at Caprera. In this most regrettable affair both Victor Emmanuel and Garibaldi acted, as was their wont, according to their convictions, and in what they considered the interests of the fatherland; both had those interests at heart, both had the same goal in view, but, as has been said, they differed as to the proper course to be taken to reach that goal. Victor Emmanuel in this instance saved Italy from many complications, of which it would have been impossible to forecast the consequences, while Garibaldi's action must have brought home to the French Emperor the falseness of the position he held in Italy by withholding from the Italians their national capital, and rendering truly friendly relations between the two States impossible.

(To be concluded.)

RUTH; OR, THE CLOTHES-PINS.

CHAPTER II.

Thad been my mother's dearest wish before her death that the brothers should become reconciled and make up the quarrel of which she felt herself the innocent cause; but apparently his return to the scenes of

early disappointment only tended to embitter my uncle's feelings, for when my father attempted to bring about a meeting he was met with a short and stern refusal. Unfortunately he was now a ruined man, having lost the greater part of his estate in railway speculation, a mania for which about that time affected all classes of society like an epidemic; and my uncle, with a want of generosity for which I trust the state of his liver was alone accountable, chose to impute an interested motive to his advances, and stated openly that the brother who had supplanted him in his dearest affections when he was a penniless youngster should never be a gainer by the fortune which he had passed the summertide of his life to win in voluntary exile beneath a tropical sun.

Of course this insinuation rendered it impossible for my father to make any further overtures, and we saw nothing of the retired indigo-planter, who, I presume, about that date made the amiable will which I had just heard read.

My mother's dying wish, however, was not destined to remain unfulfilled. One evening towards the close of autumn—as my poor father, now completely broken in health and fortune, was sitting under the thatched veranda of the little

Devonshire cottage to which we had retired, listlessly inhaling the soft breeze that blew across the darkening sea, while I read to him from Milton, his favourite poet, and had just declaimed the verses which close the ninth book of *Paradise Lost*:

Thus they in mutual condemnation spent
The fruitless hours, but neither self-condemning;
And of their vain contest appeared no end—

we were surprised to hear the unusual sound of a carriage stopping at our gate, and soon afterwards a tall, upright old gentleman with snowy-white hair walked rapidly up the narrow path towards us. I saw the colour flush and fade in my father's pale face as he hastily bade me go indoors.

But the stranger stopped me with a gesture, saying to my father, 'No; let him hear what I have to say. Brother, I was wrong to refuse to meet you, and I have come to ask your pardon. Here is my hand.'

My poor father's eyes glistened as he grasped in his own thin, wasted fingers the brown hand extended to him; but he was a true Englishman, hating every outward sign of emotion as if it were a horrible crime to possess a tender heart, and he merely replied, 'Not at all, Jack; not at all. I was hasty too; but I am right glad to see you, old fellow. Sit down and let us have a cigar.'

So the brothers were reconciled at last, and chatted away on indifferent subjects till they had quite recovered command of themselves; nor did they allude again to that old quarrel which had parted them for more than a quarter of a century.

I suppose that stern dislike to the exhibition of the softer emotions which characterises most Englishmen of to-day is a plant of modern growth; for in the good old times when Sterne and Richardson delighted the world with their sentimental outpourings, we read of men embracing each other and dissolving into tears without restraint, though some of those same men who boasted so much 'sensibility,' as it was then termed, were brutalised and vicious in their pursuits and language to a degree that would not be tolerated in modern society. Shakespeare, it is true, writing in the more virile age of Queen Elizabeth, speaks of Othello's eyes 'unused to the melting mood;' and few will deny that there is something more sterling and noble in the burying of emotion deep in the secret recesses of the heart than in the wearing it on the sleeve, as people appear to have done in the days of 'Mr Tatler' and 'Mr Spectator.' We all know the story how Sterne was discoursing with great feeling on the iniquity of a man who treated his wife unkindly, declaring that such a wretch deserved to have his house burned over his head, when Garrick stopped him with the dry remark: 'I hope, Sterne, you are well insured at home; and I think Englishmen of to-day have lost nothing in real depth of feeling, though they may be less ready to expose every pulsation of their hearts to public view.

The reconciliation between the two brothers proved a real and lasting one. My uncle took lodgings at the neighbouring seaside village of Lynmouth, from which he walked up to our cottage every day, spending long hours with my father, and endeavouring in the most delicate way to alleviate the latter's position as far as lay in his

I often wondered what could have worked such a change in the feelings of the fiery old Anglo-Indian, whom from childhood I had believed to be as implacable as the car of Juggernaut; and one day he told the story with unaffected simplicity.

'I had ridden into the neighbouring county,' he said, 'to call on a gentleman who is a Quaker, and who, I knew, had great influence with the poor, and could assist me with some local reforms I was then contemplating. It happened to be the season of the hay harvest, and all his servants were away in the fields when I arrived; so I tied my horse to the gate and walked round the house in the hope of finding some one, for I had come a long distance, and did not wish to leave my errand uncompleted.

'As I passed a French window which opened on to the lawn I heard the voice of a young girl reading aloud, and, looking into the room, perceived my friend seated in his easy-chair listening reverently to his daughter, who was reading a chapter from the New Testament. They did not rise to greet me as other people would have done; but the old gentleman smiled pleasantly and motioned me to a chair, while the young lady continued her occupation till she had come to the end of the chapter.

'She was a beautiful girl, with a quiet seemliness about her smooth hair, her simple, modest dress, and snowy linen, which surrounded her as it were with an air of purity and peace. As she bent her shapely head over the book on her knee, her clear, low voice read out the grand passages with gentle earnestness; and when she came to the words, "And grieve not the holy Spirit of God, whereby ye are sealed unto the day of redemption. Let all bitterness, and wrath, and anger, and clamour, and evil speaking, be put away from you, with all malice: and be ye kind one to another, tender-hearted, forgiving one another, even as God for Christ's sake hath forgiven you," there was such a divine sweetness in her tones that it seemed as if a good angel were pleading with my rebellious heart, and the holy exhortation kept ringing in my ears long after she had closed the book.

They made me stay with them that evening, and I had many opportunities of observing the decent order and quiet cheerfulness which reigned in that well-regulated house. Ah, brother! people may laugh at the Quakers, but they are good people; and happy will be the man to whom Ruth Dingly gives her love. Her gentle words affected me like a revelation, and the next day I ordered posthorses and came to seek you.'

My father pressed my uncle's hand in his, but said nothing, for indeed there was nothing to

This conversation took place during the last weeks of my father's life, and when the end came, and he was no longer with us, my uncle took me back to Worcestershire with him, and treated me like his own son. He was anxious that I should travel and acquire some modern language, which he declared was a necessary part of the education of every man who pretended to culture in these days of rapid communication; and at my own request he sent me to Heidelberg that I might complete my studies at that famous university. I had been there two years when the news of his sudden death hurried me back to England.

That the good old man, whose loss I mourned sincerely, had intended to make me his heir I could not doubt; for he had always encouraged me to live in a style befitting such expectations; but why he had neglected to make a new will, or even to destroy the old one, I could not guess, unless it were that he was one of those people who cannot bear to destroy any written paper, whether trivial or important; and that man, strong in the consciousness of life, is ever only too prone to postpone making preparations for death.

I took out the shilling which was his only legacy, and was surprised to find the name 'Ruth' deeply cut in Roman characters on the face-my mother's name! Perhaps this was the very shilling which he had received when he enlisted for her sake, and which in his anger he had left as a silent reproach to his more fortunate brother. There is something terribly ghastly in these vengeances which attempt to reach beyond the grave, the hand that is dust still striving to smite the

living!

How this shilling now seemed to rise up in judgment against him, rendering abortive the work of reconciliation and atonement he had held so dear, and leaving his brother's only child, the child of the woman he had loved, a beggar! Nay, as if in very mockery, the coin bore the name of her through whose gentle instrumentality the reunion of the brothers had been brought about.

'In spite of himself he has been ruthless to the end,' I murmured; and I shuddered as I perceived the pun I had involuntarily made on my own evil

fortunes.

CHAPTER III.

Y reflections were interrupted by the driver stopping to tell me that one of his horses had cast a shoe, and that he must go somewhat out of his way to find a smithy.

Accordingly we turned down a cross-road, and presently arrived at a pretty village nestling among orchards beneath a wooded hill; and while the driver went in search of the farrier I started towards the only inn, above the porch of which swung the now somewhat rare sign of 'The Barley Mow, with these verses beneath, composed doubtless by some local poet:

Stranger, stay to quench your thirst; If you won't drink your horses murst.

Unable to resist so touching an invitation, I entered the parlour, where a bright fire blazing on the hearth, a kettle singing merrily on the hob, and a snowy cloth neatly set for a meal, as if anticipating the arrival of a guest, had a pleasant air of welcome. A rosy-cheeked landlady, over whose head some forty winters had passed kindly enough, bustled in to inquire whether I should like a room, adding, with a touch of housewifely pride, that the beds were well aired, and that there was a chamber upstairs overlooking the garden, which she was certain would be to my liking. Whether it was owing to the sight of my mourning dress, or that women of whatever age or degree always feel a kindly sympathy for the helpless condition of a lonely young bachelor, her voice had such a pleasant, motherly sound about it, and she seemed to take such a warm interest in my comfort, that it occurred to me I might do worse than accept her offer. I really had nowhere to go, for I had travelled straight from the Continent, and was already beginning to feel that longing for complete peace and repose which surely follows on keen mental excitement; so, dismissing my carriage, I ordered my portmanteau to be taken upstairs.

Next morning, when I opened my casement and inhaled the fresh, dewy air of the country, I felt thankful that I had not returned to London. The

birds were singing blithely among the gnarled old apple-trees just bursting into blossom in the neighbouring orchard; below my window was a tidy lawn ornamented with great red terra-cotta flowerpots filled with homely English posies as sweet to the scent as they were pleasing to the eye; while a few tree-stumps filled with ferns and creepers, and a secluded arbour embowered in white honeysuckle and climbing roses, gave a pleasant air of retirement and rusticity to the spot, which, together with the ripple of a trout-stream, the hum of bees, and the soft bleating of the lambs in an adjacent meadow, was peculiarly soothing to a man in my then state of mind. The hostel appeared to be little frequented save by the rustic politicians of the village, and by an occasional bagman whose rare arrival was an event of local importance. It therefore offered me every facility for such privacy as I might desire, and as I despatched my breakfast of fried trout and new-laid eggs, I mentally exclaimed, 'Here, then, will I prolong my stay and take mine ease at mine inn while my money lasts. I have still a score or so of pounds left from my allowance, and when they are gone, why, I can but follow my uncle's example and take the Queen's shilling; and the shilling he left me, poor fellow! shall be the last I will part with.' Fortified with which resolution, I thrust a well-worn German book in my pocket and sallied out for a walk, determined to trouble my head no further about the frowns that fortune might have in store for

I have always experienced an intense delight in solitary and quiet communion with our beautiful and mysterious Mother Nature. To throw myself on a bank and watch the tiny insects following their myriad occupations among the flowers and herbs, as busy as the beasts that people a vast forest; to examine the delicate stamina of a blossom lifting its golden apices to the sun; to mark the wondrous development of every blade and weed and seed and moss, is to me to read a book of inexhaustible interest. And, as day after day I pursued my lonely rambles, not a cloud darkened the sun, not a bird carolled on the bough or a bud burst into summer foliage on the tree, but it gave my young and ardent mind, thirsting for knowledge, food for speculation and research.

Sometimes I would take a rod and try to lure the shy trout from the busy stream which wound round the bottom of the hill, now brawling over gray, lichen-covered boulders, now sliding darkly under the overhanging trees of the wood; and I have often stood so long in perfect silence watching my fly float temptingly over the head of some finny giant who, I knew, was, or ought to be, lurking in the depths below, that the bright-eyed squirrels have come to peep at me round the trunks of the trees, the brilliant kingfisher has sunned his gaudy plumage on a neighbouring branch, and even the timid heron stood motionless watching the pool beyond with a gravity of demeanour which seemed to mimic my own, and afforded me intense delight.

But more often I would take a book, and, losing myself among the woods, spend long hours striving to follow the intricate imaginings of some of the misty metaphysical German authors whose works I had brought with me from Heidelberg, where I had imbibed a taste for abstract speculation and searchings into the infinite and unknown, which at that time exercised a strong influence on my thoughts.

(To be continued.)

SUNDAY WITH A THEATRICAL COMPANY.

is Saturday night in a provincial theatre. Before the footlights a crowded audience is watching with keen interest the development of the old, old theme—the triumph of vice and villainy in the first three

acts, and its discomfiture by patient virtue in the final scenes. Behind the stage all is bustle and activity. The inexorable 'train call' is posted up in the passage leading from the stage-door to the dressing-rooms, and in obedience to its intimation the actors are packing up their dresses and properties in readiness for their weekly pilgrimage on the morrow. For Sunday to the theatrical who tours the provinces is a busy day. Not for him the comforts of home, the pleasures of the family circle, the complete severance from business cares which is the privilege of even the poorest of the workingclasses. On the contrary, Sunday is a day of changes and discomforts, of long railway journeys, beginning with taking farewell of lodgings and acquaintances just becoming familiar and friendly, and ending by the arrival in a strange town on the hunt for new 'diggings.'

The outsider is apt to think, when he thinks at all, that there is a certain amount of romance in this weekly travelling from one place to another. There may be at first; but every actor who has been on the road for a number of years will agree that the romance soon wears off, and that it very speedily becomes a bore. The fact is, the ordinary man can hardly enter into the situation. Lingering over his bacon and egg, and then marching to church with a silk hat and a gilt-edged prayer-book, he belongs to quite another and a different world. The idea that at that moment thousands of professionals are on the move never enters his head, or, if it does, he thinks that on the whole it is rather a jolly way of spending Sunday. So it might be if it only came once in a while; it is the repetition of it every Sunday which becomes so painfully monotonous. As to the scale of this weekly transmigration, the reader has only need to stand a few hours on the platform of a big railway junction to see what an enormous business the Sunday travelling of theatrical companies has become. At Derby or York, Crewe or Stafford, anything up to a hundred companies will pass through in the course of a single Sunday. The railway companies lay themselves out for this special form of Sunday traffic, and on some lines—as at Derby, for instance

—an official is set apart to see that the theatrical trains are got away without hitch.

Let us look a little closer and see how it is done. A company finishes an engagement at Manchester on Saturday night. On Monday night it is due to open at Glasgow. Obviously, the journey could not be delayed until Monday, for two very clear reasons. In the first place, a long railway ride would be a very bad preparation for an opening night's performance; and, in the second place, the artistes would arrive too late to enable them to have the Monday afternoon rehearsal which in nine cases out of ten is a stringent decree from which there is no escape. There is, too, even a third reason. So many companies have to travel, and so many of them require special trains, that the resources of the railways would be taxed to their uttermost to cope with the work if it had to be piled on the top of their ordinary Monday's arrangements. So we come to this, then, that unless the company is very small, and in need of no rehearsal on the Monday, Sunday travelling is absolutely necessary.

And now for the method of operations. During the week the advance manager has gone ahead and made the way ready for the advent of the company. The other manager, the one who travels with the company, has seen the railway people and made all his arrangements. If his 'show' is a big one he may take a special train. If the combination is but small, and he learns that other companies have to pass through on Sunday on their way north, he may have arranged to join one or even more of them. By Saturday night all these preparations must be made. The 'train call' is posted up behind the stage-door, apprising everybody that the train will leave, say, at ten-thirty next morning. The hour depends on the length of the journey. If short, there is no hurry. If it involves a long run -from Birmingham to Dublin, or Newcastle to Douglas, or Manchester to Plymouth—the hour will be very early indeed; while sometimes, if the Irish Sea has to be crossed, it may be necessary to join the train an hour or so after midnight. In that case the company miss at least one night's bed; a hurried rush home to lodgings to pack private bags and have supper, and away off to the station.

We will suppose, however, there is no such hurry in our case. Half-past ten on Sunday morning is a reasonable hour. It means, though, that all packing must be done on Saturday night. So, as the play proceeds, everything is put away as soon

as done with. Scenery no longer required is bundled up. Curtain cloths, wings, fairy gardens, baronial halls, or haunts of vice in city slums-all are put away. The same thing applies to costumes, dresses, armour, wigs, and other properties. As the actors change from one scene to another, everything that has been used for the last time is bundled away into the big wicker 'skips' which form the professional travelling-boxes of theatrical artistes. This is no slight matter, particularly in the case of a heavy play which involves frequent changes of dress by actors and actresses, and which is produced with its own special scenery. When the late Wilson Barrett toured with The Daughters of Babylon his scenery alone weighed eight tons. By the time the play finishes nearly all this is ready. Last of all, the players sweep their own personal effects into the baskets-grease, paints, crayons, brushes, and so on-and then all is complete. They go off to their lodgings for supper for the last time. A lorry arrives to carry away the luggage to the station, and the theatre is left to the ancient dames who gather up the orange-peel and spread holland cloths over the plush-seated chairs in stalls and circle.

It is Sunday morning when we next see our friends. In ones and twos they make their way to the station. They are easily recognised in the streets, and as a rule the impressionable youth of the town make a point of being about to see them off. It is so interesting to see them in their everyday garb! Yonder is the bewitching heroine, now perhaps rather commonplace; and the stoutish party who walks alongside is the scowling villain who last night gripped her by the wrist and swore that she should surely die! He is smoking an old brier pipe now, and you are sure the heroine, who is laughing at his jokes, is sucking peppermintdrops. But here we are at the station. The manager makes sure we have all arrived, for the train is nearly due. The comedy man is usually late, and it is so to-day. Just when everybody is becoming uneasy he comes bounding on to the platform, in a bad temper because he overslept and his landlady didn't waken him. As the train comes along we notice that the carriages are marked by printed bills on the windows-'Mr Brown's company, The Madman's Freak'-and that other compartments are set aside for the ladies. Though this is not an inexorable rule, it is very common. The 'boys' and the 'ladies' are often expected to ride in separate compartments. The manager sets the example by going with the men, and his wife heads the womenfolk in another compartment. And so, to a faint cheer from the little band of gallants who stand and look wistfully at us, we steam out of the station. If the journey is but a short one, it has not time to become monotonous. Should it be a long one, cards and papers help to while it away, and small-talk serves the same purpose among the ladies. There is a diversion when a busy junction is reached. There is almost certain to be a wait, but the monotony is broken by the arrival of other trains, and to the outsider it is interesting to see how one company hastens to the other to make inquiries about friends and colleagues, and to learn where they have been and whence they are going, and what sort of 'business' they have been having.

On the whole, then, this Sunday travelling is not as pleasurable as it might seem to be. In summer it is not so bad, and the passing landscape is rich both in beauty and novelty. In winter, however, it is dreary and cold in the extreme, and the difficulty of obtaining a wholesome meal is not the least of its many drawbacks. But the greatest drawback of all is the fact that it prevents those home associations, those Sunday gatherings in the domestic circle, which are such a happy feature of English family life. Let the reader, therefore, have a kindly thought for those people who are ever on the move yet never have the joy of feeling that they are a 'day's march nearer home.' When, on a raw Sunday afternoon in winter, he stirs the fire and gets nearer to its cheerful blaze, settles in his easy-chair with an engrossing novel, let him think of the thousands of players who at that moment are being whirled about the country in cheerless trains, to be dumped at twilight in strange towns, to find their way to strange 'diggings'-all that he may be able to go and see the play in comfort on a Monday night.

THE NEW CENTURY FRICTIONLESS MOTOR.

EADERS of the original article on the above subject in the November number of this *Journal*, fascinated with the easy, graceful glidings of the American condor, appear to be urgent for fuller particulars of the

earlier movements which lead to such bewitching results. For such enlightenment we must again turn to the safe and wonder-working book of nature, but they must be prepared for a complete contrast. No longer smooth, easy, almost indolent

circlings in air, but short, sharp, powerful, straining effort, sustained for greater or less periods as circumstances may require, on land. Of the mighty albatross, whose flight is longer and more steadily sustained than that of the condor, and is therefore more adaptable to man's use, we read: 'The weight of these large birds is so great, and the span of their wings so wide, that they have much difficulty in raising themselves into the air before flight. This they do, rising from the sea with outstretched neck, by striking the surface of the water

with great exertion with their feet for some sixty yards, when, tucking in their legs, they are fairly launched on their flight.' The condor runs in the same way on dry land before rising in flight. This creation of a sufficient momentum for man's purpose of flight might be more favourably imitated on a level road by a run of a few yards by one light of foot, ending with a sudden upward spring on outspread air-blades, or, so to speak, a tucking up of the feet before launching off on the supporting air. Or some might prefer to gain momentum by a launching of the aeronaut with his air-blades over a straw-padded track from a high swing. In each case, patient practice alone can secure the rapid setting of the air-blades to a new angle for the steady upward rise like a paper kite spoken of by Professor Darwin in closely watching the condor's gliding flight.

No doubt the chief difficulty at this point will prove, after sufficient practice, no greater than the first increasing of a cycle to full speed, or, better still, the first strike-off of a skate to full speed, or even the incredible skill and control of a figure-skater. Two things are essential to success: (1) the construction of the air-blade machine, which must be equal to meeting each and every movement of the condor as detected by Professor Darwin; (2) a strict course of training in the swift, regular handling of the air-blades to imitate the easy, lounging gait of the albatross.

Under the head of construction we discover from nature's repository how to add nearly a sevenfold supporting-power to the air-blades without increasing their surface. Professor Darwin distinctly notices the separate action of each large terminal feather in the condor's wing, no misty blurring of these feathers together. That such

work from each individual terminal feather is expected by nature the strained back-curve of each tip-feather in a rook when alighting testifies. Thus, by dividing the air-blade at its tip into seven terminal blades we gain a sevenfold support to the traveller, and nature bestows the greatest supportingpower in the least possible space. Next, attention should be drawn to an essential feature of each airblade-namely, a stiff, sharp fore-edge for cutting its way and even gathering pace from the opposing air. Another surprising but beautiful effect is displayed in nature's resourceful power of adding ease and elegance to the rapid flexing and expanding of the air-blades—an impossible feat if we think only of the opening and shutting of a hand-fan when supporting one-half of the aeronaut's weight; but by a simple but most ingenious twist of one joint in the air-blade all the terminal blades are brought on edge to the air to be flexed or expanded with the greatest ease.

Readers of this article are invited only to observe closely and imitate nature's incomparable contrivances to obtain as a reward a safe, clean, swift, domestic conveyance, well suited to new century traffic requirements.

Finally, what is claimed for such a machine is that man possesses in his own weight alone an inherent power of progression, ever at hand and independent of all mechanical help; also, that such air-blades can claim more weatherliness for meeting the ever-changing forces of the opposing wind by their flexing and expanding construction than has ever as yet been attempted. The skeleton of such a machine has been seen by the writer, and might on inquiry be on exhibition as a guide to the strength and weight of construction necessary.

THE 'FISHING LIAR' AND HIS VERIFICATION.

FISHING-NETS OF SPIDERS' WEBS.

By Louis Becke.

ANY years ago the writer was discussing with an eminent German naturalist—the late Dr J. S. Kubary, of Ponapé, in the Caroline Islands the habits and customs of some of the native tribes in the Western

Pacific Islands, and the extraordinary ingenuity they displayed in their manufactures. At the time, the doctor and the writer were walking along a narrow mountain-path leading to a native village on the island of Ponapé. It was early dawn, and every now and then our progress was barred by spiders' webs stretching completely across the path from branch to branch, and so strong that we had to break them down with a stout stick. I had never before seen webs of such extraordinary

strength and size, and of such wondrously beautiful construction. My friend, however, assured me that they are nothing in comparison to what, he believed, were to be met with in Eastern New Guinea, in the vicinity of Astrolabe Bay. He had, he told me, seen a published statement or a letter (I forget which) from Baron Maclay, a distinguished Russian naturalist, who lived for many years among the cannibal tribes of Astrolabe Bay, in which he affirmed that certain mountaineer tribes used these spiders' webs for catching fish in the mountainestreams.

Whether the Baron had actually seen the nets or the operation Kubary did not know; but that Baron Maclay would never make such an assertion without ample foundation he was certain. At the

same time, Kubary could not conceive how the webs were utilised for fishing purposes. His one theory, as he explained to me during our walk, was that the natives, by some cunning contrivance, were enabled to remove one of these gigantic webs en bloc —perhaps by cutting away the branches of the trees on which they were spread, and then placing the entire web across some narrow mountain-stream, and driving the fish into it. 'Some day,' he added, 'Maclay's missing journals of his discoveries and researches may be found, and we shall get at the truth.'

Baron Maclay, I must mention, died of fever in New Guinea, and his extremely valuable ethnographical collection, journals, &c. were never recovered—at least so far as the writer knows. His wife was an Australian lady, a daughter of the well-known New South Wales premier, Sir John Robertson, who was one of my earliest friends.

Years after my meeting with Kubary, I one day said to old Sir John that it was a great pity that his son-in-law's scientific notes had been lost; that I for one, and Kubary for another, should like to learn something about those wonderful fishing-nets of spiders' webs. The old gentleman's eyes twinkled as he stroked his long white beard. 'My boy, an ordinary Russian is always a good liar, an educated one a better; a scientist or a politician must be as good as a Persian. Maclay, being a Russian, and a very good fellow too, couldn't help exercising his natural talent at the expense of a German rival scientist. He was only taking a rise out of the Dutchman.'

Truth is stranger than fiction-how often we hear and say it! - and now after thirty years comes an irresistible and undoubted confirmation of the Baron's story in a book which is now before me. It is entitled, Two Years among New Guinea Cannibals: a Naturalist's Sojourn among the Aborigines of Unexplored New Guinea, and is by Mr A. E. Pratt, Gill Memorialist, Royal Geographical Society. Mr Pratt, accompanied by his son, had most exciting adventures in New Guinea during 1901-3, and tells them in such a simple, self-effacing manner that those who have been similarly situated cannot withhold their admiration. The photographs taken by him are most excellent, and I regret that those dealing with the especial subject of this article cannot here be reproduced; for he gives us, on page 262, the picture of a mountaineer native of New Guinea with his spider's web net, and on page 268 a vivid photograph of five of the mountain people engaged in fishing in a pool with these nets.

Now, let me quote Mr Pratt, and in quoting him I can absolve Baron Maclay from the undeserved imputation accorded to him by Sir John Robertson:

'One of the curiosities of Waley, and indeed one of the greatest curiosities that I noted during my stay in New Guinea, was the spider's web fishingnet. In the forest at this point huge spiders' webs,

six feet in diameter, abounded. These are woven in a large mesh, varying from one inch square at the outside of the web to about one-eighth of an inch at the centre. The web was most substantial, and had great resisting power; a fact of which the natives were not slow to avail themselves, for they have pressed into the service of man this spider, which is of about the size of a small hazel-nut, with hairy, dark-brown legs, spreading to about two inches. This diligent creature they have beguiled into weaving their fishing nets. At the place where the webs are thickest they set up long bamboos bent over into a loop at the end. In a very short time the spider weaves a web on this most convenient frame, and the Papuan has his fishing-net ready to his hand. He goes down to the stream and uses it with great dexterity to catch fish of about one pound weight, neither the water nor the fish sufficing to break the mesh. The usual practice is to stand on a rock in a backwater where there is an eddy. There they watch for fish, and then dexterously dip it up and throw it on to the bank. Several men would set up bamboos so as to have nets ready all together, and would then arrange little fishing-parties. It seemed to me that the substance of the web resisted water as readily

as a duck's back.'

Dr Kubary is dead; but I can well imagine how his eyes would have lighted up, and how he would have clapped me on the shoulder with delight, had he been spared to read this extract from Mr Pratt's volume. 'Ah, mine dear friendt,' he would have exclaimed, 'did I not dell you that Maclay vas not delling a fairy dale aboud dose spiders' fishing-nets?'

THE GARDENER.

My garden stretches to the sun,
But, O how faint and pale to see!
I love to think, when winter's done,
How gay my plot will be;

For though I cannot see them thrive, the Gardener keeps my flowers alive.

In spring, when lily-beds are white
With little bells that ring and sing,
And all green things that love the light
Are just awakening,

I half-forget how still and deep the Gardener puts them all to sleep.

And when the summer time is come,
And I am happy all day long,
The linnets, that to day are dumb,
Bear up my happy song

Above the very farthest star to where the white snow angels are.

When I kneel down to make my prayer Before I in my bed am curled, I thank the Gardener for His care

Though I sow seeds and till the sod, the real, true
Gardener is God.

B. M. DANBT.

RURAL WORTHIES.

By Sir Alexander Muir Mackenzie, Bart.

MONG the 'vanished hands' that haunt our memories of the days langsyne are the many worthies in humble walks in life, 'supers' on this world's stage, in front of which strut the great and the noble

-the lions, some of them in asses' skins may hapa useful, honest, and highly interesting class, for want of a better name yclept 'rural worthies.'

The most important of these, as carrying the social and commercial link between man and man, is certainly the mail or post carrier—the rural postman, not by any means, in the time of which we are commissioned to write, 'winged Mercuries.' Slow but sure, walking for the most part, sorting his bundles with scrupulous care-letters sealed, wafered, wondrously folded, some of them stamped, some 'franked,' social or political for the laird, news for the meenister from his boy at the academy, a cheery message from the soldier laddie to his father in hodden gray, one to the mither from the cherished lassie 'oot' at her first place; joy and sorrow, good news, bad news, 'crowns to be broke' (with swords), crowns to be made (with sickles)— 'Johnny the Post' moves among the citizens as a comet amid the fixed stars, as he and his kind have ever done since man first discovered how to communicate with his brother by scratches, coloured marks, or letters inscribed on bark, leather, papyrus, or paper. The acceleration of mails, coaches to replace the walker, express trains to replace the coaches, and (who shall say?) airships to race the trains. Evolution of post-running!

About the early forties, in the parish of Caputh, between Dunkeld and Spittalfield, started in life and along the road one John Stratton, who tells his

own story as follows:

'I was selected out of the scholars at Spittalfield School to commence post-running from that village to Dunkeld and back to Delvine and Gourdie, a distance of nearly twenty miles per day. This makes out one hundred and twenty a week, six thousand two hundred and forty a year; and

No. 498. - Vol. X. [All Rights Reserved.]

having been on the road for forty years, the distance travelled comes to two hundred and fortynine thousand six hundred, or ten times round the globe. I am now over eighty years of age. The penny post was not long in force when I commenced. I received ten pounds a year from the late Sir John Muir Mackenzie, and a penny for every letter I delivered; but there were very few letters at that time.'

Franking letters, the privilege of nobles and members of Parliament, had apparently ceased.

'My predecessor was one Johnny Lauder, of Dunkeld, who marched with a wallet over his showlder [sic]. I think I was one of the first to use a bicycle in this country, and when I first rode it into Dunkeld the town turned out to a mannot to say boys-to see this evil invention. I often walked over my twenty miles a day, being very fond of fishing and also of attending any musical meeting. I acted as precentor to the Free Church at Clunie, and had the pleasure of training an excellent choir.'

Johnny does not tell us that he applied for this post in the 'Establishment,' and only when refused transferred his services to the Frees.

'I had various incidents while on my travels. One night, about a mile from Deanscross, I saw something light on the road moving backwards. When, stick in hand, I stood it stood, and when I moved it moved. Murmuring "Ministers of grace defend us!' I advanced, and, lo! "it" was about a score of roe-deer, who bolted up the hill in grand style, greatly pleased no doubt at having frightened the "mere man."

'I knew I must see the White Ladye of Stenton some night, and so it was. One dark night, near the Stenton Bridge, there I espied a large white object-the Ladye hersel'. It moved about the road, as I did, guardedly; but when it turned, as if for me, I made a bolt for it, upon which it turned round and up the hill like an arrow, when I saw it was a large white collie. So much for the legendary ghost!

JUNE 15, 1907.

'On the occasion of the great flood in 1847 I had to take by the high ground to reach Spittalfield; when I got a boat, and sailed over fences and hedges to Delvine, where already horses, cattle, and sheep were being driven up to the Croft—the high ground of Inchtuthill.

'After my retirement I served on the School Board of Caputh, the first one elected, along with Sir Alexander Muir Mackenzie, Rev. (now Dr) Theodore Marshall, the late Mr T. G. Murray, Bailie Jack of Dunkeld, and Rev. Mr Macpherson, Free Church minister—a fine mixture of Whigs and Tories, on the whole quite harmonious.'

Charles M'Intosh of Inver was postman round and about this district. He is sixty-seven years of age, and has been runner on Tayside from 1858 to 1890. His father was a weaver until the factories dispossessed him and other small tradesmen. His uncle Charlie is immortalised in Robert Chambers's Threiplands of Fingask, when he gave the classic tune 'Braes of Tullimet' before the laird of that ilk and a jovial crew of sportsmen. M'Intosh's round would be about twenty miles a day, or six thousand two hundred in the year, totalling for thirty-two years' service about two hundred thousand miles. This was partly before the Highland Railway was made, and he says, 'I've seen us waiting the morning (?) coach, according to order, till sax o'clock at nicht! In 1877 he received a gold watch and chain in acknowledgment of faithful service from the inhabitants of Dalguise district.

Since his retirement he has been occupied with bugs and fleas, ferns and fungi, as Charles is an accomplished botanist, ornithologist, and whatever 'ist' describes best the searcher and devourer of the classic 'puddock-stool.' 'Geologist? Well, na, I havena great experience in rocks; but I have taken great observation of the different gravels used in the embankments of the Highland Railway. I have made many notes of the different floods on the Tay and Braan of no small value to the hydrographers of the Tay basin.'

Charles had many colleagues: Hugh Robertson, Butterstone; Andrew for Amulree. Andrew Robertson was called the 'grumbler,' on whom the young sprigs would play many a prank. He was too proud to use spectacles, but one day was obliged to put them on, to no effect, however, as a wag had previously abstracted the glasses, and he was seen peering through the empty rims! They would cut an inch or so off his walking-stick, which puzzled

the worthy man 'immense.'

'In my delivery, I fancy my experience is much the same as other postmen. Some customers were always expecting letters which never came, and for which I was held to blame, and others were always mighty curious as to the contents of other people's letters—a remarkable trait in the character of folk usually quite honest in other matters. My daily walks were much enlivened by my study of botany, while out of hours in the same pursuit I often may have committed "trespass," but

generally without much rebuke. Once, however, up comes a keeper-lad, and says he, "What are you deeing here?" "Boternising," says I. "Boter -what?" says he. "Is you a Latin name for trespassing? for that's what ye're deeing." We M'Intoshes of Inver have been precentors in Little Dunkeld Church for three generations, so that one of us might have been "hanged," as the precentor was when the meenister was drooned, the steeple dinged doon, and the bell drucket.'

He is no mean violoncellist, and, with his son Charles or neighbour Mr Sim, delights in rendering old Scotch music, the pathetic, as in 'Touch not the Nettle,' or in the wilder strathspey, say 'Pulney Loch' and 'Deil among the Tailors.' His rendering of 'Simon the Cellarer' is a treat reserved for the Brethren who are in the 'Light,' on the sacred festival of St John's Day, to whom he acts as

Grand Musician.

In his simple cottage you meet with a fine collection of dried plants and herbs, well-preserved bird-skins scientifically arranged, and many curiosities-inter alia, a remarkable conical stone with ring, which may have been a weaver's weight or primitive curling-stone, and an old hand-made gun —the rifling of the barrel shows very fine work and extraordinary mechanism. He is a scientific scholar and a 'gentleman' under the rough exterior of a rural postman.

John Houston, rural postman of Borgue, Kirkcudbright, has an extraordinary record: 'Entered the postal service from Kirkcudbright to Borgue in 1868. Journey six miles each way, but house tohouse delivery has increased the work, so that I walk near twenty-five per day. I have served thirty-eight years, and only for one week have I been off duty. A close observer of nature, I took careful notes of the weather during my "walk," and am known far and wide as a skilful weatherprophet, which is attested by many notices in public prints. I claim to be able to predict a storm four days in advance of others and be generally accurate. Of these it is my practice to issue forecasts from a "guy" on top of a pole. A white ball denotes fine; red and white ball, showers; red and black ball, change; red, much rain; black, very stormy; with notes written with chalk on blackboard.

Mr Houston has always been foremost in new inventions, such as rat extermination, speedy harvesting, automatic coupling, and a time-gun which proved a great success in Ibrox Park at a football match. He has also taken a foremost part in athletics, football, and cricket. There is a very pleasant notice of Houston in the Weekly Welcome for June 27, 1906, in 'Notable Men in the Ranks.'

The name of Edward Capern, the rural postman of Bideford, Devon (1819-94), deserves mention in any collection of rural worthies. His parents being poor, he worked at first in a lace factory. This tried his eyesight, and in 1847 he was appointed rural letter-carrier at Bideford, with a salary of ten shillings and sixpence a week. From time to time he contributed poems to the North Devon Herald, and a collection appeared in 1856, entitled Poems by Edward Capern, Rural Postman of Bideford. Landor, Tennyson, Dickens, and Charles Kingsley were subscribers to the book, which brought him one hundred and fifty pounds. His salary was raised to thirteen shillings a week, and he received a civil list pension in 1857 of forty pounds a year, which was raised to sixty pounds in 1865. Another volume, Ballads and Songa, was dedicated to the Baroness Burdett-Coutta.

The Helston poet-postman is noted as one of the latest Cornish rural celebrities, but that worthy himself declines to have his history published.

We have not to chronicle the deeds of any unfaithful post men or mistresses, such as pictured in the Antiquary, as we believe but few 'Jenny Caxtons' have to wait until their love-letters have been deciphered by the horn-spectacled old post-mistress, Mrs Mailsetter; still, I recall one instance, better

told perhaps in dialogue.

Scene: a Highland Lodge, nigh to the high pass in Drumochter Forest-laird in kilt and sporran, powder-flask, and shot-belt, fidgeting with his muzzle-loader. 'Mail's late, John.' 'I hear her; she's left Dalwhinnie,' answers John Crerar, who stands holding back the eager pointers, while Kitty, the white pony, stands sagaciously by. A merry tootle, and John Anderson pulls his four-in-hand up with jingling chains and rattling splinter-bars. 'Now, Rob, ye will be particular to deliver this in Dunkeld and bring answer back, as we are sair needing.' 'All right, Sir John,' answers the cheery Rob Stewart, placing the missive in an enormous pocket in a gigantic coat; 'I'll no' forget.' 'Eich, va!' chuck, chuck, from John, and away go the willing four on their fourteen-mile stage to Dalnacardoch. Next day no answer by return coach. Rob appears as usual. 'Did ye forget my letter, Rob? asks the angry laird. 'Dod, Sir John, indeed I did; and here's the letter,' producing it. 'Weel, Rob, dinna forget this time, or I'll'-Rest of sentence lost as the coach starts off at a smart pace. Now, the story as told to me has it that four times did Rob forget, and four times was chidden, till at last he fractiously exclaimed, 'Dod, Sir John, for guidness' sake tak' back your letter. I canna be fashed wi' it ony longer.'

STALKERS AND KEEPERS.

Amongst many notables, we select the Clan Crerar, long connected with Atholl and Dunkeld. The following notes were supplied by Ian, seventh Duke of Atholl, from chronicles of every person connected with his estates, and marked with unfailing accuracy:

'Alexander Crerar was "fowler" to the second Duke, and was living in 1745. The family came from Breadalbane, and according to legend were M'Intoshes. One of the clan, being pursued by his enemies, asked help of a basket or creel maker

near Dull. The gudeman bade him go into the house, change his clothes, and assume the part of a "creel-maker;" and if asked who he was, say "Criathar" or "Krear," ar meaning a riddle or a sieve. Hence the name Crerar, or, as Scrope has it, Crerar.

'John Crerar came to Blair-Atholl in 1776, and assumed charge of the forest, assisting the Duke to clear the ground of sheep and of poachers. He lived at Pulney, and M'Intyre had charge at Forest Lodge. Scrope bears witness that he was "honest, faithful, a most attached adherent, possessed of astonishingly active powers and admirable skill in stalking and shooting the deer." In his off-moments he was a composer of music, being a pupil of the famous Neil Gow (who died 1807), whom the Duke paid for instructing his favourite stalker.

'His son, Charles Crerar, served the Duke of Buccleuch when tenant of the Atholl Forest, and ultimately went to him at Langholm as factor,

where he died full of honours.

'John Crerar, believed to be the son of Frederick Crerar, feued the lands of St Adamnan, which was afterwards the residence of the Duke of Atholl when Dunkeld House was pulled down in 1828. This John began life as keeper at Dunkeld, chiefly employed in killing roe-deer to protect the then rapidly growing forest, and earned the sobriquet of "Crerar Dhu nan erbchen" ("Black Crerar of the roe-deer"). He walked into Delvine, his shoes and stockings in his hand, about 1820, and saw his first pound-note from the late Sir Alexander Muir Mackenzie. He became whipper-in to John Muir Mackenzie's Harriers, was raised to keeper, fisherman, and stalker, and finally land-steward, in which capacity he served the present Baronet for near forty years, dying in 1890. A true sportsman all round, shooting, curling, fishing came naturally to him, as did managing his farm, having a surprising success in shorthorns, at that time coming into notice. He and his laird, being in advance of their time, were more than once nearly stoned off the field when they brought some new-fangled invention to work, such as reaping-machines and potato-planters. and loud and deep were the execrations when a steamengine was set to work to replace the dreary round of the four-horse mill. Needless to say, he was a Tory of the Tories, and about the last of that gallant crew.

John Ferguson, ferryman at Caputh from 1850 till 1887, son of Sandy Ferguson, was brought to Caputh from East Ferry, Dunkeld, when that ferry was abolished on the building of the brig at Dunkeld, for 'his skill at the oars.' The ferries in those days were simply cobles of various sizes. (See description in Caputh Ferry, by Sir A. M. M.)

The chain-boat put on in 1833 would be John's first charge, under his father, Sandy, and well he understood his boat and his river. Never would John go out if 'she' rose to a certain mark; neither when 'fou' nor 'sober' would he budge but when it was safe. Many a risk, however, was run when

the river was in high spate, and an uprooted tree or large block of ice would strike the chain or one of the twin boats, and unless speedily freed would inevitably have wrecked the boat, which might be replaced, and drowned John, who could not be so easily replaced. In loading his boat John exercised strong discipline. Like his prototype Charon, he would, if not actually yet morally, 'batte con remo qualcunque s'adagio,'* and soundly rate the loiterer; and no one dared land until he had made all secure with his chains and gave the word, 'Noo than.'

In half-spate the Lady Jane or Lady Mackenzie would rattle merrily across 'her lane,' when John would come up with a bleary eye to 'ha'e a crack,' in which Lady M. always readily joined. One day it was: 'John, I see that "she" goes quicker to Caputh than she does to Murthly.' 'Ay. She's like yer ladyship, keen to get hame.' The following was his reply when called upon to respond for the 'Navy' at one of our convivial dinners: 'Been mony times round the warld, mair on fresh water than many wha ca's themselves sailors ha'e been o'er saut!'

When the river was low Mr Keay used to take the ford and evade the toll, but he was greatly astonished when one day the river suddenly rose, and he shouted to John to ferry him across. 'Ca awa', as ye're used to,' was the unexpected reply. Others trying the same trick might get off the track and into deep water, from which John would not rescue them without receiving his obolus.

One to use the ferry in natural course would be the village carrier. Old Rob Gellatly, his broad bonnet tightly drawn down over his brows-which bonnet never came off for laird or ministertrudged weekly alongside of his old white mare to Perth, fourteen miles each way, paying two tolls, besides the ferry dues. There he would execute the various and varied commissions, from a sack of meal to a 'wee bit bairnie's printed frock,' a plug of tobacco, or a packet of pins, and naturally all the news and gossip of the great city were imparted to the quiet, stay-at-home 'weavers' of Spittaly. Telephones and steam have now thoroughly abolished this class of 'rural celebrities' or worthies. Rob could sing with rare expression that delightful pastoral ditty:

Oh, Johnny's content . . .

And his wee little bairnies rin toddling hame.

Many a quaint reminiscence could be quoted of the sayings and doings of many a humble worker in rural life. The pendicler, the joiner, the weaver with small holding, the fisherman, the mole-catcher, are of the 'old order' now vanished off the land in these days of progress.

НОРРУ.

CHAPTER XI.

IVE long years had passed since Hoppy's disappearance, five long years of reproach and sorrow for both Sir Ralph and Mirabelle. The latter, under the chaperonage of an aunt, now made her home with the

General, her father having eighteen months before joined a 'party' where he was at last certain of being always in the 'majority.' He had left an immense fortune, and his pretty daughter, the great heiress, was besieged by suitors of many degrees. But, changed and sad, though more beautiful than ever, she refused all pretenders to her hand, and lived a quiet and retired life, doing much good in an unostentatious way, with the stern old man, the sharer of her burden of remorse.

Vare alone enjoyed any degree of intimate friendship with her. He had become Sir Dethe Vare now, succeeding to the title on the death of a cousin, and had left the army, retiring with the rank of major. He had never given up his hopes of winning Mirabelle, but had been much too clever to force the pace until he believed that time had been given ample opportunity to exercise its powers of oblivion. Of late he had ventured to press his suit, for

he thought that he had discovered unmistakable symptoms that the cure he had so patiently awaited was on the way to accomplishment; and his supposition was so far correct that Mirabelle had eventually been induced to say, 'Bring me certain and positive proof that Hoppy is either married or dead, and I may then, perhaps, seriously consider your proposal.'

'But,' he urged, 'you set me an almost impossible task. Sir Ralph has tried, private inquiry agents have tried, and I also have tried to find some clue to his whereabouts, but without result. It is tantamount to telling me to go about my business for ever, and all because a man gets into a rage and

deserts you.'

Five years earlier such a remark would have caused Mirabelle to flare up and lash the reckless offender with her ready tongue; but she had learned a bitter lesson since then of the endless misery that can be caused by a hasty temper; so, stifling her anger, she quietly replied, 'I am sorry, Sir Dethe; but I cannot say more than that,' and abruptly terminated the interview.

A week later he sought her again, and—Sir Ralph being also present—made the following

startling announcement.

'I have succeeded,' he said, 'by an unexpected

^{*} Dante, Inferno, Cary's translation: 'beats with his oar whoever lingers.'

HOPPY.

piece of good luck, in coming across certain traces of Hoppy, which I have some alight grounds for hoping may eventually lead me to his retreat. I leave London to-night, and shall probably be away for some little time. I won't say more now than that I will, of course, wire to you if I find him; if I don't, I will tell you all about it on my return.'

'Oh, that's all nonsense, Vare!' broke in Sir Ralph in great agitation. 'It won't hurt anybody to tell us all you know now, surely?'

And Mirabelle cried, 'Ah, yes, Sir Dethe, it is cruel to keep us in suspense like this.'

But Vare shook his head. 'I am sorry, Miss Melgrove,' he said, looking her full in the face with a glance replete with meaning; 'but I cannot say more than that.'

And the girl, recognising her own words of a week ago, had to content herself with shrugging her shoulders; and taking the mystified Sir Ralph by the arm, she led him haughtily out of the room.

Crossing that evening to Paris, Vare caught the 'Rapide' from 'La Ville Lumière' to Marseilles, and embarked in a French steamer at that busy port, the termination of a pleasant thirty-six hours voyage bringing him in sight of the African coast and a dazzling white sugar-loaf streaked with horizontal brown lines, which he learned was the town of Algiers. Here he landed, and, taking up his quarters at a hotel, proceeded to prosecute certain inquiries. As a result, he discovered that his London information had not been at fault, and that Hoppy had actually arrived in Algiers shortly after his disappearance from the former town. But beyond that he could not carry the trail; the man appeared to have been swallowed up, and he was disconsolately thinking of giving up the search, when he knocked up against one of those unexpected pieces of good fortune which now and again come to us at the eleventh hour, when the accomplishment of an undertaking appears hopeless.

Sitting one afternoon, sipping his coffee, at an outdoor café, and watching the motley crowd, he remarked a man, whom he recognised from his dress to be a soldier in the Foreign Legion, attentively regarding him from the opposite side of the street. Presently the fellow crossed the road, and sauntering towards him with an easy swagger, to the intense disgust and astonishment of the exclusive Englishman, pulled up a chair and installed himself, an uninvited guest, at the indignant baronet's

'Captain Vare, I think?' he asked in a refined and gentlemanly voice; and, noticing the other's look of amazement, added with amusement, 'Met you at Aldershot in the good old days, you know.'

'You have the advantage of me, sir,' snapped Vare, scenting that unpleasant thing—to such men as he—the social failure. 'Might I ask your hame?'

'You might certainly,' drawled the other, 'but really it wouldn't interest you if you heard it. Many of us who have gone under, from one cause or another, find our way out here, and I shouldn't have bothered to speak to you, only I fancied, foolishly perhaps, that your presence in this hole might in some way be connected with poor old Hoppy of ours, who was once in your regiment, you know. Ah, I'm right, I see, after all!' he exclaimed as he saw Vare's sudden start and the look of eager interest that now replaced the haughty stare with which he had at first regarded his unwelcome companion. 'Hoppy was my chum in this cursed country, and so I dare say you won't mind having a drink with me now, eh?'

'Of course, Mr-Mr'--- He paused inquir-

Smith—let us say Smith; it's an excellent name,' supplied the other, with a grin.

*Certainly, Mr Smith, with pleasure; and allow me to say that you are just the very one person in all Algiers with whom I should like to have a

And talk they did for a good hour or more, and Vare learned that Hoppy had, nearly five years previously, joined the Foreign Legion under the name of Eustace, but that he had discovered a previous army acquaintance in 'Mr Smith,' and, respecting each other's confidences, they had become great pals, with a friendship that had waxed strong and enduring. Also, that two years afterwards he had been selected for promotion, and sent down to Bouc-al-Aran as one of the non-commissioned officers of a party of black troops who were to form the escort of an expedition which was going 'the devil knew where.'

'Of course we weren't told what the game was,' added his informant; 'but we guessed that it had something to do with interfering with some similar one of our own—British, I mean—because Hoppy was taken over the heads of heaps of older non-commissioned officers simply because he spoke English. Oh yes, I know there was I,' he laughed, noticing Vare's look of interrogation; 'but old Hoppy was an awfully steady chap, you see, and—well, most of the rest of us have our little faults. No; I shouldn't ask anything about that expedition,' he went on reflectively; 'it's rather mysterious, and a sore subject, I think, with the authorities.

'You see, Escheaux, who was sent in command, was not only a clever fellow, but—well, not exactly a good Republican; and I dare say they were glad to get rid of him. Anyhow, nobody came back, and that's three years ago, and it looks to me as if the whole lot had been wiped out. Take my advice, lie quiet a bit, and I'll try to find out something for you. I have a chum in the headquarters office here—a clerk who knows lots of funny things—and I'll get at him over a good dinner, and see what he can tell me about it.'

'Perhaps,' said Vare with some hesitation, 'you

may not be particularly flush just now; and as er—this is my business, I hope you won't be offended if I offer you'—

'Thanks awfully. Hoppy was my friend. I thought that I had made that clear to you,' cried the soldier, reddening. 'Meet you here same time to-morrow. So long;' and he stalked away, leaving Vare looking rather foolish as he angrily twisted his moustache and muttered, 'Silly ass! Fancy a private in the French Foreign Legion having any pride left whatever!'

'It is as I thought,' announced Mr Smith next day as he met Vare at the café. 'The fellow in the office tells me that although Escheaux's people have long been applying for information about him, they have none to give them. They tell them-but I don't believe it-that they have sent several native messengers from Bouc-al-Aran at different times, with instructions to try to trace the expedition, and bearing orders for its recall when found. But nothing has come of it, and things have been so upside-down lately that there doesn't seem much chance of their taking any more trouble about the matter. It is only Escheaux and the other officers that they would bother about, you see; the rest—only a few d—d foreigners and a mob of niggers-don't count. So they just tell any inquisitive relatives that the mission is still in the wilds, and there it will stick, so far as the Government is concerned, until only its bones are left.

'I shouldn't stir up the mud if I were you; but if you have the time and money, get a caravan together—big-game shooting, you know—and start on the hunt yourself. My pal up there tells me that he thinks he made a few rough notes of the orders given to Escheaux when they passed through his hands for copying; but of course that's all on the strict Q.T., and if he finds 'em you mustn't give him away by letting on to a soul that you know anything about 'em whatever.'

'Not likely,' replied Vare; 'and I think your plan a capital one. And as I have plenty of money as well as leisure, and a very particular desire to ascertain Hoppy's fate, if your informant can give me an idea as to what part of this godless country the expedition was to make for I'll certainly see if it can't be managed.'

Two days later Vare was in possession of what he wanted. To find his way to a spot more or less vaguely indicated on the map by certain degrees of latitude and longitude, and to stay there until he received further orders, were the most important points of the document, which purported to be a hasty and surreptitiously obtained copy of the instructions given to Captain Escheaux for his guidance on his scientific expedition.

'I hardly know in what manner to express my gratitude to you, Mr Smith,' said Vare as he finished studying the paper, 'for the ready help you have given me; and if you would now tell

me how I can be of any service to you, you will much increase my obligations.'

'Take me with you on this hunt,' came the quick reply, 'and I'm sure that you won't regret it. I know,' the man went on shyly, 'that there's the question of buying my discharge from the Legion. I—er—haven't the necessary funds available just now, but if you could advance me the money I should soon pay you back in service, for I should be worth half-a-dozen men who didn't know anything of the country.'

Vare held out his hand. 'Consider it done,' said he warmly; 'that is to say, if I decide to go. But it will be as a friend and companion, not as a hired organiser, and we'll cement the bargain by your dining with me at the hotel—yes, just as you are—and we'll talk over our plans in comfort.'

comfort.'
Mr Smith grasped the outstretched hand eagerly.
'Thank you,' he said, and his voice was unsteady.
'I shall not disappoint you;' and then the two men wended their way to Vare's palatial hotel, where their appearance together on such evidently confidential terms caused no little astonishment and comment.

'Sir Teeth Bare!' announced the new footman, as he flung open the door of Sir Ralph's drawing-room, a few days after the discovery at Algiers, and ushered the amused little man into the presence of the General and his 'adopted daughter,' as the old soldier now invariably called Mirabelle.

'Well?' The question broke from them both

simultaneously.

'You shall judge for yourselves,' replied the new-comer gravely, as he shook hands. 'I'll, tell you all I have found out since I saw you last, and you two shall decide as to what shall be done next.'

Then he related the particulars of his quest, its many disappointments, and its final success. 'And now,' he ended, 'the matter rests with you. Am I to go or not?'

'Go,' exclaimed Mirabelle instantly. She had never doubted it for a moment.

'Ay, go, Vare,' echoed the old man, 'if you will undertake such an apparently hopeless task. You have done splendidly so far, and who knows that you may not even yet succeed?'

'That is settled, then,' cried Vare cheerfully; and then the three of them entered upon an animated discussion as to the best means of organising, and especially who should pay for the projected expedition into the unknown.

'May I hope?' whispered Vare presently, as, the General having strolled to the window, he rose to make his adject.

make his adieux.

'You know the condition,' answered Mirabelle under her breath: 'positive proof that Hoppy—that Hoppy cannot come back;' and the tears sprang to her eyes at the thoughts which Vare's story had conjured up.

The little man ground his teeth as he walked rapidly towards his club. 'She cares for him as much as ever, I verily believe,' he grumbled. 'I was a fool to tell her the truth. It seems to me that I am growing quite idiotic in my old age'—he was under forty—'getting quite enthusiastic over Smith's yarn, and letting myself in for a hunt for a fellow whom I hate, and who, if I find him, will certainly deprive me of what I desire most in all the world to win.'

But Mirabelle, on her knees in her bedroom, with clasped hands and streaming eyes, prayed, 'Dear Lord, bring him back to me. Let not the death of my loved one lie heavily on my soul.'

Vare spent the next few weeks in busily preparing for his 'trip after big game,' as his expedition was considered by his friends, for he kept its real object a secret. Several of them wanted to go with him; for though he was the last person they would have expected to take to this kind of thing, he was really not so effeminate as his appearance suggested, and his wealth was a guarantee that, whatever the sport, he would at all events do the business in comfort. But he would have none of them. He had a companion, he told them, waiting for him in Algiers; and as his hunting-grounds were far from the track of civilisation, the transport of baggage, even for two only, was quite as much as it would be possible to provide for.

So the half-pay captains and impecunious toadies were choked off, and the sportsman quietly slipped away from London alone. When a wire reached Sir Ralph, a month afterwards, despatched from Boucal-Aran, containing the laconic statement, 'Start to-day,' those to whom he communicated the—to him—important intelligence, replied, 'Really?' or 'You don't say so?' or something equally inane, accompanied by that vacuous expression of countenance that betrays perfect ignorance of the matter under discussion.

(To be continued.)

UNNECESSARY NOISES.

HE extraordinary increase in the variety of unnecessary and irritating noises in modern city life is beginning to attract the attention not only of the busy workers whose nerves, by reason of this never-

ending din, are continually on the rack both night and day, but also of the medical profession. Work has to be done, business transacted, sleep attempted, to the strains of the piano-organ, the melancholy dirge of the street-singer, to the bawling of 'caowls' and 'mieulk,' and the yells of 'orl the winners.' Through all these tortures runs the continuous hum of street traffic, the birr of the motor, the houk of the motor-bus, and, worst of all, the steady grind and shake of the tractionengine. No wonder that diseases which are directly attributable to disturbance of the auditory system are very much on the increase. At a conference of medical men organised by the Street Noise Abatement Committee of London, Dr T. B. Hyslop gave it as his experience that a much larger proportion of patients are now being treated for complaints connected with the ear than was formerly the case, and the influence of undue noise on infant mortality is becoming very serious. Even when one is asleep, noise affects the brain; and in a busy town refreshing sleep is out of the question.

In New York there is a Society for the Suppression of Unnecessary Noises, organised by an energetic lady, Mrs Rice. She hopes, with the aid of a number of prominent men, to secure in the first place relief for the hospitals. This is certainly a step in the right direction, and one which the London society might take a note of. She proposes that car-bells should not be rung by cars passing

any of the great hospitals, and appeals to the automobile clubs to secure co-operation in order that when cars are passing hospitals noises may as much as possible be avoided. Motorists in our own country might well remember the existence of hospitals. Of course it would be impossible to lay down a hard-and-fast rule that horns are not to be blown in the vicinity of hospitals, because very often it is necessary to do so; but there is a very great deal of unnecessary tooting, and nothing irritates the nerves of a sick person so much. But besides this Society for the Suppression of Unnecessary Noises, the Americans, always practical, have constructed a steel bridge which is to all intents and purposes noiseless. The device is very simple: merely the laying of eight inches of ballast on a bed of steel, upon which the ties are placed instead of upon the ironwork, with the result that the noise of crossing the bridge is reduced to a minimum. This invention, if we may so call it, may prove to be of great value in diminishing the noise of the elevated railways in the great cities of America, the annoyance from which is said to be almost unbearable. It is most certainly to be desired that inventive genius should be devoted to discover methods whereby the increasing discomforts of modern life caused by the multiplication of noises may be alleviated.

It is evident that this question is also with us becoming an important one, almost in truth a national one, in view of the pronouncement made by eminent physicians that one of the great contributory causes of physical deterioration is the impossibility of the young, and indeed the old, getting proper sleep in our big towns. It should be known that the Street Noise Abstement Committee are making great efforts to induce the

Thus, at the Medical legislature to interfere. Congress already alluded to the following resolution, the terms of which demand close notice, was carried: 'That legislation should provide for prevention by the police of street shouting by coal or other hawkers, costermongers, milkmen, and vendors of newspapers; of organ-grinding, of itinerant brass bands and other forms of street music; that it should also provide for the effective supervision, regulation, and control (as to speed and otherwise) of all classes of vehicles used for the carriage of passengers or goods, such as motor-omnibuses, traction-engines, lorries, and carts using the public thoroughfares; for the direction of the routes through which such vehicles shall be allowed to pass, and for the entire prohibition of noisy traffic between the hours of midnight and 6 A.M.'

If this resolution be analysed it will be seen to divide itself into two parts, which may be labelled 'noises ancient' and 'noises modern.'

The truth is, that while people have suffered and complained from time immemorial about the first class of noise, it has been the advent of the snorting, rattling, rumbling, horn-blowing motor traffic, defined by Mr George R. Sims as 'a Gargantuan-Gilbertian Grotesquerie,' which has made the long-suffering worm of a public turn, and directed general attention to the physical results on the national welfare entailed by the coming of the

new locomotion.

It is really on this problem of motor traffic and how it is to be conducted that the question of unnecessary noises lies. The other nuisances can be dealt with in a subsidiary way; but were it not for the excruciating noise made by the new traffic it would have been next to impossible to arouse such public interest in the manifold cries and sounds which have been with us for so many years as to lead to any hopes of effectual measures for their suppression; and a point which should be remembered is that organs and brass bands are the 'people's music and beloved of them.'

Before dealing with noises modern it may be as well to consider noises ancient. The list, indeed, as enumerated in the resolution, is by no means complete. For instance, it does not include the practising of church chimes, the unnecessarily loud striking of clocks, or the rumbling of carts on rough pavements. Some noises which our ancestors had to submit to have disappeared, such as the tolling of the curfew-bell and the cries of the watchmen as they made their rounds. It is only within recent days that the keeping of poultry in towns has been prohibited as a nuisance. Curiously enough, there is no law against the keeping of pigeons, an anomaly which should be looked to, as these birds, if kept in large numbers (as they sometimes are), can become an appalling nuisance to light sleepers.

It must not be supposed, however, that the previous generation was oblivious to the annoyance caused by street cries. Thus the inhabitants of

Montagu Square in London had the good fortune to have a private Act of Parliament passed in 1813, by which it was made illegal for itinerant street vendors, musicians, and newsboys to shout or otherwise annoy the inhabitants of the square, who had the remedy of being able to bring the offenders before the magistrates. In 1897 a lady had the courage to put this Act into operation by summoning to the Marylebone police court three noisy newsboys who persisted in causing annoyance by shouting while selling newspapers on Sunday morning. The case attracted considerable attention, and was perhaps instrumental in initiating the campaign against such street noises as organs and costermongers' cries begun by the Betterment of London Association, and carried on by the Street Noise Abatement Committee. It has been successful to a certain point, a bylaw having been passed by the London County Council prohibiting the calling of vendibles to the annoyance of the inhabitants; and as regards organ-grinding and street playing, if a sufficient number of householders can, in any defined locality, be got to sign a petition to the Chief Commissioner of Police, asking the support of the police to prevent such nuisances, the Commissioner, on receipt, notifies the local authorities, and then notices are affixed in prominent places bearing that 'Organs and street cries are prohibited.' It is true that these notices do have some effect; but if they are disregarded the onus lies on the individual householder to come forward and put the machinery of law into motion. What is wanted is that these noises shall be made a police offence, such as can be dealt with by the police direct.

All the same, though organs, cries, and their kindred pests are a horrible nuisance, it is seldom, except in cases, which are rare, of persons who are afflicted with peculiarly nervous organisations, that this class of noise can be said to be actually detrimental to health. There is, of course, the case of John Leech of immortal memory. His was a temperament so constituted that street noises had an extraordinary wearing effect on it. Mr Frith, in his memoirs of the great caricaturist, describes meeting him at dinner the day before his death. 'In reply,' he writes, 'to my inquiry how he was, he said he should be well enough if he could get away from the terrible noises that never seemed to cease in his neighbourhood. Back and front of his house, he said, noises of all kinds were incessant; his servant's time was taken up in sending away street musicians; the cries of the hawkers were awful; work was impossible except under agonising conditions. A butcher's cart passed and repassed his house repeatedly with a dog on it that barked continually. He then mentioned other nuisances, and concluded his grievances with a sentence I shall never forget: "Rather, Frith, than continue to be tormented in this way, I would prefer to go to the grave, where there is no noise." It is hardly too much to say that the continual strain of having to work under these conditions,

with the nerves at full tension, killed Leech. Carlyle's endeavours after quietness for sleep and literary work had something of the grotesque about them. Froude tells us that the cocks around Cheyne Row had been finally abolished, 'purchased out of existence by a five-pound note and Mrs Carlyle's diplomacy.' At a cost of one hundred and seventy pounds he built for himself in 1854 a sound-proof room on the house-top, where he might work without interruption at his Frederick the Great. It seems to have been a doubtful success.

Regarding modern noises, it may be that the Moloch of motor traffic is claiming its daily quota of victims. It is, of course, an established fact that the ear gets accustomed to noises which are constant by night, and that after a short time actual sleep is not, in the majority of cases, interfered with. Not only that, but the converse holds good. On coming to the country, men accustomed to city life find the silence too oppressive; the chirping of the birds irritates their nerves much more than the rumble and roar of the city. The serious thing is the medical testimony that sleep obtained under such conditions is

no restorative to jaded nerves.

Dr Hyslop, in a pamphlet on Noise in its Sanitary Aspect, says: 'The fact that town life under existing circumstances makes it impossible to obtain adequate brain-rest goes far to cause the prevalence of insanity, about which the various municipalities are so solicitous, but which in my opinion they could do much more than they do to prevent. And again he says: 'The value of sleep as a restorative is more dependent upon quality than quantity.' Here, then, is the explanation of the request that noisy traffic shall be entirely prohibited through residential streets between midnight and 6 A.M. While we are in full sympathy with the object of the resolution-namely, to secure a diminution of the noise-fiend in our cities—this does seem a somewhat sweeping demand, and one is not inclined to envy the drafter of that particular clause of the Bill if ever it comes before Parliament. What, for instance, are to come under the definition of purely residential streets? And still more important, what is, and what is not, noisy traffic? These be problems which may come before our legislators. It must, in this connection, be remembered that the motor has come to stay. It is no longer merely a rich man's toy, but one of the commercial assets of the nation; and the regulation of the structure, both internally and externally, is one of the great problems of the future, for the motor is decentralising all our big cities, is carrying towns to the country, and is also carrying town noises to the country.

Motor traffic can be divided into two classes—the pleasure motor and the commercial motor; and the latter again, as in the case of railways, into passenger and goods bearing machines.

The ordinary pleasure motor, if properly driven, is, so far as noise is concerned, more or less bearable. True, the often needless repetition of the pheut, pheut

of the pneumatic horn is not a cheerful sound, nor does the burr of the passing car tend to soothe the nerves; but these sounds, per se, would not be sufficient to found such an indictment against the perpetration thereof as to make any attempt to induce the legislature to interfere likely to succeed. But when we come to the heavier machines of commerce it is a different matter. Take first the motor-bus, the numbers of which are increasing day by day not only in London but in all our large cities, and which are a great thorn in the side of the railway companies. These motor-buses, even in cities which have electric tramways, are striving to oust the existing systems. Whether they will succeed or not is for the future to show. But the question directly concerns a large section of the community -those who have houses abutting on the routes by which they travel, especially that large class of workers who reside outside the immediate radius of boroughs in suburban villas, which, if not actually jerry-built, have at any rate comparatively light foundations.

The internal noise of the Juggernauts is being dealt with in London by the Commissioner of Police. For some time (longer, it is said, than was absolutely necessary) no notice at all was taken of the internal groanings and clankings of the primitive motor-bus; now that question has been taken up and the extra noisy ones have been dismissed the streets. But that is in London; other cities have yet to face the problem of the noise made by the interior of motor-bus machinery, and it may be that they do not all possess the plenary powers of the London police.

But what is more important—and here we come into contact with the motor goods traffic—is the effect on roadside residences of the continual passing of weighty vehicles on roads which are not built for heavy traffic. It may be that this hardly comes within the scope of an article devoted to noises; but the question is so very nearly allied to it that it may be lightly touched upon, and for this reason: the rougher and lighter the road the more noise and the more vibration will there be.

What is wanted is a road on which there will be the minimum of noise. Incidentally from this point of view, there will probably be also the minimum of dust, for noise and dust are twin-sisters. Is there no panacea for the evil? It may interest some readers to know the remedy adopted in California to overcome the dust nuisance. It is the application of oil in a very scientific manner. The oil is put on in three applications. It must be hot when discharged, and must not be poured on indiscriminately but drilled into the dust. A machine has been devised to meet the requirements of the process. A big tank mounted on four wheels drags a sort of tender-box supported by two wheels, into which is run from the tank supplies of oil. This box has a furnace under it which heats the oil, and attached to it is a drag looking somewhat like a hay-rake. A number of curved rods or fingers go out from the

bottom, and these are drawn through the dust along the road. They make little furrows in the dust, and into these furrows through a series of pipes is discharged the oil. A second finger or sort of thumb arrangement, fixed farther back, turns the dust over the oiled furrows, and the surface is then left to absorb the oil, a process which requires about an hour to effect. A roller is then drawn over the oiled surface. This has to be repeated three times, with a diminution in the amount of oil used each time. Now, oil is a deadener of sound, and it is possible, and even probable, that if this process is the success which is claimed for it, and the cost be not prohibitive, a remedy for the dust and noise nuisance both in and out of our towns lies to hand.

But however the roads be treated to minimise dust and sound, there will always remain the vibration caused by the passing of the weighty vehicles, and this is the most serious of all the charges, because one does not see how it can be prevented except either by practically relaying the roads and streets or making new highways for motor traffic alone. It is a fact that the walls of houses abutting on roads which are much used by the heavy goods motors have cracked, and that the houses themselves shake as in an earthquake. Many of them will soon have to be abandoned. Taking all these facts and arguments into consideration, it will be seen that there is a prima facie case for urging the legislature to interfere, and to attempt to devise some scheme which, while not interfering with a British industry which is also an aid to trade, will give some protection to the present and future generation from the results which our medical advisers threaten will overtake those who live continually exposed to them. And as the greater includes the less, so may those to whom life is made a burden by reason of the itinerant musicians of their own and other countries live to realise that the coming of the motor was a blessing in disguise.

RUTH; OR, THE CLOTHES-PINS.

CHAPTER IV.

NE day, after a long walk, I returned towards evening to mine inn, and sat down before the fire to wait for tea; for, though it was now the summer season, I still loved to see a cheerful blaze upon the hearth. My mind

was preoccupied with certain abstruse questions I had been studying during the day, and, falling into the current of my previous reflections, I said to myself, 'What if Gottlieb Wernsdorfius be right, and there is a sympathetic affinity between atoms that have once been related, at however remote a period? The needle feels the influence of the pole at any distance, and why should the subtle sympathy of related atoms be wholly destroyed by mere transmutation? Matter cannot perish; this world of ours floating in the ethereal firmament has not lost or gained one atom since its creation. The population of the universe may increase, but the earth supplies the food on which the multitudes thrive and grow, and they in turn return to the earth again. The atoms of which we are composed but change their groupings and form new combinations, like the glasses in a kaleidoscope: the sea may become a cloud, the cloud a shower, and the shower a river; and the cloud and the river may travel far over the face of the globe, but nothing is lost. The river will find its way to the sea again, or will water fat pastures, which will breed fat sheep, which in turn will make fat men. The atom remains imperishable; it is the indivisible unit of which created matter is the sum. Why, then, should not its sympathies survive and remind us of their existence in every fibre of our brains and nerves? We all know that there are certain visionary localities which are perfectly familiar to us in our dreams, though we have never beheld them with our waking eyes; and, again, that there are places which we have never seen even in our visions, yet which strike us with a strangely familiar air when we behold them for the first time.

"Why, this very village in which I stand'—I was sitting in my easy-chair, as it happened, but my argument did not halt for such a trifle— 'this very village was familiar to me the moment I entered it. I had never set foot here before, or even heard its name; yet the moment I did, every house assumed the aspect of an old friend, and I could have told at once where to find the shop with brass thimbles and bottles of sticky sweetmeats in the window, the cobbler's stall, or the smithy's forge beyond the church. How are these things to be accounted for unless on the theory of what the old Wittenburg doctor calls in one of his jaw-breaking sentences "before-begotten atomic relationships"?

'Who knows,' I exclaimed aloud, forgetful of all save the subject of my meditations, 'but that many of our sympathetic feelings are reminiscences of

some former state of existence?'

'Ay, truly, who knows?' whispered a voice so close to my ear that I started up, and, facing about, saw to my surprise the smiling face of a jolly little man dressed as a Quaker, who was standing looking through the window at the other end of the room.

I had not heard any one enter, and felt so amazed that I stood hesitating to utter the question which trembled on my lips, when, turning towards me, he said in the most natural way possible, 'Verily, friend, I think we shall have a stormy night.'

I glanced at the sky without, but all looked to me serene; nor could I discover any indications from which my companion could form such an opinion as he had expressed. I therefore merely answered, 'Indeed?' somewhat interrogatively, when I was again startled by hearing these words whispered as if at my ear:

'Thou wonderest how I can predict a storm with such a lookout?'

This was so precisely the case that I advanced a step towards the Quaker, determined to put an end to my perplexity, when the girl coming in with my tea stopped me by inquiring what I would be pleased to have with it. This weighty question settled, I can hardly express my amazement at observing that she left the room without taking any notice of the stranger, but apparently walked right through him on her way to the door.

I felt so confounded at this that I positively rubbed my eyes to be sure that I was awake. However, regaining my self-possession, I said as calmly as I possibly could, 'Will you do me the pleasure, sir, to take tea with me?'

'Friend,' replied the stranger, 'I thank thee for thy civility, but must decline thine offer, for I have to treat this night of important matters with my worthy ancient friend William Penn.'

This statement led me to think I was in the company of a madman, so I merely observed, 'The person you name has been dead nearly two centuries. How can you, then, pretend to have business with him?'

'See and believe,' whispered the same voice as before; and, lo! when the Quaker raised his hand as if to fix my attention, I beheld through a misty vista extending far beyond the limits of the room the portly figure of William Penn advancing and looking as though he had just stepped out of West's picture, except that his complexion was paler and his form less defined.

This vision lasted but a moment; the next I was alone, with no appetite remaining for my meal, which that night was removed untasted, much to the surprise of the maid and my hostess, who anxiously inquired whether there was anything not to my liking. So, to escape their importunities, I pleaded a sudden feeling of indisposition, and, saying that I desired rest, retired early to bed.

CHAPTER V.

ondinary circumstances above related, and soon the prediction of my strange vision became amply verified. The placid moonlit sky was suddenly darkened by a ragged army of fugitive clouds hurrying after each other, as if fying before a sombre, pall-like mass of vapour that rose behind them in the north-east, and, rapidly extending across the arch of the heavens, rendered

the obscurity complete, save where an occasional violet flash low down on the horizon, accompanied by a distant rumbling, indicated the presence of the electric fluid with which it was charged. The wind, which had risen, sighing and moaning round the chimneys, now as suddenly died down again as though awed into silence, and a few heavy drops of water splashed against the window-pane. Then peal after peal of thunder rattling right overhead announced that the storm had broken, and the rain poured down in torrents, while the flashes of lightning followed each other in such rapid succession that the room was hardly ever dark.

How long this lasted I do not know, for at length exhausted nature exerted her sway and I fell into a troubled sleep.

Even then my overtaxed mind was morbidly active, and I dreamed that I saw my mysterious stranger in a new shape, he being now tall, bony, and thin, with straight, lank hair, and dressed in dark-brown clothes of an antique cut, with a tall steeple-crowned hat on his head; in short, in the habit of a Puritan of King Charles's time. Still, I recognised perfectly his features and the expression of his countenance. I too was equally transformed, for I now wore the rich garments of a Cavalier about the Court. Strangely enough, however, I did not wonder at these metamorphoses till later on recollection; but all seemed at the time to be quite natural and as actually occurring. I felt, too, that the stern Cromwellian had good cause to call me to account for some clandestine flirtations I had been indulging in with a certain beautiful maiden named Ruth who was under his charge, and with whom I had fallen in love, notwithstanding the party difference that divided us.

Anon my dream changed, and I found myself in a richly ornamented salon, where a company of ladies and gentlemen in the costume of the middle of the eighteenth century were variously engaged—some at cards, some chatting in pairs or groups, others listlessly moving about observing what was

'You have heard that my Lord Bute has turned the King from his passion for Lady Sarah Lennox, and that he is to marry the Princess Charlotte of Mecklenburg-Strelitz?' said a tall, aristocratic-looking man behind me, whose rich costune betokened him a person of condition, though an enormous hooked nose, an extraordinarily long chin, and a pair of small, leering eyes did not give a pleasant expression to his countenance.

'Yes,' lisped a foppish-looking youth who was standing beside him; 'Sir Horace tells me she is a mighty genteel and amiable person, though not solovely as her ladyship.'

'And what do you know about beauty?' said the first speaker, with a supercilious smile. 'There are no beautiful women nowadays; the race died out when you were in long-clothes. I can remember'—

Just then the doors of the salon were thrown open, and a liveried servant announced 'Miss Dingley; whereon a gentleman near me observed, 'The rich banker's daughter.' I looked up in the direction of the new arrival, and saw a young lady handsomely but simply dressed, whose smiling face did not appear strange to me.

'Faith!' said the tall man, staring at her through a large gold quizzing-glass, 'I believe I was wrong; there is still one beauty left. You must introduce

me, Sir Edward.

'I must beg you to hold me excused, my lord,' replied the gentleman addressed, somewhat coldly. 'My acquaintanceship with Miss Dingley is not sufficient to warrant me in taking such a

The nobleman's lips tightened into an unpleasant smile as he replied in a low voice, 'Liberty, Sir Edward, is a somewhat unfortunate expression;

may I ask you to explain it?'

'I should think one so well acquainted with the meaning of the word license as my Lord March needs no such explanation,' answered the other, drawing himself up to his full height and turning on his heel.

The Earl shrugged his shoulders slightly, and then, beckoning to an officer in uniform, linked an arm in his and strolled into an adjacent room,

conversing in a low voice.

I had been so taken up with watching this little incident, and wondering whether it would lead to a duel on the morrow, that I was startled when the

silence which for a moment reigned in the room was suddenly broken by a sweet, fresh voice, the tones of which seemed strangely familiar, singing the following serenade:

Though years be flying, Love lives undying Like yonder star. And in sweet memory My heart will turn to thee When thou art far; Wide waves may sever, Yet the dove ever Wings home her flight. Night it is dreary, Morn will be cheery, Bringing the light.

And, turning in the direction of the singer, I perceived Miss Dingley seated at the harpsichord. As I approached the instrument, drawn by an irresistible attraction, a lady covered with diamonds joined her and said, My dear Ruth, I am so de-lighted to see you. I protest you are in exquisite voice to-night. How is your good father?' After a few more words spoken in a low tone, she turned in my direction and audibly whispered, 'That is the gentleman who has requested me to introduce him to you; will you permit me?' I felt it was so, and became so flurried that I awoke-to find the morning light streaming through the casement, while the words of my dream-song kept ringing in my ears:

Night it is dreary, Morn will be cheery, Bringing the light.

GARIBALDI: A CENTENARY TRIBUTE.

PART III.

ARIBALDI remained at Caprera until the outbreak of the war of 1866 called him away from his hermitage to fight once more his country's The war operations of Italy battles. were doomed to failure. The in-

capacity of her leaders was conspicuous from first to last. Though outnumbering their enemies on land and on sea, the Italians lost the game of war at Custoza and in the sea-fight off Lissa, notwithstanding the undoubted bravery they displayed in both actions. The only success scored during this unfortunate campaign was achieved by General Garibaldi at Besecca, where he worsted the Austrians, and was preparing to advance on Trent when the armistice, signed on the 26th of July 1866, between Italy and Prussia on the one hand and Austria on the other, prevented his advance.

Owing to the astounding military successes of her ally in Germany, Italy, though vanquished in the field, reaped the fruits of victory. But her military weakness had become so apparent that she had to play a very subordinate part in the negotiations which followed, and to submit to the unusual con-

ditions imposed by Austria, who refused to recognise a second suspension of hostilities on the 3rd of August unless Italy evacuated the positions she held in the Truilo and Trentine. Peace was concluded by Prussia alone, who, without even consulting her ally, guaranteed her adherence to the terms agreed upon as soon as the Emperor of France (to whom Austria had ceded Venice) should have transferred it to King Victor Emmanuel. This transfer took place on the 22nd of October, and Italy received as a boon from France the once proud city, the Queen of the Adriatic, which had filled with her fame the annals of her country.

One by one the severed provinces had been united, all except Rome, which was still a papal city guarded mainly by foreign mercenaries. Garibaldi, true to himself, unheeding the warnings of those who tried to dissuade him from his purpose, as they had tried when he was on the point of starting on his Sicilian expedition, assembled his volunteers and entered the province of Rome. At first all went well. The Garibaldians captured Monterotondo, and entered Viterbo, Velletri, and Frosinone, welcomed everywhere as liberators by the people, who voted unanimously their annexation to the Italian kingdom. But Garibaldi was disavowed by the Italian Government, who, either through timidity or regard for the French Emperor, shrank from sanctioning an enterprise which might fail; and the hesitation of the Italian Cabinet, or, more likely still, his own inclinations, caused Napoleon to despatch a strong force to the assistance of the Pope. Garibaldi, abandoned by his own Government, and with reduced forces, had to face the united Papal and French troops, whom he engaged at Mentana. This battle was perhaps the only one in which the great partisan leader was vanquished in the open field, and the result of the fight has been turned to account by detractors of Garibaldi, who have wished to justify the conduct of the Italian Cabinet from the event. A few particulars of the conflict were related to me by General Ricciotti Garibaldi, who, with his elder brother Menotti, fought at Mentana, and I shall give the General's very words:

'The Garibaldians numbered under five thousand men [at Mentana], having lost two thousand of their best men during the two preceding weeks owing to political intrigues. The enemy is supposed to have numbered about seven thousand. At about three in the afternoon the battle of Mentana was a victory for the Garibaldians; all the positions lost in the morning through surprise had been retaken, with heavy loss on both sides. The sudden appearance of the French outflanking on the left forced the Garibaldians to retire; but Mentana itself was held till next morning, when the castle capitulated.' It is clear from these words of General Ricciotti Garibaldi, which I have textually reproduced, that though overmatched in strength, the Garibaldians had, as usual, overcome their less enthusiastic, often lukewarm, adversaries, when the appearance of a strong French force changed the fortunes of the day, as Blücher did, and as Grouchy might have done, at Waterloo. The joint strength of the French and Pontifical troops was double at least-according to some triple—that of the Garibaldians, and, besides being more numerous, they were better armed. The newly invented chassepots, like the Prussian needlegun, practically decided the contest; but had the Italian army co-operated, a single division would have enabled Garibaldi to occupy the city before the arrival of the French, and the Emperor would probably have recognised an accomplished fact. Garibaldi's noble efforts were not made in vain, for, though not immediately successful, they not only kept the question alive, but demonstrated that it urgently needed a solution.

Three short years after Mentana, Rome was evacuated by the French garrison, which was required for the defence of French soil, and was occupied by the Italians, after a faint, almost nominal, resistance of the Papalini, on the 20th of September 1870.

The same year that saw the occupation of Rome saw also the downfall of the second French Empire and the invasion of France. Italy, the ally and

friend of both belligerents, remained neutral, and her attitude on this occasion, though severely criticised by some, was the only possible one under the circumstances. She was indebted to both Powers for the consolidation of her national unity, and if her indebtedness to France had been greater, she had also made some repayment towards its extinction. If she had received Lombardy and Venetia, she had given in exchange Savoy and Nice. Lastly, France had been the aggressor, and had wantonly provoked what she hoped would be a war of conquest, in which case she would have tightened her grasp on Rome. But Garibaldi's generous heart was moved by the misfortunes of those by whose side he had fought, who were now, deservedly or not, in sore straits, and the weaker party, and beaten to the ground. Garibaldi forgot and forgave Mentana; he remembered only Magenta and Solferino-the greater benefit which outweighed the lighter injury. Evading the cordon of troops which guarded the passes over the Alps and which were stationed all along the north-western frontier to prevent any infraction of neutrality, Garibaldi, with his two brave sons Menotti and Ricciotti, crossed the border into France in the autumn of the year 1870. Some eight hundred volunteers contrived to slip through the cordon of troops, to whom were soon added twelve hundred Italian workmen, labourers and artisans thrown out of employ through the war, making in all two thousand Italians, who, together with some six thousand marksmen (franc-tireurs), made up the whole of the fighting strength of General Garibaldi's force. It was nominally much greater, for it was supposed to include between fifty-five and sixty thousand mobilised National Guards; but these were so utterly inefficient that they were never employed in active operations requiring great marching powers and endurance under privations. Yet, with this small available force divided into brigades, he gave battle at Chatillon, capturing prisoners and colours, and took Dijon from the Prussians. General Ricciotti, who accompanied his father in the expedition, especially distinguished himself by the admirable use he made of his brigade to screen the movements of the French main army. The mobility of the irregulars was such that the German commander was completely deceived as to their number, and remained concentrated with a tenfold force of disciplined troops.

These encounters in the south-east of France could not alter the results of the war, but they added to the laurels of the great chief who, with very inferior forces, was able to hold in check a numerous host of veteran soldiers, and who won against odds almost the only success achieved during the campaign. The fight at Chatillon and the capture of Dijon were the last exploits of Garibaldi, and they closed worthily a life of heroism and honour.

Retiring after the war once more to Caprera, he lived out his last years—save for a brief sojourn in

Rome, when he was returned deputy—in peace and contentment, happy in the knowledge that the cause for which he had toiled and battled for forty years, undismayed by reverses, was triumphant at last. The fatherland was free from the Alps to Sicily, and from sea to sea, for the first time since the fall of the Roman Empire, and united under a native ruler. Much remained to be done; much remains to be done still; but the greatest step had been taken in the achievement of political liberty and union. Henceforth Italy was the mistress of her own destinies, and her great-hearted champion could utter his nunc dimittis, when the hour came, with a glad and thankful spirit.

That hour came in 1882. He had long been ailing from a bronchial complaint, which on the 1st of June developed suddenly into an acute form. On the 2nd his case had become desperate; and in the evening he quietly and serenely passed away in his cottage at Caprera, preserving his senses to the last, with his son General Menotti Garibaldi by his side—his second son had been sent for, but could not arrive in time—and a few of his old companions.

The thrill of grief which ran through all was his best funeral oration. All felt, in the words of Victor Emmanuel, that the first of Italians had passed away, and that they would never look on his like again. And they were right, for men such as Garibaldi are rare in all ages, and are an honour to the whole human race; they are reverenced by all men alike. Brave as his sword, gentle as he was brave, disinterested and unambitious, he was the protector of the weak, the stainless knight of freedom wherever the former was wronged or the latter endangered. He was undoubtedly the brightest and foremost figure in the galaxy of Italian patriots, the chief builder of her national unity. Well might the nation weep and mourn for her noble son; well may she pray and trust that his spirit may continue to inspire her children, and, like the 'spirit of Montrose' to Dundee, be the guide of every Italian commander, to lead him to In his world-wide sympathies for the oppressed of every nation he is unique, and stands on a higher pedestal than perhaps any other of the great national heroes the world has known. The period may have influenced him in this respect, but he must have been susceptible to such subtle influence. He was cast in an antique mould modified by modern civilisation. Next to his universal sympathy for those who suffered from tyranny of whatever kind was his magnetic power over the minds of his fellows, that strange mastery over other men possessed by Napoleon and all leaders of men, which has always been the chief element of their success.

His son General Ricciotti, who has inherited many of his father's qualities, related to me an incident in connection with this curious power of his father's which happened on the occasion of his visit to Malta, which was then a hotbed of religious

intolerance and superstition, wherefore the majority of the Maltese regarded Garibaldi, for having attempted to oust the Pope, as a kind of antichrist. The British authorities endeavoured to dissuade him from landing, fearing some hostile demonstration on the part of an excitable population; but the General was not to be turned from his purpose by personal considerations. Landing with his staff, he proceeded to one of the chief hotels of the city, before which a crowd had already assembled, and with ominous hisses and mutters of 'Down with Garibaldi! was beginning to make itself General Garibaldi did not wait for the heard. storm to burst. Rising from the table where he was seated with some friends, he advanced to the balcony overlooking the square, which was by this time packed with a dense, seething crowd. In the words of his son, he stood there gazing on them, and they gazing at him. A great hush fell on the throng; but it was suddenly broken by a ringing shout of 'Viva Garibaldi!' Waving his hand to obtain silence, the General spoke a few words, such as he knew so well how to speak, and his clear, resonant voice, which had sounded on so many battlefields, now rang out over the square. He told them briefly what he had done, and why he had done what he did. The cheers which rose again from that superstitious throng at the conclusion of his address proved that the ordeal had been won; and an English officer in attendance on Garibaldi, who had tried to prevent him from going outside, urging young Ricciotti to bring in his father, was astounded at this revulsion of public feeling. Even his son, accustomed as he was to the sight of his father dominating a mob, had felt uneasy as to the result on this occasion.

His kindness of heart was at least equal to his The following anecdote is told by a companion-in-arms. On hearing of the fall of Gaeta, the last stronghold occupied by the Bourbons, he announced the glad tidings; and, commenting on them, he said, 'Our civil contests are over, Cialdini. With our people in Gaeta, Italians will no longer now slay each other.' Then all at once his joy seemed to leave him, his expression became troubled, and he withdrew earlier than was his wont to rest. Uneasy and somewhat alarmed at the General's demeanour, and fearing that he had become suddenly indisposed, or had received bad news of a private nature, one of the party of officers who had remained in the dining-room was sent by his colleagues to inquire as to the cause of the General's sadness or indisposition. He found his chief reading the Times. The officer explained why he had come. Garibaldi answered, after a pause, as if speaking to himself, 'Poor youth! born at the foot of a throne, perhaps not through any fault of his driven away-hurled from it. He, too, will have to test the bitterness of exile-unprepared! Is that all? All! Yes, and enough to make any one sad. But you went to Marsala. It was the duty of all of us to go there; otherwise, how could

Italy become one?' The officer returned to his companions, moved by what he had heard; and though several were amazed at what he told them, one who knew Garibaldi best said, 'I am not at all surprised. The General is such a man that should Antonelli, Francis II., and Pius IX. be in distress or homeless, he would not only welcome them at Caprera, but give them his room and bed.'

His love for animals was proverbial. He was much attached to his dog Castor, whom he left with Mr Murray, the British consul at Tangiers, when compelled to quit. On his return to Caprera in 1860, after the triumphant expedition of Marsala and liberation of all Southern Italy, his first thought on landing was for his two chargers, whom he ordered to be unsaddled and unbridled, to enjoy the rest they had so well earned. He did not forget his dumb friends even on his deathbed; and among his last recommendations to those around him was the care of some of his favourites, especially of two blackcaps whom he fed every day with his own hand. Indeed, in him the saying was verified that the bravest are ever the gentlest.

Disinterested almost to a fault, he steadily refused not only the honours and rewards he might have justly claimed or accepted from his countrymen, but even those proffered by a foreign State for which he had battled and for the independence of which he had striven. He preferred to earn his own living rather than be indebted to others, and left to his sons little besides his modest patrimony at Caprera and the heritage of his deathless name, which they have so worthily preserved.

If his civic and private virtues were such as have been rarely united with greatness, his qualities as a warrior and as a leader have scarcely ever been equalled, never excelled. His marvellous expedition to Sicily would of itself suffice to attest his supreme excellence in the art of war. The campaign of 1860 stands by itself; there is nothing like it in history. Garibaldi, with a mere handful of men, attacked a kingdom defended by one hundred thousand regular troops, defeated them in four battles, and liberated the whole of the south of Italy within the brief space of four months. True, the population was mostly disaffected, but no man would have stirred had Garibaldi been checked in his first encounter at Calatafimi; even Napoleon's landing at Frejus with his 'thousand' cannot compare, daring as it was in a military point of view, with Garibaldi's attempt in 1860. Though there are some points of resemblance in both these enterprises, they were undertaken by men who relied on their own personal influence over others to achieve success, and who led an insignificant force (in both cases about one thousand men) to conquer or liberate—the one France, the other the Two Sicilies. But Napoleon's task was smoothed from the first by the collapse of all armed resistance, whereas Garibaldi had to join battle over and over again ere he was able to reach

Naples. On almost every occasion he met and outfought his enemies, whether French, Austrian, or Neapolitan, and under him the Red Shirts (Camicie Rosse) acquired a fame enjoyed by few Italian bands since the Black Bands of Giovanni de' Medici.

General Giuseppe Garibaldi by his first wife had two sons and one daughter; by his second, a son and a daughter. The two former, named Menotti and Ricciotti, shared with their father the perils and glories of the campaigns of 1866, 1867, and 1870. General Menotti Garibaldi died two years ago from typhoid fever, contracted on his property situated in the Campagna, where he was occupied in improving the condition of the estate, and especially of the peasants, to whom he was a most kind and liberal landlord. His surviving brother, General Ricciotti Garibaldi, is a fine soldier and a generousminded man like his father; and besides fighting his country's battles, he fought also in France and in Greece in the cause of freedom and of national reconstruction and defence. On two occasions, in 1866 and 1897, he crossed over to Greece, and during the latter unfortunate campaign he led his international corps of volunteers, one thousand three hundred and twenty strong-of whom, however, only nine hundred and twenty-four were present in the ranks - to victory at Demoko. Shortly after, an armistice was concluded between the Greeks and Turks. The General, in his story of the campaign, commends highly the cool courage of an English gentleman, Thomas Palmer Newbold, a special correspondent who was fighting in the ranks of the Red Shirts. He was slightly wounded in the last engagement under Lamia, and received the honorary grade of captain. General Ricciotti Garibaldi advocates strongly the employment in war of bodies of volunteers, and his great experience gives much weight to his opinions. Certainly he, like his father and brother, has proved repeatedly on the battlefield what these irregular levies, well organised and well led, are capable of; and history teaches us that the people of Southern Europe, owing to the configuration of the soil and to their temperament, have always shown a greater aptitude for guerilla warfare than the more methodic northerners have displayed on their less mountainous territory. But it must also be borne in mind, in estimating the value of these irregular patriotic levies, that they surpassed themselves under the leadership of a great captain in whom they had implicit faith. Thus the Red Shirts, led by Garibaldi, became, like Napoleon's soldiers, well-nigh invincible. Whether they would have been so under another commander may well be doubted. However that may be, the question lies outside the limits of a brief sketch like the present, of which the sole object has been to place before the general public, whose fathers welcomed the Italian hero to our shores in 1864, a few of the salient incidents of his career; for some of which I am indebted to the courtesy of his son General Ricciotti Garibaldi.

The name and exploits of the great patriot are household words all over Italy; and his residence at Caprera, the Mount Vernon of Italy, is the scene of a yearly pilgrimage from all parts of the country on the anniversary of his death. So should his name be revered in all countries where freedom reigns, in whose cause the hero lived and died.

THE END.

FLORENCE: AN IMPRESSION.

By LADY WYNFORD.

is a soft, dull, gray evening in Florence, city of the past and of its mighty sons, whose work stands up proudly against the sad sky: Brunelleschi's work, dome of a cathedral, dim, indefinite, rounded, and plum-

coloured where a warmer light falls on its tiles; Giotto's work, the tower, fair and pure and delicate, the best thoughts of a man's mind—nay, let us say rather of his soul. And around these two gather the dull-red roofs, and the soft ivory walls, and the stain of wet and the stain of time, with the shadows falling in narrow, paved streets full of hurrying figures.

Here is a doorway with marble carving over it, its sharpness blunted by time, its whiteness mellowed. The ironwork on the door within writhes and twists and curls itself into the flowershapes its maker dreamed of—deliberately—with all its time before him, working as men do not work now, because the world has taken to spinning instead of rolling, and they must needs keep pace.

There is a red-frocked child running down the street, and broad puddles on the flags reflect it and also the clothing of a mule which stumbles before a block of gray Fiesole stone on a protesting cart.

Towering and threatening above its neighbours rises a palazzo, stone and iron and gloom and dirt. If one stops, to stand, jostled and hustled, beneath it, one will cease to hear the rattling of cab-wheels and the cracking of whips, with strange noises to tired horses. Instead, there will be the clear, sharp ring of steel, and the clash of it falling from a limp hand on to the stones; there will be wild Tuscan oaths, and the old rings and torch-brackets bedded in the wall will not be empty any more; there will be a splash of rich crimson in one of them, a banner, with the torch below wavering into its gilt fringe, for the dusk falls.

Ah, that was a rude contadino; his elbow has sent us reeling almost into the gutter, quite into the present of which he is part. He is a grand fellow all the same, with his strong, dark, clean-cut face, which we of the chinles. North may sigh after in vain. He turns into a church, and we will follow him in and out again—having looked round us while he was at his devotions, and been awed and fretted and mystified all in turn. The awe we felt for much majesty, for dim pillars and shadowy arches, for suggestions of breadth and height and depth, for proportion delicate and wonderful, for the holy and

gentle thoughts of bygone minds who painted their Madonnas or saints with stiff figures and quaint, surprised faces, because their art had taught them no better, and imparted true piety and devotion to the poses of those figures and the expressions of those faces because their religion had so taught them.

When the awe passed, we saw more clearly for its absence. There was a little wax doll in a case, hung with tinsel, a tinsel halo round its uplitted head. Spangled hearts lay heaped upon many altars; others displayed small oleographs. On all, tapers burned in painted wooden candlesticks of strange and hideous shapes. There were no more old pictures to be seen, and the stained wooden pulpit dated from last year!

We pattered slowly towards the doorway, and wonder swept away the feeling of irritation. These makers of wax dolls and hangers-up of tinsel hearts, were they indeed the after-comers of Angelico and Bartolommeo, of Orcagna and Donatello?

We have come out again, and look down the street, to where it widens, and the bridge ends it, a proud, strong curve into the air, with the tawny flood whispering beneath it, stealing on through oldest Florence—grime and age and the beauty that comes of both—to a broad plain with a silver mist across it. Beyond the plain there are hills, and beyond the hills, where the sun sets, there lies the Land of Youth, if one there be. And perchance the dreamers and workers of Florence have found it, because they made that Florence.

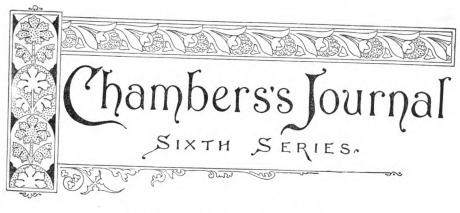

THE FIRST ROSE.

Her tiny hands are swift to seize

The golden buttercups and daisies—
Just playfellows she reckons these,
Too intimately dear for praises;
But when she spies a radiant rose,
The first-born of our garden bower,
Her little face with pleasure glows,
Flushed pinker than the perfect flower.

Her happy eyes grow wide; her hands,
Like two curled rose-leaves, upward flutter,
Then folded, show she understands
More than her lips have learnt to utter.
And when she lifts her face, all sweet
With wondering love—with reverence maybe—
I bend the rose-branch low, to meet
The fervent kisses of my baby.

B. ADA TYACK.

DAKAITI IN INDIA.

By Major-General W. Tweedie, C.S.I.

Ut jugulent hominem, surgunt de nocte latrones; Ut teipsum serves, non expergisceris?

Hor., Epist., Lib. I. E. 2.

*

N the Urdù ('horde') language which, after the Mughal irruption into India gradually evolved itself, and, spreading far and near, came to be known as Hindùstànì, a dakait is one who

has taken seriously to gang robbery (or dakaiti), now on a large scale (as in attacks on sleeping villages), and again on single buildings or seldom that these heavy-handed rather than lightfingered operators make an attempt on the dwellings of the European residents. A prestige doth hedge the imperial race in India as 'divinity doth hedge a king' all the world over. Every white-skinned member of the official classes is, in the eyes of the gentle Hindu-as sometimes also in his own-like a god descended from heaven. The hardier Moslems scarcely go so far as that; but, what comes to the same thing, they regard their foreign masters as a tribe of highly dangerous jinn, or 'genii,' whom it is most unadvisable to disturb or irritate, when through the protection of Allah they chance to be lying more or less dormant. Every general statement needs, however, some qualification; and it will appear from the following narrative, which is true in every particular, that the eyes of the Indian slim one may fall when least expected on the superfluous possessions even of the judge and magistrate.

I. -THE VENUE.

In 1874, as for some years previously, I happened to hold an appointment—not the highest, but the second—at the court of one of the mimic potentates of southern India; and if I can but bring before the eye of the reader the bungalow (or house laid out on a single story) which formed my official residence and was the scene of the following incidents, the facilities, not to say temptations, which the spot held out to robbers will be evident.

Imagine, then, a low-browed château of a type No. 499. -Vol. X.

not unrepresented in the villa architecture of our south coast watering-places, among the features of which are spacious verandas and innumerable inlets. Imagine, further, ample grounds dotted with giant trees, under the shadow of which robbers might come together unnoticed in the brightest moonlight. Within these same grounds are stables, servants' quarters, and other accommodations, the superior style of which is accounted for by the circumstance of their having been erected at the cost of the native Government, presumably under treaty obligations, to suit the requirements and ideals of a British 'political' officer. In front, the outlook is towards the walls of a turbulent city, the space between being occupied by the depressed channel usually more or less dry-of a considerable river, along the rocky bed of which, as over a great natural highway, a body of traffic is always passing, both on foot and on horseback, as well as in bullock-coaches and atop of donkeys, camels, and elephants. From this highly picturesque scene of life and motion the walks and shrubberies of the bungalow are separated by the superior elevation of their site, and by a low parapet useful in its way for military purposes, but offering no obstacle to those who would enter quietly.

It was long after dark on April 18 of the abovementioned year. The season of vehement heat was at its intensest. The sultry air was overloaded with the luscious fragrance of the mango-tree blossom. Every door and casement of the bungalow stood open to admit the refreshment, such as it was, of the night-breezes. There was no 'lady of the house,' but only the one master; so that the stir and bustle of a night-nursery were wanting. The small sepoy guard which local usage sanctioned had been dispensed with because of the clatter which attends the movements of sentries. There was not so much as a house-dog to lay himself down with one eye open behind the unbarred thresholds. Most of the inmates had gone for the night, some to their places within the grounds and others to homes in the bazar; but three good men and true remained

[All Rights Reserved.] JUNE 22, 1907. to spread their rolls of bedding within the bungalow. One of these was an armed orderly of that martial Sikh race whose prowess cost us so dear at Chillian-wala, while the other two—a chaprasi (or belted messenger) and a domestic—were of the Moslem race.

In accordance with the old-fashioned Anglo-Indian method, not yet perhaps wholly superseded, one of the rooms of the house was fitted up as a more or less public office, in which the Government business was conducted daily, with the four doors open to the poorest man or woman who had a petition to present or a story to unfold; and, moreover, on stated occasions the same apartment was used as a court-house, into which murderers, burglars, forgers, and reprobates of every description were ushered, whether as accused persons or as witnesses, to take their stand before the Dharm-autàr, or 'Incarnation of Justice.' The main access to this place-of-all-work was from an outer veranda, through an anteroom called the 'matted hall' because carpeted with stuff made of fibre. Out of this hall a side-door opened into the principal diningroom, part of the proper furniture of whichnamely, three large oaken plate-chests-always stood in the hall for the convenience of the servants; and the consequence was that every convicted or unconvicted felon, as he passed through the 'matted hall,' was liable to have the highest aspirations of his crooked nature acted on by the sight of three padlocked and brass-clamped strong-boxes only too suggestive of Government cash-chests.

On Tintock's tap there is a mist, And in the mist there is kist,

and nursery rhymes of that sort, can hardly have appealed more forcibly to the imagination of old-world Scotsmen than the bazar rumour and gossip about those very matter-of-fact boxes must have done to the cupidity and spirit of enterprise of the criminal classes. In reality, the contents of the boxes were of a mixed description. Table equipments of Elkington's best electroplate largely took the place of the more precious metal; but room had been made by the side of these for a goodly number of racing trophies in solid silver, each of which was enclosed, after the manner of silversmiths, in its own proper shell of wood and morocco.

IL.—THE ROBBERS AT WORK-AND AFTER.

In the Indian hot months, sleep, when it comes at all, comes heavily; and the darkest hour which ushers in the dawn was making blackness visible when, awaking from the first long slumber, I called out to ascertain what time it was. Surat Singh, the Sikh henchman, sleeping lightly as becomes a soldier, entered the room with the desired information—which must have come to him instinctively, for every lamp was out; and as he was returning to his carpet a queer sort of crash happened, as if he had knocked over something with his feet. The next moment he was arousing his two heavier-eyed comrades, making for the open, and shouting 'Chor! chor!' ('Thief! thief!') at the top of his voice.

Imagining that he had merely caught sight of some lurking trespasser, I was in no hurry to follow him up; and by the time I did so lights had been fetched from the stables, and the situation disclosed was in this wise. Under a tree near the bungalow lay the three plate-chests, much broken up as with a hammer; and yet, most wonderful to state, a sepoy sentry of the guard over the British Residency was pacing up and down within sound of the spot. Innumerable articles taken from the boxes lay strewn on the grass. Most of these, as bright as plate-powder and 'elbow-grease' could make them, glittered weirdly in the torchlight; but here and there a darker object bespoke the ignorance and stupidity of the robbers in throwing from their hands unopened the cases containing the race-cups -the only pieces in the whole collection which, if made acquainted with the crucible, would have repaid the honest fellows for their night's labour.

The Sikh orderly was a fine youngster. Not a word is to be said against him; but, somehow, his untutored mind was full of the idea that he had highly distinguished himself by driving away ever so many ruffians without their booty. Just as among ourselves the line that separates 'tact' from deceit inclines to be vague and wavy, so with Orientals to draw the long-bow is not too rigorously excluded from the confines of laudable rhetoric. 'A plain, unvarnished tale' scarcely is an Eastern commodity; a great talker is tacitly assumed to be a great liar; indeed, by a ridiculous piece of confusion, Indians whose knowledge of English depends on the ear only observe no distinction between the words 'liar' and 'lawyer' in the sense of barrister or special pleader.

The Sikh's statement was as follows: He and another had spread their beds in the dining-room; while the third man slept-and slept almost as sleep the dead-in the adjoining 'matted hall' out of which, from under his very nose, the plate-chests had been carried. Some time in the course of the night he had noticed from where he lay that the house-lamps had been extinguished. This preliminary performance, as it was subsequently ascertained to be, of the robbers he had sapiently ascribed to the interference of a passing div, deòta, or deus-that is, evil spirit; the antagonism subsisting between all such children of darkness and every manifestation of celestial light and goodness forming, as is well known, one of the fundamentals of ancient Zoroastrian and Aryan dogma. It was not till after my call had roused him, and he had tripped over and sent flying a tier of empty wooden despatchboxes which the wily ones had placed across one of the dining-room thresholds, alarm-bell fashion, that he had come to realise the situation. And then it was that his forward tactics had saved the house from being looted. How all these particulars except the last were afterwards verified will appear in the sequel. Indeed, it was even then apparent that the work of the robbers had by no means been interrupted; for when the scattered contents of the boxes were brought together it was discovered

that quite a nice little collection of soup-tureens, salvers, and the like was missing.

The news of what had happened was not long in spreading. The first to appear on the scene were those of the servants who lived outside the precincts. Poor, humble, faithful fellows! the varying expressions of their dusky features as they stood before the desecrated receptacles which they had come to regard with so much reverence would have made a study for a painter. When the sentries of the Residency guard were questioned, one of them stated that he certainly had heard a knocking during his two hours of duty, but that, being an unlearned man who came from a remote country, he had not presumed to notice sounds in which the Almighty was perhaps concerned—so difficult is it to speak with persons in whom, for want of education, or rather through education in wrong directions, the margin of the supernatural has been inordinately extended.

In a short time no less a personage than the British Resident hove in sight, and with him several officers of his staff, all of them filled with astonishment and curiosity as well as anxious to express their sympathy. The pity of it was that an attempt was then made to affix the guilt on the household. This man and the other man were particularly recommended for prompt incarceration. More especially did suspicion fall on the Sikh orderly because of his shoes having been found in the grass beside the rifled boxes. The explanation of this circumstance which had satisfied my mind was not accepted by every one. Among the many characteristic points of appearance through which the castes and classes of India are distinguishable the cut or fashion of the foot-gear is to be reckoned. For example, the shoe of the Moslem gallant is as different an article from that of the Sikh man-at-arms as the rapier is from the claymore. The robbers, it appeared, in reconnoitring the house-interior before proceeding to business, had, as usual, taken notice of the shoes which, conformably with Eastern custom, the inmates had shuffled out of at the several thresholds. Recognising among them a pair belonging to a fighting-man, they had been careful to carry this pair outside with them, so that the owner, if he should chance to catch the alarm, might at all events find himself barefoot. By a happy accident, however, the Sikh had that very day bought a new pair of shoes, which he had placed in his bedding, where they came as ready to his feet in the moment of need as the handle of a tankard does to the grip of the thirsty traveller.

In the end, and to my great contentment, the police came to the conclusion that it was unadvisable to lock up any member of my establishment on bare suspicion. Apart altogether from the principles of justice, men of respectability will not take service in Anglo-Indian houses when they see a kind of rule established that in the event of a robbery occurring the servants must go to prison. A common complaint in India is that the

masses of the people will not help the authorities; and doubtless under alien and more or less despotic governments this will always be a weak point. But really, for a long time after the abstraction of my plate-chests, the interference and espionage which petty police-officers—of course with the most laudable intentions—brought to bear on every detail of my household proved so aggravating as to make me cease to wonder at the invincible tendency of Indian communities to leave crime unreported.

III .- DETECTION.

Just three days after the occurrence of the robbery, as I sat in my office drawing up the record, now before me, on which this veracious history is based, word was brought that my plate was being fished out of a deep water-hole on the farther side of the river. Off I posted to see what had happened, and, sure enough, the first thing I noticed, on gaining a certain imli bàori, or 'tamarind-tree well,' was a shapely loving-cup-its lustre turned black by the foul and brackish water-ascending to the upper air at the end of a horseman's turban. One of my own men, who was a great swimmer, had, it appeared, been bathing in the well, when his toes, as prehensile as a monkey's, had 'located,' as the doctors say, a number of hard substances in the mud at the bottom; and, lo and behold! article after article of my lost property was coming up as fast as willing hands could haul it. In the course of the day every piece was thus recovered, with the notable exception of the spoons and forks, not one of which was forthcoming. The explanation of this came later. A week or so afterwards, an aged woman, whose hut opened on the enclosure of a city mosque, chanced to observe a man, evidently from northern India, burying a gruesome-looking bundle in a heap of rubbish. Afraid to meddle with what, for aught that she knew, might contain the remains of a female infant, the good dame, after the manner of lone women everywhere, had recourse to a 'holy man,' or mulla, by whom the suspicious parcel was found to contain innumerable strips of base metal. By that time the news of the plucky invasion of the Feringi's bungalow had been widely bruited, and the native Government, as in duty bound, had proclaimed a substantial reward for information tending to clear up the mystery. Bethinking himself of this, the mullà carried his prize to the Prime Minister's office, whence it was sent to me for examination. Beyond a doubt the pieces of white metal were neither more nor less than my spoons and forks chopped up for purposes of assay and fusion. Did ever 'minions of the moon' experience so cruel a disappointment? For their sakes I could almost have wished that the wretched implements of eating and supping had been made either of honest horn or of sterling metal. It appeared, on inspection, that the wrapping in which the metallic pieces had been put together consisted of a Hindustani garment serving at once as drawers and trousers; and, moreover, on the corners of the

fabric there were cabbalistic markings which, if interpreted, would serve to indicate, if not the place where it was woven, certainly the man who had worn it, and perhaps also the washerman who had chiefly handled it. The reader will be spared the narration of how, by means of these and other clues, a successful result was ultimately achieved. Suffice it to say that before the season turned I had the satisfaction of knowing that, in respect of the indignity which my bungalow had suffered, the prestige of the British Residency had been amply vindicated. On the requisition of the native state in which the offence had been committed, three men belonging to the professional robber class had been apprehended in a distant British province, and before being handed over had made a full confession. Most properly it was decided that a judicial functionary of the native Government, and not the aggrieved British officer, should try the case. On the 23rd of August-I love to be particular-after the three miscreants had been sentenced, not for the first time, to terms of imprisonment, one of them was brought before me. The pathetic expression of the man's countenance, as he stood in his leg-irons in the 'matted hall' which had formed the scene of his ill-judged enterprise, was not soon forgotten. By that time the plate-chests had been put to rights again, the only difference being that Rangoon teak had partly replaced the oak. Each of them, moreover, had been screwed down at its four corners to cubes of hardwood set in the stone floor below it, so that an elephant could not now uproot it, easily as he could crush it with a forefoot or break it up like tinder with his tremendous forehead. The idea had been that it must have taken several men to carry outside those ponderous boxes; but the deponent now before me maintained strenuously that he, and he alone, performed the porterage part of the business. To prove his words, he laid hold of a chest as if to raise it in his arms, and finding it impossible, of course, to do so, ascribed his failure to weakness induced by the cutting off of his daily

pill of opium—a statement raising far too large a question to be dealt with in a mere excursus, even were such a thing allowable. The queries that were addressed to him brought out the following additional particulars:

The robbery had been planned under the assurance that the chests contained bags of rupees, if not even of gold coins, for the carrying off of which the green baize cover of the dining-table, together with a number of deerskins, had been spread out beforehand! When nothing but tablefurnishings issued from the boxes, the robbers would have gone off in disgust but for the chance of the stuff being of silver. Taking away with them as much of it as they could carry, they had entrusted their burden to the safe keeping of the nearest well, all except the spoons and forks, retained as test-pieces for assay. On these proving spurious, their fragments had been buried, as the reader has seen, in the mosque; and that was the end of the performance.

Some would have it that a story without a moral is like a kite without a tail. Be that as it may, at least two useful lessons are derivable from the series of incidents now narrated. One is, that Government work should always be done in a Government building which is not at the same time a private residence; and the other is that every human habitation in which there is anything to attract the robber should have its canine guardian. There is no denying that a house-dog is a trouble. The cook does not always regard him with favour; the housemaids naturally dislike the labour of getting his muddy footprints and scattered hairs out of the carpets; the neighbours are prone to imagine that he is always barking when he is not howling. But none of these things alter the fact that the house-dog, preferably a little one shut up in a closet, is the true palladium, if the plate is not to be swept off the sideboard into the sack of the nocturnal robber without a note of warning being sounded.

норру.

CHAPTER XII.

VO men, khaki-clad and bronzed, stood side by side in the African dawn upon the summit of a small, conical hill. Bareheaded, they systematically searched with powerful glasses every yard of the pleasant country

that, as the mists lifted, slowly unrolled itself at their feet in gently swelling, tree-studded undulations of green and park-like land.

'Nothing, as usual,' petulantly cried the smaller of the two as he returned his binoculars to their case. 'We have long since passed the country where we ought to have found some signs of them,

according to the paper, and I'm sick of it. We'll go north to-morrow, for there's no doubt in my mind that they have been completely wiped out

long ago.'

But the other, whose attention had been fixed on one point for the last few moments, slowly answered, 'I'm not so sure of that, Vare. Hold on a moment,' he exclaimed, as his companion placed an eager hand upon his shoulder; 'it's only one of the ordinary native villages that I have found, but I've spotted what looks remarkably like a proper flagstaff among the huts, which may mean news of our friends. Ah!' he ejaculated excitedly, 'I told

you so. There's a white man coming out of a hut, and—yes, there he goes, straight for the pole; and —wait a jiffy, can't you?—yes, by the Lord Harry, he's hoisting the tricolour!

'Let's look, Dick'—for such had Mr Smith become—cried Vare, as, not waiting to get out his
own glasses, he lifted those of his companion to his
eyes. 'Yes, you're right; and it can surely only
be some of the Escheaux lot. Take the compass
bearings—quick, my son—and we'll make a start
as soon as the porters have had their grub.'

Then the men, descending the hill to the camp below, gave the necessary orders, and within an hour of the discovery tents had been struck, loads distributed, and the black string of human ants, with their white leaders, had marched off with unwonted gaiety, for the word had gone round that the end of their long journey was in sight.

It was only some hours later, and after having taken several false routes, that they finally arrived in the immediate neighbourhood of their search; and when at last they suddenly came upon the village, they found that the news of their arrival had already preceded them. A curious sight met their gaze. The square was filled with natives; but around the flagstaff and on the side facing the travellers the ground was quite clear. Drawn up in the centre of this open space was a guard of honour consisting of one black soldier and one white, while in front stood another European, holding a drawn sword, which he solemnly brought to the salute as he advanced to meet the new-comers.

'It's Apner!' cried out Dick, rushing impulsively forward. But Vare halted the porters and held back. 'Apner, as I live, and alive and jolly as ever!'

'Dick—my dear Dick!' answered the man with the sword. 'I am glad to see you. Yes, it's I all right, but not very much alive, and very far from being jolly. I suppose that you have at last brought us orders to quit, eh? And they have not come too soon, I assure you. But there is Braun —you remember Braun the German? Not a bad sort of chap as Germans go.—Dismiss the guard, Braun,' he called out feebly, 'and come here.' And the white man addressed gravely dismissed the black, and came staggering towards the others.

'Yes, we're pretty bad, both of us,' he continued, as he saw the compassion in Dick's eyes. 'It's an awful place for fever this, though it doesn't look it. Braun and I and the guard,' he smiled sadly, 'are the only ones left. You see, the doctor went first of the officers, and then the quinine gave out—there never had been enough—and one by one all the whites died except us two. Then the black troops deserted and married; some are still in the village, but only the one you saw considers himself still a soldier. And so, you may imagine, I am nighty glad to see you. But who's the other fellow over there? Why doesn't he join us?'

'Oh, he thinks he'd better not interrupt the official reception, I expect,' laughed Dick. 'Silly

chap! why, it's Vare of your old regiment; and it's his show this, not the French Government's. He's come to find you quite on his own hook, and I'm out of the Legion too now.'

'Then you don't bring orders ?' cried Hoppy.

'No, not exactly orders; but that makes no real difference, surely? You're quite forgotten at headquarters, and naturally you'll come back now "along o' we."'

But Hoppy answered never a word, and stalked off towards Vare, leaving Dick gasping with amazement until recalled to himself by the warm greeting of Braun.

'How do you do, Vare? Welcome to the French post of Iwa, which I have the honour to command. I little expected to see you out here.'

'Ah, Apner, so it's you after all! You're a non-commissioned officer, I see. I congratulate you; but you don't look very fit;' and Vare, all his old hatred revived at sight of his rival, glanced contemptuously at the patched and faded uniform, the golden beard, the shrunk, emaciated frame.

'No, it's not a healthy place,' replied the other man, his haggard face flushing at the other's insulting tone. 'I shouldn't advise you to stay in it too long. And now, as representing the French Republic in this territory, which is under their protection, I must ask you to tell me what brings you here, so much off the track of—well, we won't quite go so far as to say Cook's tourists, but Cockney sportsmen would suit you better, perhaps?'

'I must again congratulate you on your most important command and rank,' sneered Vare; 'and if I may ask the representative of the French Republic for leave to camp in their sphere of influence for a day or two, I'll give you the information you want later.'

'Certainly. And perhaps you and Dick Smith will share my supper this evening?' coldly replied Hoppy, mastering with difficulty an intense desire to pull the little wasp's nose.

Dick can do as he likes. I prefer to stay with my men; and Vare turned on his heel with undisguised temper, and busied himself with giving orders as to his camp.

'But it's perfectly ridiculous, Apner!' excitedly exclaimed his friend Dick, as later on they discussed together a savoury mess of stewed kid. 'This fellow Vare-who, from what you tell me, must be a bit of a beast, but whom, I must confess, I have found a pleasant enough companion, and who has always behaved extremely well to mehas come out here at no end of fuss and bother, not to mention expense, to find you and restore youso he tells me-to the sorrowing arms of your "parient" and somebody else who shall be nameless. And now that he has most miraculously run you to earth, all alone, with the exception of poor Braun-who seems just about done for, I'm afraidand one nigger, you solemnly tell me that you won't come back because the last words of your chief as he lay dying in your arms were orders to

stay here in this God-forsaken place and keep that old parti-coloured rag there flying until further orders. I know what a stickler you are for duty—you always were in Algiers; but haven't I told you half a hundred times that you are clean forgotten, and that you would be looked upon as a man from the dead if you came back and reported the fate of the others and Escheaux? Besides,' he went on passionately as Hoppy shook his head, 'you won't live another six months here, and then what will become of your orders and flag and all the rest of the caboodle?'

Hoppy smiled faintly. 'Dear old Dicky,' he said gently, laying his hand affectionately on the other's shoulder, 'I quite appreciate all you say, and I wish I could come back with you. But you know perfectly well that if you were in my place you'd do the same as I, and - Well, I don't know if you ever heard of certain things that took place at Rhanibad five years ago, for you had joined the Legion then; but I once thought myself justified in disobeying orders to save-another man's life, and a nice peck of troubles it brought upon me. So, do you think that for the sake of saving my own skin I'm going to repeat the experiment? Answer me that, man; answer me that. As commanding here, I shall give Braun permission to go with you. No, I shall send him with my report, if he's well enough; but here I stick until I get orders to leave; and, after all, that won't be so dreadfully long, now that you can show them the road to Iwa. If you don't mind explaining all this to Vare it will save me an unpleasant job; and you'll take a couple of letters home for me, I

Dick got up and shook himself violently. 'If I were in your shoes I don't know what I should do, and can't tell till I am, which I hope will be never,' he grumbled. 'I can only now express my opinion that I think you are carrying your high-falutin ideas too far. But there is one thing I am quite certain about, and that is, that when once you have made up your silly old mind you are as obstinate and impossible as—as a donkey on Margate Sands, and so I give up the argument, and be blowed to you, dear old chap!'

'That's capital,' laughed Hoppy. 'And now let us have another look at Braun. I've given him the quinine you gave me; but I'm afraid that the little ceremony this afternoon, which he would persist in joining, was too much for him in his present state of weakness.'

He was right. Poor Braun had mounted his last guard; and though he lingered for three more days, nursed unremittingly by Dick and Hoppy, on the fourth he entered into the great secret, taking his own private one—most of the men of the Legion have them—with him.

They buried him beside the others, Vare and his men attending; and when the sad little ceremony was over, and the simple wooden cross with his name—real or assumed—roughly and indistinctly

cut upon it, had been set up at the head of the long mound of fresh red earth, Vare surreptitiously took a distant snapshot of it, to add to the other photographic records of his trip. He still maintained his attitude of haughty aloofness towards Hoppy, whose decision to remain he did not attempt to combat; and when he looked at his rival's weakened frame, and remembered the many months that must elapse ere he could be succoured, Vare smiled grimly as he said to himself, 'I think you'll be "her ladyship" yet, Mirabelle, for you'll never see Master Hoppy again, I fancy.'

One other photograph he took-surely the gods laughed -that of Hoppy himself, but all unknown to his subject. He had originally asked Dick to do it, and the latter, after much pressing, had reluctantly agreed. But when he attempted the feat Hoppy had vehemently protested, although he had no suspicion that his friend was acting for Vare. Glad at heart-for, harmless as the thing was, and understanding the Major's difficulty, owing to the strained state of the latter's relations with Hoppy, Dick nevertheless had a distinct feeling that he had not been perfectly straightforward-he had returned the baronet his camera; and the latter, laughing at what he termed the commander-in-chief's modesty, said the matter was of no importance. Nevertheless, the very next day, coming across Hoppy fast asleep under a tree, stretched out on his back on a woven mat, and dressed only in a cotton shirt and ragged pair of trousers, he took advantage of the opportunity thus offered, and hurriedly took a snapshot.

'By Jove!' he said to himself as he gazed at the stark figure, worn face, and emaciated limbs, 'really he might be dead already. I don't think that all the quinine in the country would keep him going now until they can fetch him;' and he retreated to his tent with soft and satisfied steps, more certain than ever of his bride.

A few days after Braun's death Vare and his party took their departure, Dick leaving his friend behind at his lonely post with many forebodings of evil. But quinine and other medicines were not now lacking, Vare having given a cold assent to Dick's demand for a supply to leave behind him; and so, with oft-repeated promises that the authorities should have the report, and certain people in England the letters which Hoppy had entrusted to him, the warm-hearted fellow tore himself away with a last, long, lingering hand-grip, and the two old comrades never set eyes on each other again.

Half-way back on their homeward march, the same insidious disease that had played such have with the French party, and which had declared itself in Dick soon after they left Iwa, became acute; and, in spite of all that the really distressed Vare could do for him, he slowly sank, and followed the same path as Braun through the gates of the great unknown. Who and what he really was he did not disclose—as is the way of the thoroughbreds who go under—before his death, and the lonely Vare, as he laid him in his narrow grave, wondered if

there were any anxious hearts in far-off England waiting for tidings of a well-loved lost one—tidings that would never come!

When Vare took possession of the dead man's few effects, the addresses of two sealed letters in Hoppy's handwriting caught his eye. He knew them both well; they were merged in one now, and his heart blazed with rage and fear as he realised what the delivery of the epistles might bring about.

Vare, his hatred of Hoppy apart, was not by any means a bad man; but as day by day he pursued his solitary march, brooding more and more over the possible chances of relief reaching his rival in time to save his life, he allowed certain ideas completely to dominate his sense of honour and to grip him in an unholy embrace. Dick was dead. The porters—not that they were of much account—had been twice changed in different tribal territories since he had buried him. There was nothing to show that he (Vare) had ever come across Hoppy, no reason to think that anybody at Bouc-al-Aran or

anywhere else in Africa would question him on the matter; for the real object of his expedition had been kept a secret, the authorities in Algeria believing it to be big game. Besides, he told himself, Hoppy was to all intents and purposes already as good as dead; for he felt sure that he would not survive many more months of Iwa. And, after all, would the Government thank him, a stranger, for worrying them about a solitary man of the Foreign Legion, whose return might bring up awkward questions about a useless and impolitic expedition long since comfortably consigned to oblivion? No; a thousand times no. And so, before he reached the outskirts of civilisation, he had made up his mind to keep silent; and one shameful night poor Hoppy's report and letters were carefully burned, and Sir Dethe Vare, Baronet, V.C., D.S.O., found himself irrevocably committed to the dreadful path with which the long days of lonely contemplation had familiarised him.

(To be continued.)

MY LORD'S PERQUISITES.

By Michael MacDonagh.

URING a ramble in Essex I came upon a pretty little village called St Osyth, close to Clacton-on-Sea. In the parish church I was informed that the altar-cloth and the cushions of the pulpit were made from the

counterpane and the velvet hangings of the bed in which George II. died. How that came to pass makes an interesting story of the soft things of official appointments. In the royal household there is an office called Groom of the Stole, filled by a peer if the reigning Sovereign is a king, and styled Mistress of the Robes and filled by a noblewoman if the Sovereign is a queen. The office was formerly a political one, its occupancy being changed with every new Government, and the appointment to it was made by the Prime Minister. Its duties are now entirely associated with the ceremonial or etiquette of Court life. There is a salary of five hundred pounds a year attached to the office, and the holder of it at the demise of the Sovereign receives as a perquisite the furniture of the bedchamber in which the king dies. The Groom of the Stole when George II. died was the Earl of Rochford, who had the furniture of the room in which the monarch passed away removed to his residence at St Osyth, and presented the rich trappings of the bed to the parish church.

The state drawing-room at Chatsworth, the seat of the Duke of Devonshire, holds the chairs in which William IV. and Queen Adelaide sat when crowned in Westminster Abbey. Coronation chairs are a perquisite of the Lord Great Chamberlain, and that office was filled at the beginning of the

reign of William IV. in 1831 by the sixth Duke of Devonshire. Formerly my lord enjoyed other perquisites. On the morning of the day on which a king is to be crowned, and before His Majesty rises, his wearing apparel is carried to his bedchamber by the Lord Great Chamberlain. For this simple service my lord became the possessor of the king's bed and all the furniture of the bedchamber. In 1831 the Duke of Devonshire was amusingly circumvented and deprived of this perquisite by William IV. By order of the King, the bed and valuable effects of his bedroom were replaced by a suite in plain deal. In recent times this perquisite has been abandoned. The Lord Great Chamberlain also receives forty ells of crimson velvet for the robes he wears at the Coronation. But his perquisites do not end even there. At the state banquet in the evening, after the Coronation, he serves the king with perfumed water with which to wash his royal hands both before and after the dinner. The basin and the towels go to the Lord Great Chamberlain as his fee.

In a few country houses are to be seen large, cumbersome, and unwieldy chairs with high, carved backs and seats in dark-green leather, which are always objects of curiosity to guests. From these chairs Speakers have guided the deliberations of the Commons in Parliament assembled. Formerly a new chair was supplied to the House of Commons on the meeting of each new Parliament, and the Speaker carried off the old chair as a perquisite. Lord Sidmouth, who, as Henry Addington, was for seven years Speaker of the House of Commons, at the end of the eighteenth century, had two of these seats of authority, one at each side of the fireplace in

the drawing-room of White Lodge, Richmond Park, a residence that was given to him by George III. in recognition of his personal devotion to the king. There are as many as five of these chairs at Clandon Park, Surrey, the seat of the Earl of Onslow, whose ancestor, Arthur Onslow, was Speaker of the House of Commons from 1727 to 1761. But if the Speaker has been deprived of this perquisite, he is still in the enjoyment of several valuable gifts over and above his salary of five thousand pounds a year, free of income-tax, his house, 'with coal and candle,' for nothing, and his retiring pension of four thousand pounds and a peerage. On his election to the Chair of the House of Commons he receives one thousand pounds equipment-money, as it is called, to fit himself out with the wig and robes of his office. He used to be presented also with two thousand ounces of silver plate to grace his sideboard; but in 1839, on the motion of that rigid economist Joseph Hume, the House of Commons decided that this service of plate, which had previously been the perquisite of the Speaker, should be attached to the office, and be permanently maintained in the diningroom of the Speaker's house. Past Speakers had also to thank a grateful country for allowing them one hundred pounds a year to pay their stationery bills, and an annual allowance of two hogsheads of claret. These also have ceased; but the carcasses of a plump doe in December and a fat buck in July from royal deer-parks are still delivered to Mr Speaker. Moreover, at Christmas he receives from the Clothworkers' Company of London a present of 'four and a half yards of the finest black cloth that the country can produce.' The original object of this very ancient custom, which has been in operation for six centuries, was to popularise the wearing of English broadcloth at a time the trade was languishing, by inducing the great personages of the land to wear it. The company spends two hundred and thirty pounds a year in providing such perquisites. The cloth costs thirty shillings a yard, and is specially manufactured by a West of England firm.

Even so exalted a dignitary as the Lord Chancellor does not affect to despise small perquisites, although, as head of the judicial system of the country and Speaker of the House of Lords, he is in receipt of the munificent salary of ten thousand pounds a year, and on appointment receives eighteen hundred and forty-three pounds thirteen shillings equipment-money, and on retiring gets a pension of five thousand pounds. Lord Chancellor Halsbury presided as Lord High Steward at the trial of Earl Russell by his peers for bigamy. The state chair, with its canopy and other trappings of rich silk, provided for such trials formerly fell to the Lord High Steward, but on this occasion the perquisite was denied to Lord Halsbury. The general cheers with which an announcement by the First Commissioner of Works to that effect, after the trial of Earl Russell, was received in the House of Commons

showed that the abolition of some of these quaint and curious but valuable perquisites which fall to high officials of the State, in addition to fat salaries,

would meet with popular approval.

The Lord Chancellor, however, remains in the enjoyment of the annual gift of broadcloth, as well as other perquisites of a more unique character. As Keeper of the Great Seal he retains always in his custody that symbol of sovereignty. It consists of two heavy silver discs, six and a half inches in diameter and close on one inch in depth, and each artistically engraved ith an effigy of the Sovereign, hinged together so as to form a sort of mould, from which is obtained in coloured wax the impression of the Great Seal, as large and as thick as a musin, which is attached by a plaited silken cord to all important State documents, such as treaties with foreign Powers, patents of nobility, and the credentials of ambassadors. A most beautiful purse, which is at once the receptacle and the outward sign of the Great Seal, is solemnly carried by an official in Court dress, called the Purse-bearer, before the Lord Chancellor as, with slow steps and dignified mien, he enters and leaves the House of Lords or the Court of Chancery. It is made of rich crimson velvet, on which the Royal Arms are exquisitely embroidered in gold. The purse is renewed every year, and the old one goes to the Lord Chancellor. The wives of Lord Chancellors have cunningly turned the purses to objects of household decoration. Hardwicke was Lord Chancellor for so many years-from 1737 to 1756-that Lady Hardwicke was able to provide the state bed in their house in Wimpole Street with several counterpanes and hangings from the purses which thus fell to her lord.

The Lord Chancellor has a more interesting perquisite still in connection with the Great Seal. When the mechanical parts of the seal become worn out and a fresh one is required, and when, at the accession of every Sovereign to the Throne, a different Great Seal with the effigy of the new ruler has necessarily to be provided, the old Great Seal becomes the property of the Lord Chancellor. An interesting contention arose over the right to the possession of the Great Seal of George IV. Lord Lyndhurst was Lord Chancellor on the death of that monarch; but before the new Great Seal of William IV. was completed a change of Government took place, and Lord Brougham was appointed Lord Chancellor. Each of them claimed the Great Seal of George IV. as his perquisite. William IV., to whom the dispute was referred for arbitration, decided to divide the die, which consists, as has been described, of two parts—one with the Sovereign enthroned forming the obverse of the seal, and the other with the Sovereign on horseback its reverse—and that a part should go to each of the contending claimants. But His Majesty's graciousness did not end here. He had the two silver discs set into silver salvers, and presented one to Brougham and the other to Lyndhurst.

The action of William IV. has become an established precedent. In 1860 a new Great Seal was ordered, as the one provided at the accession of Queen Victoria had become somewhat defaced. Lord Chelmsford was Lord Chancellor at the time; but before the new seal was completed he was succeeded, on a change of Government, by Lord Campbell. In the disposal of the old Great Seal, they decided to be bound, subject to the consent of Queen Victoria, by the decision of William IV. Her Majesty readily consented to follow the precedent of her uncle, and accordingly Chelmsford and Campbell received each a side of the Great Seal set in a silver salver. This precedent received an extended application in 1878, when it again became necessary to provide another Great Seal. The old seal fell to Lord Chancellor Cairns; and he, though under no obligation to do so, gave one of the sides to his predecessor on the Woolsack, the Earl of Selborne, who was Lord Chancellor in 1873. The Great Seal made in 1878 was discarded in 1898. It became the property of Lord Chancellor Halsbury, to whom also fell the last Great Seal of Queen Victoria. The cost of a Great Seal, I may add, is between four hundred and five hundred pounds.

The Speaker and the Lord Chancellor, who receive such handsome perquisites, make by custom similar gifts to others. The three clerks who sit at the table of the House of Lords taking minutes of the proceedings for the Journals of the House, enjoying salaries ranging from one thousand five hundred to two thousand five hundred pounds, and the three clerks who discharge similarly light and pleasant duties at the table in the House of Commons for equally generous emoluments, wear bob-wigs and flowing stuff gowns like barristersat law in our courts of justice. They shine resplendent in new wigs and gowns whenever there is a change in the occupant of the Woolsack or the Chair, for every new Lord Chancellor presents the clerks of the Lords, and every new Speaker the clerks of the Commons, with fresh sets of these

The Attorney-General, who receives a salary of seven thousand pounds, and the Solicitor-General, whose salary is six thousand pounds a year—both receiving in addition high fees for any cases they

may conduct on behalf of the Crown in the law courts—are, like the Lord Chief-Justice, the Baron of the Exchequer, and the Master of the Rolls, provided with more broadcloth than they need for the clothing of themselves through the benefactions of the Clothworkers' Company of London.

The Lord Mayor of London also receives as well as gives perquisites. In December of every year four does from Bushey Park are presented to him, and every July he receives four bucks from the same royal preserves. To each of the two Sheriffs of the City three does and three bucks are similarly delivered; while the Recorder, Chamberlain, Town Clerk, Common Serjeant, and Remembrancer receive one doe and one buck each. These animals are killed and delivered on the warrant of the First Commissioner of Works as gifts from the Sovereign. The custom is associated with royal grants and charters to the City of London of certain hunting privileges in the days of ancient civic hunts, of which there are records dating as far back as 1101.

The Foreign Secretary, with a salary of five thousand pounds, also gets his four and a half yards of broadcloth from the Clothworkers' Company. The Home Secretary, who has a salary of five thousand pounds, and his Parliamentary Under-Secretary, who has a salary of fifteen hundred pounds, receive gifts of venison from the royal preserves. Mr Henry Broadhurst, who was Under-Secretary of the Home Office in 1886, writes in his very interesting autobiography, From Stone-Mason's Bench to Treasury Bench: 'One curious experience that befell me during my short term of office was the discovery that I was entitled in virtue of my position to half a carcass of a buck from Windsor, or in lieu thereof one or two guineas-I forget the exact equivalent. I chose the half-buck, and in due course it arrived at the Home Office, when I had it transported to my home. It proved rather an alarming addition to my small larder; but it enabled me to fill a rôle which I have found the most grateful in life-that of the dispenser of favours. I was able to distribute among my friends joints of royal venison.'

A predilection for perquisites is indeed a common human weakness, from which, as we have seen, not even the highest and best-paid magnates of the State are free.

RUTH; OR, THE CLOTHES-PINS.

CHAPTER VI.

HE storm of the previous night had passed, and the refreshed earth and glistening leaves sent forth a grateful fragrance; my spirits rose as I walked forth into the mellow sunlight, and I felt indeed that

'the morn was cheery.'

But a sad change came over the spirit of my dream when the maid brought in my usual monthly

bill with the breakfast, and I discovered that a contingency had at length arrived which, though I had foreseen it, I had never cared to dwell on—in fact, that I was now actually reduced to my last shilling, and must at once bid adieu to the pretty spot where I had idled away so many pleasant hours, and nerve myself to begin the stern struggle for existence in earnest.

My father, like most men who have once been

wealthy, had managed to keep about him a certain air of luxury and refinement, even when his fortunes were at their lowest ebb; and, whatever his private troubles may have been, had never allowed me to feel the want of money, so that I was but ill

prepared for the struggle before me.

However, youth is the age of hope in earthly eventualities, as age is that of the purer hope in things eternal; and, as I set out to walk to the neighbouring town-for after settling my bill I had not even enough money left to pay for a carriage-I reflected philosophically that my pleasant sojourn in this quaint old village would always be a green spot to look back upon when the road before me was dark and dreary, and felt pleased to think that I had left my books and portmanteau in the care of my landlady, on the chance that some day in the far future I might be able to return.

'Now, however,' said I to myself, 'the nearest barrack-yard must be my destination, and in a few days I suppose I shall be wearing the tasteful livery of Tommy Atkins, and going through the graceful movements of the goose-step, to the admiration of my country and the terror of my foes, under the tuition of a red-faced drill-sergeant, who will tell me to keep my "helbows hin, 'old my 'ead hup, an' move my eyes to the right with a r-rattle." Well, the Queen's service is a fine career for any man, be he gentle or simple.

> Ben Battle was a soldier bold. And used to war's alarms; But a cannon-ball took off his legs, So he laid down his arms.

By the way, I wish Tom Hood would not put such unpleasant ideas into one's head. I wonder what will become of my atomic sympathies if such a fate befalls me?'

Thus idly communing, I trudged stoutly along, and had accomplished some four miles of my journey when my attention was attracted to a poor beggarwoman sitting by the roadside with a baby in her

'Buy a string of clothes-pins, your honour,' she said in a professional whine, holding them towards me.

'I am afraid I have no clothes to hang on them,

my good woman,' I answered.

'Oh, your honour won't refuse a trifle to a poor, lone widdy-woman with a child, that has not tasted a bit or sup this day .-- Have you, deary?' she said to the baby, who, catching its mother's meaning, held out its little hand and then pointed to its mouth.

'That is a very intelligent baby of yours,' I remarked; 'but if you can get no work, why do you not go to the overseer of Little Plumptre, whose duty it will be to pass you to the union at Chiselpoorborough, where you will get food and a night's lodging? No one need starve in England, you know.' I spoke as I had been told it was right to speak on such occasions by well-meaning county magnates who, however, had never been in want themselves.

'Yes, sir; and it's two weary miles to Little Plumptre, and six more to Chiselpoorborough, and the child to carry all the way in the hot sun; and when I get to the union they will keep me in till twelve the next day to do the labour, and what work can I get after that? I shall have to go on from work'us' to work'us' like a rolling stone, till it's weary I'll be in heart and body. Indeed it is,

She had given up the whine now; and as I looked at her worn shoes and the poor little, halfstarved, ill-clad infant, I really pitied her. 'Well,' I said, pulling out my uncle's shilling, the only coin I had, 'if this is any good to you, you are welcome to it; and you can keep your pegs, for I have no use for them.'

'No, no, sir; you will please to take the pins; they are only twopence the dozen,' said she, wrapping them in a piece of paper; 'and I know it's agen the laws to beg outright, so I won't ado it; but I thank you kindly, sir, and may Heaven reward you!'

She seemed so bent on my taking them that I thought it best to humour her, and carried the parcel mechanically for the next mile of the way.

Presently I sat down on a bank to rest, and, having nothing better to do, fell to reading the advertisements on the scrap of newspaper which enclosed my purchase. I had seen nothing but the Worcestershire Advertiser at my late quarters, and this was a bit of a London paper with the usual long list of moneylenders' artful notices, offering to advance sums to any amount without security. I was wondering what one of these harpies would say to me if I asked him for five hundred pounds on my own security of, say, a dozen clothes-pegs, when my attention was attracted by an advertisement at the top of the next column:

'NEXT OF KIN .- If Mr Aubrey Chesney, late of Heidelberg, will communicate with Messrs Close and Sebright, Lincoln's Inn Fields, he will hear of

something to his advantage.'

I looked at my watch. It was only five minutes past eleven; if I pushed on I should be in time to catch the eleven-fifty express from Evesham to London. And, happy thought, my watch would pay the fare.

CHAPTER VII.

BOUT half-past four that afternoon I presented my card at the offices of Messrs Close & Sebright, and was at once shown into the latter gentleman's private sanc-

tum, a comfortably furnished room, containing a bookshelf, a few portraits of eminent judges on the walls, and the usual row of black tin boxes in which lawyers keep their clients' private papers, and from the noble names stencilled on many of which I judged that the firm held a high professional

Indeed, it was easy to see that Mr Sebright was a man of very different calibre from my quondam friend Mr Tite.

Tall and gray-haired, with a frank, courteous manner, and shrewd, kindly eyes, he inspired you at once with a feeling that he combined large business capacity with a refined and upright mind. Added to this, his alight Scotch accent had an honest ring in it that was pleasant to hear; though why a Scotch accent should sound more honest than any other I have never been able to determine; I only state the impression it makes on me.

'I am glad to see you, Mr Chesney,' he said, motioning me to a chair; 'and I think, when you have heard what I have to say, you will be glad to see me. The facts of the case are simply these:

'Some time ago I chanced to read in the Illustrated London News that the will of Mr John Chesney of Pixley Hall, Worcester, had been proved, and I remembered that a gentleman of the same name and address had come to our office and made a will of a very different nature, at a date subsequent to that of the will described in the probate. I mentioned the matter to my partner, who remembered quite well that about two years ago your uncle, then a stranger to us, called one afternoon stating that he had just come from his physician, who had told him that he was suffering from acute disease of the heart, which might kill him at any moment, and that he wished, therefore, to make a will without delay, bequeathing the whole of his property to a nephew. He would not allow us to make a rough draft, but dictated the will then and there, had it duly attested, and carried it away in his pocket. Under these circumstances we thought it our duty to communicate with Messrs Tite & Mortmain, the executors, who, however, informed us that every search had been made among your uncle's papers, and that no such will was now in existence. As they act for some of the charities benefited by the former will, we thought it useless to try to get anything further out of them, but I felt so strongly on the matter that I took the responsibility of sending a clerk down to Pixley to make inquiries. Most of the furniture had been sold, but he succeeded in tracing your nacle's bureau, and had it taken to pieces, on the chance of there being a secret drawer. There was, however, nothing of the kind, and no will was forthcoming. Being a persevering fellow, he returned to the Hall and asked the housekeeper if she knew what luggage your uncle was in the habit of travelling with. She showed him a lumberroom full of bullock-trunks, old portmanteaus, &c.; and, after getting nearly choked with dust, he at last discovered a leather hat-box, with a label, the date of which corresponded with your uncle's visit to us. This was opened, and in the compartment for collars the will was found, with other miscellaneous papers.

I expect your uncle originally kept the box ander his bed, but that at some spring cleaning the

housemaid had removed it to the lumber-room without his knowledge. I have known such things happen before.'

Need I say that after this disclosure all thoughts of enlisting vanished from my mind; and, warmly thanking Mr Sebright for his kindness and promptitude, I entrusted him with full powers to recover my inheritance.

CHAPTER VIII.

OME months after the events related in the last chapter I found myself back again in my old comfortable quarters at 'The Barley Mow,' much to the delight of the

good landlady, while the painters and decorators

were busy at Pixley Hall.

I had gone out one afternoon to follow my favourite occupation of fishing, and had wandered farther up the stream than I had ever done before, when I noticed a rosy-faced old gentleman in a wideawake hat nodding and smiling at me from the opposite bank. His face seemed familiar, so I nodded and smiled back again.

'I trust, friend,' said he, 'that thou hast been successful, for verily the day is propitious.'

The words went through me like an electric shock, for they at once recalled to my mind my mysterious visitor at the inn.

'I beg your pardon,' I stammered; 'but I think I had the pleasure of meeting you one evening at "The Barley Mow" early in the summer."

'Nay, friend, that can hardly be,' he replied, 'for I have been absent from England for the last nine months; and now I am fain to confess that, though thy face is familiar, I cannot recall thy name.'

'My name is Chesney,' I said. 'My uncle used to live at Pixley.'

'That, then, accounts for my perplexity; verily, I must have seen the family likeness,' he returned, smiling. 'Thine uncle was an old and valued friend of mine, and if thou wilt cross by the footbridge higher up it will give me much pleasure if thou wilt afford me thy company as far as my house, which is not far from here. I need not tell thee that the nephew of my old friend will always be welcome at Dingley Manor.'

Curious to see the end of this adventure, I followed him, secretly wondering what would happen next, and we soon reached a fine old Elizabethan mansion, before which spread a broad lawn studded with noble trees.

'Ruth,' said my companion to a young lady who rose from her seat beneath an acacia to meet us, 'this is the nephew of my good old friend John Chesney of Pixley; thou must make him welcome.'

I noticed that she coloured slightly as, lifting her large, clear eyes to mine, she frankly extended her hand; while I stood gazing at her like one in a dream, for every graceful line of her slender figure, every delicate shade of expression that crossed her pure and lovely face, reflected to me as if in a mirror the image of my vision-love-

Ruth, the Puritan's daughter.

Somehow, after that I became a more ardent disciple of old Izaak Walton than I had ever been before; and there were few days that I did not find my way to Dingley Manor, and as each day passed my beautiful Ruth became more and more dear

One evening I was turning over some old music, when my eye caught the first lines of a song written in faded ink on a sheet of paper grown yellow with age:

Though years be flying, Love lives undying.

It was the song of my dream !

'Where did you get this, Miss Dingley?' I asked breathlessly of my fair companion, who was softly playing the last notes of an evening hymn, and looking to my enamoured eyes more like an angel of heaven than a creature of this earth, in the soft autumn twilight which lingered with loving tenderness on her fair hair and white, upturned forehead.

'That? Oh, there is a story about that,' she replied with a bright smile. 'One of my ancestresses, a Puritan maiden, my namesake, was beloved by a Cavalier gentleman in the time of the civil wars; she loved him too, but, being a good

and dutiful daughter, she could not disobey her father, who approved not the match. So there was a sore parting, and her lover had to fly the country; but before he went he sent her those verses to tell her that he would always be true to her, and she remained true to him till the king came back, when, her father yielding his consent, they were happily married, and lived in this house for many years. There is a portrait of her upstairs which I must show thee. People say I bear some resemblance to it; but it would be only vanity for me to think such a thing,' she concluded, with a demure little shake of her head which would have done credit to her Puritan ancestress.

What I replied does not immediately concern the reader.

Though I have often since thought over the events of that strange night at the inn, I have never been able to arrive at a satisfactory explanation of how my delusions-if delusions they wereare to be accounted for. My health was good, and I do not think, as some of my friends insinuate, that I fell asleep over the fire.

My father-in-law declares that when he first saw me he felt sure that he had met me somewhere; and as for Ruth, who is now sitting near me making tea, she cannot remember, she tells me, when my face was unknown to her.

THE END.

DAINTIES. YORKSHIRE

ANY articles of food are associated by origin or name with geographical localities; but, of all the counties which are associated with particular dainties, the largest county gives its name to the greatest number.

Some of the Yorkshire dainties have a world-wide fame, but others are never met with beyond the

borders of the county.

The most famous Yorkshire delicacy is the universally esteemed York ham, and the jambon d'York of the French menu tempts many unwary travellers into partaking of bacon and ham direct from Chicago. No one who has tasted a York ham could be imposed upon by the substitution of any other kind, for it has a delicacy and a peculiarity of flavour which no other ham possesses. The flavour is due to the particular mode of curing, although Mrs Glasse, the famous authority of olden times on the subject of cooking, attributes it to a specially fine kind of salt used throughout the county.

Yorkshire pudding is too well known to need more than a passing mention, as throughout England it is regarded as the orthodox accompaniment of roast-beef. In Yorkshire homes where the supply of meat is limited the pudding is served first, and, with a little gravy from the meat, takes

away the keenness of the appetite and tends to

economise the meat. Yorkshire pies are less well known, but in olden times they were often sent at Christmas-time to friends in London and other towns; and the ancient cookery-books give particular instructions to raise a thick crust or 'coffin,' so that the pie may go its long journey without being broken. The delicacy of the Yorkshire pies of olden days may be judged by the following recipe from an old-fashioned cookery-book: 'First make a good standing crust, let the wall and bottom be very thick; bone a turkey, a goose, a fowl, a partridge, and a pigeon; season them all very well; take half an ounce of mace, half an ounce of nutmegs, a quarter of an ounce of cloves, and half an ounce of black pepper, all beat fine together; two large spoonfuls of salt, and then mix them together. Open the fowls all down the back and bone themfirst the pigeon, then the partridge, cover them; then the fowl, then the goose, and then the turkey, which must be large; season them all well first, and lay them in the crust so that it will look only like a whole turkey; then have a hare ready cased, and wiped with a clean cloth; cut it to pieces—that is, joint it; season it, and lay it as close as you can on one side; on the other side woodcock, more game, and what sort of wildfowl you can get. Season them well, and lay them close; put at least four pounds of butter into the pie, then lay on your lid, which must be a very thick one, and let it be well baked. It must have a very hot oven, and will take at least four hours.' It is not surprising to find that a footnote adds that the crust requires a bushel of flour.

At the present time pies figure very largely on Yorkshire tables at Christmas-time; but they are generally filled with seasoned pork. There is another dainty specially associated with Christmas in Yorkshire homes, and that is a dish of frumenty. It is made by removing the outer husk of wheat by bruising it with a rolling-pin or wooden mallet. The inner part of the wheat is placed in a jur, covered with milk, and put into a slow oven to 'cree' for twelve hours, during which time it is stirred occasionally. When required for table use, sugar, spice, raisins, and milk are added to the 'cree,' and it is eaten either hot or cold.

Other seasons are associated with other special fare. Gunpowder Plot is celebrated by a feast of parkins. This is a special kind of gingerbread which is baked in round, flat cakes. It is generally considered very wholesome for children, as it has a slightly laxative action owing to the coarse catmeal and treacle in its composition.

Simnel-cake is associated with Mid-Lent or Mothering Sunday, on which day a holiday was granted to farm men and maids that they might visit their homes, when they took with them a cake, generally made specially for them by the farmer's wife. The derivation of the word 'simnel' (simella and semola being derivations from the Latin simila, 'fine wheat-flour') shows that it is a cake made of the finest wheat-flour, although a fanciful etymologist derives the word from Simon and Nelly, and relates an amusing story of a husband and wife who could not agree as to the method of cooking the Mothering Sunday cakes, the wife wishing to bake them and the husband desiring that they should be boiled. A compromise was effected, and the cakes were boiled first and baked afterwards, with such successful results that they were named 'Sim Nel' in honour of both husband and wife. Present-day simnel-cakes are of a particularly rich composition,

with a thick middle layer and a thick outer coating of almond-paste. Scarborough is specially the home of the simnel-cake, although other Yorkshire towns produce them, and Bury in Lancashire claims to have given them birth.

Carlins is a provincial name given to a special dish of peas which is always eaten on the fifth Sunday in Lent, or Carling Sunday, a name possibly derived from care—i.e. sorrow, the Passion. The pagans had a custom of eating beans as a sign of sorrow, and 'carlins' is a survival of the custom. The peas are hard and gray, and resemble those usually given to pigeons. They are soaked over night, and the next day boiled and then fried in butter.

Other dainties include tea-cakes, clap-bread, gingerbread, eccles cakes, apple pasties, and mint pasties, all of which figure on the tea-table, for a Yorkshire tea is of a substantial nature and forms an important meal.

Fruits and vegetables resemble those of other parts of the kingdom, although, owing to climatic conditions, the seasons are later than in the southern counties. One fruit deserves special mention, as it is found in full perfection on the Yorkshire moorlands, and that is the bilberry (well known in Scotland as blaeberries). This dark-purple berry, with its delicate coating of bloom, is sometimes eaten uncooked, but more often it is made into puddings, pies, jams, and syrups; but no matter in what form it is eaten, it is regarded as having special virtues in the prevention and cure of scrofula.

The sea that washes the Yorkshire coast offers only such fish as may be found elsewhere; but it offers them in abundance, so that herring and other fisheries support a fair proportion of the Yorkshire population. Whiting, too, abound, but they are so much appreciated by Yorkshire people that not many find their way into the London or Midlands fish-markets. Local fishmongers find constant occupation in skinning and curling whiting for the seven o'clock delivery in time for early breakfast. They are generally served fried with bacon, and the combination is worthy of note, as indeed are the other items which are deservedly classed under the name of Yorkshire dainties.

THE RED GERANIUM.

By Helen Porter.

AN BULGER sat up in bed and looked round the infirmary ward with a face of disgust. How weary he was of everything! How tired of the waxed boards, the rows of beds with their blue-checked quilts,

the tall clock ticking away the hours in the far corner! Nothing seemed altered in the eight years he had been there, bedridden; the only change was in the floating population who drifted in and out; and since old Patsey died, the week before, Dan found himself the oldest inmate.

Close at hand a sick man and a deformed boy were playing cards. 'Tis aisy some folks do be amused!' muttered Dan crossly, for the sight annoyed him. He felt so dissatisfied with his surroundings that he had long passed the stage of taking any pleasure in the amusements of his neighbours.

Then, as he painfully drew himself into an easier position, his glance fell on a flower-pot on the window-sill at the side of his bed, and his whole face brightened.

'Git me a sup av wather, Thady,' he called out to a more fortunate patient who was able to walk. 'The geranium is morthial dhry entoirely.'

Thady, as requested, went to the bathroom, and returned immediately carrying some water in a cracked mug.

cracked mug.

'Tis a grand little plant, Mr Bulger; sure,
'twud be a pity an it to die.' As Thady spoke
he winked at one of the card-players, for Dan and
his geranium were a standing joke.

Such a miserable specimen it was, too! Long and lank, with thick, distorted stalk, and a bunch of leaves at the top—poor, pale leaves pining for fresh air and for sunshine. Almost every condition necessary to plant-life was wanting except a loving care, without which it must have died years before.

Dan smiled. No girl at her first ball, no budding poet, was half as susceptible of flattery as this old man about his only possession. 'Tis doin' well,' he said; 'tis lookin' foine this summer. It has seven leaves more nor last year.'

'Does it ever flower, Mr Bulger?' asked Thady with an air of innocence.

'Is it flower? Why, 'tis a grand red flower! It does be covered wid flowers. Wait till ye see it; ye'll be surprised!' cried Dan hopefully.

'Well, indeed thin, Mr Bulger, ye have a consate av yer own about the plant!' cried a fellow-inmate from across the ward. 'I've been here goin' on three year now, an' divil the sign av a flower I ever saw on it! Ould rubbish it is. I do be wonderin' the matron doesn't sling it out. Sure, 'tis only to humour ye she laves it!'

'Ould rubbish! Ould rubbish is it?' stuttered Dan, shaking with rage. 'Maybe 'tis ould rubbish ye are yersel', Mr Moriarty! Maybe 'tis yersel' she'd be slingin' out in half a shake!' A defiant snort from the other here interrupted him, but he continued, ''Tis an ornyment to the ward, that's what it is! Look at the beautiful green av it. An' you an Oirishman, too, Mike Moriarty! I'm s'prised at ye! Barrin' the big branch ye can see out av the far window, 'tis the only bit av green I've sot eyes on for eight year. Green for the honour av Ould Oireland, sez I!' And after making this bid for popularity, Mr Bulger looked triumphantly round the ward.

'More power to ye, Dan!' 'Right ye are, Mr Bulger!' 'Sorra a bit av him desarves a better!' cried some of the audience, rejoicing, like patriotic Irishmen, in his sentiment, and also as Irishmen rejoicing in even the semblance of a fight.

'Well, I never saw sign av a flower on it, anyhow,' retorted Mr Moriarty, conscious that he had come off second best in the encounter.

'The air av the place don't seem to suit it,' said Dan, and there was a touch of wistfulness in his voice. 'It hasn't flowered this six year; though

that's not sayin' it never will, he added, looking sternly at his enemy. 'If I had a sup av new mould for it ye'd soon see!'

'Sure, it's too ould, it is, to be doin' any good at all, at all. Faith, 'tis loike yersel', it is, Dan Bulger—dyin' av ould age!' and Mr Moriarty laughed brutally as he turned over and drew the blankets about his head.

There is not always much consideration for one another's feelings in a workhouse.

'Dyin' av ould age, is it? Dyin' av ould age! Maybe 'tis better to be dyin' av ould age than av the complaint ye're troubled wid, Mr Moriarty! with a scornful inflection on the name. 'Me an' me geranium is wather-drinkers, which is more nor can be said for all here!' Again Dan looked round for public approval, feeling that he had routed his tormentor; but this sentiment was not so well received as the last; while Mike, resenting the allusion to his habits, which were unfortunately beyond a doubt, growled, 'Quit yer blethers, man, an' let me git to sleep.'

And, satisfied for the present with Mike's discomfiture, Dan turned his attention to his plant.

Suddenly something unusual, unexpected, caught his eye. Breathlessly he examined it. Yes; he was not mistaken. Deep in the heart of the leaves a tiny flower-bud was hidden, and, with quite wonderful strength of mind, he said nothing about it. What if it should never come to anything after all? Day after day he watched it swelling, admining its tender green, measuring every fraction of the slender stem on which it rested so proudly.

Happy in his secret, he was so unusually gentle that the matron began to wonder if he might not be unwell. It was so unlike Dan to lie there quietly with never a complaint or a peevish word.

His companions, too, did not understand this new attitude. It was something extraordinary to see the smile on his face, the look of placid content in the tired old eyes.

When Jim Blake whispered, 'Tis not long for this wurrld he is at all, at all; he'll be the next as 'll be tuk,' he only voiced public opinion.

The day when a thin line of red flushed the side of the bud Dan spoke of it, and from that moment till the geranium was in full flower he and his plant were the centre of interest in the ward. It was a mean enough blossom, goodness knows; but the rarest orchid could not have pleased the old man more as he lay and watched it with rapturous eyes.

Poor Dan! he had almost forgotten what a flower ought to be like in the eight years he had passed in this place. There was no view from his window, nothing but the gray stone wall of the next building; still, by throwing himself a little forward, he could catch a peep of the blue sky overhead. But now he only wanted to lie quiet, for his flower was satisfying enough; he did not need to strain his poor paralysed limbs even to see the

clouds above. Was not all his world there on the high window-sill? Silly? Perhaps. Unnatural? Perhaps. A great waste of feeling? Possibly. But to understand how Dan felt to that stunted geranium one would need to change places with him, not for a brief moment, but for the eight long years he had been, like the plant, starved of all that makes life glad.

As he lay there in that curious state, half-waking, half-sleeping, what dreams passed through his mind! One could not say whether he were in the land of dreams or in the land of realities, for his dreams were so real to him, and his thoughts roamed free in the past. He seemed to see the little cabin, with its mud-tramped floor, the dresser in the corner with its row of gaudy bowls, the peg on the wall where the rosary used to hang, the crude photo tacked to the shelf above—the photo of the boy who had died in 'Ameriky' half a lifetime ago. He could almost feel the peat-laden breeze as it blew softly through the casement, stirring the leaves of the geraniums which made the windowledge so bright; he could almost see the bent form of the 'missus' as she watered her favourites, and hear her voice, 'Troth, they do be great company the creatures. Some hold by cats, an' more by dogs; but give me geraniums, sez I.' And the start with which he came back to the present filled his eyes with sharp tears.

The door at the end of the room had opened, and a lady-visitor stood on the threshold. In her arms she held a magnificent crimson pelargonium; and as she explained that she brought it 'to brighten up the ward a bit,' the matron busied herself placing it on the centre table and wrapping a piece of crinkly paper round the pot. It made a rich splash of colour in the dingy room, and every eye was drawn to it. Every eye but Dan's, for after the first glance he turned away, his heart torn with jealousy.

'And this is our gardener,' said the matron presently, pointing to Dan. 'You see, Miss Moore, he has a plant of his own.'

The lady said a few words to the old man, which he received in sulky silence; and she, thinking he was merely shy, added kindly, 'I'm glad you like flowers too; you'll admire mine. You do admire it?' she asked.

'I admire some flowers, ma'am. I don't hould by all.'

'But you like my pelargonium, surely?'

'I'm not carin' for palgorums, ma'am, nor any but red geraniums;' and Dan stiffened his lip so that it might not quiver.

'Oh, then, if you are so fond of geraniums, I must get you a new one. This poor old thing is last blossoming; it is too old, you see.' Miss Moore spoke kindly, but drew back, startled at the tone of his reply:

'No, thank ye, ma'am. Sure, ye mane well; but my geranium is the very best. A prize wan it was, a quare deal better nor any of yer palgorums, or

sich-like trash.' He spoke firmly, raising his voice so that all the ward might hear; and, his protest and confession of faith over, he lay down and pretended to go to sleep.

'Never mind him, miss; he's not been himself of late,' the matron explained in a whisper as she

led her visitor away.

'Wan in the eye for you, Mr Bulger!' exulted Mike Moriarty as soon as the door closed. 'Tis aisy seein' the lady doesn't value yer ould cabbage, surely! She knows what's what. Bad scran to the ould weed! We can be seein' now what a geranium ought ter be.'

But Dan was too dispirited even to make a reply, though the taunt went home. Indeed, for the next few days his life was one long misery. None of his companions meant to be actively unkind, with the exception perhaps of his avowed foe, Mike; but it was great fun to take a rise out of the old fellow, and they never knew that to him their chaff meant real suffering.

At last he could bear it no longer, and resolved to make an end of it. With great secrecy and infinite care he managed to screw one of the heavy iron knobs off his bedstead, and after the lights were out he rose painfully in bed and hurled it at the offending pelargonium. The crash wakened every one, and it was some small satisfaction to Dan even in the midst of his disgrace to see by the faint light from the night-watcher's lamp that his enemy was shattered beyond hope of repair.

'Deed, then, an' I'll tell Miss Moore the next time she comes,' added the nurse after a severe scolding. 'You are a nasty, ungrateful old man. You might have killed some one with that heavy

weight, too.'

'I'd be sorry to hurt any, barrin' Mike Moriarty, miss,' was the stubborn answer; and, failing to get assisfaction from Dan, she closed the conversation by turning away and leaving the ward in darkness once more.

As the days went on Dan did not recover his spirits. The rival plant was dead, yet the memory of its glories still lingered and furnished a topic for those who wished to tease him; and in spite of himself a feeling of shame for his rash act disturbed the old man. He was conscious, too, that by betraying his jealousy he had made himself stidioulous

When next Miss Moore appeared he turned away, trying to avoid her notice. She came straight up to him, however, holding up a brown-paper bag. 'Some fresh earth for that plant of yours, Dan,' she explained, smiling at him.

'Thank ye kindly, miss.' Dan's voice was tone-

'Shall I repot it for you?'

'Don't be goin' for to touch it, miss.'

'Oh, I assure you I'll be very careful—I'm quite a skilled gardener myself. Why, where is the pelargonium I left here, by the way? Surely it is very soon over?' She looked round, and several voices broke in, eager to tell her the history of its premature death.

Dan pretended not to hear, and yet every word stabbed him; it sounded such a black episode as

related by Mike Moriarty.

Curiously the young girl studied the culprit, noting the flushed and averted face, and some impulse made her advance to speak to him again. 'Why, Dan, how had the poor plant annoyed you?'

The tone was gentle, and the old man looked up startled, for he expected reproof, and as he did so the girl saw that his eyes were misty and ashamed.

'No ways-no ways, miss-only-only'-

stammered. She sat down on the edge of the pallet, laying her soft, white hand on his old and twisted one.

'Tell me all about it, Dan.'

"Twas this way, miss. They did be makin' a laugh av me an' the wan wee flower on the plant, an' I c'u'dn't bear it; it made me mad like.'

'I'm sorry I brought it if that is so; but you could hardly expect yours to have flowers like mine, which comes from a conservatory and has every care;' and as she spoke she thought there was something a little pathetic in the professional jealousy of an old gardener, for such she supposed him to be.

'Ah, miss, don't be thinkin' that-leastwise'-He could not explain, but added, with a shake of the head, in a voice all broken and husky, 'Twasn't only that, miss; but she was powerful proud av the

And at last the girl understood.

'Your wife?' she asked gently.

'Yes, miss; an' she's gone to Glory this nine year, an' it hurts me to hear them raise the laugh on what she was so sot on once.'

It was quite a little time before any answer could come for the painful lump in her throat, and the girl turned and looked at the miserable plant with altered eyes-with eyes which, like Dan's, saw in it a reminder of happier days, of days which had not always lain in the narrow ward of a workhouse infirmary. The shabby, stunted geranium was the last link to be broken, for friends and home and love had gone, never to return.

'I think I understand;' and her voice required quite an effort to steady it. 'I think I can see what

a very precious plant it is.'

Dan had recovered his composure, and at her words a new light shone in his eyes.

'What did ye be sayin', honey? I'm a bit deaf the day.'

'I said I can see how precious the plant is,' she repeated louder.

Dan's glance flew round the ward to see that all were listening, and he answered with a ring in his voice, a new note of pride, 'Tis so, miss. I allers knew 'twas a grand plant.'

The girl smiled, and, seeing his little manœuvre, humoured it. In a loud, clear voice she said, 'You are quite right, Dan; it would be a beautiful plant

if it got half fairplay. But it cannot thrive in such a place. If you will let me have the timest cutting, I'll get my gardener to see to it. I shall be proud to have it in my greenhouse, and will bring it and show it to you next year.'

Her words, her kindly glance, seemed to infuse new life into the old man. He was radiant.

'Faith, thin, honey, ye'll have yer cuttin' an' welcome. I'm not wan to refudge anythin' to a lady. It's a prize plant it is, an' a greenhouse is its proper place, not a dirty hole like this.'

So the cutting was taken, and the old stump repotted in the fresh mould the girl had brought; and when presently she went away she left a happy,

contented Dan behind her.

Reinstated in the respect of his companions, his own conscience at rest-for the girl had freely forgiven him for destroying the pelargonium-his plant honoured and appreciated, no wonder he felt a different creature. It was a pleasure to see him, and as he launched a scathing taunt at Mike Moriarty even that irascible foe had not the heart to insult

'Tis little ye know about plants. 'Tis aisy seein' what a gomeral ye are, Mr Moriarty. The lady axed for a cuttin'-ay, an' was proud to have it! Put that in yer poipe an' smoke it, Mike Moriarty!'

THE MESSAGE OF NATURE.

In the wonderful glow of the sunset, The emerald green of the field, In the soft-whisp'ring lap of the waters, My message to thee is revealed.

Where the breezes waft over the river, And break up the water to gold, Which glows in the flame of the sunset, The thoughts of my loved one are told.

In the deepening gray of the evening, With voice soft and tender in tone, The sweet, mournful gusts of the breezes Bear tidings for thine ear alone.

On the soft wind which blows from the river, And speeds down the vale to the sea, The white flecks of cloud swiftly moving Are laden with memories of thee.

Oh, read in the wide arch of heaven, And soft touch of Nature's caress, The message of love for my dear one, Which my heart has no power to express!

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, June 22.

OME from his tactful labours in the fields of the higher diplomacy, it is the pleasing and appreciated custom of the King in the time of the busy social season to lend his supreme

services to the close knitting of some of the elements of the social fabric. Apart from the interest that he exhibits almost every week in institutions of national, municipal, philanthropic, artistic, and other characters, to say nothing of the sport which has always been one of the chief loves of His Majesty's life, he devotes much of his time to the paying of more or less ceremonious visits upon those of his subjects who are favoured with his intimate friendship; and it is nothing in these days for the royal motor-car to run out from Buckingham Palace at noon in the direction of a mansion in Belgravia or Mayfair, where the King will pay the nearest thing to a surprise-visit for luncheon that is practicable in his case, for earlier in the day some warning has always been conveyed to the honoured host that he may not be unprepared—or absent. Yet at such times there is a conspicuous absence of some of the severer forms of etiquette, and so it comes about that, the great honour apart, His Majesty is in all respects the most welcome guest. The King has established a new code of rules for hosts which is well understood in the circle in which he moves. Does he wish to make a call on one of his friends, and a message to that effect is sent forward, it is then understood that when His Majesty arrives there shall be no other person present, however distinguished, except the host himself, and indeed that no other member of the family may be permitted to enter the apartment where the King may be unless specially inquired for by him. In the matter of dinner and houseparties attended by the monarch, custom has changed somewhat since the middle days of the reign of Queen Victoria. The late Sovereign used, of course, to scrutinise carefully the list of guests

whom a host proposed to invite to meet her; but head-gear, No. 500.—Vol. X [All Rights Reserved.]

it was seldom that she suggested an addition to the names unless there were some very important reason for making one, or unless it appeared that the name of some personage had been accidentally overlooked by the host or hostess. But nowadays the selection of guests to meet royalty is a more considered matter, and the chief guest constantly makes suggestions, a course of procedure which tends to the increase of the general pleasure and contentment. In the case of the week-end visit, which is a form of recreation in which the King most delights, it is an understood thing that His Majesty is generally invisible in the morning. He always breakfasts alone, of course, and does not generally leave his apartments at all during the morning hours, which are usually devoted to attendance to State and other matters incessantly claiming His Majesty's attention. In most country houses which the King honours with his visits, the royal apartments are in the nature of a self-contained flat, sometimes with an exit to a private garden, and in this way the necessities of the situation are best attended to. Occasionally His Majesty is still absent at luncheon, but he usually attends at afternoon tea. Dinner with the King is always a very short affair, usually consisting of but three or four courses, and being completed within the hour. This has been His Majesty's most sensible practice for many years past; but somehow his excellent example does not seem to have achieved complete popularity in society, for long, wearisome dinners are still in vogue.

If all the examples which are set by the Court in these days were as strictly followed as they ought to be, society would be a healthier and saner thing than it is, and a happier one no doubt; but in some few cases there is sometimes seen what amounts very nearly to open defiance of such example. For instance, for many seasons past the Queen has carried on a campaign against the slaughter of birds when the object is that of adding them to ladies' head-gear, and yet their use is almost as frequent as Reserved.

ever, and in some cases the offenders have had the effrontery to exhibit their offence before Her Majesty herself. Needless to say they are in no wise forgotten. In these days of the burden of tipping, many people are heard to bewail the fact that the King does not take a strong line against it, and by some vigorous denunciation and the establishment of a strict non-tipping practice on his own part give a powerful initiative to the removal of this evil. How far a bold hint from His Majesty in a matter like this may go was indicated in the case of his pronouncement two or three years ago to the effect that it was never to be regarded as any slight upon the Sovereign that his health was drunk in water by those who preferred to do so. Teetotal dining has become increasingly the fashion in recent times, and it is certain that this wise edict had no inconsiderable influence in this direction at the time and since. Once His Majesty did permit himself to make a denunciation against the tipping excesses of the times; but custom in this tyrannical business seems to be too much even for kings, for it is well known that he conforms to it to a very full extent. Some curious stories are told in this connection. The Duke of Fife has strong objection to any of his guests ever tipping one of his servants, regarding it as a slight upon his hospitality. The King knows this, but yet was unwilling when he had stayed with the Duke for deerstalking, and had been well pleased with any particular servant who had attended upon him, not to show his appreciation in some tangible manner. So once when shooting he placed a sovereign at the bottom of a tobaccopipe, and then filled it with tobacco and made show of lighting it. When it was found that there was something wrong, he handed it for inspection to the gillie or loader whom he specially favoured, who, like a wise man, understood when he examined it. At the same time the King, with a smile, accepted a cigar from his host, who a few days later came to hear of the little deception that had been practised. 'The King can do no wrong,' he said.

So the London season is now in its full whirl, and everybody that way inclined, with time and money to spare, is doing his or her best to live at the greatest pressure. The Americans are running about everywhere, and wonderful are the measures which have been taken to accommodate their desire to spend as much as possible before their return. The other day, when making a periodical examination of the contents of a favourite second-hand book-shop in the West End, I noticed that certain volumes I had seen there some time before were now priced some 30 or 40 per cent. higher than they were in the winter, and I asked the reason why. 'The Americans are coming,' said the shopkeeper, and it happened that these volumes were of the kind to appeal to Americans. But nothing is more noticeable in London now than the effects of the entente cordials in the large number of

French visitors who are among us. They are becoming quite 'a good second' to the Americans, and their enthusiasm as temporary Londoners is great, though the hotelkeepers and shopkeepers will tell you that there is much less to be made out of them. And here in London now we have the strange anomaly of the French people crowding out some of those few restaurants which make a speciality of purely English fare, while the Englishmen elsewhere are eating their way through a menu of the most advanced Parisian character. It is a curious thing about the English taste in the season in these days that it is always wanting something very new and novel, right up to the point of freakishness. A year or two back the freak-dinners, invented in New York, on which anything up to a few thousand pounds might be spent, and the object of which was to make the affair look as little like a dinner as possible, became popular in rich London, and there have been signs that the idea is not yet done with. And some of the West End purveyors will tell you strange stories of the current tastes of quite a large section of the community. Not long since what are called Chinese edible birds' nests were instituted as a special delicacy, and have achieved permanent popularity with some very rich gourmets, to the extent that they have even been displayed in shop-windows as articles of ordinary and regular sale. These nests are small gelatinous things said to be composed largely of the saliva of the Chinese crag swallow, and they cost fifteen shillings an ounce. They are made into soup, a consomme of chicken being first prepared and a whole nest added to each. A small plate of the completed soup, consisting of little more than a large spoonful, costs the diner from five shillings to seven and sixpence. Another fancy soup is made nowadays from 'visega,' which is the dried backbone of sturgeon, and costs about twelve and sixpence a pound. It is also said that the popularity of escargots, or French snails, at the idea of eating which we used to shudder, is so much on the increase that one dealer in Piccadilly sells more than a hundred thousand of them in the season; and you can buy frogs on skewers at two shillings a dozen, or the legs of frogs, in tins, at four shillings the tin. On the whole, our French friends are decidedly to be congratulated on their choice of dining-places when in

A newspaper correspondent said lately that there was an increasing tendency among Englishmen in town towards excessive attention to matters of dress—towards something akin to foppery. Nothing could be farther from the truth. To any one who has lived in London for ten years or more the simplification in male attire that has been in progress during the last three or four seasons has been most striking. One decade back a man dared hardly be seen in any public place in the daytime unless adorned with a silk hat and enveloped in the regulation frock-coat. Nowadays such things, unless

worn for some special reason, are positively regarded as foolish. On the Stock Exchange, in Parliament, in the clubs, everywhere, the silk hats and the long black clothes are comparative rarities. Tweed suits and bowler hats, and even caps of kinds, have taken their place, and it is no uncommon thing for men to be seen about at their business and their pleasure in attire designed specially for golfing or motoring. This is an advanced form of carelessness, but it is gaining in popularity. Ten or fifteen years ago all men had tastes in walking-sticks; now they do not walk out with sticks at all. Their fancy golden watch-chains have disappeared, and often enough the gold watches at the end of them as well. All this is not because they are any the poorer; it is because, as they will tell you, they are more sensible, and in this matter, if in no other, they are adopting the simple life in the most wholehearted manner. It is the new life of the open air that has become so popular that has done it all. Golf and the car are responsible. Every man goes in for one or the other now, and he has been taught the excellences of comfort and convenience, and has a feeling that he likes to be prepared for his favourite enjoyments at all hours. The process of his conversion to sartorial simplicity began by his keeping at his office reserve suits for motoring and golfing. This was an irksome arrangement, so now he lives more in the reserve suits. It cannot be said that the place generally looks the worse for the change. In many respects we are becoming a more practical people than we used to be.

* * *

They are shaping a stadium and raising tier upon tier of seats in the far West End of London for the purpose of holding Olympic Games there in the course of next season. This is but what has been done in other capitals, and it will not be any unique thing for athletes from all over the civilised globe to forgather thus in one spot and contest for supremacy. But to the complete and reflective sportsman it will look like a concrete emblem of the more or less general state of things that nowadays obtains in and about the Metropolis. It seems to him as if 'the whole world in arms' is constantly attacking us in our sport and attempting to lessen our general sporting superiority-in a friendly way, of course, but, as sport goes, attacking us all the same. Perhaps the average person has not reflected, like this complete sportsman, on the extent to which this internationalism in sport, as it may perhaps be called, has attained, so he may be reminded of some of the facts. In the springtime there come to us lacrosse players from Canada, showing us how ineffectual have been our attempts to acclimatise a game like this in Britain. At the same time there swoops down on the English courts a tennis-player from the United States, and takes away a championship that had seemed to have a permanent home in this country. While these ordeals of the real and sterner tennis are being undergone,

there is a lady-champion from America and menchampions from the colonies arriving and preparing themselves to battle for the championship of lawntennis. Teams of lawn-bowlers from Australia and New Zealand are at the same time practising here and there on our suburban greens, and simultaneously there is the news that cricketers from South Africa, stirred with ambition by the examples that have been often set to them by their kinsmen in Australia, have arrived at Southampton, and all the talk then is first of test-matches and next of county matches. Newspaper critics devote columns of space to speculating upon English teams that may or may not be set against them in defence of our English honour in cricket. More news of sporting invaders! A Frenchman wins one of the biggest of the early races of the season on the turf, and racing men's minds are turned to wondering how good or how bad is a Russian horse that is coming over in search of equine laurels. Horses from everywhere! How shall the British horse consider any more that he is so great among his kind? For in some stables just a few miles out of London there are a hundred thousand pounds' worth of trotting horses and coaches which were brought over from America in the bleak days of February, and here they have been in process of training, with a huge army of servants waiting upon them, that when the show came to be held at Olympia in the early days of summer they might be at their best. These are the famous Vanderbilt horses; and never, they say, were there other such horses of their kind, and never were any others tended with such care. Pass away from the horses, and on the athletic grounds there are men from America and from France trying again to win more British championships. Always championships. Away up the river let us go to peaceful British Henleythat purest of festivals of the English summer, pretty pageant of the sunshine and flowers and happiness, as it will be held again in a few days from now-and here again there are more foreigners trying to win more British championships. To some earnest minds it is the most melancholy thing of all that there are always foreigners at our Henley now. On the towpath there are strings of foreign sportsmen of all the different sorts, watching the efforts of other foreign sportsmen to 'lift' the Grand Challenge Cup, and for the first time in history they saw it done last year. Friends all to us are these foreigners, and it may seem to them sometimes that there is a touch of pathos in some of these things. England, with its big sporting heart, is against the world, and week by week she is defending her little household gods, never or hardly ever suffering herself to covet the possessions of pride that belong to others. There may be watching these Henley oarsmen the golfers who are over from America, having been competing for the golf championship at St Andrews. Two or three seasons back they also stung the amour propre of some British sportsmen by taking away with them

a championship cup that had never left these shores before, and which few of us thought would leave it while we remained alive. So there will be the procession of champions of all nations along our tracks and over our links and up our rivers and on our fields and courses everywhere through all the summer and autumn; and when at last the leaves fall and the sun grows cool, a new set of winter champions comes across the seas, this time from South Africa again or from New Zealand, and they humiliate the players of the great game of Rugby football that was born and bred in Britain. These are only a few of the invaders; there are many others of lesser renown coming and going by almost every steamboat.

* * *

There are two or three different ways of viewing all this extensive and increasing internationalism in athletics and sport, which has generally the despoiling of Britain for its object. By the more superficial observers it is held to be a fine thing that intimacy between colonies and nations should thus be strengthened. It is said that in this way we all get to know each other so much better, that we come to take a greater interest in each other, and that the bonds of friendship are tightened by rivalry on the playing-fields as they could be in scarcely any other manner. There may be something in this view; and, anyhow, it is certain that games are coming-have indeed come-to be no inconsiderable factor in diplomacy. Ministers of State are obliged to take some notice of these contests. They attend them; they make speeches; they award prizes. They have been known to intercede quietly when difficult questions have been raised. Long reports, coloured sometimes by natural national prejudices, are cabled to newspapers across the seas, and greater prominence is given in the printed sheets to these descriptions of games than to other affairs of national and imperial moment. What shall it matter if somewhere a kingdom is tottering or a statesman is brooding over a scheme for the disturbance of the world, if on some English field an American is coming near to winning a game of one kind or another? Certainly diplomats are obliged to take cognisance of this increasing internationalism in sport. They may look upon it as a factor in modern life that they dare not neglect, or they may regard it as a tool that may be used to suit their purposes. Anyhow, you may be sure that Downing Street in these days knows something about games; and there was a significant forward step made when it was announced that the New Zealand Government would pay something towards the home-going expenses of the footballers from the colony that were over here not so long ago. But all these intimacies and rivalries are ticklish things after all. It is only a sport, only a game, and it is generally a happy business; but the rivals are often treading on very thin ice, and the niceties of conduct that have to be observed are sometimes irritating, for in these matters angry feelings and unwarrantable suspicions are more quickly aroused than in the more matter-of-fact affairs of everyday life. Susceptibilities are too keen. A nation will be furious at the breach of a rule of a game, or a suggested infringement of the spirit of it, when three-parts of that nation would be indifferent to some clumsy or sinister handling by diplomats of a piece of national business of importance. One has only to think of some incidents that have taken place in connection with the yacht-races for the America Cup, of serious questions that have been raised at Henley, and even recently of the irritation that was generated when an English cricket-team was not sent out to Australia as was expected, to realise the truth of this. Countries and colonies that have not the advantage of our traditions of sport, who have only just taken up the games that we have played for centuries, do not always view things in the same light as we do-could not be expected to do so. Their standards of ethics are not the same, and though all mean well, the two views do not assimilate. Six years ago, when, after a year of training, a crew of Pennsylvanians was beaten by Leander at Henley in the final for the Grand Challenge Cup, Leander having only trained for a fortnight, they were bidden to the victors' feast of celebration, and in all innocence one of them, in answering to a toast, said they had been beaten fairly and squarely, and there had been no cheating, 'contrary to what they had been told' there would be. Of all sports British rowing is one of the purest, and Henley is the emblem of its purity. It was hard to hear these things, and to feel that they were thought abroad. It is certainly doubtful whether the dangers of internationalism in sport do not outweigh the advantages; and it is very questionable also whether the advantages at their best are as real as they are thought to be. Does not this internationalism give to games, mere relaxations after all, an enhanced importance to which they are in no way entitled? Britishers spend enough time on games as it is; the circumstances of the period tend to make them spend more. The old order of things-business first and pleasure afterwards-is to be reversed, or rather the pleasure becomes the business; for when there are international reputations at stake men must train for a year. Money must be spent upon them as on vast enterprises, as indeed these are vast enterprises. Hundreds of thousands of people must pay to see, or there will be ruin, for these expeditions cost Capitalists are needed for this many thousands. sport. Millionaires only are of any use in international yacht-racing; shrewd finance committees are needed for the management of intercolonial cricket and football; an American millionaire has just won the amateur tennis-championship, and another one brought his horses to Olympia. So this international sport becomes a matter of politics and money. Thoughtful people must come to realise that insularity is the best for British games and sports. But things have gone far, and can there now be any drawing back? It is on the eve

of Henley that year by year this question comes to be most thought over, for it is in connection with Henley that the problem is most seriously felt. Some time ago it was put boldly to the vote as to

whether Henley should go in for insularity, and there were nineteen votes to five against. The nineteen feared that we might be thought to be afraid. But the question is not yet done with.

HOPPY.

CHAPTER XIII.

HE rain fell in an unceasing drizzle; consequently the London streets were in that condition of greasy filth which is at once the disgust and amazement of foreign visitors

to the richest city in the world. The hour was that at which the toilers after pleasure return to their outwardly dingy but inwardly splendid abodes, to deck themselves out for the round of evening amusements, and Mirabelle Melgrove, bowling along in her snug little brougham, found herself somewhat short of time for that necessary, but to her distasteful, operation.

'Tell John to hurry,' she called out impatiently to the footman through the speaking-tube; and John the coachman, anxious to please a loved, if rather imperious, young mistress, let out his steeds to what was, under the weather conditions, a decidedly dangerous pace.

'Hi! hi! hi!' The horses, pulled almost to their haunches, slipped and slithered, and then the occupant of the carriage felt a sickening jolt, and almost immediately the brougham stopped.

'What is it?' she asked anxiously, sticking out her pretty head through the hastily opened window. 'I'm afraid as a gent'as run hunder the carriage, miss,' answered the footman, jumping down as he

spoke, and passing to the rear of the vehicle.

'Dear, dear,' cried Mirabelle, 'how dreadful! I hope he's not hurt;' and she hopped out and joined the small crowd which had instantly collected, to

see if she could help in anything.

'Now then, make way there,' gruffly ordered a policeman, pushing his burly form through the gathering press, and Mirabelle, following in his wake with the words, 'I am the owner of the carriage,' easily reached the side of the sufferer. He was a tall, strongly built man of military appearance, whose dress suggested the respectable artisan class, and he sat on the dirty street, pale and angry, hatless, and spattered with mud.

'Now then, keep hoff; give the gen'leman room to breathe,' shouted the man in blue; adding in a gentler tone, 'Are you much 'urt, my man, or d'you think you could stand hup with my 'elp?'

'Leg broken bad, p'liceman; case o' hambulance an' 'orspital,' shortly answered the victim of Mirabelle's impatience; and a raucous voice at the back of the crowd shouted, 'Yus, tike 'im ter 'orspital fer ter be dissected, bobby; 'e's honly a pore workin'-man; an' don't keep the rich lidy as 'arf-killed 'im a-waitin' hin the cold, cold rine.'

Mirabelle flushed crimson. 'No,' she exclaimed, so that all could hear her, 'the rich lady will not have him go to hospital, but to her own house.' Then turning to the policeman, she said authoritatively, 'I am Miss Melgrove, and I live with Sir Ralph Apner only a few doors down the square. Send for a stretcher, please, and let him be taken in at once, and I will see that he has every comfort and my own doctor.'

The policeman looked a little doubtful; but the person most interested settled the matter for himself. As he heard Sir Ralph's name a look of surprise came into his face, and eagerly saying, 'That will do me hall right, p'liceman; do has the young lady says,' he looked searchingly at Mirabelle, and seemed to find his scrutiny satisfactory.

Thus a short time afterwards a little procession carefully mounted the steps leading up to Sir Ralph's door; and as the latter closed upon it the same gin-sodden voice called out from the dispersing crowd, 'Three cheers for the ke-ind lidy!'

'And now that you are more comfortable,' said Mirabelle, when, the doctor having done his work, and the patient settled down for the night, she and Sir Ralph stood beside the bed of their unexpected guest, 'is there any one you would like us to send to and let them know of your accident?'

'There's honly my brother, miss, and thank you. 'E keeps a lodgin'.'ouse for gen'lemen;' and he gave the street and number. 'An' hif I may make so bold, sir,' he continued, addressing Sir Ralph, 'do I hunderstand that you are General Hapner?'

'Yes, my man, that's my name.'

'Father, maybe, sir, hof Lootenant Hapner, 'Underd an' Fust Sooties—that was ?'—regretfully.

The General stiffened at once.

'Perhaps you would like to speak to me privately,' he said.—'Mirabelle dear, you had better leave us.'

'That's the very name, sir,' cried the man. 'No, no,' he went on, seeing the girl's look of surprise and her evident intention of withdrawing, 'don't go, miss; it's naught private; only I was Mr 'Oppy's—I beg pardon, Mr Hapner's—servant in the rig'ment afore he went Heast, an' 'e 'ad to take a nigger man hinstead o' me, haccordin' to riglations. My name's Rex, sir—10,724, Private Sam Rex; two medals, four clasps, an' best shot o' the battalion two years runnin'. Served twenty-one years, five good-conduct badges, an' now hon pension hat ninepence a day. Mr Hapner was the best master has ever I 'ad, sir, hand I'd be glad to 'ave noos of 'im indeed.—Hand you'll hexcuse me,

miss,' the now rather excited man continued, 'but I recognised you dreckly I saw yer face has the lady 'e was goin' ter marry ; cause Mr 'Oppy-there I go again - 'ad it in a phortograph-case, an' yer pretty name I knowed again too, for many's the time I've 'card 'im a-mutterin' it, specially when 'e was took sick hafter 'is trouble.'

'God bless my soul! be calm, my man, be calm. This is most interesting,' cried the General. 'I'm sure we are most grateful to you for your inquiries after my son. Twenty years' service and ninepence a day pension! I do not remember the exact scale, but that appears singularly small. No wonder we do not obtain recruits in sufficient- But what am I talking about?' he exclaimed in some confusion. 'I'll send for your brother at once. Rex, you said? Dear me! Hoppy's old servant. Fancy that!' and the white-haired, red-faced old fellow stumped vigorously out of the room, with something suspiciously like a tear twinkling in the corner of his eye.

Mirabelle got a chair, and sat down beside the patient's bed.

'Yes, I remember your name now,' she said

gently; 'Mr Apner mentioned it to me once or twice. He always put down his escape at Rhanibad to your good shooting. I'm sorry to say that we have no news as to his actual whereabouts at present, though a friend-ah, you would know him of course: Major Vare—is now seeking for him in North Central Africa. I am engaged to'-

'What! Not 'im, miss?' broke in Rex in a sur-

prised and disgusted voice.

'To Mr Apner, I was going to say,' laughed Mirabelle; 'but why should it not have been to Major Vare, for that's whom you meant, I suppose?'

'I ain't exactly hat liberty to tell, hexcept that 'e could a-saved Mr 'Oppy afore the court-martial if he'd a-liked,' savagely replied the man. 'Don't you 'ave nothink to do wi' 'im, miss. Some day I'll be hable to tell you why.'

Could have saved Hoppy! What on earth did he mean?' pondered the girl. But as it was evident that the same reason compelled him to silence as had so effectually muzzled his master at the trialfor she had heard all about it—she respected his motives and forbore to question him further.

(To be continued.)

FIRES. FOREST

By DAY ALLEN WILLEY.

HEN the white settlers in America occupied only a few miles of territory running back from the coastline, and the Indians hunted, fought, and roamed from the hills of New England to the great forests of the

Pacific coast, it was an unwritten law that the use of the flint and steel in any part where flames might spread beyond control meant death to the warrior or squaw who 'struck a light,' for the action might result in turning villages into a desert, destroying crops and tepees, and driving the wild animals which formed the food-supply far beyond the reach of the arrow.

Even to-day the greatest dread of the lumberman, the hunter, and the farmer in the newly settled parts of America is from forest fires. Only the man who has fought them knows the rapidity with which they spread and the ruin they will cause in a few hours. As the weeks pass, and the sun rises and sets without a rain-cloud forming in the sky, nature becomes so dry that it seems as if the sap had evaporated from the grain-stalks and the treebranches. The furrows of earth turned up by the plough crumble into fine powder, for there is not enough moisture to hold the particles together, and the dust rises into the air in clouds as the feet of the horses sink deeply into it. Even in the shaded woodland the heated air absorbs the natural moisture. Bushes rooted deeply are so dry that their branches snap off like dead twigs when broken. Touch a lighted match to one and it

blazes up as if coated with petroleum. The bark of the trees loses its freshness and hangs in strips, exposing the white wood.

When a territory one hundred or five hundred miles in extent is deprived of rain for a month or more of summer this is its condition. From 15th July until near the middle of November in the year 1825 the people in the Miramichi Valley, in New Brunswick, saw no rain fall, and one afternoon in October a fire started in the upper Miramichi Valley, no one knows how, but it was supposed a woodsman did not extinguish the faggots on which he had cooked his dinner. The first man who discovered it found a space about one hundred feet long and fifty feet wide in flames. The fire was in a patch of bushes and young trees. He alarmed a camp of wood-choppers about two miles distant. On returning with them half-an-hour later, he found the fire had reached a thicket of pines, and the flames were running along their top branches It had spread so rapidly that a thousand men could not have arrested its progress. The choppers were obliged to run for their lives to escape not only the flames but the dense smoke. A small pond at the edge of the forest probably saved them, as by crossing it they reached the open country and a spot where half a mile of ploughed field kept the flames in check.

The flames would literally shoot up the outside of a pine-tree, and in ten minutes most of the branches would be ablaze. The wood of the trunk, filled with inflammable sap, was converted into a mass of fire almost as quickly. The heat from a single tree was so intense that objects thirty and forty feet from it caught fire immediately. As in other forests of this kind, the ground was covered with a mixture of dead leaves and other débris a foot or more in thickness. This burned like powder, and it was discovered afterwards that in many cases roots five feet deep in the earth had been reduced to ashes. When it is stated that a single tree two or three feet in thickness will burn to a skeleton in fifteen minutes, and ten thousand are on fire at the same time, a faint idea can be gained of the 'Miramichi fire,' as it is still called. Every condition favoured its spread. In addition to the draught created by the hot air meeting the cooler atmosphere about it, a strong breeze sprang up which blew directly toward the Gulf of St Lawrence. It forced the burning mass down the valley. At the Miramichi River the flames nearly leapt across the narrow channel, and thousands of burning embers ignited timber on the other side.

Along swept the great conflagration, turning everything to ashes in its path. Several settlements in the woods were abandoned just in time for the dwellers to escape, although the roar and crackling of the flames could be heard three miles distant. Animals and birds, confused and blinded by the noise, smoke, and heat, perished by thousands; though only carcasses of such beasts as deer and bears were found afterwards to show how deadly had been the fire. The limit was only reached where the forest ended at a stretch of open country skirted by a saltmarsh. Here was absolutely nothing inflammable, and the fire burned itself out. For a month it smouldered in the burned area, occasionally starting up here and there, then dying down for want of material to consume. It reached the limit ten hours after being discovered, and in that time had spread over a territory eighty miles long and twenty-five miles wide, travelling at the rate of eight miles an hour, or as fast as a horse goes at the usual road-gait.

In the south-eastern part of Minnesota lies the town of Hinckly. The buildings are all new, and most of the stores of brick. Its population is about seven hundred. Five years ago another town of Hinckly stood on this spot, but to-day not a house stands of the original village. For an hour before the train reaches it the passenger sees charred stumps of trees every few feet amid the growth of bushes which covers the ground. The first Hinckly was laid out in the middle of a tract of woodland nearly fifty miles square. It started as a lumbercamp, and was the centre of half-a-dozen hamlets located in places where the trees had been cut down in the same forest. A spark from a locomotive fell into a pile of dried leaves in the forest at a spot about ten miles from Hinckly. For four months not a drop of rain had fallen in this part of the state, yet when a track-labourer saw the leaves afire he passed on, thinking they would soon burn out. The pile was destroyed, and for two days the

ashes remained smouldering. The next morning a little breeze sprang up and spread some of the embers, still red, to other leaves. The flames shot up from the ground to the underbrush, then to the trees. A forest fire had started. What wind there was blew directly toward Hinckly, and in that direction the fire travelled, widening as it went and gradually forming an inverted semicircle, with the village opposite the centre. The ends of the circle were a mile beyond the town before the fire in the centre had reached it. Three miles away the people heard the roar of the flames as they shot a hundred feet above the tree-tops, while every moment a huge trunk, burned through, fell with a crash. The smoke came through the woods, filling the air with thick clouds. All seized what valuables they could secure in a moment and started to escape. Some, blinded by the smoke, went directly into the burning area, and never returned. Most of the people left by the wagon-roads, only to find they were going into a furnace. More than a hundred were burned to death or suffocated in trying to get away by the roads.

Half a mile distant, on the side opposite to the fire, was a half-dried pond with a sandy bottom. Some of the cooler heads, seeing the burning mass hemming them in on three sides, remembered this spot, and groping to it through the smoke, dug holes in the wet sand and covered themselves or lay immersed in the stagnant water up to their chins. Even here it was almost impossible to breathe without strangling. The village occupied a space about a mile square. The houses were separated by yards and streets, and were from fifty to one hundred and fifty feet apart. Many of the residents did not believe that the fire would reach any but the buildings in the outskirts, and took their families into the cellars, where they

perished.

As the flames reached the town and the nearest rows of dwellings were ignited, the whistle of a locomotive was heard. Through the opening which marked the cut for the railroad-track dashed a passenger train. The roofs of the cars were smoking from the heat, and every window was shut to keep the interiors from igniting. The engineer stood at the throttle, while the fireman drenched him with pails of water from the tank in the tender. The crowds of people running hither and thither in the streets rushed for the train, and every one who could get a foothold on the platforms was allowed to do so. Then the engineer reversed his lever and backed his train into the mass of burning trees and underbrush. Luckily none had fallen across the track. For six miles he worked the engine. Several times his clothing caught fire, but the water-bucket extinguished it. In places the flames literally swept under and up the sides of the coaches, while the metal-work on the outside of the engine was so hot that it could not be touched. At last the train reached a small clearing near a swamp, and the order was given to all to

leave the train and save themselves. Every one left but two Chinamen, who were burned to asles with the cars. The rails, made of steel weighing sixty pounds to the yard, were twisted by the heat into S-shaped figures, and in some places partly melted.

This fire swept over an area about twenty-five miles long and ten miles wide. The remains of one hundred and sixty persons were found in Hinckly, where not a house was left. Altogether four hundred and sixty persons were burned or suffocated, and fifteen million dollars in property destroyed.

Farther south, in the great grain-fields of Kansas, past experience has forced the farmers to be ever on their guard during the dry season, and they are familiar with every mode of fire-fighting.

Water is useless to extinguish forest or prairie fires. Earth and sand and tree-branches thick with green leaves were the weapons that conquered a fire which threatened to destroy the town of Pottawatomie, in Kansas. No one knows how it started, but when the people began to check it the flames were advancing in a line a mile long, urged by a strong wind. Men and women, and children old enough to be of service, hurried to the locality, while a dozen ploughs were loaded on wagons and hauled to a place on the prairie several miles from the line of burning vegetation. The ploughs were taken from the wagons, while the horses were unhitched and the animals fastened to the implements, four to each. As fast as it could be driven, each team dragged its plough through the ground, turning up the fresh soil and burying the dry stubble which afforded food for the flames. The furrows were dug about five feet apart, in ten parallel rows, each as long as it was calculated the fire-line would extend should it reach the spot. While the ploughmen were thus creating a sort of breastwork to resist the flames, the others were placed at intervals in front digging earth with hoe and shovel, and forming piles to be used for ammunition to be thrown on the flames or spread over the fields as a further obstacle. The children, supplied with branches, were stationed on the leeward side of the burning area to beat down any blaze which might spring up and prevent the fire from widening if possible.

Thus began a fight which continued from nine o'clock in the morning until midnight of the same day. The people knew that if the fire went over the rows of ploughed ground the houses, barns, and crops beyond would be turned into ashes, as it was harvest-time, and the corn and wheat already cut and stacked in piles had been dried in the sun, and, with the surface of the fields littered with leaves, formed a mass of combustible material which no effort could extinguish once it was ignited. So they resisted the fire foot by foot, working in the hot air until some dropped from exhaustion and had to be carried away by others to avoid being burned to death. As fast as the flames reached the vicinity of one of the earth-piles, shovelfuls were

thrown on the blaze. The boys and girls at the sides wore out their sticks and branches with persistent beating, and the smaller ones were sent for a fresh supply. As soon as the ploughmen had finished the 'cut-off' their horses were hitched to the wagons and taken for water to the nearest stream. The water was brought back in barrels, into which the fighters plunged their heads and shoulders to counteract the effects of the heat.

Although there were fully five hundred persons in this fire brigade, they were unable to keep back the progress of the fire until it had reached the ploughed area. The flames leaped over the first furrow, but the stubble and dried grass between it and the second one had been covered with earth, and only a part ignited. Realising the desperate situation, the people devoted all their efforts to extinguishing the flames at this spot. As many as could procure them obtained branches, while the others used their hoes and shovels, some literally running into the fire in their efforts to stamp it out. Its range was narrowed several hundred feet, although a part of the space between the next two furrows ignited. Encouraged by their progress, however, the fighters redoubled their efforts, and by midnight the long row of flames had been turned into a mass of smoking embers. But the fire, though conquered, was not wholly dead. Squads of men were left to prevent another outbreak, and the others scattered to their homes to snatch a few hours' rest until called to relieve those on watch, for prairie fires are treacherous and may smoulder for several days, only to break out with renewed energy. They must be entirely extinguished or watched closely until they die out.

While favourable breezes spread a fire, the intense heat of a burning area creates a draught, which in the case of a large forest fire forms almost a gale. The greater the fire the stronger the aircurrent, so that the flames feed themselves. This is especially noted when forests near the summits of mountains take fire. The air becoming cooler as the altitude increases, the difference in the temperature of the currents is much greater than on the lowlands, and as a result mountain fires burn more fiercely while they last. A curious instance of this occurred a few years ago in the anthracite coal-mining district of central Pennsylvania. A fire started on the side of a hill about a thousand feet from its base. A part of the trees had died on account of the scanty nourishment afforded by the rocky sides, and these increased the heat of the flames. As the timber was not valuable no attempt was made to extinguish the fire, which burned itself out. A month passed, and it was noticed that a reddish glow could be seen at night from several places which had been burned over. Several miners climbed to the burned area, and found that the heat of the fire had broken open rocks and ignited a vein of coal several feet in thickness. The accidental discovery resulted in the opening of a large colliery in this place.

AN EPISODE OF THE BUSH.

By SABINA LEWIS.

ILLOUGHBY the Mailman, leading a pack-horse, drew rein under a shady Leichhardt-tree, and gazed moodily for a minute or two at the wide stretch of glaring yellow sand, relieved by a chain of hot, shimmer-

ing water-holes that marked the course of the Etheridge River; then, with a muttered curse at the fierce noonday sun, which shone down upon him from a sky of brass, he dismounted, unsaddled his tired and sweating horses, and piled his belongings at the butt of the trees.

Throwing the reins of the two animals over his left arm, he took a plug of coarse tobacco from his pouch, filled his pipe, and then, leading the horses, walked slowly down the sloping sandy bank, fringed with a narrow line of verdant she-oaks, till he reached a shallow pool.

As the horses drank, Willoughby took his quart pot and scooped out a hole in the sand under the shady side of the bole of a great dead tree that lay upon the edge of the pool, where it had been stranded in the last flood that had swept down between the mile-wide banks of the Etheridge six months before.

Quickly the water, cooled by the shade of the tree, percolated through the coarse sand, and the man drank again and again. Then, going to the pool, he knelt down and bathed his dark, sun-tanned face and long, tawny beard, which were smothered with the fine powdery dust that had enveloped him in his weary fifteen miles' ride to the river across a patch of spinifex desert.

'Come, old fellows,' he said to his horses, as, after filling his quart pot with water, he took up the reins again, 'let us see what there is in the way of grass under the she-oaks. I think we might as well spell here until the morning, eh?'

Turning the animals loose to graze upon the coarse grass which protruded from beneath the crisp, matted bed of fallen needles from the she-oaks, he returned to the shade of the Leichhardt-tree, lit a fire, and put the pot on to boil for his noonday drink of tea; pulled up some armfuls of dry grass, spread it out under the tree; unstrapped his blanket from his saddle, threw it over the grass, and arranged the saddle for his pillow.

The water boiled. He dropped in some tea, and from his saddle-pouch took out a piece of cooked salt-meat and some damper, and ate and drank slowly, his eyes fixed mechanically upon the yellow sands and shining pools of the river-bed.

Suddenly, with a loud whir of wings, a flock of black duck swept overhead, then wheeled, and with a splash settled down on a pool on the farther bank of the river.

In an instant the man was on his feet, unbuckled the short Winchester carbine that was strapped to his saddle, stamped out the smoking embers of his fire, and lay down again on his blanket, with his face towards a belt of timber about a mile down the river, from which direction the ducks had come.

'Wonder what frightened those ducks?' he said to himself as, leaning his chin on his hand, he gazed at the timber belt. 'There ought not to be any niggers about the river at this time of the year. But ducks don't fly like that unless they have been scared, and who is to scare them on this Godforsaken river but niggers—or myself?' Then he saw something that made him spring to his feet with an exclamation of wonder: a woman was walking slowly along the high river-bank, leading her horse, which, he could see, was completely knocked up.

Leaning his Winchester against the tree, Willoughby stepped out into the open and gave a coo-e-e! The woman, whose head was bent, looked up, made a gesture with her right hand to show that she saw him, and then sank, almost fell, down at her horse's feet.

In less than five minutes Willoughby was bending over her, and saw that she was crying hysterically. She looked at him and tried to speak.

Gently disengaging the bridle from her left arm, he said in his quiet tones, 'Don't try to speak just now, young lady. Now, your horse will be all right here for a little while. I'll take you to my camp;' and, lifting her gently in his arms as if she were a child, he strode along the hot, sandy ground.

'Thank you,' she said faintly as he placed her in a sitting position against the tree, making a thick pad for her head and shoulders with his blanket. From her drawn, haggard expression he saw that she was not only exhausted but hungry.

'Could you eat a little beef and damper?' he asked.
'Oh yes, yes. I am almost starving. I have eaten nothing since yesterday morning. I—I am going to Port Denison.'

Cutting some slices of beef and damper, Willoughby placed them upon a piece of clean bark for a plate, and taking the pint cup, which fitted into the quart pot, filled it with tea. She took the latter with trembling hands, drank eagerly, and then began to eat.

'You will not be afraid to stay by yourself for a little while, will you?' said Willoughby as he unbuckled his revolver and laid it beside her. 'There are no myalls [wild blacks] about the river just now; but, anyway, I will leave my pistol with you. I am going now to bring your valise and saddle; then I can fix you up a place to lie down and sleep, for I can see that you are greatly in need of rest.' He paused a moment, and then said, 'My name is Willoughby. I run the mail between Bowen and Greytown.'

'Thank you, Mr Willoughby. You are very kind to me. I-I am Mrs Winniett. My husband is Captain Winniett, the Police Magistrate of Grey-

Now Willoughby knew that well enough, for he town.3 had often seen the lady; but he merely bowed, and then walked off to the horse. Returning with the saddle and valise, he gathered fresh grass, and piled it up neatly in the form of a couch; and then, gently withdrawing his blanket from the lady's back and head, he spread it neatly over the grass, and placed the side-saddle for a pillow.

'Now, please, lie down, Mrs Winniett, and sleep. I am taking your horse down the bank to where mine are feeding. He is quite knocked up. But before I go I will make some more tea, and leave it with the sugar-bag beside you. If you should be awake, and hear a shot or two, do not be alarmed. There are some duck down there in the river-bed, and I shall be able to give you something better to eat when you awake than tough salt-meat and stale damper. And I have fishing-lines in my packbags, and these water-holes are full of fish. You will not be afraid to be alone for an hour?'

'Oh no. I am too tired to be afraid of anything, and already I feel my eyelids heavy with sleep. But, please, may I have just a little more to eat?

Willoughby smiled gravely as he replenished her platter of bark and placed it beside her, with his clasp-knife.

'There, do not sit up, Mrs Winniett. Take all the rest you can.' He glanced up at the blazing sun. 'You will be shaded here for another two hours yet. The heat has been terrible to-day, and I am rather inclined to think that we shall have a thunderstorm at sunset. Heaven send it, for it will perhaps mean the breaking up of this awful drought. Now, I must see to our horses.

The woman smiled gratefully at him, though her beautiful but tired, sun-smitten eyes were half-closed, and then again she pillowed her head of thick, brown hair upon the saddle. Then Willoughby, taking a fishing-line and his Winchester, went off to the used-up horse, led him down to the river-bed to drink, and brought him back to where the others were feeding under the she-oaks. Five minutes after he had gone, Mrs Winniett was asleep so soundly that she heard nothing when Willoughby returned to the camp with a couple of black duck and a string of long silvery fish like grayling. Stepping very gently, he bent over her and looked at her tired face.

'Poor little woman!' he muttered, as he turned away and began to gather up firewood, making as little noise as possible. As he was about to make a larger fire at some distance from the tree he saw that a low line of black cloud was slowly rising up behind the grim granite ranges to the west. He stopped and watched it for a minute, shook his head, and talked to himself:

'I must awaken her presently, before it is too dark.'

Taking up the wood again, he carried it halfway down the bank, where there were some sandstone ledges. Choosing one which projected out many feet from the bank, and which would afford perfect shelter from the coming storm, he quickly lit a fire; then, returning to the camp, he brought down his saddle and pack bags, the ducks and fish, and placed them under another ledge near by.

Again ascending to the top of the bank, he gathered up more grass, and strewed it thickly over the soft, powdered sandstone under the larger ledge; and, as he looked at it with an air of satisfaction, a low growl of thunder came from the ranges, and a faint air stirred the silent she-oaks.

With a glance at the now brightly blazing and crackling fire, Willoughby sprang up the bank once more and touched the sleeping woman's hand.

She awoke with a strange cry-half-moan, half-'Mrs Winniett!' scream—and covered her face with her trembling hands. Willoughby drew back, frightened.

'I am sorry to disturb you; but a heavy storm is coming on, and I must take you to a more sheltered place. It is only a few yards distant.'

She sat up, trembling visibly. 'Oh, I was dream ing, I think. What did you say, Mr Willoughby? Oh yes, I will come. Surely I have slept a long time. How dark it grows!'

'Yes; in a few minutes it will be quite dark. Now, will you please let me lift you as you are, blanket and all, and you will find your new camp all ready? I'll come back again for your saddle and valise.'

With child-like confidence she obeyed, and in a few minutes found herself under the ledge, seated upon the soft grass, and gazing at the blazing fire in an apathetic yet happy contentedness.

Back to the former camp went the bearded man once more, returning with her side-saddle and valise, and he smiled reassuringly at her as a clap of thunder shook the ground beneath them.

'Do not be afraid, Mrs Winniett. It is only beginning, he said, as he arranged her couch of grass. 'You will be perfectly safe under this ledge from the rain, which will come in torrents presently. My camp is just there'—he pointed towards his saddle-bags-' but if you do not mind, I'll bring my bags here, as I want to get at my flour to make a damper for supper, and the fire gives a good light. And I have a couple of ducks to pluck. Could you eat the grilled breast of a duck?

'Oh, indeed I can. I am ashamed to say it, but I am hungry still. Oh, and you have fish too!

'Yes; we shall not starve to-night. Ha, listen! Here is the rain.'

As he spoke a strange, humming roar came from the north, and a dense white wall of rain swept down and blotted out everything from sight. With it came wind—wind that bent and swayed and lashed the slender she-oaks in its wild fury. Then the squall passed, and silence followed-for a few minutes. Again a mighty, cracking peal of thunder, so startlingly near that she put her hand to her throat in terror, and then down came the rain with deafening clamour, beating upon the parched and hungry earth and churning the water-holes in the river-bed into foam. Willoughby, standing in front of the cave with his hands on his hips, was looking out towards the river, when he heard Mrs Winniett's voice. He turned and went over to her, bending down so as to hear her.

'May I not pluck the birds for you?' she said.

He nodded and smiled his thanks, and then went for his 'tucker' bags, which he brought over to the fire, and as she plucked the birds he took a small tin basin and iron spoon, half-filled the basin with flour, mixed it with water, and made his damper. By the time he had raked away the burning wood from the fire, placed the damper in the glowing coals, and covered it up, the rain had decreased into a steady, noiseless downpour, and all around could be heard the sound of running water as it streamed down the banks and over the sand-stone ledges into the waiting river-bed.

Willoughby made a second fire on which to cook the ducks and fish, the woman watching him the while with a keen interest, for her fatigue was rapidly leaving her. As he moved to and fro his tall figure cast strange, giant-like, and ever-changing shadows upon the yellow walls of the cave and the

rain-soaked she-oaks around them.

Presently he took the tin dish, and, holding it under a stream of water that was pouring over a ledge of rock, washed it carefully, then filled it and

brought it to her gravely.

'Would you like to bathe your face, Mrs Winniett? I have a clean towel in my saddle-bag which I will bring you. It will refresh you.' And then, quickly turning away, he picked up one of the ducks, cut out the breast, and sitting down with his back turned to her, proceeded to grill it over the coals by impaling it on a stick suspended between two forked twigs. Then he made fresh tea, and after the duck was thoroughly cooked, laid some fish on the fire, tried his damper by thrusting his knife into it, took it out, brushed it with some grass, and stood it on end to cool.

'Will you have some supper now?' he asked, not venturing to turn to her as he spoke.

'Yes, thank you.'

On a wide, dry strip of clean, pink-hued inner bark stripped from a ti-tree, he placed beside her the breast of duck and two carefully grilled fish, together with salt, the tea, some coarse ration-sugar, some slices of damper, and his knife.

'It is a very rough supper, but please try and eat. I think you will like the fish. We bushmen call them Burdekin graylings. I did possess a fork once, but lost it at one of my camping-places, and never troubled about another. Now I think I will see if the horses are together.'

'Surely you will have some supper too,' she said quickly as he went to the fire to light his pipe.

'Oh yes, I will have something to eat when I come back;' and, taking a mackintosh from his pack-bag, he threw it over his shoulders and descended the bank.

In a quarter of an hour he was back, saw that she had eaten her supper, drank some tea, and placed the quart pot beside the fire to keep it hot.

'The horses are all right. They are too tired to stray. Now, let me grill you another fish.'

'No, indeed, Mr Willoughby. But I should like to see you eat something now. I watched how you did the fish, and thought I would do some for you; but after spoiling two I did not try again. But I have put the tea by the fire.'

'Thank you. I will soon make my supper. But now you must please lie down and rest. Try to sleep. I will make up the fire again, and will keep it going till daylight. I shall be quite near, and if you should want anything, please call me.'

'Oh yes, I will. But first I should like to sit up a little. I do not feel very sleepy now. And —and I wished to—to ask you something—about to-morrow.'

'Certainly, Mrs Winniett. But why not wait till to-morrow? You will pardon my saying so, but I know by your voice that you are very, very tired. It will be better for you to rest.'

Again she yielded to him. There was a quiet authoritativeness in his manner that she could not resist, and which was not displeasing to her. She laid her head on the pillow, and watched him, through her half-closed eyelids, cook and eat his

supper.

She had heard people speak of 'Willoughby the Mail Contractor' as 'one of the have-beens,' and now, as she looked at him by the glare of the fire, she remembered the tall, bearded man she had sometimes seen riding down the one hot and dusty street of Greytown, dressed in the usual bushman style—print shirt, white moleskin pants and leggings, and cabbage-tree hat. He had once owned a cattlestation in Victoria; but successive droughts had ruined him, and he had come north to the goldfields. But whilst hundreds of other men all around him had done well, Willoughby had never succeeded in striking anything rich. Then, in disgust, he turned from gold-digging, and took a contract to carry the horse-mail between Bowen (Port Denison) and the goldfields. He had no friends but one, and made no acquaintances; but the miners all liked him as being a 'straight' man. The one man with whom he was on friendly terms was Chester, the bank manager at Greytown, who was an old college companion, and true to the friendship of former days.

Willoughby, stretched out under the shelter of his ledge, was thinking of her, and wondering what had induced her to leave Greytown alone to ride to Port Denison, a distance of over three hundred miles, through country infested by savage and treacherous blacks. 'Perhaps she has bolted from

her husband,' he thought. For he remembered what Chester had told him one day: 'Winniett is a hopeless, drunken scamp and gambler. She's one of the sweetest and prettiest little women that ever breathed. Been married for three years to the fellow. She had money. He gambled it all away. He would have been fired out of his billet as Police Magistrate and Gold Commissioner long ago, only that he is a relative of the Minister for Mines. I think she must loathe him now. Some day she will make a bolt of it-if she doesn't die of a broken heart.'

All through the night Esther Winniett slept peacefully and dreamlessly, and when she awoke and looked at her watch she found it was eight o'clock. Willoughby had breakfast ready, and the three horses were standing by the fire ready to be saddled. The rain was still falling steadily, and the swollen Etheridge was now 'half-a-banker'a swirling, silent rush of yellow foam.

He raised his hat. 'Did you sleep well, Mrs

Winniett?' She held out her hand. 'I do not know when I have slept so well.'

They had breakfast together, and then the woman

took her courage in her hands. 'Mr Willoughby, will it delay you if you let me ride with you to Port Denison? I do not know the road.'

'No, it will not delay me. And even if it did, I would not let any woman ride alone through two hundred miles of country such as we shall have to traverse. But now that the river is up, we shall have to follow the telegraph-line along this bank till we get to a crossing thirty miles from here. It will take us a week to get to Port Denison. To-morrow we shall be at the telegraph-station, where I have fresh horses.'

'I am very grateful to you.' Then she went on bravely: 'I must not conceal anything from you at all. I have left my husband, and am going to my home in Sydney. I had my horse brought into the yard three days ago, and said I was going out for a ride in the afternoon. I took the track to the range, slept there that night, then crossed in the morning, and struck the main drayroad. How far have I come?'

'Nearly a hundred miles. You have done very well.'

Then he saddled up the three horses, and asked her if she was ready.

'Quite ready.' He lifted her into her saddle, and then, despite her protests, covered her with his mackintosh; and then, with the pack-horse trotting ahead, they set off through the steady rain.

At dusk they reached the lonely telegraphstation, where the operator gave Mrs Winniett his room for the night. After supper he took Willoughby aside.

'A wire came through two hours ago from the

sergeant of police at Greytown to the inspector at Port Denison. Captain Winniett is dead-died suddenly after a drunken spree. Ought I to tell her?'

'No, don't. She'll hear of it when we get to Port Denison.

Early in the morning young Connolly the operator asked Willoughby if he would come with him and look at what he thought was the outcrop of a payable reef in a gully a mile away. Taking a prospecting-dish with them, they set off. Connolly had no mining experience; but the moment Willoughby saw the outcrop of quartz his eyes lit

Crushing some of the quartz with a hammer, they tried three prospects from the reef; each showed coarse free gold. Then they went to the bottom of the gully, and Willoughby washed out three more dishes of sand and gravel, which yielded nearly an ounce of gold.

'You've struck it, Connolly. Peg out your prospecting area, and send in your resignation. You can chuck telegraphing now. Have you a

miner's right?'

Well, you can use mine for the present, and I'll 'No.' take one out in your name when I get to Port Denison, and bring it back with me. But cover up that outcrop with dead timber in the meantime. Some prospecting party might happen to come

along, and then a rush would follow.' Connolly nodded. 'Right. But look here, Willoughby, we go mates.'

'No; it is your find.' 'No, it is not. It is yours as much as mine. I won't put a peg in the ground if you say "No."

'Very well, Connolly. I'll sling my mail contract. I can just about raise a hundred pounds to pay the forfeit. And I'll be back here in a fortnight with all the mining gear we want."

They shook hands and returned to the house; and Mrs Winniett, when she joined them at breakfast, could not but notice that the young operator, although he was very respectful and sympathetic in his manner to her, seemed restless and excited. Willoughby was his usual quiet self.

The rain ceased for a few hours after they left the lonely telegraph-station; and as they rode along the narrow track through the endless vista of giant, gray-barked gum-trees, the woman's spirits rose, and she and Willoughby chatted together as if they had known each other for months instead of for less than two days. But never once did she allude to her life in Greytown, nor he to anything but his squatting and mining experiences and to two years' soldiering he had done in the Cape Mounted Police.

At night they would camp by some lagoon or water-hole, and at daylight resume their journey, camping at midday for some hours to spell the horses, and then saddling up again as the sun went westward. Game was plentiful, and Willoughly travelled but slowly, for he saw that each day his companion was improving in health, and the dark shadow under her eyes disappearing. Twice only did they sleep under a roof; and then on the evening of the sixth day they saw before them the lights of the bright little township of Bowen on the shores of Port Denison; and Esther Winniett felt a feeling of depression come over her when Willoughby, drawing rein, asked her to which of the two hotels she would go. Menzies's, he said was the quieter.

'Then I will stay there. I will find out to-night when the next steamer leaves.'

They walked their horses down a long, quiet, grass-grown street towards the hotel, neither of them speaking for some minutes.

'When do you go back to Greytown?' she asked.

'I am not going back there again, Mrs Winniett.
To-morrow I throw up my mail contract, and
Willoughby the Mailman again becomes Willoughby
the Digger.' And then he told her of his and
Connolly's discovery at the telegraph-station.

Her eyes filled with glad tears as she put out her hand to him.

'I am so very, very glad, Mr Willoughby. All my good wishes go with you. Will you write and tell me how the new reef turns out?'

The man's bronzed face flushed deeply, and his veins tingled as he answered her:

'Yes, I will write.'

At the hotel door he left her. Perhaps he held her hand a little longer than was absolutely necessary when he bade her good-night and asked if he might call and see her in the morning.

From her bedroom window she saw him trot

down the street, leading his pack-horse, to deliver his mail-bags at the post-office. Then, drawing the blind, she sat down to think.

She was in the hotel garden when he came in the morning. Her face was pale, but she was calm and self-possessed as she shook hands with him.

'My husband is dead, Mr Willoughby.'

'So I have heard, Mrs Winniett.'

She motioned him to a seat.

'There is a steamer leaving at noon to-day, and I have taken my passage by her.'

'Yes, the *Leichhardi*. May I see you on board? It is eleven o'clock now.'

'I am quite ready. Let us walk down to the jetty.'

The man looked at her for one instant, then said slowly, 'I am Willoughby the Mailman, Mrs Winniett.'

Her face flushed scarlet. 'Why do you say that? Do not misjudge me so cruelly.'

At the gangway of the steamer he held her hand once more.

'Good-bye. May I write within a month?'

'Sooner, if you will,' and then she fled below to her cabin to cry—why, she did not exactly know.

Twelve months had passed, and then one day Esther Winniett received a telegram:

'I am coming to Sydney. Am tired of working, and have sold out my interest to Connolly.

'LESTER WILLOUGHBY.'

When the reply came, he took it out into the bush to read over and over again:

'I am so glad.

ESTHER.

THE MONTH: SCIENCE AND ARTS.

RUBBER.

are dependent, in these days of modern progress, so much upon rubber, which is now used to a very large extent indeed in the arts, that any diminution in the supply

of it would be viewed with serious concern. It is of very great interest, therefore, to find from a report which has been received from southern Mexico that the discovery of a new rubber-producing plant has been recently made in that country. This plant, which is known by the name of guayale, is low and bushy, and grows very extensively at altitudes of five thousand feet in northern Mexico and Arizona. It is gathered, roots included, dried, and packed in bundles weighing about one hundred pounds each. Each bundle is worth about thirteen pounds at the factory. About 15 per cent. of the dried plant is rubber. Six large factories for treating the plant have been erected in the vicinity of San Luis Potosi, Saltillo, &c. The

first operation in the process of extracting the rubber is to cut the plants into very fine pieces. Solvents are then applied to the mass to extract the rubber. The solvents which are employed are highly volatile, and after the solution is filtered away the remaining solvent is evaporated and recovered by condensation. In one of the factories, however, the rubber is separated from the dried plants by mechanical means, the process consisting of the agglutination of the particles of rubber between revolving metal discs through which the finely cut plants are fed. One of the drawbacks of the industry, according to well-informed authorities, is that it will probably have but a short life, as the guayale is of very slow growth, as are most desert plants.

OTHER USES FOR THE GYROSCOPE.

It would be strange if the gyroscope, which for so many years has been little more than an interesting scientific toy, should come prominently into the world of commerce as a vital principle in many important matters. Certainly a number of uses have been found for it lately, some of which have already been mentioned in these columns. As reported last month, important experiments have been made in the use of the gyroscope to replace, or rather augment, the mariner's compass. It is successfully used as a means of keeping torpedoes steadily travelling in the direction in which they are originally started, it has been tried with what is reported to be great success as a means of steadying ships in heavy seas, and now it is seriously proposed to use it to keep a railway train upright on a single line of rails. This novel mono-rail system is the invention of Mr Lewis Brennan, C.B., the inventor of the torpedo which bears his name, and in the demonstration which he gave a short time ago before the members of the Royal Society he was able to prove beyond doubt that, in a working model at all events, the scheme is feasible enough. The single-line model railway ran all around the room over the heads of the audience, and on this single line an electrically driven train stopped, started, and ran at various speeds at the will of the operator without showing the slightest tendency to topple over. In this mono-rail system there is no attempt to keep the centre of gravity below the rail, but, on the contrary, the weight is distributed upon it, much as in an ordinary bicycle; but a bicycle, as such, of course can never run on a rail, because to maintain its balance it must always steer in the direction in which it tends to fall, and thus correct the tendency. In the Brennan mono-rail system the electrically driven carriages are provided with a comparatively small gyroscope, also driven electrically by an independent motor. This has the effect of keeping the carriages upright whether they are standing or running. The gyroscope is of such a nature that in the event of a breakdown of its motor it would still run for several hours by its own momentum with sufficient speed to keep the train erect. At the recent demonstration before the Royal Society the model train was run from one end of the room to the other on a tight rope, which, however, was slack enough to sway from side to side. Even in these trying circumstances the model train maintained a perfectly upright position and was evidently very stable and secure.

WOOD PRESERVATIVE.

The claims of Solignum, a preservative for wood, stone, and brick work, appear to deserve attention, especially in the first connection, for the reports which are coming in from various countries are of a highly favourable character. It is a protection against decay, fungus, dry-rot, and the ravages of insects; but it is more especially in relation to its power of protecting wood against the onslaught of the white ant that the reports are principally concerned. As is only too well known to those who have lived in countries where this terrible insect abounds, its ravages among woodwork of every

description are a very serious matter. In a report from Mr A. L. Butler, of the Soudan Government, a description is given of a comparative test made with stakes of wood treated with solignum and other similar stakes untreated. In a week or two the latter were riddled by white ants, and when withdrawn from the ground were found to be Into the same holes the practically consumed. solignum-treated stakes were then driven, and thirteen months later, when the report was made, the stakes were found to be absolutely as sound as on the day they were put in. Photographs of the treated pegs and the sections which remained of those which had not been treated form a convincing accompaniment to the report. In another report from Sydney, N.S.W, a wooden curbing is described as having been in position for five years, and remaining perfectly sound at the end of that time, while a temporary curbing of similar material untreated had previously been destroyed utterly in six months. Solignum is a preservative stain which is made in three or four different colours, and the makers are Messrs Major & Co., Limited, Hull.

THE TUNGSTEN LAMP.

There appears to be no end to the number of incandescent electric lamps which are being invented, put on the market, and praised to the skies one after the other. The old form of lamp with the carbon filament still appears to hold its own almost undisturbed, although the claims for some at least of these new lamps to a great extent can be substantiated. A good carbon filament lamp consumes about three and a half watts to the candle power; the tungsten lamp, which is among its latest rivals, is said to require less than one and a half watts per candle-power, while the life of the new tungsten lamp is approximately one thousand hours, about the same as that of the carbon filament lamp. This remarkable economy appears to be due to the extremely high fusing-point of the metal tungsten, about two thousand five hundred degrees centigrade. Therefore it can be raised to a very high degree of incandescence without deterioration. The ordinary lamp may be run quite as economically by supply ing it with current of a much higher voltage than that for which it is marked, but in these circumstances the carbon filament is rapidly destroyed and the life of the lamp reduced to a very short period. The price of the new tungsten lamp is not given in Ores and Metals, from which these particulars are gleaned; but that is an important point, for the original price of the lamp appears to be the determining factor as to whether one of these new inventions shall displace the lamps in common use. The other metallic filament lamps are all from five to ten times as expensive as the ordinary glowlamp, and though it may be proved that the first cost is more than compensated by the economy in current consumption, that first cost nevertheless seems to stand in the way of their universal adoption. Some of them have so very delicate a filament that their use is limited to places where there is little liability to fracture; but apparently the tungsten lamp does not suffer from this disability.

A NOVEL RAILROAD.

Some time ago we described a lift propelled by a screw engaging in a kind of screw-thread in the sides of the well in which the lift worked. Now, according to the Scientific American, it is proposed to apply a somewhat similar principle to the propulsion of railroad cars dealing with the traffic problem in large cities. Various more or less unusual schemes have been proposed from time to time in order to facilitate the movements of large numbers of people from place to place in a crowded city. Every one is familiar with the moving pavement scheme, in which a succession of platforms run side by side, each moving faster than its neighbour by a speed of about three miles an hour, so that a passenger by stepping from one to another may board the last swiftly moving one without the necessity of having it stopped. Another scheme provides for a continuously running train travelling at a high speed, which is boarded by the passengers from a huge circular platform whirling at such a rate that its edges correspond in speed to the train passing beside it. The platform is entered by a subway giving access to the centre, where the speed is of course slow; but it would seem that passengers would need some unusual skill to reach the edge of this whirling disc without being thrown off by centrifugal force or otherwise incommoded. The screw-driven train has several points of advantage over this scheme; it is a continuously propelled train, which moves very slowly at the stations and very rapidly between them. The train is composed of a number of short trucks, each capable of seating about half-a-dozen persons. At the stations these trucks are touching one another, as in an ordinary train, but directly the station is passed they separate out to some considerable distance, and travel rapidly to the next station. There are no engines or motors on the cars, but projections to one axle of each car engage with a continuously driven screw or worm running longitudinally with the track on either side. Without illustrations it is difficult to convey an idea of this ingenious contrivance; but the screw may be compared to a long, continuous tube, like a small sewer-pipe, revolving continuously close beside the rail. In the skin of this tubing a spiral channel is cut, forming a screw from end to end. At the stations the convolutions of the screw are close together; in other words, the screw is of low pitch at these points, but between the stations it is of very steep pitch. Consequently, at the stations a single revolution of the screw would mean a forward movement of a few inches only, while in other places one revolution would mean as many feet. The screws are kept continuously revolving by electric motors placed at intervals along the track and transmitting their power by mitred genr-wheels. It will be seen that the cars need no attendants,

either guards or conductors, and that collisions between the cars are impossible. Some of the disadvantages of the system may be found in the difficulties of negotiating curves and gradients, but it may have its uses in certain districts.

THE CINEMATOGRAPH IN EDUCATION.

An interesting plea for the State recognition of the living picture as a valuable means of education is set forth in a brochure by Mr C. Urban, F.Z.S. While the opening statement to the effect that every hospital, scientific laboratory, technical institute, and college is now as incomplete without its moving picture apparatus as it would be without its clinical instruments, its tubes, lathes, and globes or maps, may be regarded as, to put it mildly, a little premature, the general idea that animated photography should be something more than a mere amusement for idle moments is undoubtedly sound. The author is at pains to demonstrate the widely different uses to which photography can be, and ought to be, applied. Difficult and unusual surgical operations can only be witnessed by a limited number of students, and even then there is very little time for them thoroughly to grasp the intricacies of the work and the skilful surgeon's methods. The cinematograph camera takes in every detail with absolute faithfulness; it forgets nothing, and will at any time repeat as often as may be desired the whole operation from beginning to end. Exception has been taken to this statement by a newspaper writer, who opined that the shaky and jerky movements of a living photograph are absolutely valueless as a guide to the medical student studying an intricate surgical operation. But these jerky and unlife-like movements are by no means an inherent fault of the process, but are simply due to the carelessness of the man operating the projecting Probably that newspaper critic was machine. speaking merely upon the observation of some badly conducted entertainment, where no attention was paid to the proper speed of reproduction. In the book in question it is well urged that cinematographic records of all history-making events should be stored in national museums for the use of posterity, just as it has often been suggested that phonographic records of the world's greatest speakers and singers should be similarly preserved, that their voices may be heard again after the singers and speakers are dead. Possibly it is easier to be altruistic for the benefit of posterity when one has not one's self to provide the cost. In both cases, however, the expenditure of capital would not be very great, and it is to be hoped that the question will be certainly taken up.

TESTING FOOD-VALUES.

The United States Department of Agriculture has established a system of what is called nutrition investigations, which includes studies of food consumed by typical individuals, families, and persons in colleges and hospitals. At the University of

Illinois several laboratories of the Department of Chemistry are devoted to the study of meat, to discover differences in composition and nutritive value. Many experiments are made in cooking various pieces of meat before the result is set down. A standing rib-beef roast by analysis consists of 42 per cent. refuse or unedible material (bone and gristle), 24 per cent. water, 26 per cent. fat, 7 per cent. proteid or muscle-building substance, and 7 per cent. 'organic extractives.' When cooked in water it loses from 10 to 50 per cent. in weight; cooked by roasting, meat loses from 13 to 37 per cent. of its total weight, while only a small part of the organic extractives are lost. When it is cooked in water, more than three-fourths of these are dissolved into the broth. In roasting, the losses increase the more thoroughly the meat is cooked. A report made for the same department states that vegetable foods, including flour, bread, and other cereal products, furnish 55 per cent. of the total food, 39 per cent. of the protein, 8 per cent. of the fat, and 95 per cent. of the carbohydrates of the diet. There is nothing new in the above; only the example of the Illinois laboratories is one to carry into every department of food for human use, for use and wont does not always mean making the best of our food resources. It may be mentioned that the York Health and Housing Reform Association has published a table of food-values entitled How to Spend One Shilling on Food to the Best Advantage.

PETROL-AIR GAS.

Petrol as a source of motive-power is familiar to every one. The heat locked up in this volatile paraffin is the impelling force in these wonderfully powerful and wonderfully light engines used in a modern motor-car-engines which, owing to their high ratio of power to weight, will help and are helping aeronauts in the conquest of the air. But petrol as a source of light may be a novelty to some. The name petrol-air gas almost explains itself: petrolvapour with air admixed in the proportion of ninetyeight parts of air to two of petrol-vapour. Two systems of adapting petrol to purposes of illumination are in vogue. The first system requires petrol-vapour and air to be fed by ordinary gaspiping to burners; while by a second system liquid petrol is delivered by pipe to the specially designed burners. In both systems the gas is burned under mantles, thus heated to incandescence. A plant using the first system mentioned (the Delaitte) is being installed at Lord Wenlock's country-seat, Escrick Park, near York, and it would seem that plants such as this are well past the experimental stages. One gallon of petrol will produce five hundred cubic feet of petrol air gas, equal in heating power, if not superior, to coal-gas; and it is claimed for the compound that it is inexplosive. One very obvious advantage of a gas which in its composition contains the necessary oxygen for its combustion is that the air in a room lit by it is not drawn upon

as in the case of coal-gas. This last point in favour of petrol-air gas is made all the more striking if we recall the fact that an ordinary gas-jet uses nearly three times the quantity of air one adult person would in an equal time. In the installation at Escrick Park an existing set of gas-pipes formerly used for coal-gas are being utilised to carry the gas to the hall-kitchen, where it is burnt in cooking-stoves, and to the joiner's yard, where it is used for lighting purposes. A considerable future may safely be predicted for petrol in this novel use as an illuminant.

LANDMARKS OF RAILWAY PROGRESS.

Messrs M'Corquodale & Company have issued the sixteenth edition of The Railway and Commercial Gazetteer of England, Scotland, and Wales. This book contains a list, in alphabetical order, of every railway station, town, village, hamlet, parish, and place in Great Britain, and shows their distance from London, with population from the 1901 census. Where there are postal and telegraph offices, this fact is indicated. A reference to this book may save a world of time and worry to railwaymen as well as to private individuals. We learn that there are one hundred and eighty-five Newtons in fiftysix different counties, in addition to forty-nine Newtowns in twenty-nine different counties; also fifty-eight Uptons in twenty-six different counties. There is a New Holland and a New York in Lincoln-for which the station is Dogdyke, on the Great Northern Railway-as well as a New York in Northumberland and another in Yorkshire. The list of London stations occupies about six pages, while for obscure places boasting of names such as Llanfairpwllgwyngyll the list is 110 less valuable.

'BURFORD: A TOWN OF MANY MEMORIES.'

By an unfortunate misapprehension, this article in our June issue was attributed to Mr T. Fisher Unwin, the well-known publisher. Mr Unwin's share in the transaction consisted only in kindly sending the paper to the Editor on behalf of one of his clients.

NIGHT IN THE BUSH.

LEAGUES upon leagues of bush-there is no sound Save the shrill cricket's chirp, the curlew's cry. The sudden night has come. Within the sky A myriad stars burn bright, a peace profound Girdles the hills; down in the marshy ground The bull-frogs chorus unmelodiously; Like a great moth an owl goes slowly by-The sentinel of night on his fixed round. The sullen thunder mutters far away, Like blades of lapping steel swift flashes play Above the feathery tops of drowsy trees. Now the deep hush is broken by the beat Of the storm's wings; it comes with rush of feet, And hollow moaning as of restless seas. LAWRENCE B. JUPP.

MISS DENISON'S CHILDREN.

By Mrs J. H. Needell, Author of Stephen Ellicott's Daughter, Quentin Harcourt, Q.C., &c.

IN THREE CHAPTERS. - CHAPTER I.

HE dinner was over. The slips of fine damask had been withdrawn from the shining mahogany in which fruits, flowers, and wax candles were reflected as in a mirror, the high polish even giving back the glow of

the red and amber wines.

It had been a sumptuous and protracted repast, for the hostess belonged to the old school, and eschewed the frivolities of simple menus and threequarters of an hour at table. Besides, this was a special occasion; the function was to celebrate the return of her adopted son from his South African campaign, and there was also a rumour afloat that Miss Denison was to make some important announce-

The guests, who numbered about a dozen, were the crême de la crême of the locality, from the peer whose name was a household word in all the Cabinets of Europe to the middle-aged man of letters whose reputation in another sphere stood almost as high; the rest were senior members of county families and Miss Denison's contemporaries, with their sons and daughters, friends of the two adopted children of the house.

The setting of the scene in the old panelled dining-room, with its cradle roof and walls lined with family portraits, was sufficiently picturesque, if a trifle gloomy; the relief came from the glow and colour of the dinner-table, the toilets of the women, and the background of palms and flowering plants which filled up the huge window-space.

As soon as the servants had retreated Miss Denison rose in her place, and a thrill of expectation passed round the circle.

She was a tall, dignified woman of sixty, with clear-cut features framed in the silvery whiteness of her abundant hair, and brows above her fine dark eyes which retained the hazel colouring of her earlier years. The mouth was firm almost to

No. 501.-Vol. X.

severity, but her smile was one of enchanting sweetness. She stood silent for a space, and then turned, putting one hand on the shoulder of the young man who sat on her right hand, and the other on the head of the girl who was placed on

'These are my children, dear friends,' she said, 'as you all know; only, to-day I wished them to be specially recognised as such. The tie could not be closer had I borne them as their mother.'

She let her hands fall, and continued in a lighter tone: 'We are met here to-night to welcome home Captain Yorke, and to wish him joy of the honours he has won and the dangers he has escaped. You have all known him from a boy, and will agree that his record is clean. He has repaid me tenfold for whatever I may have done for him, for he has made that life worth living which at one time I was disposed to let slip wasted through my fingers. I stand here to-night as the last representative of my house; but I am unwilling that an honourable name like ours should be blotted out from the county rolls, and I propose, as I have the power, to graft a new stock on the old tree. In all respects, Everard Yorke is to assume the position of a son; he is not only to be my heir, but he is to adopt my name under whatever formalities the law directs, and it is in this character, my dear friends, as Everard Yorke Denison of Coombe Hall, that I wish you to receive him to-night.'

There was a murmur of acquiescence and approval; but Miss Denison arrested it by a gesture.

'I have not quite said my say,' she resumed, with her delightful smile. 'I think it right to mention before I sit down that there may be certain restrictions or conditions pertaining to these arrangements, but they are of such a natural and agreeable character as to need no further mention.'

As she sat down she glanced at her guest the [All Rights Reserved.] JULY 6, 1907.

Premier, who immediately rose to his feet to make himself the mouthpiece of the general company. He bore witness, in a few happy phrases, to the almost more than maternal devotion which Miss Denison had shown to her adopted son from the time she received him, a sickly infant, from his dying widowed mother to the present hour, when he appeared before them as the ideal of a young Englishman, cultured, courteous, and brave, paying back in character and conduct the debt he owed. They were all proud of him, and would welcome any arrangement that made him part and parcel of their county traditions. Personally, he could not be more one of themselves than he was already.

He stretched out his hand across the table, to be grasped gratefully, but with deference, by the young man himself.

By one consent the guests, who had cheered the Premier's speech, called upon the hero of the evening to return thanks. The situation was decidedly difficult, but Everard rose to his feet and faced it.

He was a gallant young fellow, holding his six feet of height with military erectness, and suggested with his broad brow and somewhat massive features the Roman rather than the Greek type of beauty. That Miss Denison leved him as the apple of her eye was evident to all as her gaze now rested upon him.

"What can I say?' he began. 'I have no command of words to express what I feel. Lord—spoke of me not as I am, but as I might well wish to be, and of paying back what I have received from my dear mother. But you must all feel with me that I can't do that; the debt goes beyond payment even of gratitude and love. I shall be her debtor till I die.' He stopped a moment, and added, 'It would make no difference should anything arise in the future to change our relations.'

There was a slight murmur of protest from Miss Denison, and it was observed by some that Yorke looked down upon her with an expression of wistful tenderness, and also that there had been a curious absence of recognition of the substantial favours she had announced.

As the young man sat down he lifted Miss Denison's hand and kissed it. It was an un-English act, but done with a graceful spontaneity learnt, no doubt, from his foreign training; for, after Eton, Paris and Heidelberg had been his training-schools instead of Oxford or Cambridge.

A feeling of expectancy had crept over the party, traceable probably to Everard Yorke's last words; but the only one entirely unaffected by them was Miss Denison herself, who regarded them as a mere façon de parler spoken to give point to what went before. She patted his hand affectionately and smiled upon him; then, again rising from her seat, she invited the attention of her guests to another statement she was anxious to make.

'I would wish you to understand,' she said, 'that I have not loved Everard Yorke one whit better than I have loved Winifred Leigh. My girl has always been as dear to me as my boy, and as much my comfort and satisfaction. We all love the bird we have taught to sing; and my birds-you will forgive my self-confidence-justify their training. I cannot give my name and estate twice over; but I wish all to know that at her marriage or my death, whichever happens first, Winifred's provision will be adequate to her bringing up, as nearly on an equality with my adopted son's as legal skill can make it. And now,' she added, 'I have delivered my message, and we will dismiss ceremony and dissolve the meeting. The new billiard-table awaits criticism from those who care to test it, and the rest of us shall go into the drawing-room, and, if agreeable, one of our birds shall sing to us, not in

a figurative sense.'

It was the man of letters who held the door open for the ladies' departure, and as Winifred passed him his look met hers with an expression of anxious inquiry. The girl's cheek flushed and she dropped her eyes; it seemed as though she had no answer to give

give.

Captain Yorke led the way to the billiard-room.

Breakfast at Coombe Hall was held by the young people to be the pleasantest meal of the day. The season was now early October, and a succession of golden days, soft and rainless, had followed each other. When autumn is at its best, English scenery and English weather present their loveliest aspect.

liest aspect.

On the morning after the dinner-party, Winifred Leigh and Everard Yorke came down to find the table set as they liked it, close to the open French windows. Below, the flower-beds cut in the velvet turf were still brilliant with happily blended dyes; while, beyond, the park rolled its verdant acres to the verge of the distant river, and all its majestic trees were glowing under the touch of nature's matchless alchemy.

The interior was equally full of charm. A good fire burned in the distant grate, giving the note of comfort to the room; and the combination of fine damask, china, and silver is perhaps never seen to pleasanter advantage than on a breakfast-table, while the savoury dishes that wait on appetite add to the satisfactory effect.

When Everard entered the breakfast-room he found Winifred had already taken her place before the tea-urn. She looked up with a smile of greeting.

'How like the dear old times to have you at home again! I wonder now how our mother and I existed without you. We shall be alone this morning. She is breakfasting in her room.'

'That is unusual;' and there was a note of anxiety in his voice. 'She is not ill?'

'Oh no; I think she had a notion that we should like to be alone.'

Everard had turned to the open window, and was gazing steadily at the prospect before him.

Winifred rose and went to his side. 'Has it gained in interest since—last night?' she asked archly. 'Accept my congratulations, dear Everard.'

He smiled. 'I think it has. It is an inheritance which any man might envy, but to which I have no claim outside her abundant goodness. I would have been better contented with less.'

She shook her head. 'It has always been your way to consider things too seriously. Take what the gods send you, and be thankful. Above all, don't hint at a misgiving when you see our mother this morning. I have a message from her to you. She told me to ask you not to go out after breakfast till she had seen you. She mentioned eleven o'clock, in the library. That means something serious, Everard. When we were children'-

'Dear, you are a child still.'

'So the years that have made a man of you have left me standing still? I am not a child any more. Sometimes I wish I were.'

She went back to the breakfast-table, and he followed her. Whatever his preoccupation-and such was evident enough-it did not interfere with his appetite; he enjoyed his breakfast as a young man should, and the two chatted pleasantly over last night's incidents with the affectionate familiarity of brother and sister, with just an indefinable something on the man's part-a touch of restraint, of courtesy-over and above the natural relationship.

Watching his prowess in connection with a gamepie, Winifred observed, 'How you must have missed all the comforts of life at Ladysmith! Did you not often long for nice things to eat, you who were gentlemen?'

He laughed. 'We longed for something more to eat often enough, but I don't think our fancies often ran on dainties. I never heard any man grumble about our hard fare; personally, I never felt it a hardship. We did as our chief did. But I confess, Winifred, that I sometimes dreamed of savoury and well-cooked food, such as one was used to at home, and that I devoured it greedily. I always felt ashamed of myself when I awoke.

She nodded comprehendingly, and silence fell for a time between them. When the meal was over Winifred rose to go to Miss Denison's room, as she had been desired; but she paused at the open doorway and looked hesitatingly at Everard.

'I want to say one word, but am afraid lest it should not be the right one. I know nothing, Everard; but I have a foreboding of trouble. You will remember how our mother loves you, and you will not cross her wishes?'

'Yes,' he said gravely, 'I shall remember how she loves me to the last hour of my life. Thanks, dear

'How pleasant it is to have my boy at home again!' said Miss Denison as the young man

entered the room. 'Sit down, Everard, and let us have a good, square talk over things in general."

She spoke briskly, and her eyes shone with affectionate content as she looked at him.

'I am so happy,' she said softly-'so happy! Many a better woman than I is breaking her heart to-day for the gallant son who fought and fell beside you. You have been spared, dear, to make my last days my best days.'

'I am not sure,' he answered, smiling a little to soften his words, 'that those who fell were not to be envied.'

She smiled. 'A young soldier's heresy! Life is better than death, for it gives the chance of honourable living and of making the world better and happier than we found it. I am an optimist, Everard-it is only the young who can afford to be otherwise—and the future I see before me is full of hope and sunshine. Shall I tell you what I

'Do! It is what I want to hear.'

'Well, you will allow that I have not been a selfish mother, thrusting my birds under my wings when their instinct was to fly. I have let you, as a schoolboy and a student, see more of the world than most lads; and when you demanded leave to go and fight in our country's quarrel I did not say you nay, though anxiety kept me sore and restless all those weary months. And now that I have got you home again safe and sound, and with a fair record of duty done, I am in hopes-in hopes'-she paused and looked at him somewhat wistfullythat you will be content to settle down at Coombe Hall as a married man.'

'Ah, that is what I feared!'

'Feared! Is a bachelor's freedom so dear to you?'

'Scarcely that. My fear is that you have found the wife for me.'

Miss Denison's face flushed and her fine brows contracted. Then she spoke emphatically.

'For twenty-five years I have ordered my life in subordination to that of the children of my adoption; their good was my good, and out of their happiness I got my own. I don't choose to boast of sacrifice; but it is undeniable that during all those years I denied myself many of the indulgences of my age and position. But it was not sacrifice, Everard, considering the love I bore you both and the reward that I promised myself. I had lost, as you know, the lover of my youth; but I said to myself, "These children shall be to me as my own; they shall inherit my name and my fortune, so that when I go down to the grave I shall not be blotted out of remembrance." Winifred is the most charming girl in all Dorset; and, to my delight, after two seasons in London, she has brought back her heart to the home-nest. She has a fine intellect and a heart of gold. I offer you, Everard Yorke, a pearlof great price.'

She paused, frowning, for he sat silent, with bent brows and eyes on the ground.

'It is all so true,' he said at length, lifting up his head and meeting her gaze; 'and never until now did I feel the debt I owe you a burden. I paid back love with love, and your benefits with a gratitude free as your own generosity. But since yesterday everything is altered. In making me your heir and representative you have made me'—he hesitated—'in a way your bondman.'

'That is distinctly disappointing'—and she laughed a little bitterly—'and it is also unworthy; but it has its compensations. I may at least understand that you feel bound to carry out my wishes?'

- 'I am not worthy,' was his answer. 'I have neither a fine intellect nor a heart of gold. I am not Winifred's equal. She would not take me for her husband.'
- 'Ask her—ask her, Everard! I am content to wait for her answer.'
 - 'But she knows your wishes.'
- 'I have never expressed them; but as a woman I can read a girl's heart, and I should not have spoken to you as I have done unless I had known that you would not plead in vain.'

'Plead!' he repeated, but it was to his own fighting spirit, not audibly to her.

Miss Denison rose and put her hand on his shoulder. 'My dear,' she said, 'you have had your fling of adventure and of danger; with others you have fought a good fight, and my advice now is that you should rest on your laurels and take the goods the gods offer you. If you have not thought of this thing before, think of it now. I repeat that

to know that you and Winifred will reign after me at the old Hall, and your children's voices ring through its rooms and passages, is the dream of my life. I don't want to hurry you, still less to threaten you, Everard; though I own it was this condition I had in my mind when I spoke last night. Take heart of grace, and bring me the good news I want as soon as you can. I love my own way, as you know, and on this way I am steadfastly bent.'

He took the kind hand that patted his shoulder and pressed it between his own. 'It is true that I am your bondman,' he said, with the smile that all his world agreed was delightful; 'and it is a bondman's duty to obey.'

'I would rather you were Love's bondman,' she retorted; 'but that will come. Of course you love her, have always loved her; the heat and glow are latent. You will make me the happiest of women—all I have gathered up in the hands I love. I shall chant my "Nunc Dimittis." She nodded, smiled, and quitted the room.

The young man, who had risen as she rose, stood for a few moments, as the door closed upon her, lost in thought. It was thought that contracted his smooth brows and hardened the corners of his mobile lips.

'What would she think of me?' was the question that stung him to self-contempt. 'A brave man under fire! But none the less a craven in spirit, a coward, and a traitor!'

(To be continued.)

THE SACKING OF THE COTTAGES.

By HENRY LEACH.

HERE are not so many of those quaint old dressers in the kitchens of the cottages of Wales as there used to be—not by thousands. Spinning-wheels are becoming scarce. In the most rural districts of England

those little cottage-chairs which had so evidently been handed down through at least two or three generations of farm-servants have ceased to be passed on as family property under strict entail and inviolable as the most sacred possessions. They have 3one. Ugly, rickety cane-bottomed things which cannot be depended on for more than a decade have taken their place. The old grandfather's clock has disappeared from the corner, and the time is taken from a diminutive piece of American machinery on the mantelpiece. Tin candlesticks have taken the place of brass. Where are they all-those old familiar things? Some of them are in Belgravia and Mayfair, many in the dining-rooms of the country seats of the rich, not a few are in the lavish homes of the meat-packers and trust-mongers of America, and the few that remain against the many that have been taken away from their old abiding-places are on view for a very short time at certain select business depôts in London, marked variously f/e and tk/l; which, being reduced from terms of secrecy to those of ordinary commerce, mean fifteen pounds or sixty

pounds, or something like that.

The plain fact is that the tasteful well-to-do, in their modern craze for the simplest articles of plain, old cottage furniture, have made up their minds that they will have all that the rustics possess in this line. They want all the dressers and the clocks and the chairs that they can find; and, the cost being no consideration, they are determined that they will have them, and that the sentiments of their owners must be sacrificed. A rich man's home is incomplete without a Welsh dresser, and there is a stigma attaching to the lady of the house until she has a spinning-wheel in some odd corner. For a time after the beginning of this fancy as a definitely constituted cult the rustic folks held fast. They were faithful to the family feeling, and when Mrs Moneybags in person submitted her blandishments with a strong pecuniary flavour they were proof against them-

This lady was often lacking in determination and tact, and, retaining from the old days of impecuniosity some of that strong feminine prejudice against paying very many more times for a thing than what it is intrinsically worth, she was apt to stop the increase in her offers a few pounds too soon, and, having read the cottager a lecture on his folly and delicately hinted at the possibility of his future starvation, she went her way. But thereafter the same cottager's mind was uneasy. There were family consultations round the kitchen fire, and it was suggested and agreed upon that old grandfather Bill, who had made the dresser, was in many respects not the good soul that generous memory had been making him out to be. Likewise, holes of a large size were picked in the character of other ancient worthies of the family. And it was undeniable that times were bad.

Simultaneously, at the other end of the social scale, the demand for the old, simple things in the cottagers' homes was established as a definite fashion, a craze. A lead was given in the highest circles, and the thing was done. The rush began, and it was determined that the cottages must be sacked. Society, through its own direct individual agency, was unequal to the task; but every mania brings forth its commercial specialiser, and a new profession was created at once to grapple with the emergency. The managers of warehouses of the antique in the western parts of London determined that they would sack the cottages, and that they would satisfy the appetites of their customers with dressers and grandfathers' clocks, and make much profit. In order to make the more of it they would send into the fastnesses of England, Scotland, Ireland, and Wales, particularly Wales, certain shrewd men who were specially fitted to the business in hand, which was to find out all the cottages possessed of the things that Belgravia wanted for its country adjunct, to overcome all family scruples by the most artful coaxing, and to buy the things at the very cheapest price. No ordinary commercial traveller was equal to such a task. A combination was needed in the one man of the virtues of a Scotland Yard detective, a Bond Street salesman, a City stockbroker, a village parson, and the mother of six. But the resources of humanity are equal to almost any demand, and no sooner were the lines of this new profession sketched out than its first members were getting into the north and west bound carriages at Euston and Paddington. They were the pioneers of furniture-spying, and they were bluntly called furniture-spies. They have done very well since then. They are in the employ both of firms of dealers and private individuals whose demands are so extensive, whose appetite for cottage curiosities is so voracious, and whose means are so unlimited that they deem it best in their own interest to have their own special pickers-up of these old-time goods. It has been stated that, besides various minor peers, a duke has had one

such agent—after all, that word 'spy' has a disagreeable sound—in his private service for many years; that one of the most celebrated of American millionaires, who has achieved some reputation for the merciless manner in which he has been denuding Europe of her art treasures and storing them in New York, with a most beautiful indifference to import duties, has three of them; and that in all these cases these men make from three hundred to six hundred pounds a year each.

The cottage curio-hunter is really a clever man, and is worthy of his hire. He knows a genuinely old-fashioned thing when he sees it, and he has the fine taste of the connoisseur which informs him what its value will be in the collection of his patron or what it will very probably be sold for by the dealer in whose interests he is acting. Moreover, he knows where to hunt for these things, and in what obscure corners of the country they are to be discovered in the greatest abundance and at the most moderate price. Again, he has a fine sense of the intricacies of lowly human nature which enables him to make a good bargain with the simple cottager and take a rich prize home to London or to the hall of his master. Such a man may earn his wage by a single good bargain in a week; or at least he used to be able to do so, for the humble cottager has of recent years become well educated to his own interests. The agent is given a roving commission to go practically where he likes and do what he likes, provided that he sends a fair number of curios to headquarters at fairly regular intervals. He concentrates himself on the most out-of-the-way places that are to be discovered on the map. Regularly he starts for Wales; occasionally, when the spirit moves him, he will go down into Cornwall; sometimes he will cross the Border and make his depredations in Scotland. He may take a month to 'work' halfa-dozen little villages in the same district. He will make it appear that he is merely on holiday, and will become on the most friendly terms with as many of the humble individuals as he possibly can, so that at length he will be permitted to drop into their cottages for a nice little chat and a pleasant cup of tea. Then he will cast a curious glance over the various little odds and ends that there are in this small abode, and he will pay a tactful compliment to something or other that strikes his fancy. He hears the history of it, and takes occasion to drop a word on the exaggeration of sentiment that is sometimes sustained in such matters. A day or two later he calls again, and says he has been thinking about it, and he makes an offer, which is refused. But eventually he buys what he wants, and he sends it away.

Sometimes, however, the agent will flit from village to village with great rapidity, and a case has been spoken of in which one of the profession worked fifteen English and Welsh villages in six days, and as the result of his labours for that

period he sent to London four dressers, three sets of cottage chairs, three grandfathers' clocks, five warning-pans, three spinning-wheels, twelve old brass candlesticks, and a small quantity of oddments including snuffers, bits of old china, and the like. For the whole of this collection he paid out a total sum of fifteen pounds. On their arrival in London a matter of ten pounds had to be spent upon them in small repairs, and in generally doing them up so that they were ready for their grand new homes. Then they were all sold within a fortnight, and among them they realised one hundred and twentyeight pounds ten shillings, which represented a very fair margin of profit. The dressers yielded sixty pounds, the chairs twenty-five pounds, the clocks twenty pounds, the warming-pans eight pounds, and so on. This was in the comparatively early days of the craze, when the rustic was not quite so experienced in such matters as he is at present. He would probably want fifty or sixty pounds for this lot if he had them now-which he has not. When the agent is doing a kind of flying tour on these lines he has not the time to conduct operations on the confidence-trick lines as already explained. Other expedients have to be adopted for getting inside the cottages and ingratiating himself with the inhabitants in a very short time. This has frequently been done by selling to these poor people articles of food or clothing, of such as they are in need, at absurdly low prices, such as make the hearts of the buyers warm towards the kind fairy traveller instantaneously. Here, indeed, there is no deception. Good tea has been sold to these folks at sixpence a pound, and cheese at twopence, and they have been sincerely informed at the time that they will never get such a chance again. It is good business to lose a shilling on a pound of tea in order to gain five or ten pounds on a piece of old oak.

The thorough agent, whose object in life is to get the better of his opponents and never to miss a chance—for the competition between such agents is very keen-takes care to inform himself in every way possible of the history and circumstances of all such families as he knows to be in possession of goods that conform to his requirements. There was once an old and well-to-do family named Chidioke, residing at Haddon Manor in Wiltshire, and for over four hundred years they had in their possession one of the most beautiful old oak cabinets that could delight the heart of the collector. About the middle of last century the family died out, and the greater part of the furniture belonging to it was sold, among it this cabinet, whose value did not seem to be properly appreciated. At that time the profession of which we have been speaking had not been established, and such breakings-up of family homes as this were not attended to, so that the cabinet was bought by a farmer living on the estate, who had married one of the former servants at the house, the wife being desirous of obtaining it as a memento, with little or no knowledge of the

value attaching to it then or such as would attach to it in the future. But the farmer died and left his wife in very poor circumstances, and by that time the mania for the collection of these old things had set in in full force. One of the agents heard by chance of the history of this old cabinet, and knew that it must be a prize well worth his capture. After much diligent investigation he discovered that it was stored in a stable-loft, and presumed, therefore, that but a very small value was being placed upon it by its then owner. In due course he made his overtures, and with very little difficulty he succeeded in purchasing it for the modest sum of fifteen shillings. Very shortly afterwards it was sold to a wealthy connoisseur for no less than five hundred pounds, and it is said that it would take very much more than that to buy it again if it were ever placed upon the market.

Here is another little story of a successful coup by a smart agent. Living in a little stone-and-peat house, at Llangollen, going by the name of Bryn Cottage, was a family named Carthew, and in this dwelling there had been for some three hundred years an old-fashioned dresser which was a model of its kind, a 'perfect specimen,' as it would be called, which for all this time had been put to the mean and common uses of the kitchen work of such a humble abode—as why should it not have been? Several agents at length came to know of the treasure in the cottage, and made their advances to the Carthew family who lived in it, first of all offering a modest sovereign for the dresser, and then bit by bit increasing their tenders until they stood still at fifteen pounds. When the harvests were poor and the times specially bad the agents called again; but though the Carthews treated their dresser as of little value from the point of view of its rarity, they cherished the family sentiments that attached to it, and they would not give it up. But at last the chief of the Carthews died, and there was a sale, and at that sale the agent of a well-known firm bought the dresser for twenty pounds. It was carried to London, 'done up,' exhibited somewhat, and then in due course it was bought by an agent of the King for seventy pounds.

There is a pretty story about one of the very choicest old spinning-wheels that are to be found anywhere, which is at present in the Ingestre collection, and is likely to remain there for a very long time to come. It took ten years for the agents to capture it from an obstinate lady, the wife of a miner working in the Crosby coal-pits. An agent discovered it as he was making one of his rounds. He saw it through the window. He noticed its early pattern, its beautiful points, its bits of oystershell inlaid in the framework, and his heart began to beat. He knocked at the door and presented his compliments to Mrs Simmons, the wife of the miner, and in due course he broached the subject of the wheel. But she would not listen to any proposal for its purchase, and the man saw that he

must defer his overtures to another day. Then the secret got out among the other agents, and they all called, so that the lady became much incensed, and it was told along the country-side that on one occasion she drove them away from her door with a flat-iron held menacingly in her hand. But it is the favourite proverb of the agents that everything comes to him who waits-waits at the doors of these humble cottages, where sooner or later the pressure of hard times is likely to be felt. The roof of the cottage fell in, and the vulture agents swooped down upon it then, thinking surely that the Simmonses must yield. But they tided over this difficulty, and snapped their fingers in the faces of the fine gentlemen from London. Then there was a strike at the pits where Simmons was employed, and he was out of work on a very meagre allowance of strike-pay. The agents condoled, and renewed their offers, but they were rebuffed again. But a woman's love for finery, and her unselfish desire to have a 'fine wedding' for her daughter, were not proof against the sacrifice which was not to be made when there was no shelter in the home, and when the unpleasantnesses of privation were being experienced. There was a Miss Simmons, and she had a sweetheart, who in good time came to claim her for his wife. Dear old Mrs Simmons emptied the family stocking, but still there was not enough for her to achieve her objects of pride and ambition in the matter of a wedding that would do justice to her bonny daughter; and so she beckoned to the men from London to come, and she sold the wheel-for twenty pounds. Before it went to its present collection it was sold again for forty-five pounds an exceedingly high price for a spinning-wheel, for a good one can be obtained for a five-pound

Talk to one of these agents, and he will tell you many curious things about his work, and many quaint anecdotes of his experiences and of the hustling times that he has in competition with his rivals. He says that a few years ago there was certainly ten million pounds worth of curioson the valuation of the period—in the workmen's cottages in the country; but, thanks to the depredations which have been made, there are not so many now. In the heyday of the fashion some ten thousand pounds' worth was captured every week and sent up to London. In these times huge profits were made by the dealers, and the agents made fine commissions that now and then enabled them to set up country cottages of their own and put in them one or two trifles gathered in their wanderings. But by-and-by the workman-cottager became better educated to the value of his things, and he put it to himself very sensibly that if the grand folk in London wanted his poor sticks, no doubt they would be willing to give a good price for them, fools as he thought they must be. A simple farm-labourer had in his cottage a very old oak wardrobe. It had been his grandfather's, and that was the earliest that he knew of it; but it must have dated much farther back than the days of this old gentleman. An agent saw it, and he thought that a couple of pounds might very likely buy it, and so he offered them. What amazement was his when the labourer winked and smiled, and calmly stated that a cheque for a hundred would make the wardrobe his, but not a penny less! It turned out that there had been other agents there before, and that they had already raised their offers to some seventy or eighty pounds. Very likely the farm-hand got his hundred soon afterwards, or perhaps more.

Here is an example of the times when the mere antique furniture agent feels the fierce joy of lifethe thrills. Late one night one of the members of the profession heard that a specimen of extreme rarity and high value had been suddenly discovered in a little village in the north of England. There was no time to be lost; he knew that two or three of his competitors were already hot upon the trail. So he took the first train available to the village, and opened negotiations with the owner of the gem; but this man was exorbitant, and the process of doing business was slow. The agent thought that he might wait a little while; but one night, when all the occupants of the little inn where he was housed had gone to rest, including himself, there was a knock at the outer door, a stranger was admitted, and from his bedroom the agent recognised the voice and name of one of his keenest rivals, who had evidently driven over from the junction some miles distant, where a night mail had set him down. This man was one who had the reputation of 'plunging' when he had set his mind on getting possession of any article that was open to be bought, and it was difficult for competitors to hold the field against him. So the other knew that the time for decisive action had come. He must act before morning.

He waited until the new-comer had retired and all was quiet again, and then he put on his clothes, crept stealthily downstairs, unbolted the door, and went out. He had a couple of miles to walk through the rain to the cottage containing When he reached it he the coveted article. roused the inmates, and bartered with them in their night-clothes. Unusually wise for their kind, these simple folk argued with themselves that there must surely be some special and very important reason why this man should come out thus and bargain with them in the small hours of the morning. The inference was that their curio had increased in value, and thereupon they put up the price. A few hours before they had told this man they would sell it for twenty pounds; now they asked fifty for it. The agent said that, for private reasons, he could not wait until the morning. 'Then pay the price to-night,' was the simple rejoinder. Eventually the bargain was completed at forty-five pounds at a quarter to two in the morning. Tired, but satisfied, the agent walked back to his inn, and

he must needs give some early intimation to his rival of how he had outwitted him. So as he crept back to his room for a long sleep he sought out that of the new man, and on the door he pinned a copy of the receipt for the money that he had paid, with a note attached to the effect that the original could be seen on application to No. 5 not earlier than eleven o'clock in the morning.

норру.

By Captain CECIL NORTH, Author of The Moorish Treasure, The Hermit of the Irati, &c. CHAPTER XIV.

EX'S brother came to see him early next morning, and frequently afterwards during the first stages of his recovery, and he always showed himself as grateful to Sir Ralph and Mirabelle as Private Rex himself.

The two men passed many a pleasant hour together in the invalid's comfortable room, smoking and talking the talk of barracks.

Then one day a queer thing occurred. Mirabelle had, early in the afternoon, taken up several newspapers for Rex's amusement, amongst which was the Army and Navy Gazette; and Sir Ralph, going into the room half-an-hour later, found the man evidently labouring under the influence of some

strong excitement.

'General,' he called as soon as he caught sight of his visitor, 'there's somethink I want to tell ye. There's a Colonel Morrison died lars' week, an' I see by this 'ere Gazette that hit's the same as was colonel at Rhanibad. I 'eard 'im give Mr 'Oppy leave to go hout after that Vare, only 'e made 'im promise that if trouble came Mr 'Oppy wasn't to say anythink about it. I told Mr 'Oppy that I'd 'eard too, an' then 'e made me promise 'im that I 'd keep mum, an' I kep' to it as long as the colonel was livin'. But that's 'im w'at's dead, certain, an' so I carn't do no 'arm in tellin' ye now.-Ah, miss,' he exclaimed as Mirabelle came in, 'I'm just tellin' the General somethink as'll hinterest ye;' and he repeated his story with more detail to the astonished girl. 'But w'at's wus,' he added, 'that there Vare, as was lyin' hinsensible beside 'im-as we thought-when the colonel spoke to Mr 'Oppy the second time an' reminded 'im of 'is promise, was honly shammin', an' 'eard it hall, though neither of the orficers fancied such a thing. But 'e 'eard right enough, for I saw 'im start an' hopen 'is heyes fur a second, to see who it was a-talkin'; an' w'en afterwards, jest to make sure, I made bold to say to 'im the mornin' o' the court-martial, "You remember w'at you 'eard that bad day, sir, 'urt though you was? Couldn't you say the word to save Mr 'Oppy that 'e carn't say 'isself, seein' as you ain't made no promise?" the look 'e gave me an' the queer colour 'e turned as 'e said, "I don't know w'at you're halludin' to, Rex; you must be still hunder the influence of yer larst secret drunk. Be hoff wi' you," showed as 'is conscience was a bad un, an' that 'e wouldn't hact right.'

The General was much agitated at this extraordinary story. 'Do you know, Rex, that you are saying a very serious thing, and making a villainous accusation against your late officer and my personal

'Iss, sir; but it's gorspel truth; an' it's not friend ?' honly me that knows things of Major Vare. Hall the rig'ment saw as 'e'd a down on Mr 'Oppy. 'E'd pull 'im hup on p'rade-'e was hadjutant then-an' talk to 'im as made the men wonder the lootenent could stick it. An' heven w'en 'e was 'ome on sick-furlough, lodgin' hat my brother's, w'en the sentence on Mr 'Oppy was printed in the noospapers, 'e cut it hout—to put in 'is pocket-book, I suppose, to look hat w'en 'e wanted cheerin' hup.'

Well, this is a most extraordinary story to be sprung upon one,' said the General after a moment's reflection, 'and I cannot yet clearly see my way; but until we have some news of Major Vare and learn if he has been successful'-his voice shook slightly-' we must leave this matter alone and have patience. If it please God to let me have my boy back, then, as this Colonel Morrison -I don't want to be unkind, but I really cannot refrain from saying this unworthy colonel—is dead, we may be able to arrive at the solution of what is now a deep mystery to me; but my wish is that until that time the matter should not again be referred to.'

That evening Mirabelle said a few words in private to Rex, and elicited from him that his brother still possessed the newspaper from which Vare had made the cutting. He promised to tell him to bring it when he next came to see Rex, and then Mirabelle could have it to do with it as she liked. And thus did the nets of Fate draw closer and closer round the unconscious baronet, who little thought, as he that very evening sent a telegram, from Bouc-al-Aran, that the seed of distrust had already been sown, and would blossom, when he least expected it, to the complete undoing of his plans.

'Umph!' grunted Sir Ralph as he read the long-looked-for message, which was delivered late next day: "Partially successful. With you soon." Doesn't sound very promising, and deuced vague into the bargain. Why can't the fellow speak plainly? I'm not a child, afraid to hear the truth.

But Mirabelle slipped out of the room, and a few minutes later Rex had sent a letter to his brother. She did not appear at the subsequent interview between the two men; but next morning she received by post an ordinary newspaper, yellow and ancient as to date. This antiquated Daily Telephone she did not think it necessary to show to the General; but a brief examination of it in her own room satisfied her that it was a conclusive piece of evidence about a little private matter which had hitherto always puzzled her, and of which Sir Ralph was ignorant.

'I think, dear dad'-she always called him dad now-'that we must give Sir Dethe a patient hearing, and learn all that he has to tell us before we hint at any such thing as an explanation of this charge Rex brings against him. I know how distasteful this will be to your strict notions of honour and friendship,' she went on coaxingly, 'and I would never have suggested such a course if I had not suddenly discovered ample proofs of the truth of Rex's allegations about Major Vare's treachery and dislike of Hoppy. Will you, then, like a darling, go away for a while-Aunt Alice, of course, remaining-and let me see Sir Dethe at first alone? If he is an innocent man I shall soon find out, and there will be no harm done; but if not-which I am convinced is the case—then I must pit my woman's wits against his cunning, and try to get to the bottom of the mystery. But if you were here, you know, you could not, after what you have heard, prevent him from seeing that we have cause to doubt his honour, and then we might not-nay, I am convinced that we never shouldget at the true story of this "partially successful"

'I don't like it—don't like it a bit,' grumbled Sir Ralph; 'but I have perfect trust in my girlie, and I am sure that she won't do or say anything that is not strictly right and above-board. So you shall have your way, and I'll trot off in good time—he can't be here for some days yet—and leave you to the care of your aunt Alice, and—and the good God.'

For answer Mirabelle lifted up her sweet face as she whispered, 'Something tells me that we are doing right, dad.'

And the grizzled old warrior bent down and kissed her, with all the love shining in his eyes that he would have lavished on his own daughter had the Fates willed that he should have had one.

'Mirabelle!'

'Well?'

It was the same greeting that had met him once before on an almost similar occasion, yet he fancied that this time he detected something almost menacing in the silvery tones.

'Have you nothing better than that to welcome a man who has penetrated into unknown Africa for your sake?'

'Oh yes, presently; but think of my anxiety. Your telegrams told us nothing. And, please, I am Miss Melgrove, Sir Dethe.'

Vare's face hardened.

'Certainly. Where is Sir Ralph?' he asked.

'My story is fitter for his ears than yours, Miss Melgrove.'

'The General has gone away. I persuaded him. I did not think that at his age he should be submitted to any strain. You need not be alarmed. You must tell ne all, and I know that you will not hurt my feelings unnecessarily. Is Hoppy married?'

'Oh no.'

'What, then, did you mean by "partial success"? Quick, tell me.'

'Since you force my hand like this, I will tell you, and at once,' sharply replied Vare; 'but it will not be pleasant hearing. I partially succeeded in my search, inasmuch as I found Hoppy alive, but ill, one of the two remaining white members of a French exploring expedition sent out three years ago, as I told you before. I stayed with him for many days, and when I left him'—the scoundrel shied for a second at the awful lie—'I left him beside his comrades. I buried him!'

Mirabelle covered her face with her hands and strove to master her emotions. But it was some minutes ere she was able to bravely say, 'Go on, please, now. Tell me every detail of your journey.'

Then, in a soft and sympathetic voice, Vare described to her his long wanderings with Dick, the many obstacles met with and overcome, the many disappointments suffered. Truthfully, and withal modestly, he told of the first part of his expedition, eulogised Hoppy's devotion to duty, his refusal to leave his lonely post, to disobey his orders, even when amply justified in doing so if ever a man was. Then when he came to Braun's death he dealt with an astonishing wealth of detail; but it was to Hoppy he assigned the rôle of him that was taken, and to the German that of him that was left. Then he described with real feeling the death of his companion Dick; but he forgot to mention the two letters that he had found amongst the poor fellow's kit. And then he carried the story homewards, finishing it with his present arrival.

Mirabelle, with a set, pale face, listened without interruption; and when at last the painful tale was ended, she rose and slowly paced the room with bent brows, a prey to bitter and conflicting thoughts. Suddenly she stopped short in front of Vare, who was watching her somewhat uneasily, and abruptly asked, 'You bring me no message, no letter, nothing? Surely he did not leave you without something for us?'

'You forget. I told you that, for some unexplained reason, poor Hoppy chose to regard me with suspicion—almost as an enemy, in fact. No, he gave nothing to me whatever; but I am not so sure about Dick. I asked the poor fellow, a short time before he died, if there was anything I could do for him here at home, any message I could deliver; but he said no, nothing on his own account, and that whatever he might have for others he was charged to deliver with his own hands or not at all. Of

course, after such a snub-by Hoppy's orders, I suppose-I had nothing more to say; and as he wished to conceal his identity to the last, even from me, I buried all his belongings with him, just as they were, without any examination.'

'One more question,' said Mirabelle, 'and then I will ask you to leave me. Have you nothing to show me, no absolute proof of Mr Apner's death, something that will dispel this dreadful feeling of doubt that haunts me?'

Vare rose from his seat with dignity.

'I do not think, Miss Melgrove, that I quite deserve this treatment at your hands, he said; 'but since you choose to torture me in this way, with, to me, inexplicable doubts of my veracity, I must take the only means I have of justifying myself in your eyes. Here in this envelope are two photographs I took, not with any idea of using them in the way you compel me to do, I assure you, but simply as private and sad souvenirs of my journey. One, you will presently see, is that of a row of graves and crosses, the last, the newly made one, being my late brother-officer's. The other photo is more painful still; it is one of the poor fellow himself, taken a few hours after his death. It is not good, as you will perceive, but sufficiently clear, I think, for you to recognise Apner in spite of his beard and changed appearance. Now, I will go. I regret that you have forced me to give you this additional pain; but perhaps you will be relieved to hear that I shall be leaving England again almost immediately. I knew what reception usually awaits the bearer of bad news, and so I have made arrangements with a man I met in Algiers to go on a year's shoot to the Rockies. At the end of that time I shall return; and, believe me, the most cherished thing I shall carry with me on this new expedition will be the permission you gave me before starting on the last one, that in the event of certain things happening I might hope. I sha'n't see either you or the General again before I leave, so I'll say good-bye; no, not good-bye-au revoir, Mirabelle; au revoir!' And with well-feigned emotion he flung out of the room with the air of an innocent man suffering under an unjust accusation.

It was not before she heard the front door bang behind her visitor, who had not waited for the usual attentions from the footman, that the stunned girl, her fingers trembling, dared to open the envelope. Slowly she drew forth a photograph. It was that of the row of graves; and she noted, as she gazed upon it with burning eyes, the unmistakably fresh appearance of the last one. Mechanically she counted the crosses—there were eleven and she shuddered at the thought of the lonely German faithfully watching the flag, who would not find any one to place him in line with his comrades when the fatal fever claimed him.

Then she remembered that, of course, Vare would have informed the French at Bouc-al-Aran, and that probably a relief-party was even now on its way to the rescue; and she wondered how it was that he

had not mentioned it when he so circumstantially related his adventures, and she felt glad that the brave Braun would stand a chance yet of getting out of that deadly Iwa alive. Then she braced herself to look upon the other picture.

Blurred, ill-developed, and indistinct as it was, no second glance was needed to establish the identity of the long white figure, and poor Mirabelle, burying her head in the sofa cushions, sobbed as if her very heart would crack. And there her aunt found her, and at once sent off a messenger for Sir Ralph, who was close at hand; and presently she was soothed and comforted by the old man's presence, and able to tell him everything exactly as she had heard it from Vare.

After the first shock, the General was inclined to see the man himself and thrash out the Morrison question before he left for America; but, as Mirabelle said, 'What earthly good can it do anybody now?' adding to herself, 'And I shall know what to say to Sir Dethe a year hence, when he comes back and dares to broach a certain subject to me.'

It was not for some days that she could bring herself to show the photographs to Rex and give him an account of their history; and when at last she did do so, the worthy fellow glared upon them as he listened to his fair visitor's story with something as nearly approaching a scowl upon his features as the girl had ever seen.

Suddenly he said, 'Ave you such a thing as a magnifier, miss?' And on Mirabelle bringing him a reading-glass of Sir Ralph's, he proceeded minutely to examine the picture of the body of

his old master. Mirabelle watched him with curiosity. She had a strong belief, from many conversations, in his acuteness and great experience of the underside of men and things; but she was certainly startled when he exclaimed, 'Ah, I thought my heyes, champion shot o' the battalion, 'adn't lost their power. Take the glars, miss, an' look at them little specks in the phortograph, in the distance behind Mr 'Oppy's body, an' tell me w'at they are.'

Mirabelle did as directed.

'Why, they are the graves, Rex,' she cried wonderingly. 'I never noticed them before. How clever of you to see them without the glass! But what about them?'

'Count 'em, miss.'

'One, two, three, four-un-um-um-eleven.' 'Well, miss, carn't you see? 'Ow can there be eleven with Mr 'Oppy a-lyin' there, an' eleven accordin' to the Major's pretty little story an' the hother picture?'

'Yes, I think I see, Rex,' she slowly answered Eleven graves, including Mr Apner's, in one photograph, and yet eleven when Mr Apner lies unburied under the tree! Oh, Rex, Rex, what does it all mean?'

'Mean, miss? Why, it means as there's some

'umbug a-goin' on, an' that I don't b'lieve Mr 'Oppy's dead at all. I never could abide that Vare,' he cried viciously. 'E'd rob a church if 'e thought 'e wouldn't get cotched.'

'Hush, Rex!' cried Mirabelle, 'you mustn't say these things; but tell me, how are we to get to the bottom of this awful mystery?'

'Only one way, miss,' promptly answered the old soldier. 'Ye know w'ere this place is now; it's writ on the back o' the photor—"Hapner's grave, Iwa"—latichude an' londichude hall complete. Ye've plenty o' money, miss. Send hout a hexpedition an' clear it hup.'

'Oh Rex, do you think it possible?'

'Course I do, miss; an' if ye'll wait till my leg's mended, I'll go along of it myself an' see there ain't hany 'anky-panky this time.'

'Rex, you are a perfect old treasure!' cried Mirabelle, and the delighted girl, stooping suddenly, planted an impetuous kiss on the cropped bullethead.

'Well, I'm blowed!' cried the invalid in astonishment.

But Mirabelle bolted from the room.

'If Rex can go, I can go; and, by the Lord Harry! I will, too,' declared the General that night when he had taken in Mirabelle's marvellous story.

'Well, then, I am not going to be left alone behind,' laughed the girl; 'and so I'll have to go as well. Joking apart, dad,' she continued earnestly,

'we can easily engage a professional explorer or African hunter-one of those men who shoot elephants and write books about it—and go comfortably with a big caravan and donkeys and tents and things. Money can do anything, and there is no lack of that; and we're both strong, and as we can afford to do it, there is no earthly reason why I shouldn't go as well as you. Something tells me that Hoppy is there, well and alive, and we'll find him and bring him back, with proper leave from the French. We can say that we have an idea where he is, and that if we can find him we mean to bring him quietly home. Oh yes, dad, I'm coming too; and so the sooner you begin to hunt about for a man to organise the thing the better it will be for everybody.'

And so it came about that four months after Rex's discovery, at about the period when the newspapers announced the departure for an extended trip in Egypt of Sir Ralph Apner and the Honourable Mirabelle Melgrove, a splendidly equipped expedition, furnished with full powers from the gallant and courteous General at Algiers—who knew nothing of any report from Vare—set out from Bouc-al-Aran on the long march to Iwa. And Vare, hunting wapiti on the Little Big Horn, in blissful ignorance of the storm preparing for him, congratulated himself on his clever tactics in absenting himself from England while Mirabelle got over her grief.

(To be continued.)

BURN-FISHING IN THE HIGHLANDS.

By WARD MUIR.

STRANGE and singularly stubborn misapprehension exists in the minds of many of those unfortunates who do not fish to the effect that fishing demands extreme patience. I can

dimly perceive that the origin of this absurd notion is traceable to the spectacle of sphinxlike and semi-somnolent mackintoshed figures sitting on stools in a punt, and for interminable hours focussing their attention on floats which move not and rods which do not bend. The innocent tripper's hired hand-line dangling from the barnacled and chilly pier of some seaside resort doubtless adds its quota of evidence—false evidence, as I hold—to the case for the patience theorists. And an unhappy day's trolling for pike in a wind-swept reservoir which contains, as a matter of fact, neither pike nor even a few hidden snags to perform the kindly office of occasionally creating the illusion of a nibble, apparently completes the chain of evidence. Were the sport of fishing limited to these depressing exercises, the accusation of patience—and an inhuman degree of patience is usually implied in the accusation—might be somewhat difficult to refute, on the face of it. But as long as angling for salmon,

sea-trout, and yellow trout comes under the comprehensive heading of 'fishing,' just so long will the statement that 'fishing needs patience' be a total misrepresentation of the fundamental truth.

Your successful fisher is persistent; but he cannot necessarily be called patient, which is a very different adjective. Indeed, his success probably depends on impatience rather than on patience. Precisely in so far as he is impatient is he likely to be successful. After an hour's failure to catch anything, the typically patient man would sigh heavily - 'patiently,' to be sure-pack up his gear, and wander-'patiently,' in a word-home to his hearthside. His characteristic impatience would prevent the true fisher from doing anything of the sort. Long before the unfruitful hour was up he would have 'impatiently' tried half-a-dozen different models of flies in an 'impatient' endeavour to hit on the exact one which the fish were favouring; he would have hastened from pool to pool, from meadow to wood, from wood to moorland, possibly even from one stream to another; not because he was patient, but because he was impatient-impatient of his failure and impatient to ferret out its reason and rectify it. By the time the nominally patient man had reached

home and settled himself to a novel, his impatient comrade would have ascertained, by experiment, the right flies and the right kind of water, and be catching a creelful of what Cotton quaintly calls 'the scaly people.' Or, even if he had not made these discoveries by the end of the day, he would at least have tried to make them, and thus earned the honourable title of an impatient, and therefore resourceful, fisherman.

In no branch of the sport is this persistent impatience more necessary than in angling for trout, and particularly for burn-trout. Burn-fishing is a sport the pursuit of which elicits a very frequent mental readjustment to the problems of the perpetually changing circumstances. It might almost be compared to golf in this respect. Rarely, if ever, are two casts in burn-fishing exactly alike; as rarely, if ever, are two strokes in a game of golf exactly alike. The burn-fisher scrambles on up his glen, meeting a fresh type of runnel or pool at every turn of the way, and approaching each with a different mode of attack, hastily invented on the spur of the moment. The pools of the average Highland burn are, as a rule, so small that three or four casts cover them thoroughly, and five minutes or so is enough time to devote to each before pushing on to another. A brisker and more diversified recreation could, therefore, hardly be imagined than burn-fishing, with its constant shifting, its constant novelty of scene, its constant alteration of action.

For there is all the difference in the world between burn-fishing, as I write of it, and fishing for salmon or sea-trout in some large river such as the Spev, say in its lower reaches near Grantown, where the fisher must arm himself with an eighteen-foot, twohanded rod, a landing-net, and perhaps a gaff, and wade up to his middle in treacherous, often ice-cold, water, in order to throw his minnow or the bright bundle of feathers called by courtesy a fly to the central depths where his prey is presumed to be lying. There is something grandiose in this aspect of the sport, something supremely dignified -a dignity which, it must be acknowledged, certain other forms of fishing do not exhibit. But peculiar disadvantages are attached to it. It is emphatically a sport for the rich; even more emphatically a sport for the muscular and healthful. Burn-fishing, on the contrary, is a sport for all. From Tweed to John o' Groat's, thinly spread over the land, there is a vast army of burn-fishers of every class, who are not any the less accomplished sportsmen because they have not caught a brace of salmon in their lives, and have never aspired to possess a pair of wading-breeches. No one who has ever traversed any of the rural districts of Scotland between the months of May and October can be unaware of the existence of this army, and can have failed to hear tales of the historic performances of its scattered skirmishers. The burn-trout is one of Scotland's assets. Its value, moreover, has been realised, and precautions are now being taken to render that value permanent and increasing.

Given a good burn, clear of weed, as all good Highland burns are, and not too difficult to fish by reason of marginal vegetation, no village need now-adays fear for a constant supply of summer visitors, both from far-away England and from Glasgow and Edinburgh. A salmon-river attracts rich men in ones and twos—rich men who can, as it were, buy an entire section of the river, lock, stock, and barrel; but a burn fairly full of yellow trout will act as a magnet for a less rich but still money-spending fraternity, not in ones or twos but in dozens.

Many pleasant memories of fishing are connected in the writer's mind with an excellent though comparatively little-known burn, the Dulnan, on the borders of Inverness-shire and Elgin. Strictly speaking, the Dulnan is a river, not a burn; but, as it empties itself into the mighty Spey, the word 'burn' is more applicable to it locally. It is a burn, too, inasmuch as little or no wading is required for reaching any part of it, even at the widest pools; and it is essentially a burn in the characteristics of its fishing water, of which every conceivable sample is to be found within any given mile-a profound relief after the monotonous magnificence of the lower Spey's tremendous reaches. The Dulnan leaps and rushes, sometimes foamily white between jagged boulders, sometimes stilly swirling in coffeecoloured depths, sometimes singing over pebbles. Here it is bordered by oat and hay fields, there by red-barked pine-woods, outposts of the ancient Abernethy forest; in another place it carves a tortuous channel through peaty moors hummocked with purple heather and speckled by patches of fluttering cotton-grass. A day's fishing slowly leads the sportsman through all these, beguiling him with a thousand pleasurable impressions quite apart from, and to the appreciative eye not less fascinating than, the varieties of his actual pastime. The burn-fisher of a stream such as the Dulnan, cheerily tramping homeward with a score of plump little yellow trout—though none of these, maybe, turns the scale at more than a quarter of a poundneed scarcely envy his brother who has spent the hours whipping the surface of the humdrum Spey, and who has perchance one fine salmon to show for his fatigue.

At the risk of raising a chorus of protest from 'dry fly' brethren of the South, it should be added that the art of burn-fishing is not confined even to the humble wet fly, but may be practised legitimately with the worm. The fly's the thing, of course; but no burn-fisher of any experience will deny that in certain conditions he might as well not fish at all as fish with the fly alone; and, given one of these occasions, the use of a worm-bait is far from being as crude and facile an alternative as it may sound to the uninitiated. Worm-fishing in a 'spate' is no very subtle affair, it must be admitted; but worm-fishing in dry weather, when the water is low and transparent, demands genuine dexterity and science. Thanks, I suppose, to superior farming and the better drainage of the land, spates are now

of shorter duration in most of the burns of Scotland than they used to be. The water rises quickly to a discoloured torrent in which worm-fishing is hardly better than mechanical; but it falls again with equal suddenness; and for the burn to be 'doon' is now far more normal, in most districts, than for it to be 'drumly.' It is when the water is at its clearest, and therefore in its least promising phase, that the really great worm-fisher shows what he can do as a last resource. The employment of tiny hooks, infinitesimally thin-drawn gut, small pink worms, and an approach to the stream's brink which resembles, in caution, the legendary crawlings of the Fenimore Cooper Indian stalking his prey-these are the tactics wherewith the worm-fisher circumvents adverse fate, and, to the amazement of the helpless fly-fisher, fills his basket with trout unquestionably caught by the exercise of sheer mother-wit. The Sassenach who went to Scotland and was so rash as to give vent to the opinion—an opinion quite common in parts of England—that worm-fishing is only fit for boys would be laughed at, and rightly laughed at, as an ignoramus. The Scots burn-fisher cherishes a proud affection for the fly; but, nevertheless, he rarely sallies forth without a bagful of worms, not because he is incompetent to make the most of the daintier artificial lure, but because the latter may at any moment happen to become useless; whereupon he will, regretfully enough, fall back upon the

manipulation of the live bait in circumstances which, as a matter of fact, call for a fineness of touch, a nicety of casting, an instinctive cunningness in concealment, which are really almost less requisite with the fly than with the worm.

Burn-fishing may not be a great sport, but it is a very charming one. Monotony of any sort-except the monotony of either catching a great many fish or of catching none at all-is impossible. There are occasional cessations in the wielding of the rod, while the fisher climbs over rocks and bushy banks from a worked-out pool to a new and untouched one, which alone would make burn-fishing a preferable sport for the restless genus of mortals to loch-fishing from a boat. There are halts-alas that one must not forget the probability of their occurrence !-- when gut-casts must be mended and flies or hooks replaced after one of those inevitable accidents with an overhanging branch or a sunken root; and there are pleasant pauses, of course, due to the circumstance that even an angler must of necessity minister to the inner man with sandwiches. These are the times when the burn-fisher has an opportunity to 'lift up his eyes unto the hills,' and bless the kindly chance, whatever it was, which first turned his thoughts to this particular branch of sport, and introduced him to the Highland landscape, incomparable in its richly tinted, ever-modulating beauty.

A SEQUEL TO THE ARMADA.

S soon as Medina Sidonia had hurried his stricken command out of reach of the English cannon, he, of all people in the fleet, condemned two of his captains to be hanged for cowardice.

There were no braver men than the Spaniards of that day, and never had their courage been more sorely tested than in the tremendous action off Gravelines. They had been harassed for a week by an enemy with ships of greater speed and guns of heavier metal, who could choose their own distance, and hit as hard as they liked without being hit back; no sleep, no respite, scanty rations, ten thousand of their number down dead or wounded, blood streaming from their ships' scuppers, the wind driving them to destruction on the banks, and the enemy closing on them and pouring in heavy shot like musketry. And not a ship struck! The waves closed over them amidst a last volley of small arms and a chorus of curses and gibes at the victors for their cowardice in not daring to close.

If any one's neck needed stretching it was the Duke's, and this would have been hard justice. He had protested his incapacity when appointed to the command of the English enterprise, and continued consistently to prove it up to the hilt till

relieved. Still, he should have been the last man in the fleet to condemn others for cowardice.

One captain, Cristobal de Avila, suffered; and, with the brutality characteristic of weak natures, by order of the runaway commander his body was suspended to the yardarm of a pinnace and sent swinging round the fleet. Next was to have come the turn of Captain Cuellar.

Now, Cuellar had fought his ship gallantly from the first engagement off the Mew Stone to the final disaster off Gravelines, and the only reason he was not fast by the sacred standard at the end of that terrible day was that his ship had been so hammered that it had become unmanageable, and drifted out of action. That such a man should be hanged for cowardice was too much. Still, the 'fiery' Duke was bent on emphasising his own incapacity; and it was only with the greatest difficulty that Francisco de Bobadilla succeeded in saving Cuellar's life. As it was, the disgraced captain was deprived of his command and placed on board another ship, under charge of Don Martin de Aranda, to experience as strange a series of adventures as any recorded in history.

We next hear of him on a lee-shore off the wild west coast of Ireland. Sligo Bay in a westerly gale is a perilous place. A strong steamer embayed there would have to fight; for the Spanish vessels,

with their crippled spars and famished crews, there was no chance. The destruction was appalling. The wreckage of the timber in itself would have sufficed to build a respectable fleet; and the wreckage was an indication of other things. On one beach, five miles long, eleven hundred bodies were counted. A few figures may help us here. One mile equals one thousand seven hundred and sixty yards, which multiplied by five equals eight thousand eight hundred yards. Eight thousand eight hundred divided by eleven hundred equals eight. That is to say, that to every eight yards of that beach there was a corpse; and the like was to be seen in other places.

Into such a hideous death-trap Don Martin de Aranda's storm-beaten crew were driven. They were in evil case. It was not alone the trampling surf on the rocks and the hard sea-sand they had to fear. Beyond, more merciless, scoured the Irish, armed with club, axe, and knife, dragging the half-drowned wretches from the grip of the waves, stripping them of clothes, gold, and jewels, and—silencing them.

Like tragedies were enacted under Cuellar's very eyes. De Aranda's ship was dashed ashore and broke her back. The after-part was instantly swept away, and all the 'fraughting souls' within it. The bow held together a while longer. To it Cuellar and another gentleman clung desperately. All around, on sea and land, was ruthless destruction. Close at hand the Conde da Villafranca's great vessel was a hopeless wreck. The Count himself was not the last man to leave his ship, as is the practice with us. He and Diego Enriquez betook themselves to the ship's tender, and, battening down the hatches to keep out the seas, suffered themselves to be rolled ashore. The tender turned turtle, and Cuellar thinks the two were smothered. It was of little moment to them, poor wretches! No sooner had the craft touched the sands than the Irish were on it with their axes. In a few minutes the bottom was broken, and the two Spanish noblemen were dragged out and left naked on the beach for the wolves and ravens.

Courageous, vigorous men face death unflinchingly, but they love life. From the hell on sea to the hell on land Cuellar fought his way, clinging to a hen-coop. His companion had provided himself with another kind of life-buoy by stuffing his belt with gold, and was naturally drowned out of hand. Cuellar was more fortunate. Blinded and buffeted by the surf, bruised and wounded by the tangle of the wreckage, he won the shore.

Happily for himself he was the last piece of jetsam just there, and none were awaiting his coming; there was metal more attractive farther down the beach. He crawled for concealment to a hollow in the sands. It was already tenanted by two Spaniards, stark naked, but with their lives. For a while they lay there shivering, and then the end seemed at hand. Two Irishmen, axe in hand, came upon them.

And now comes a curious incident. Instead of using their axes to brain the unfortunate castaways, these two savages cut down some bushes and threw them over the Spaniards for protection from the weather or for concealment. It may be that they had something of the milk of human kindness in them. It is significant, however, that soon afterwards a troop of English horse came galloping by.

Ireland then, more than now, was a semi-active volcano, always smouldering, constantly bursting into eruption. The ashes of the Desmond outburst were not yet cold. Into this crater of sedition there were constantly drafting inflammatory fragments: Spaniards, the best soldiers in the world, with arms and gold; in bad case indeed, but still with arms and gold, and a hatred for England. Elizabeth's garrisons were few and scattered, and small in garrisons were few and scattered, and small in numbers. They knew nothing of the overthrow of the Armada. All they knew was what they saw passing under their eyes: that the most vindictive enemies of their country were landing in thousands. The order went out to slay, and ten thousand of these poor wretches were put to the sword and the rope.

The moment the Irish found that the English were killing the Spaniards they left off doing so themselves, and protected them.

At dusk Cuellar and his companions stole from their cache. Their first care was the pious duty of burying the poor, battered corpses of Villafranca and Enriquez. The wolves were clustering thick to the carnival. Then they sought shelter for themselves. On a hill near the shore was a monastery. It was deserted, save for twelve Spaniards hanging from the rafters; and so they passed on.

passed on.

With a very few alterations of the text, Cuellar might have written verses 25, 26, and 27 of chapter xiof the Second Epistle to the Corinthians. Twice at least was he beaten, once was he knifed, twice he suffered shipwreck, in journeyings often, in perils of waters, in perils of robbers, in perils by his own countrymen, in perils by the heathen (for 'heathen' read 'heretics,' the English and Dutch, in perils in the wilderness, in perils in the sea, in weariness and painfulness, in watchings often, in hunger and thirst, in fastings often, in cold and nakedness.

nakedness.

The first 'hospitality' he encountered was at a cottage. The inmates were an Englishman, a Frenchman, an Irishman, and a girl. The Englishman received him with a knife, wounding him The Frenchman was a more generous foe. He had been beaten in action by the Spaniards in the past, but the sting of defeat did not prevent him from interfering on behalf of the wretched castaway. His interference did not amount to much. Was ill-treated, and stripped to his shirt. His shirt would have gone too but for the girl, who protested on the ground of Christianity, 'though she was no more a Christian than Mohammed.' The Frenchman then took further heart of grace, and dressed, as

well as he could, his wounds, and gave him some food.

Somewhat refreshed, Cuellar staggered on—whither? The Frenchman told him that the O'Rourke would protect him; but the O'Rourke lived over the hills and far away, many a weary mile 'o'er moor and fen, o'er crag and torrent,' beset with roving bands of English.

Soon he came to another cottage. This time his chance was happier. Its sole occupant was a boy, too young to be formidable, and, as it appears, of a class superior to the savages round him. He had some education—he could speak a little Latin, well enough to converse with Cuellar—and some feeling. He offered the castaway what he most needed, rest and refreshment. Later on the owners came in, father and son, large, fierce men, laden with the spoils of the beach. Presumably they had seen the English at work, for they not only did not molest him, but even showed him some kindness.

That, however, was no abiding-place for him, though flight was only a degree less dangerous. Troops of English soldiers were scouring the country, and a meeting with them meant 'a short shrift and a lang tow' for Cuellar. In the morning he was afoot again on his way to the mountains, with the boy as his guide. One party of English they avoided, but they were caught at last. The weary journey seemed to have reached its end; probably Cuellar was too spent to care much. But the boy, by some ingenious means which he could not comprehend, saved his life—his life, but not his skin. His captors stripped him of his last garment, robbed him of a gold chain which he had concealed beneath it, and beat him severely.

It is, of course, impossible to follow Cuellar's itinerary, either at this portion or during the greater part of his wanderings. He was a stranger in a strange land, amongst a people whose language he did not understand, and was, with rare intervals of rest and safety, hunted for his blood like a wolf from cover to cover. Under these circumstances it is not surprising that his topography is somewhat vague, or even that the whole narrative may appear somewhat disconnected.

In weariness and painfulness, in cold and nakedness, Cuellar struggled gamely on. After a while he came to a stretch of bracken, and, doubtless bethinking himself of his first ancestor, made himself an apron therewith. At his next restingplace he met some of his countrymen who were either less deeply versed in the Scriptures or possessed less gumption. In this shelter was a tempting heap of ferns inviting his weary form to repose. Just as he was about to respond it started into life, and up sprang three naked figures. They turned out to be a Spanish officer and two soldiers, jetsam like Cuellar. With these companions he reached the O'Rourke's castle, where he found others of his countrymen.

The O'Rourke was away enjoying himself, which is Erse for fighting. From the Spanish captain's

account, that part of Ireland seems to have been one universal Donnybrook. The sole industry of the population was to protect their own cattle and lift their neighbours'. Occasionally some successful 'financier' would attract the notice of the bloodyminded Saxon, who thereupon came down in force and drove him to the hills, whereupon a sort of jubilee redistribution presumably took place. Another injustice to Ireland!

In her husband's absence the O'Rourke's wife did the honours, and provided her guests with shelter, food, and clothing-of sorts. By-and-by the chief returned, and made things more comfortable. Then followed a short period of comparative comfort and safety, till the news came that the English were about to pay the castle a visit with the intention of relieving the Irish chief of his guests. The O'Rourke rather welcomed the prospect, but Cuellar refused to expose his host to danger on his account. At about this time news came that a Spanish vessel which had escaped the general destruction was on the coast refitting. Cuellar hurried down to intercept it. Too late! Ere he reached the shore a gale came on, and the ship went the way of her ill-fated consorts.

The Spanish captain's position was now one of extreme peril. There were hawks abroad, English soldiers hanging and shooting. The chivalry which had dictated his departure from the O'Rourke's castle forbade his return. Of other efficient shelter there was none; the Irish kerne might conceal but could not protect him. Moreover, few men are content to put their necks within reach of the halter for a stranger and an alien. One such was found, an Irish priest. He helped Cuellar all he could, and found him odd jobs. One was as assistant to a blacksmith, 'whose wife was a brute,' a pithy sentence which seems to contain a whole volume of misery and degradation. At length the priest found him comfortable quarters at the castle of an Irish gentleman.

Here Cuellar passed some happy days. He was treated by his host with the courtesy that became his class. For the first time for many a weary week he was fed and clothed like a respectable man. He had, moreover, the delight of once more associating with his own countrymen, to several of whom this 'fine ould Irish gintilman, one of the olden [and present] time' had extended his hospitality. But, after a while, surgit amari; which might almost be translated 'he got up to be loved.'

Cuellar was attractive and agreeable. There are no prettier women than the Irish. They are also impulsive. The fugitive soon found himself the centre of embarrassing attention. At first he tried to repay the consideration of the ladies by music, song, and story. Then he took to telling fortunes by palmistry. When a handsome man is holding the hand of a pretty girl who is interested in him, when he and she are sitting close together, with their heads close together as palmistry demands, complications are likely to arise. At

length, medio de fonte leporum, rose Cuellar, and in the character of an undefended male appealed to his host for protection.

More serious trouble was at hand. News of the guests at the castle had come to the ears of the English, and it soon became abundantly clear that the place would in a few days become too hot to hold either Spaniards or Irish. The castellan was obliged to tell Cuellar that he was not strong enough to resist, and that flight was imperative. The Spaniards preferred fight to flight. There were amongst them hidalgos, 'sons of somebody,' the chivalry of Spain. They asked their host as a personal favour to lend them muskets and ammunition and provisions for some weeks. To this he readily assented.

Thus equipped, the Spaniards took up their position on a small fort which stood at the end of a headland projecting into a lake. Cuellar gives the name of the place as Manglana, which appears to have been one of the nesses that run out into Loch Erne. Here they were attacked by the English in force. For a fortnight the siege and defence were maintained with vigour, and then the stars in their courses came and fought against the big battalions. The weather appears to have been dreadful, and it is small wonder that the besiegers broke up their camp. To live in a swamp, with a deluge overhead all day and all night, with periodical marches over a narrow spit, a straight path in which a thousand might well be stopped by three; to be picked off en route by the practised muskets of desperate men fighting for their lives behind a strong stone wall; to have to retreat pursued by the same musketry, and with no meed of honour and glory in the event of success, was enough to dishearten the bravest. And there were no finer fighters than the Spaniards behind a wall. Witness Saragossa, more than two hundred years later, at a time when, in the open field, Spanish valour was not conspicuous, as also Albuera and a score of other battles.

From Loch Erne the Spaniards felt their way across to the north-west coast. There Cuellar found shelter in contrasted quarters—amongst the women of course, and with the clergy, who, being Roman Catholics, have no dealings with the gentler sex. His companions were also accommodated in various hiding-places. At length a vessel was found to convey them across to Scotland.

Here, then, seemed the end of their troubles. They were in a kingdom at constant enmity and strife with England, governed by a monarch whose mother had been beheaded by the English Queen. In the light of history, Scotland at that time was scarcely the place a Spanish refugee would have selected as an asylum. The year of the Spanish Armada was also the birth-year of the National Covenant in defence of religion, the afterwards famous Covenant. James himself had levied a force to resist the landing of Spanish troops, and had suppressed Maxwell's movement in favour of Rome

with a high hand. The unfortunate fugitives, though not molested, soon found they were not

wanted.

News of their distress came to the Prince of Parma, who forthwith made arrangements to have them brought across to Holland. Unfortunately for them, he did not command the whole Dutch coast. Since the taking of Brille by the Sea Beggars, the shores of Holland had hardly provided healthy watering-places for Spaniards. The port of landing had to be selected with circumspection.

No doubt the skipper of the boat was well aware of this; but fate, in the shape of a Dutch privateer, intervened, and drove him ashore with an accompaniment of cannon-shot. Most of the Spaniards escaped the chance of battle, and the chance of drowning on the Dutch coast is negligible. If a ship of shallow draught strikes there, all the crew have to do is to step overboard and wade ashore. But the noise of cannon had attracted the notice of the residents, who happened to be Hollanders and Zealanders. The result was that the fugitives were wiped out almost to a man. Only Cuellar and two companions escaped.

This was his last adventure. At nightfall he won his way across to safety. It is probable that the sweetest music Cuellar ever heard in his life was the challenge of the Spanish sentry.

NIGELLA.

LOVE-IN-A-MIST in a garden grew, A cloud of green with a heart of blue.

When soft winds swept it, it shimmered free Like drifts of light on a summer sea.

Many a blossom was gleaming there, Sweetly fragrant and far more fair.

The rose was worshipped, the daisy kissed; But no one cared for Love-in-a-mist

Till, over the grass like velvet shorn, There came a little maid forlorn.

And when she saw it, she bent and cried, 'Oh, Love-in-a-mist! can love misguide?'

She knelt and held it against her face, So cold, so pure, like a nun's embrace.

'Green's grief-stricken, and that am I! Blue is faithful until I die!

Life is fleeting, and love is long!
Oh, Love-in-a-mist! What's right? What's wrong!

She sank till her fair head lowly lay, With pillow of green on bed of clay.

The sun went down, and the moon rose high, And great pale moths went flitting by.

And there they found her, her pale cheek kissed By tendrils green of Love-in-a-mist. M. W. M. FALCONER.

SOME OUT-OF-THE-WAY KINGS.

By Poultney Bigelow.

Sepius ventis agitatur ingens Pinus, et celsæ graviore casu Decidunt turres, feriuntque summos Fuluina montes.

O sang the most genial of heathens, a prince amongst philosophers, the friend of emperors and Prime Ministers, a Roman country gentleman, a simple farmer in outward life, a man of the world for all time—the poet

Horace. And for the benefit of those whose love of the classics has been stifled by a college education, let me mention that a free translation might mean: 'It's well for presidents and other potentates to rise cautiously, because the higher they soar, the sorer it feels when they come down.'

And this reminds me of King Ja Ja from the West Coast of Africa, who never heard of Horace; and indeed Ja Ja himself was but a hazy name to me when I paddled abreast of his palace in the island of St Vincent, one of the most beautiful of the British West Indies. Here is perpetual summer, a soft breeze at all times tempering the heat of the sun's rays, grand volcanic mountains clothed with luxuriant tropical vegetation rising from the sea to altitudes almost alpine. Here grow sugar, cocoa, oranges, bananas; here life is easy and man surrounded by everything calculated to make a king forget any throne!

But King Ja Ja was not happy. At home he commanded twenty-five thousand warriors—the finest army in the world, said he; but then that was before the Rough Riders conquered Cuba—or was it Spain?—it's all so long ago, and my note-book is not handy! At that time the standing army of the United States was exactly the same as that of King Ja Ja, and this induced his Majesty to a comparison of forces in which he demonstrated to his own satisfaction that his African empire, being equal in fighting forces, must necessarily correspond in other respects. I was not there to correct royalty; it is dangerous enough to correct a president.

No. 502.-Vol. X.

Ja Ja was a real king. He wore a gauze undershirt and white linen trousers, had bare feet, and very gorgeous oriental slippers. His Chief Lord High Chamberlain was a bright-eyed, woolly-headed black boy, who showed me to the reception-room with as much ceremony as though it were into the presence of a reigning sovereign of the Old World.

King Ja Ja had turned his army against that of Queen Victoria, and at the end of the war, instead of putting him into a prison with irons on his hands and feet, as we treated Jefferson Davis, the British Queen made him a present of a palace in this West Indian Paradise, gave him plenty of pocket-money, sent him his wife, and in addition allowed him all the personal liberty compatible with permanent residence in St Vincent. He introduced me to his wife, a handsome African damsel dressed in a lownecked white stuff, which made me think of a lambchop with a cuff round the handle. She offered me whisky in a pewter mug. When I declined it he was offended, until I told him that my medicineman forbade me such things. This surprised him. He said that I was the first white man he had ever met who didn't ask for whisky. Then he offered me some sort of fruit-syrup and water, which of course I accepted, in order to prove to him that I had no objection to colour. Then the king made me treasonable overtures. He expanded upon his power, upon the value of his alliance; he urged me to bring down an American man-of-war and carry him away, and then found the Empire of Ja Ja in Africa. Queen Ja Ja, if I am a judge of features, did not encourage the Empire of Ja Ja scheme. In St Vincent she was important as a wife; in Ja Ja she might become again one of a hundred or so.

Ja Ja was a fine negro in his way, and maybe I was wrong in not quoting this conversation earlier, and thus anticipating by a few years the founding of our great Colonial Empire. However, Ja Ja might have been disappointed had the Stars and Stripes ever waved over his African capital. We might have deceived him. He might have become merely another Aguinaldo! Besides, I discovered

JULY 13, 1907.

[All Rights Reserved.]

that his opinion of the United States Navy was tinctured by his belief that I had sailed down from New York in my canoe, and that my trusty Rob Roy was a species of torpedo-boat. This legend served me in good stead, although I heard of it only long afterwards.

Opposite the palace of King Ja Ja lay the famous little ketch in which my British friend E. F. Knight had sailed from England all the way to the Plata River. All lovers of the sea have read The Cruise of the Falcon. King Ja Ja had seen me clambering in and out of the Falcon, and had conceived the notion that I might fit it out once more and carry him away to the United States-the land where his claims to empire would be satisfied. I did not tell him that he would probably find it hard to gain admission into any New York hotel, and I paddled away with Kings are quaint mixed feelings about Ja Ja. beings in their combination of craft and kindergarten. The moment I talked with Ja Ja I knew him for a king. Only a king could have thought his kind of courtly thoughts; only a writer of comic opera could treat seriously the lofty themes discussed that day in our Tropical Paradise.

On the other hand, King Masupa of Basutoland was different-in degree but not in kind. offered me no whisky, because whisky is contraband in Basutoland; and, besides, he had drunk

up the last of the bottle.

Masupa succeeded the illustrious Moshesh-a corruption of Moses—and this old Moshesh was a grand old scoundrel who divided his time between raiding Boer cattle and professing Christianity to British missionaries. He organised the Basutos into a nation of fighters, mainly by raiding upon his neighbours, putting the men to death, sparing the best women for the purpose of rearing children, and bringing up young boys only in case they proved available recruits for his army. But in time even the missionaries looked askance at Moshesh, and the British Government wearied of his ambiguities.

King Masupa buried his illustrious ancestor with rites half-Christian and half-African, and then ascended the throne of Taba Basio with a promise henceforth to follow the advice of the British $\hat{\mathbf{R}}$ esident Commissioner, who at the time of my visit (1896) was the eminent Godfrey Lagden, since knighted.

Masupa's throne was a sailor's chest, on which he sat with African dignity, telling me that he was thirsting to lead his armies against the Boers and win back the soil of his ancestors. While he was thus orating I prepared to photograph him, for he was picturesque in his royal cups. His right hand was extended in dramatic gesticulation, he wore a coloured shirt of European make, his legs were bare, and in his left hand he swung a knobkerrie, or warclub. He was every inch a king-in Africa; and I wanted him thus on my plate. But the moment he penetrated my purpose, up he sprang with a yell and rushed into his royal palace. Here was not a tithe of the comfort surrounding Ja Ja in St Vincent; but here were other things dear to savage

royalty-an abundance of wives and many courtiers. Masupa shouted and his Court conveyed. They dragged a box from under his bed, and from it they pulled out several bits of royal apparel, which they submitted for approval. King Masupa finally selected a paper collar, a checked shirt, and a spiketail coat with gold lace and buttons, which had once been a consular uniform; then from an assortment of old hats he selected a high silk one. And then he struck an attitude.

His courtiers stood about admiringly. I have thought of this picture at times when, for instance, a great war-lord issues on to the parade-ground in the flashing uniform of the Royal Bodyguard! Masupa was no less serious. He too ruled by divine right; he too commanded the loyalty of a people and the unbounded admiration of many courtiers. What odds if the one lives in a Kaffir kraal and the other in a Versailles, Holburg, or mammoth Schloss? Royalty is not a thing merely of dress; it is of the spirit, knowing naught of outward limitations.

Masupa treated me with effusive cordiality, and gave me his royal hand at parting—the hand of a black sovereign, the man who is to his people in Africa what Booker Washington is to Africans in Massachusetts to-day. He is the great leader of his people, the second Moses -more than a Moses, for he rules by divine right of succession.

The last words of such a man to me at parting cannot be of trifling import, however oracular or obscure to my finite senses.

'I have not enough royal insignia!' quoth the king of the Basutos. 'I want another insignia!'

I bent my ear to catch his words.

'Can I help your Majesty?' said I eagerly.

'You may,' quoth his Majesty.

What is lacking in your royal insignia?' said I. 'A red jacket.'

And I heard no more.

In Borneo I had the honour of audience with the mightiest monarch of the Far East. I put it thus, for he thus put it to me. This was none other than the Child of the Sun and Moon, the Sultan of Brunei, whose commands were issued from the largest island in the world, and ranged so far in all directions that they included not merely the Philippines to the north and the Java archipelago to the south, but covered much of the Chinese mainland on the west and whatever of Australia was worth noticing. This kindly old gentleman died but a few months ago, mourned by all of his Court, for each member of the Court owned a share in the pirate craft of which his Sultan was titular commander. Brunei is a Venice on stilts. All the houses of this famous Malay capital are cocked up on slim piles so neatly arranged that canoes paddle through the subway of the city; leastways, you paddle your canoe by compass straight under the flooring of the houses which lie in your water-path. A more beautiful capital than Brunei, floating on tropical waters with a background of forest-clad hills rising close behind the shores, it would be hard to imagine. We once had a Consul at Brunei. That was some forty years ago. He swindled all the natives that trusted him, secured some concessions, sold out, and then disappeared. To-day you may still see the jungle which is pointed out as the residence of the American Consul in Brunei—vox et prateres nihil!

The venerable Sultan received me kindly-at least he meant it so. My seat was at the mouth of a cannon, and there crouched around the butt-end of this gun a cluster of Malay warriors ready to fire at the imperial command. This was merely Court etiquette, I was told afterwards; but at the time it took away my appetite, and so I declined a cup of coffee when it was passed to me. This nearly precipitated the catastrophe I dreaded, for the British Commissioner kicked me under the table and told me to drink the coffee unless I was looking for trouble. And, indeed, trouble seemed in the air on that memorable day. For the Sultan was dressed in a skirt which I mistook for a janitor's apron, he wore on his head a velvet skull-cap such as is still the fashion with the historic concierge of Paris, beneath his apron peeped the bottoms of pyjamas, on his feet were carpet-slippers, and altogether his appearance induced me to mistake him for one of the domestics, and to whisper loudly into the ear of the British Commissioner, 'When is the Sultan coming?' Nothing had prepared me for a real Sultan-save an accidental surprise-party which landed me on the wrong side of a Turkish bath in Northern Africa; but that has nothing to do with

The Sultan of Brunei is the mightiest monarch of all, so far as divine right is concerned; but his divinity has been sadly perforated of late years by Rajah Brooke on the one side, the North Borneo Company on the other, to say nothing of British dominion at Labuan and American usurpation in the Philippines.

It was a grand thing to hear this venerable potentate protest in Heaven's name against American interference with his sovereignty. He claimed all the islands of the Mohammedan faith, and asked me to urge this matter upon the attention of my paramount lord at home. I told him that our sovereign was at that moment building a canal which would only occupy him half a century or so, and that the moment that was done I would ask him to hand over to his Imperial Majesty whatever there was then worth giving up.

The dear old gentleman has since joined his ancestors in the Mohammedan heaven, and let me cuddle the thought that my simple words helped to smooth his last moments. His was a gentle nature—as kings and cattle-lifters go. He professed the

noblest sentiments and rendered justice according to verses in the Koran. There was nothing he hated so much as being called unorthodox; and for this reason he criticised Sultan Muley Aziz of Morocco much as William of Germany dilutes his approval of Edward VII. During my stay at Brunei this illustrious ruler was taken to task by the British Commissioner for having stolen some water-buffalo from neighbouring territory. The old gentleman summoned witnesses, thumbed the Koran, gave judgment in his own favour, and then sent a handsome present to the people whose cattle he had stolen. Thus was divine majesty fortified, thus were the diplomatic forms maintained, thus were his victims rendered happy, and thus was the Koran once more justified as the finest flower of human reason—east of Suez.

Britain is wise in that she humours—nay, pays honour to—the failings of faded royalty. Throughout her vast Colonial Empire she moves like a patient nurse in many wards, ministering to the varying needs of many sufferers, dealing with each according to individual need. This wise nurse dominates her patient by gentle personal contact, sympathetic listening to real or imaginary ailments. It is hers to act the sympathetic part, to have her own way while apparently yielding.

The Sultan of Brunei is dead, and in his place rules another descendant of the Prophet. But a British adviser is at his elbow, although the casual stranger sees him not, and even his own subjects know it not. Germany is not so successful as Britain in the colonial world, for the barrack-yard is not adapted to the cultivation of diplomatic flowers. When Germany deposes an inconvenient kingwhether it be the late King of Hanover (who protests still in the person of his son, the Duke of Brunswick) or a West African sovereign, twinbrother to Ja Ja-she acts after barrack-yard ethics and with academic, not to say brutal, consistency. The squad of soldiers appear; the palace is cleared; the king is taken out kicking and scuffling. The methods differ but slightly from those employed in the arrest and deportation of a Berlin pickpocket or an untamed editor. Enough to say that Germany's unthroned kings are a menace to the success of monarchy by 'right divine.' King Edward sleeps serenely in the midst of a dozen deposed sovereigns. Why? Because he has left to those sovereigns the most important part of their attributes—the 'divinity;' in other words, the throne, the robes, the crown, the sceptre, the palace, the flunkeys, the flags, the heraldry. King Edward knows their worth. He is satisfied with a voice in the administration, and this voice is never heard except in a gentle whisper. Imagine a Prussian lieutenant issuing orders in a whisper!

норр Ү.

CHAPTER XV.

E should be getting near the end of our journey, sir,' said a big, brownfaced, brown-bearded man, who, at the head of a large and motley caravan, trudged beside a couple of strong donkeys ridden respectively

by a white-haired old gentleman and a beautiful girl, and who gazed with evident admiration at the latter's radiant face and neat figure, so strangely out of place in such a party. 'I have a man in the last lot of porters who tells me that he formed one of the native escort of the French expedition whose traces we are looking for. He appears to have stayed on at this place, Iwa, until all but two of the whites had died of fever, and then married a woman of these parts and beat his sword into a ploughshare. As far as I can gather, when he left there was only one black man actually doing duty, the rest of the escort having either died or married and betaken themselves to the ways of peace. He also talks of another caravan, with two whites, coming afterwards, and staying at Iwa until one of the two Foreign Legion men died, and then going back north again, leaving the other poor chap still on guard over the nonsense flag-pole which represented their "comic-opera" occupation. He says, too, that one of this second lot died on the way back, and that he knows where the man is buried; and as this agrees with what you have told me, I fancy that we can believe him, though he is a deserter.'

'Good-good! Yes, that completely bears out our previous information; doesn't it, eh, Mirabelle?' cried the old man addressed, turning to his charm-

ing companion.

'Yes, dad dear. Indeed, I never doubted that part of Major Vare's story. The only thing that tortures me is the question: which of the two men died, Hoppy or the German?' answered the girl, with a quiver in her low voice.

'Well, let us see this man, and ask him; he would surely remember his white non-commissioned

officers?'

'No, no, dad; he might only give us false hopes. Let us wait until we can see for ourselves.'

'You're right, Miss Melgrove; you'll know for certain some time to-morrow, I reckon,' broke in the brown man. 'If all my calculations are correctand this nigger's story seems to point that way-we should sight Iwa at sun-up.'

Mirabelle's face flushed and her hands trembled, but she said nothing; and the little party wended their way over the rolling land in silence, at the head of their long following of porters and servants, guards and baggage-animals.

Late that night the large camp was pitched practically on the same spot that had previously been

occupied by Vare, and at dawn next morning the brown man, the leader of the expedition, stood using his glasses in the same sweeping search from the top of the same conical hill. And once again did history repeat itself, and once more, as the rising sun caused the flagstaff of Iwa to gleam white against the dark background of trees and huts, did a man come out of one of the latter and hoist to the breeze the worn and faded flag of France. Everything was repeated as it had occurred many months before, with one notable exception: the faithful guardian of the Tricolore was a black man and not a white!

'Umph! that looks bad. But I don't know, after all,' muttered the observer as he turned to descend the hill. 'I never yet knew a nigger who would carry on without a white man to drive him, so I expect the other chap's sick, that's all. If he'd followed the rest there would be no flag hoistednot likely; but I'll keep it to myself in case-Blow it all! I hope that sweet, plucky girl isn't

going to get a bad knock.

'Mirabelle, my dear,' said the General, with some hesitation, a few hours later, 'Mr Tealus tells me that we shall certainly come upon Iwa directly we top that rising ground ahead. He also says that he sighted the place at dawn this morning from the hill above our camp, and that the French flag is still flying. This is excellent news; but still, perhaps he had better ride on alone with Rex and a few men, and we will wait here, eh? He can then ascertain exactly how matters stand, and can bring us back a report immediately.

'What! Oh daddy, I didn't think you would be such a coward! Stay here? Indeed, no; let us all three go on together. Surely, after all these years, you can bear to know the worst that may await us!' exclaimed Mirabelle with rising voice.

'Hush, my dear girl, and don't give way to excitement. I was only thinking of you, child. I'-and the old man's voice grew cold-'I have faced bitterness—ay, and death—far too often to think of my own feelings. Come; and beckoning to Tealus, who had fallen back amongst the men, the old soldier sat more erect than ever upon his humble steed and proudly rode forward, followed by his ashamed and penitent companion.

'Ah!' broke simultaneously from three pairs of lips-for Rex was with them-as the long expected village, with its oft-pictured square and

flagstaff, burst upon the travellers' sight.

'Yes, Sir Ralph, there you are at last, and the niggers have spotted us already. See! they are swarming out like bees,' cried Tealus, anxious to turn the current of the girl's thoughts from gloomy things. 'Come along; down we go. They're friendly—I know the signs; and there's the first of the French native soldiers turning out, gun and all, ready to give us a salute; and leading the way, closely followed by Sir Ralph and Mirabelle—who had now dismounted—and a native interpreter, he made quickly towards the village, leaving the caravan under the command of Rex, as previously arranged, waiting on the high ground.

As they approached the square the crowd of natives opened out, and disclosed, standing at the base of the flagstaff, clothed in a motley garb, half-uniform, half-rags, but with a well-kept rifle and bayonet, which he held at the 'charge,' the pathetic figure of the solitary remaining black soldier of the expedition, true to the honour of his salt.

'Alt! ici français,' he shouted in queer broken French; but the interpreter replying in the dialect of the country, an animated colloquy ensued.

'Well?' shouted Tealus impatiently, breaking in upon the apparently never-ending palaver.

'He say he sentry; white man much sick in de hut ober dar. Me know which he mean, sar. He not leave 'im post. You go see white man.'

'All right. Tell him to put up his gun and stay there as long as he likes, and that we come from the French General at Algiers, with orders for his officer,' cried Tealus. 'Now, you, show us which hut he means.—Come along, Sir Ralph.'

And away they went, almost running in their eagerness, in the wake of their fleet-footed guide. They were accompanied by a chattering, noisy crowd, and as they neared a neat hut, which, with its surrounding patch of garden and generally clean appearance, betrayed the nationality of its owner, the latter, flinging open the door, staggered out, steadying himself by clutching at the jamb with one hand, while with the other he nervously fingered a revolver.

Gaunt, haggard, and wild-eyed as he was, Mirabelle knew him instantly, and with a cry of 'Hoppy! O Hoppy! it is you after all!' she rushed forward, and, flinging her arms round the poor wreck that swayed and tottered in bewildered unbelief, she just succeeded in holding him up until the others came to her aid.

'No, no, my boy, it's all right; it's your old dad in the flesh, and no ghost. We've come to fetch you—Mirabelle and I; so keep quiet now, like a sensible fellow. Fancy fighting your old father!'

Slowly the meaning of the words bored into the fever-ridden brain; the wild look in the eyes disappeared; and presently the poor fellow, obedient to his father's orders, swallowed the contents of a small bottle which Tealus had produced from his pocket.

'I was a doctor, as you know, in the old days,' said the latter, 'and this is an opiate which I thought might be useful. It's just what he wants now, and he'll be right as a trivet by-and-by.'

Then they took Hoppy into the hut and laid him down on the little bed from which the clamour of the natives had drawn him; and Tealus and the interpreter having driven the crowd off with assurances that their good white friend was in no danger from them, peace and quiet once again reigned, and the patient fell into a deep sleep, the very semblance of death itself. When he awoke many hours after, his brain was clear; and, lying in delicious languor, he listened to the extraordinary story which his father slowly related to him.

Little by little Vare's terrible treachery became beyond doubt, and Hoppy swore a great and solemn oath that when they met the reckoning should be paid in full.

'And so poor Dick died, and that scoundrel never brought you my letters or gave my report to the people at Bouc-al-Aran!' said Hoppy at last.

'No, dear,' answered Mirabelle; 'and he told me that although Dick may have had something, the latter hinted that you had ordered him to stick to it at any cost, and so he buried all his possessions without examination.'

'Well, we shall pass the grave. You said one of your porters—I dare say I know the man—told Tealus he knew where it was. I shall take upon myself to see that the poor fellow was properly buried, and at the same time recover my letters—if they are there,' he added grimly.

And this he did on their return journey, finding that, as far as the body was concerned, Vare had done all that was possible. But although the dry earth had kept Dick's clothes and few possessions intact, there was not a trace among his papers of Hoppy's letters or report.

Their homeward march was safely accomplished, Hoppy and his faithful black soldier meeting with a warm welcome at Bouc-al-Aran. His subsequent entry into Algiers was almost in the nature of a triumphal procession, for, greatly to his disgust, his story had-much exaggerated-become the property of the ubiquitous reporter, and he found himself, although a foreigner, almost a national hero. However, after many delays and endless formalities, he was at last enabled to get his discharge from the Foreign Legion; and with the ribbon of the other Legion in his button-hole, and in his portmanteau the old flag that he had kept flying so well-by special permission-he eventually embarked with his friends and two servants-for Rex had at once assumed his old position, and the authorities had allowed his master to take the black soldier with him-and in due time, reaching Marseilles, took train thence for England.

When he arrived at Dover, his heart still full of bitterness against the treacherous Vare, the very first paragraph that caught his eye as he opened the newspaper told him that his enemy was out of his reach for ever, a higher power having taken the matter in hand and settled it in its own fashion.

'Tragic Death of a Baroner,' it ran.—'A telegram has been received from Stinking Water, the hot sulphur-springs on the Great Fork, that Sir Dethe Vare of Comstead Hall, Testshire, who was on a hunting-trip on the Little Big Horn, slipped down a snow-slide while in pursuit of a wounded wapiti,

and was precipitated over a precipice many hundred feet deep. The body of the unfortunate baronet was subsequently recovered, battered out of all recognition.'

Silently Hoppy handed over the paper to Mirabelle, who in her turn passed it on to Sir Ralph.

'There's but one regret,' said the latter as he finished reading; 'I cannot now tell the truth about Morrison. The man by dying in this ridiculous manner has stopped our tongues for ever.'

But here it may be said that, at a certain interview which subsequently took place between the General and a personage in Whitehall, the whole disgraceful story was told, in confidence, and that somehow or other in the course of a few days the members of the service clubs were suddenly quite cordial again in their manner towards Hoppy, some of them even going so far as to say, 'By Jove, old man! awfully glad, ye know; we know what we know, don't-cher-know?' which cryptic phrase was a very serious emotional departure indeed from the rigid rules of their caste.

Hoppy, however, had learned much since he left the Sooties, and these wondrous expressions of goodwill caused him nothing but secret amusement.

He married the girl of his heart after all; and though she did not get a V.C. for a husband, she got a Chevalier of the Legion of Honour, which was certainly somewhat of a novelty since the days of the Crimean war.

Rex makes an excellent butler at Idsworth Castle, where his master now lives, and spends his spare moments on the private rifle-range attempting, with an indifferent measure of success, to teach black Hanan to shoot more or less effectively.

The old General is still hale and hearty, and none the worse for his African experiences; and Tealus sends him from time to time weird-looking horns and heads of strange and fearsome beasties.

There is also a little 'flea' to be seen hopping around the castle; and if you ask him, 'What should a soldier do?' he will solemnly lisp, 'Obey orwers.'

THE END.

THE EARLY HOSTILITY TO TROUSERS.

By WILLIAM ANDREWS.

HE silk hat is quietly but most assuredly passing out of fashion, after being the popular headgear for about a century. One wonders if, when the hat has gone, the

trousers will next be discarded, and breeches once more return into favour with the masses and the classes. The world of fashion is fickle; the eccentric costume of to-day is often the favourite of to-morrow.

The modern custom of wearing trousers was taken from the military dress introduced into the army by the Duke of Wellington during the Peninsular war. In early days these were known as 'Wellington trousers,' after the Duke.

When they were coming into general use at the commencement of the nineteenth century the religious world and the fashionable were most determined in their opposition. A clause in the original trust-deed, dated 1820, of a Sheffield Nonconformist chapel provided that 'under no circumstances whatever shall any preacher be allowed to occupy the pulpit who wears trousers.' Some doubts were expressed in many quarters concerning the question whether a man could be religious and appear in trousers. One of the founders of the Primitive Methodist body remarked to a colleague in the ministry 'that trousers-wearing, beer-drinking So-and-so will never get to heaven. Father Reece, a famous Methodist minister, twice President of the Conference (born in 1765, died in 1850), could not be induced to adopt trousers, and among the Methodists was the last to follow popular fashion in this respect. He was minister | of Waltham Street Chapel, Hull, from 1837 to 1840, and was a notable figure in the town; but he did not, like the Rev. John Wesley, wear silk stockings and shoe-buckles.

Clergymen were very slow to adopt the new fashion, and it was a long time before trousers replaced breeches of grave colour. The Rev. H. T. Ellacombe, M.A., observes that parsons donned trousers about the same time that bishops doffed their wigs, to their great comfort in each case. Much rebellion against the tyranny occurred, and Bishop Blomfield is credited with being the first to give up the episcopal wig early in the reign of George IV.; but as late as 1858 Archbishop Sumner appeared in a wig at the marriage of the Princess Royal of England. Writing in 1879, and recalling the past, Mr Ellacombe said the modern costume of some of the clergy showed a great want of reverence for externals. It was far different in his younger days. Then, he says, no clergyman thought of officiating in any but the recognised costume. He adds: 'I remember a clerical friend from a distance happened to call upon me just when a funeral was announced. Being busily engaged with a clothing club, I desired him to take it, but he declined; he had trousers on.'

It is stated in Cooper's Annals of Cambridge that 'in October 1812 orders were made at Cambridge, by Trinity and St John's College, that students appearing in hall or chapel in pantaloons or trousers should be considered absent.' At Oxford the offence of appearing in trousers was more serious than at Cambridge. At Oxford a college tutor had to submit to severe censure for ven-

turing to wear trousers. This was the Rev. Joseph Burrows, a somewhat able scholar, who died in 1862 at the age of seventy-nine years. He had been in succession Hulmeian Exhibitioner, Fellow, Tutor, and Bursar of Brasenose College, Oxford. Mr Burrows ventured to adopt the new fashion, and was taken to task by the principal of the college, Dr Frodsham Hodson, who said that trousers were far from proper wear for undergraduates; but for a tutor and Hebrew lecturer to appear so attired in the presence of young gentlemen in statu pupillari argued an unbecoming disregard for discipline. In 1810 Mr Riquad was the proctor at Oxford, and being a man of broad views, he overlooked the offence of students whom he met on his rounds wearing trousers. His laxity in the matter gave great offence, and is said to have resulted in his resignation.

Gentlemen early in the nineteenth century were not permitted to enter dancing-rooms if they wore trousers. In 1814, we read, the ladies' committee of Almack's—the pink of fashion—decreed that no gentleman should attend balls given by the club at Willis's if they wore trousers. On one occasion the Duke of Wellington, the hero of Waterloo, presented himself in trousers, but a young official courteously intimated that he could not enter so attired. The Duke went away. He who had defeated the great Napoleon was not equal to fighting against fashion. Similar regulations were in force in other parts of the country.

The introduction of trousers was much earlier among the people in America than in England. Lord Carlisle, writing to his wife in 1778 from a boat on the river Delaware, remarked that 'the gnats in this part of the river are as large as sparrows. I have armed myself against them by wearing trousers, which is the constant dress of the country.'

The rich as well as the poor made fun of trousers when these were coming into fashion. We learn from an informing volume, entitled Sheffield in the Eighteenth Century, by Mr R. E. Leader, B.A., that Mr Marriott, the founder of a well-known Sheffield firm, introduced them into that town. After a visit to London he startled his fellow-townsmen by appearing in trousers. He was greeted with the exclamation, 'Whol, lad, thou's gotten breeches wi' chimbley-pipes on 'em! Wherever didst get 'em?' The ridicule was so merciless that Mr Marriott thought it prudent to put them away in a drawer until more enlightened times dawned. But one day, when he was at work, some frolicsome friends went to his wife, and, by professing they had 'the master's' authority, gained possession of the 'breeches with chimney-pipes,' and pawned them. So when he wanted them for his next visit to London he had perforce to go in more ancient costume.

We cannot fully realise the opposition displayed in former times to the introduction of numerous articles of attire now in use. He was a brave man who ventured in the public streets as the leader of a new fashion.

MISS DENISON'S CHILDREN.

CHAPTER II.

the remote end of the village which was dominated by Coombe Hall stood a substantial red-brick cottage. It had been at one time the residence of the steward of the estate; but as his family increased

Miss Denison appropriated to his use a larger and more commodious house, which had the additional advantage of being nearer her own. The cottage was known as The Retreat, and had been occupied for many years by a Mr Waring, his wife, and daughter.

The habits of the tenants conformed to the name of their abode, for Mr Waring, though a man of good family and an ex-professor of the London University, persistently declined all neighbourly advances on the plea that his wife was a confirmed invalid, himself devoted to abstruse literary work, and his daughter too young for society. Mrs Waring had died the year before Everard Yorke went to South Africa, and he had formed perhaps the only exception to the rule of exclusiveness, some slight service that he had been able to render to the poor lady having led to his introduction to the family. From that time he had been a fre-

quent visitor, Mr Waring having no objection to a guest who asked nothing from himself, and was willing to relieve the tedium of his wife's illness by loans of books and friendly intercourse.

It had not occurred to the one parent, selfishly absorbed in her own sufferings, or to the other, who scarcely realised his daughter in any other capacity than as his pupil and amanuensis, that it was Agatha Waring that drew Everard Yorke to their home. Neither of them perceived that the girl was beautiful, or that her nature was full of depth and nobility. The mother had been a pretty blonde in her day, and she disparaged Agatha's opposite charm; and both father and mother accepted her patience and intelligence as a matter of course, to be received as the sunshine and the dew.

But Everard saw with open eyes. Bred in luxury that tended to foster self-indulgence, he had, as not infrequently happens, a latent seathetic appreciation of the sterner virtues, and he watched with an admiration that quickened into love the sweetness and dignity with which she accepted her hard lot. With taste refined to ideality, the slim, tall figure, and pale oval face lighted by dark eyes finely set in their orbits, and shaded by a wealth of

soft black hair, appealed to his perceptions beyond the charm of brilliancy. That, under her father's teaching, she had been made an accomplished scholar added reverence to love, while the touch of her skilled fingers on the piano and the quality of her singing voice quickened reverence to passion. It was the one ordinary accomplishment that had been sedulously cultivated, for Mrs Waring was herself a musician, and found it a solace in her hours of pain.

No love-passages had passed between the pair until after Mrs Waring's death, which occurred some time before Everard had volunteered for South Africa; then, under the stimulus of Agatha's grief and his own projected departure, he had pledged heart and honour and life to her service, and had received in return the assurance that she loved him. It was an assurance as full and adequate as even his exigence could desire, and given with the tender dignity that was one of her most winning characteristics; but it was qualified by the belief that their love was hopeless on the grounds that her father would never release her from his service, and that Miss Denison, who was even ignorant that intimacy existed between them, would oppose their engagement.

What does a young lover say to such objections? That they can be brushed aside as gossamer, and that his own fidelity is proof against the opposition of heaven and earth. It was vain to lay the matter before his benefactress until his return from South Africa. He might never return; but should he survive and come home, his first action would be to announce his engagement and take the consequences—an assurance he had found the opportunity to repeat in the short interval between his return and the dinner given in honour of it.

A few hours after his interview with Miss Denison the young man made his way to The Retreat. There was always a harassing doubt whether his mistress might not be shut up in Mr Waring's study, and invisible; but circumstances favoured him. The old family servant who admitted him, and who was secretly favourable to his suit, told him that her lady was in the sitting-room 'busy writing.'

'When is she not "busy writing"?' he cried

impatiently. 'May I go in?'

'Ay, ay, sir; it will rest her pretty eyes a little.' As he entered the room he saw how intently she was occupied in copying from a pile of manuscript by her side, a task made formidable by the cramped hieroglyphics of the scholar's handwriting, and to which her bent brows bore witness. He made a step forward.

'My dear, my dear,' he cried, 'I cannot bear it!'

'Oh, it is you!' she said, with a smile of exquisite welcome. 'It seems incredible that I did not hear you.'

For reply he pushed away her papers, and taking both her hands, drew her within his arms with a tenderness full of poignancy.

'How long is this cruel drudgery to last?

Let us end it, Agatha; give me the right to take you away from a tyranny that is killing you, and teach you what happiness is, and ease, and leisure.'

His voice fell a little. On what financial foundation was this structure to be reared? But he had come resolved to recover his lost self-respect.

She did not release herself from his embrace, but suffered him to hold her with his arms about her waist, her eyes looking into his with an expression full of a tender mockery.

'You mean as your wife, Everard, without consent

from my father or Miss Denison?

'As my wife, dearest. I ask nothing better than the right to work for you, if you will have me on such terms. It is you I love, not Winifred Leigh, and I shall be perfectly happy to see all that might have been mine transferred to her. I have kept a cowardly silence to-day, Agatha; but it was less from sordid self-interest than from love to the kindest and most generous of women. Forgive me, dear; I will not fail you in the future.'

'Ah,' she said, 'all that is a dream where the awakening would be very rough. I love you with heart and soul and strength; but honour is stronger still. I could not do so base a thing as to abandon my father or suffer you to break all ties of duty to her who has been more than mother. Where would be our right to happiness in such a case, and what chance of ease or leisure when you—or rather we—were engaged in the struggle for our daily bread?'

'I have faced hardship, Agatha, and not been

found wanting.'

'Yes, under the stimulus of numbers—heroes and fellow-sufferers both—with an end in view that fired the spirit and braced every nerve to endurance. It would be another story if the inducement were nothing but the support of a wife who had forgotten duty to marry you, and suffered you to beggar yourself for her sake. Love would not bear the strain of such incredible selfishness.'

She released herself from his relaxed grasp and sat down; she was a little exhausted by the energy of her protest, and anxious lest she had gone too far. Besides, she could scarcely shut the golden door of hope against herself without a pang.

Everard stood for several moments without speaking, and his face showed signs of both pain and anger; then it softened as he suffered his eyes

to rest upon her.

'Am I to understand that you mean all that you have just now said—that you have no belief in my courage or my constancy, and that you think my love so poor a thing that it would not bear the strain which other men bear joyfully for the sake of the woman who has trusted them?'

She was silent.

He knelt down beside her so as to bring his face on a level with hers.

'Disowned by Miss Denison, you will not take me for your husband, Agatha? You are afraid?'

'I will not,' in a low but firm voice. 'Yes, I am afraid, if you will have it so.'

'And your advice is'—his lips were against her cheek—'that in order to keep Coombe Hall I should lie against my conscience to sweet Winifred Leigh, when every beat of my heart, every pulse in my body, is for you?'

'No, no; that does not follow. Miss Denison would be incapable of forcing a marriage; but since she—the other—is so sweet, and loves you, Everard, all that is noblest in you will learn to love her

sooner or later.'

He rose from his knees. 'I see,' he said; 'you judge me unstable and unworthy at all points; and I have deserved it. I should have spoken openly long since, and claimed you against all opposition, even your own. But I am still yours, Agatha—yours for all time. If you will not be my wife I will be no other woman's husband, and Miss Denison shall know this at all costs.'

'You mean,' she asked with intense anxiety, 'that you will do this thing at once?'

'Since it is the only honest thing to do, why not at once?'

She hesitated. 'But if I ask you for my sake to wait a little—a week, ten days—before you take this step, will you refuse me, Everard?'

Her hand was on his arm; her eyes besought him

in passionate appeal.

Before he could answer, a door on the upper landing opened—the door of Mr Waring's study—and his voice was heard in irritable complaint: 'Whom have you with you, Agatha? Work is out of the question with this hum of voices below. Dismiss your friend;' and the door closed again.

The lovers looked at each other and smiled; but there was a bitter-sweetness in Everard's smile.

'I will go,' he whispered. He stooped and kissed her. 'Go, Agatha, to return.'

'But—you will do as I ask; you will wait?'
'Till I see you again,' was his answer.

As Miss Denison was crossing the passage from the library after her interview with Everard, a servant met her to say that Mr Anstruther was waiting to see her in the drawing-room.

Mr Anstruther was the man of letters who had been one of the guests on the previous evening, and she concluded that the visit was one of formal courtesy. Miss Denison's feeling towards him was one of distant respect rather than intimacy; she was not a student, or even a great reader, and Mr Anstruther's philosophical essays and critical appreciations went beyond the sphere of her interest. But to know him was held to be a distinction, and she was content to accept it as such.

She was always gracious as a hostess, and her greeting as they met was so pleasant and cordial as to relieve her visitor of a certain anxiety.

'I was afraid,' he said, smiling, 'that you might object to my calling upon you at uncanonical hours; but it was done with a purpose. I was bent upon finding you alone.'

'Ah, you are going to intercede for some protégé,

and any such request is granted in advance. I can trust your judgment implicitly, and it is such a satisfaction to have merit pointed out to one.'

'No,' he said gravely, 'it is not that; nor am I come, as perhaps would be the proper thing, to pay you compliments on the perfect success of last night's banquet, and to congratulate you on Everard Yorke's safe return. What a charming young fellow he is !'

Her face glowed with pleasure. 'I think so, but it is music to my ears to hear him praised by others. And is not Winifred charming also? I should like to ask you if my meaning last night was generally understood. From the time that I brought the two pretty children under my roof my intention was that they should marry each other. In this way, you see, I am able to make them share and share alike. It was this arrangement that I hinted at.'

The man of letters made a sudden gesture. 'No,' he said, 'I did not take that as your meaning, whatever others may have done. Had I done so I should not have ventured to come to-day on what seems likely to be a fool's errand.'

He turned a little on one side as if to avoid Miss Denison's questioning eyes, as well as to hide the shock of her careless words. The lady remained silent and expectant; it was for him to explain his meaning. He did not keep her long in suspense.

'You have dealt me a blow in all ignorance,' he said gravely. 'My object in coming here to-day was to ask your consent to my trying to win your adopted daughter for my wife. With any other girl I should have pleaded my cause direct; but she has been so specially your possession—your rights in her, as in him, are so absolute—that I hesitated to infringe them. I had meant to say, "Will you give her to me if she is willing to come?"

Miss Denison sat confounded; if she had inflicted a blow, she had also received one. She appreciated the distinction of the offer as a testimony to Winifred's charm and value; but under any circumstances the union would have appeared to her incongruous. Nearly twenty years divided them; the girl was in the lovely freshness of her undimmed youth; the man had fought a hard fight with life; and, allowing that he had conquered, the warfare had set its seal on character and aspect. But this was a secondary consideration. The primary one was her fixed desire to unite youth to youth, and so to establish, as she had said, her dear adopted children in social equality; still more influential was her conviction that Winifred's affection followed her own wishes.

The silence had become embarrassing; she raised her eyes and looked at her companion. It is curious how impressions vary under differing moods of mind, and Miss Denison perceived as she had never done before that neither the face nor figure of the man of letters was deficient in masculine beauty.

'It was good of you not to speak to Winifred

first,' she said, a little lamely.

'I am glad I did not, as it would have given her pain to know how much her refusal cost me. And yet there would have been a certain satisfaction in getting my dismissal from her own lips. You will pardon a disappointed man's persistence, I hope, if I venture to ask if the young people are engaged to each other, and if it is beyond a doubt that they accept your arrangement not from duty but because they love each other?'

Miss Denison flushed a little; she began to feel irritated at this unexpected obstacle in her scheme.

'My dear Mr Anstruther,' she said a little stiffly, Winifred has loved Everard from the time she was old enough to know her own heart. Her anxiety during this cruel African campaign almost broke down her health; she has become radiant since we knew of his safety and could count on his return; and, to speak in confidence, I came to you direct from a consultation with Everard Yorke about their marriage.'

Mr Anstruther bowed in submission, as it seemed; but he was a strong man and an observant one, and he had come to the conclusion that Miss Denison's assurances lacked conviction, and was mentally resolved not to forgo his chance of a great happiness on the dictum of a third person. What she desired she believed.

After the interview was over, and he was retracing his steps across the park glades, he set his mind to evolve some plan for obtaining an interview with Winifred, so that he might convince himself whether his suit were hopeless or not. Almost disallowed by himself, there was a flickering spark of hope in his inner consciousness. It would need but a blush, a glance, an inflection of the dear voice, to tell him if Miss Denison had read the girlish heart aright, and in that case he would wish her joy of her gallant young lover, and brace up his own spirit for a lonely pilgrimage till death.

The sudden rush of a friendly collie known to him as a member of the household abruptly scattered his thoughts. Was Fate going to be so unusually kind to him? The dog was Winifred's favourite outdoor companion; probably the mistress was not far off.

Anstruther, who had stooped to caress and restrain the animal, straightened himself and looked eagerly around. Winifred was approaching from a side alley, but evidently she had slackened her steps as she recognised him.

Strange as it may appear, this obvious reluctance to meet him brought an added glow of courage to his mind; he soon lessened the distance between them and held out his hand.

'I am so glad of this happy opportunity of speaking to you alone !' he began, hope rising higher as he felt the fluttering of the little hand that seemed so anxious to escape from his grasp, and observed that the girl's sweet composure was at fault. 'You give me leave to speak to you?'

He had dropped her hand, and even retreated a step or two, for her obvious embarrassment was an appeal to his chivalry.

'Why not?' she returned, forcing a smile. 'But

will you not come to the house? Miss Denison would not forgive me if she knew that you were so near, and I did not bring you in to luncheon."

'I have just had the pleasure of seeing Miss Denison,' he said dryly, 'and she did not ask me to luncheon. I fear I am not in favour with Miss Denison.' He saw that she changed colour, and he went on boldly. 'I have another far more serious fear, Miss Leigh-that I am not in favour with you. You would not look at me last night or give me the chance of a word. How have I been so unhappy as to offend you?'

Winifred had rallied her courage. There must be no self-betrayal on her part because of the great man's pleasant humour; so she raised the eyes that had been cast down, and looked at him steadily. Anstruther returned the gaze with a quickened 'Truth and honour sit on her brow,' he said to pulse.

himself; 'and what sweetness and humour too lurk in the curves of that lovely mouth! What is she going to say to me?' What she said was this: 'Do you mean that it is

in the power of a girl like me to make you unhappy, Mr Austruther? If it were so I should be

more unhappy than you.'

'Not if it were equally in your power-and in your power alone—to console me, dear,' he said. 'Do not let us beat about the bush. A woman's instinct is unerring, and you must know that I love you. I have waited on your pleasure month after month, watched and waited for any little sign of favour, and thanked God devoutly when I have received it, not daring to speak because of the difference between us. Then, of late, I have thought-fancied —that you were moved by sympathy towards me, and that I had a chance of quickening it to love. Is it so? Have I a chance?' He stopped, breathless, for her answer.

Young love was feeble as compared with his virile intensity, and Winifred answered, not by words at first, but her face lighted up with a radiance that seemed to him adorable. As he drew nearer slie retreated a step or two, clasping her hands behind

'Wait!' she said. 'I do not quite believe it. "Because of the difference between us!" It has been the dream of my ambition that you should love me, but I thought it was only a dream, and I was ashamed to neet your eyes lest I should betray myself. Can it be true that I can make you happy?'

He caught her in his arms and kissed her

'My darling! My matchless darling!' he re reverently. peated, with the immortal fatuity of the happy lover, 'you have opened heaven to me, or, better still, you have given me a new earth to dwell in.

And then they fell into reminiscence: he recalling the circumstances of their first meeting, their first talk together, and subsequent discussions along the wide horizons of thought and literature; and she in her turn telling him of the influence of his writings upon her mind and imagination, stimulating her desire to live a wider, nobler, more unselfish life.

It was not till this divine emotion had subsided a little that Anstruther remembered his recent interview with Miss Denison. They were now walking, hand clasped in hand, in the remote recesses of the heavily timbered park. He stood still and looked at his companion humorously.

'Oh, I had forgotten! What of Everard Yorke?'
'Nothing will please him better. He honours
and admires you, as all do who know you. He
has even ventured to tease me about you; only, I
could not bear it.'

'Then is Miss Denison utterly deceived? I for-

got I have not yet told you of my reception this morning.'

Winifred listened anxiously, and sighed.

'It is such an infinite pity that she feels like that. I have always known that she would have been better pleased if we had wished to marry, because in her generosity she liked the idea of my being the mistress of Coombe Hall. Of course I love Everard, and he loves me, but not'—— She hesitated.

'Not as we love each other,' he amended. 'Then,' asserted the man of letters with conviction, 'it is only a question of time and demonstration. We shall all three unite to bring Miss Denison to a better mind.'

(To be continued.)

WITH THE NUBIAN TRIBES OF NORTH AFRICA.

By Captain T. C. S. SPEEDY.

PART I.

HE nomad tribes of Africa who inhabit the vast plains stretching between the Red Sea on the north and the Blue Nile on the south are generally, though somewhat erroneously, called

Arabs. They are in reality Nubians, this term being the natural outcome of the word 'Nuba,' which signified 'the land of gold,' and which was given to the country in very ancient times. Subsequently these races were included by the Greeks under the general term Ethiopians, owing to the darkness of their hue; the Greek words aitho and ops meaning 'burnt faces.'

I travelled and lived among these tribes for some years, and became intimately acquainted both with their manners and customs and their modes of sport. The following are a few of the reminiscences of my life among them.

The Nubian tribes, though nominally at peace with each other, think it by no means derogatory to their honour to raid each other's camps in order to carry off the cattle. In fact, like our Highland clans in the Middle Ages, a foray of such a kind is regarded as a gallant exploit; and although, as a rule, each combatant avoids, if possible, taking life, the motive that restrains them is undoubtedly not so much one of humanity as the wish to avoid the serious consequences of a never-ending blood-feud. Although these forays occasionally take place by day, they are generally perpetrated on fine moonlight nights, which naturally increase the chance of success. When a raid is considered desirable a council of all the young men of the tribe is convened, and those most renowned for pluck and cunning, and also those who possess the best-trained and most reliable dromedaries—that is, riding camels—have the honour of being selected for the work.

When the evening arrives, all preparations having

been carefully made, the well-mounted party will start for some distant camp, perhaps a hundred and fifty or two hundred miles away. Travelling at the rate of about sixty miles a night, and always resting by day, they will on the morning of the fourth day be within a few miles of their destination. They will then halt and rest for the next twelve hours, so that both they and their dromedaries may be perfectly fresh for the coming raid.

Two of the party will then proceed as noiselessly as possible to the vicinity of the grazing-ground to spy out the land. These grazing-grounds are generally some ten miles or so distant from the village of the tribe (where the grass has already become eaten down), and are consequently guarded by but a small number of herdsmen, and the cattle are only taken home every other day to be watered. At night they are all driven together and made to lie down in one spot, huddled up as closely as possible to each other for the better protection from all danger, whether of robbers or wild beasts, while not infrequently, to scare away the latter, large fires are lighted at short intervals.

Having ascertained the exact locality and the best ways of ingress and egress, the marauders will, when the time comes, rush the camp, and with loud shouts and gesticulations cause a stampede, driving off the cattle adroitly in the direction they wish them to go. The herdsmen rush in and endeavour to rescue their animals, and a desperate struggle ensues; but the attacking party, being the greater in number and having the advantage of being mounted, generally proves victorious, and while half the number are repelling the owners, the other half would be driving the cattle at the top of their speed farther and farther away.

Great skill and judgment are required to conduct the flying herd for the first four or five hours; but as soon as the danger of immediate pursuit is over a halt is called, and at a convenient spot the cattle are rested and, if possible, watered. When the drive is again continued, a dozen of the raiders will remain behind in ambush to receive the owners, who, having reported the raid at their village and had their numbers reinforced, will hurry off in pursuit. If successful in arresting and driving back these, the rearguard of cattle-lifters, on joining the main body in advance, will report 'all clear,' and the herd will then be driven at less speed than before.

In due time the stolen cattle will be safely landed within the marauders' zareba, when the women will rush out, and, with their peculiar shrill zaghareet (or cry of victory), congratulate the men on their daring prowess. The assistance that the camels give their owners on these and many other occasions shows how wonderfully sagacious these animals are, and how they can be educated in many ways quite foreign to their nature. It may perhaps be as well to explain here a fact which I have often found to be unknown-that is, that the camels of Nubia are of two kinds: the ordinary rough-paced baggagecamel and the hadjeen, or dromedary, which is used for riding only. Both of these have but one hump. It is a mistake to imagine that the dromedary is a two-humped camel. That variety is an isolated species called the Bactrian camel, which is found only in Tartary, and is utterly unknown

It is scarcely necessary to allude to the courage and dauntless spirit of the Nubians after all that we know of the daring manner in which, with merely the simple weapons of sword and lance, they threw themselves against our well-armed and well-trained troops during the Mahdi's rebellion; but I will relate an instance of the self-sacrifice and heroism of a chief, which is not a solitary example of the devoted love they bear their tribes. Mohamed Okrub-that is, Mohamed the Elephantso named on account of his unusual strength and stature—a former chief of the Beni Amer, was the most renowned swordsman of his day. While out hunting he received the unwelcome tidings that one of his camps was threatened by an attack from the Hadendoas, their hereditary foes. He at once set off for a narrow defile at the foot of some mountains not far from the imperilled camp, and despatched the messenger who had brought the bad news to bid his people to come with all speed to the spot he was making for. On their arrival at the defile he ordered them to continue their flight to the mountains, assuring them that he could hold the pass single-handed until their retreat was secured. Scarcely had they disappeared within the gorge when the enemy approached; but as night had now fallen, they recognised him only by his war-cry, and imagining that his followers were with him, feared to advance, but kept aloof, hurling their lances in his direction.

His shield was soon rendered useless by the number of these missiles that transfixed it, and in a luckless moment, as he was drawing them

out, one of them pierced his side and inflicted a mortal wound. With consummate coolness he took two of the lances, and driving the blades into the ground, placed the butt-ends under his arms to prop himself up in an erect position, in order that he might appear to the enemy by the dim starlight to be still living even after death Two hours subshould have overtaken him. sequently the moon rose, and a breeze springing up, his body was blown down, when the Hadendoas, rushing up, discovered, to their extreme chagrin, that for a considerable time they had been kept at bay by a lifeless man. Thus by his magnanimous chivalry this brave chief had saved his tribe.

The two following instances of the power of enduring pain which these nomads possess were related to me regarding chiefs of the Beni Amer

and Hadendoa tribes respectively.

Hamid Ajir, the late head of the Beni Amers, with whom I was personally acquainted, and whom I much esteemed, was, on one of his hunting expeditions, thrown from his horse, and sustained a compound fracture of the right thigh. He was so far from home that it took three days to carry him back in a litter. On the arrival of a Greek surgeon, who had been summoned from Kassala, the leg was terribly swollen and in a high state of inflammation, the pieces of broken bone having lacerated the flesh. The surgeon, before examining him, asked Hamid where the pain was; but the chief, unwilling to own before his men to even a sensation of suffering, replied with a smile, 'What do I know of pain? Surely it is the art of the physician to discover that.'

On another occasion, at the commencement of the rains, a party of Hadendoas, taking advantage of the season, had managed by the stealthy stratagem which is so marked a characteristic of their tribe, to carry off in broad daylight a herd of cattle belonging to the Beni Amers. The Beni Amer herdsmen, after a desperate struggle, found themselves overpowered; but one of them in breathless haste sped from the scene of the foray, some twenty miles away, to acquaint his chief with news of the calamity. Hamid Ajir, with an armed force, at once set off in pursuit, but, alas! only arrived at the Khor el Gash-that is, the dry bed of the river Gash—in time to see his enemies on the farther side mockingly pointing to the rushing torrent, at least ten feet deep, that had suddenly come down and was sweeping rapidly through the khor, rendering further pursuit impossible. Hamid, seeing that it was impossible to recover the cattle, shouted to Musa, the chief of the Hadendoas, who was on the point of galloping away at the head of his men with the stolen prize, 'Stop! Give me my revenge. Stand, if you are a man, and let me have a chance of spearing you.' 'As you will, replied Musa; and, wheeling round his horse, he stood stock-still at a distance of fifty odd yards. Hamid, wishing to punish but not to kill the chief, hurled his lance with terrific force at Musa's leg, and so precise was the aim that the weapon, penetrating flesh and muscles, pinned the thigh to the saddle. The Hadendoa, not deigning to notice the wound, gave his foe a parting salaam, and without withdrawing the lance, rode off at a gallop.

The generally received opinion that of all animals the lion is the most courageous is said by the Nubians to be a complete fallacy. They declare him to be by nature a coward, and assert that even when wounded he almost always retreats, never springing on his foe unless brought to bay. This theory, of which I was at first sceptical, was in some measure confirmed by a circumstance which occurred one night when I was travelling from Bogos to Massowah in the early part of the year 1885. Being anxious to catch an English steamer that was then in the harbour of Masssowah, I was pressed for time, and should have marched all night had not the darkness prevented. I had but one man with me (my guide), and only my riding-camel. We encamped at midnight in the midst of a thick jungle, and waited for the moon to rise. As soon as we halted I desired that a fire should be lighted and coffee boiled, wishing to partake of such supper as I might before I slept.

To my amazement, my guide would not hear of having a fire, giving two reasons for objecting: one being that the light would attract marauders, should there be any in the neighbourhood; and the other that the lions—who were, he said, swarming in the place, and who in any case would be sure to scent us out—would know by our having a fire that we were afraid of them. If we had no fire they would believe us to be dangerous foes, as they have found by experience that cattle-lifters, who always remain in the dark, are not to be attacked with impunity, many a lion having come off the worse for an encounter with their lances. Accordingly no fire was lighted.

The strange and, to me, novel reasoning of my guide but little reassured me, and I cannot but own that I did not altogether relish the situation, especially as the night was so dark that it would have been impossible to take aim at any animal that might attack us. Putting on a bold front, however, I munched some biscuits, took a pull at my flask the contents of which I found more consolatory than the philosophy of my companion - rolled myself up in my blanket, and pretending to be perfectly indifferent to the condition of things, said that I was going to sleep. My guide, in truth indifferent, hobbled the dromedary, lay down, drew his sheet over him, and was soon snoring. went on, but I was as wide awake as ever. All was perfectly still save for the occasional falling of a leaf or the cracking of a distant branch, when suddenly a terrible roar rent the air close to the spot where we were. I started up and awoke my guide, telling him what had happened. 'In the name of Allah!' he exclaimed, 'what else did you

expect, sir? Please don't listen to the lions; let us sleep;' and, turning over, he was again oblivious to everything in less than a minute. That serenade was not the only one I was treated to that night during my solitary watch. Lions roared round us at intervals for the next three hours; but, as the guide had predicted, we were not attacked. I cannot express, however, with what pleasure I roused my man as soon as the moon rose, when we proceeded on our way.

I had on one occasion a remarkable proof of the reasoning power of these animals, and of the cunning devices they have recourse to in order to obtain their food. While on a shooting-trip in the Ainsaba district, in north-western Abyssinia, we camped, as usual, on the sand of a dry torrent-bed. Vegetation was scarce; but a few tamarisk-bushes were growing here and there, and to these our various animalschiefly camels, ponies, and goats-were tethered. We were lucky in finding an encampment of the Habab tribe in our vicinity, for, in the hospitable spirit of many of these people, they brought us as much milk as was required for our whole party, including not only myself and my friend, but servants, hunters, gun-bearers, and the general retinue of the camp. Payment was declined, as a superstition exists that were money taken for milk the cows would become dry; but it was characteristic of the Nubian good-heartedness that the milk was not refused, although it was the hot season, as with but little green food in the country the supply was at any time likely to run short. A few needles, a couple of red cotton handkerchiefs, and a small pocket looking-glass were considered ample compensation for the liberal gift. The herdsmen cautioned us to keep a good watch during the night, as lions abounded in the neighbourhood; and as sportsmen were then almost unknown in that part of the country, they had not learnt to dread firearms. Being thus warned, our servants redoubled their care in hobbling and tethering our animals, arranging our camp in the form of a square, into the centre of which they were brought; baggage and tents were placed on either side, while large fires were lighted at the four corners, and men were told off, two at a time, to keep them alight until the morning. About 8 P.M. my friend and I made an excellent supper from the result of our day's sport, and after smoking our post-prandial pipes, retired early to our couches in order to be ready for the next day's march.

A couple of hours passed in peaceful oblivion, when we were suddenly awakened by a terrific roar, which seemed to shake the very side of our tent as if with a blow. Sitting up, I called out to my chum, whom, owing to the perfect darkness, I could not see, 'What do you think of that for a roar?' He replied that the beast could not be far off, and he hoped that the fires were being well kept up. The watchers, who probably till then had dozed at their posts, immediately flung on fresh firewood; and although fierce flames at once shot up, they

seemed but to intensify the blackness of the night. I drew my 'express' out of its case, and going to the door of the tent, cocked the hammers and waited for a possible glimpse by firelight of his

feline majesty.

My head hunter, Idris by name, had, however, heard the clicks, and coming quickly to the tent, begged me on no account to fire. He whispered that it would be next to impossible to get an aim, and that merely to inflict a wound might bring most disastrous consequences. The creature, if infuriated by pain, would despise the shot, and in his thirst for revenge would make a desperate leap, and landing in the centre of the camp, might create irrevocable havoc. He assured me we had nothing to fear, as the roaring was only a ruse to endeavour to stampede our animals, which were all too securely tied up to be able to get away. He told me that lions usually hunted in couples, generally lion and lioness together. They planned their campaign in the following manner: one waited to leeward of the camp, while the other went to windward, prowling and roaring in the hope that the tethered animals, scenting him, would in their terror rush forth, and, in flying from him, fall into the clutches of the watcher on the other side.

In replying to Idris I had at first used his word haiwan-that is, animal; but, chancing to say assad that is, lion-he quickly begged me not to use that word again, as it brought misfortune to mention 'his majesty's' name! The only safe way was to speak of him by an attribute, such as 'The Powerful One, 'The Mighty Roarer,' 'The Great Hunter,' alluding to qualities that would be flattering to him. Again, after a very short interval, we were treated to another roar, longer and more terrible than the first. It was, in fact, a deep and prolonged rumbling, and seemed to shake the very earth, being followed by a series of short, choking gasps. Then silence ensued, and as the awe-inspiring odour gradually vanished, camels, horses, and all the animals seemed to lose their terror, and gathering courage, ceased to strain at their tethers. The dogs, who had crept to the farthest corners of the tent, cowering under our bedsteads, came out, and wagging their tails in a pathetic, confidential manner, lay down, as before, near the entrance to the tent.

But the reign of terror was not yet over. Suddenly, from the opposite side of the camp, a loud, sharp, and very peculiar short, strident cough came forth, and I wondered what was now about to occur. 'Ah!' said Idris, 'that is her ladyship. His lordship has gone back, and being angry at finding nothing beneath her paws, has shown his teeth and made as though he would bite her as a punishment for the fact that, after all his efforts, no supper has been provided for him. That cough-roar is her reply; and she, knowing his intention, has sprung at him, intimating that she will stand no bullying, as it was not her fault that nothing had come out.' 'But,' said I, 'is it possible that these savage

creatures converse with each other in this fashion ?' 'Ay,' replied the hunter; 'we do not understand all they say, but we know that they convey their ideas to each other as clearly as we do.' Just then fresh roars arose, coming, as before, from the windward side, and again our poor beasts tugged and struggled for freedom, and again the dogs ran back and hid themselves. But on this occasion the tactics appeared to have undergone a change. Each successive roar was somewhat suppressed, and sounded more and more distant, as though the animals were retreating and all attempts at an attack had been abandoned. 'Ah!' exclaimed Idris, 'her majesty has been taking the part of her lord. She has walked round the camp, and at first tried the effect of her voice, while he remained in her place to pounce on anything that might have escaped. Finding that her roar caused no stampede, she shammed a retreat, lowering her tone to cause the effect of being at a distance and as if she were farther and farther away at every fresh sound, hoping that, if fear were removed, our animals might saunter forth, and in that manner fall a prey to either herself or the lion.' Feeling very sceptical as to these statements, and scarcely able to believe that wild beasts could plan and pursue a course of reasoning with such precision, I told Idris that at present, at any rate, I would go back to bed, as there seemed no chance of my getting a shot, and I was too sleepy to stay up any longer.

Next morning, just as we were leaving, Idris approached me, and begged, as I had appeared to doubt what he had told me during the night, to come and see the tracks the lions had left, as in them, he thought, lay sufficient proof of what he had asserted. 'I may fabricate,' he said, 'but the spoor cannot.' Going to the west, or windward, he pointed out the large footmarks of the lion, showing how he had crept round the camp till he stood still when he gave his first stentorian cry. Following the tracks, we came upon the place where he had suddenly pulled himself up and emitted the second and more prolonged roar, on each occasion planting his feet firmly in the sand to increase the power of his lungs. Still continuing our quest, we came to the spot where he had returned to the lioness and threatened her; and there, facing his footmarks, was the disorder in the sand where she had sprung at him and given her short, coughing bark of defiance. Idris then begged us to follow the tracks of the lioness; and, as distinctly as he had traced those of the lion, he pointed out how she also had gone round the camp and stood still and roared, and again gone on with lighter footsteps, treading daintily, as if reluctant to be heard while she ventriloquised her tones to produce the idea of distance. This reasoning seemed so thoroughly borne out by the marks on the sand, and the circumstantial evidence appeared to be so convincing, that we could but accept the testimony of our guide, who spoke not by the light of a newly conceived idea, but from the experience of an old hunter.

HOME-BUILT VESSELS SHIPPED ABROAD.

HERE is an industry little heard of, yet one which has an important part in the work of the Empire. It is the building of vessels that are never launched—at least, in the waters around the British Isles.

Every year many craft, some of curious design, and nearly all of a type unfamiliar to the home-eye, are shipped abroad in plates and bars, or in sections. In packages for handy conveyance, these vessels arrive piecemeal at some inland lake or waterway hundreds of miles from the seaboard. When put together, these steamers do invaluable work in fostering trade in Africa, South and Central America, India, China; in fact, there is scarcely a navigable channel where Scottish-built boats are not to be seen, though ofttimes manned by a motley crew.

This constructing of craft for shipment is a special trade. The length of the largest boat that can be carried bodily on the deck of a foreign-going liner is fifty feet. How, then, could the Brahma have been sent out to the Indian rivers unless in plates and bars? She is a paddle-steamer of light make for smooth water, two hundred and sixty-seven feet long and fifty-one feet broad. Her birthplace was at Polmadie, Glasgow, her builders Messrs Alley and M'Lellan; and this graceful steamer is now carrying two thousand passengers each journey on an Eastern river, and her four boilers and two sets of engines drive her along at nearly seventeen and a half miles an hour.

A very queer-looking craft is the three-bowed suction-pump dredger Foyers, specially built for the Indian Government by William Simons & Company, Limited, Renfrew, of entirely new design. This vessel was built to improve the Indian canals, and can dredge a bottom twenty feet wide in one journey.

In many cases a feature is light draught. To navigate shallow rivers the ordinary make would not do; therefore stern-wheelers are a constant order. A boat of a pretty model is now on the river Zambesi. It is the Chipands. The hull was galvanised and built in riveted sections arranged for bolting together in the river. This is sometimes done because the ground on both sides belongs to foreign owners, or is not suitable for putting up a temporary building-yard. The Chipande was divided into sections of handy size. At the junctions were heavy double frames, jointed with rubber. The floor-plate of the frame next to the junction was carried up watertight to a depth greater than the light draught, so that any water which might get through the bolt-holes in the bulkhead could not get into the main part of the hold. The method of completing the boat was as follows: The india-rubber was fastened by means of cement to one of each pair of the heavy frames, and holes made in it for the bolts. Two

adjacent sections were then lowered into the water, brought together, and the top butt-straps bolted up. Another one was then lowered down and bolted on to them, and so on until all the sections were united, when the weight of the end-pieces brought the bottoms of the frames together so that they could be easily connected. The water was then pumped out of the compartments next the bulkheads, and the hull was ready for fitting.

This is a very easy way of building a ship, and any one who can screw a bolt can fasten the sections together. The *Chipande* is a small vessel ninety-one and a half feet in length, with sixteen feet beam. Yet she is very roomy, and has a dining-saloon and a bathroom, besides sleeping accommodation for fourteen passengers, the captain, and two engineers. The draught, when she is loaded, is only one and a half feet, so that the vessel can sail in nineteen inches of water. A locomotive boiler is fitted into these stern-wheelers, with compound jet-condensing engines.

Quick building was done in the case of a water-boat for a harbour in the Far East. She carries four thousand five hundred gallons of fresh-water to ships lying outside, and steams five miles an hour. She is equipped, also, with a powerful centrifugal pump. Only ten hours were occupied in launching the sections, fitting them together, and putting in the engines ready for working.

A stern-wheeler sent from the Clyde to the Nile in connection with the irrigation service, which is to have her headquarters at Khartoum, will have a length of one hundred and fourteen feet and twenty-two feet beam. The engines are compound surface-condensing, with two hundred and eighty-five I.H.P., giving a speed of twelve miles an hour, and the boiler is of locomotive type. In this case the woodwork is to be supplied in Egypt, and the value of the steamer before being shipped abroad was two thousand nine hundred pounds.

But the value is ofttimes doubled by the cost of transport. To convey the mission steamer Chauncy Maples to Lake Nyassa and the putting her together by plates and bars cost fully seven thousand five hundred pounds, and the price of the steamer in Glasgow was about nine thousand pounds. The Chauncy Maples is a powerful vessel one hundred and twenty-six feet six inches in length, and has students' quarters, chapel, printing-room, four first-class cabins, and other passenger accommodation. The decks and houses are of teak. So that the ship might be transported to inland Africa, she was divided up into three thousand four hundred and eighty-one packages, many being about half a hundredweight. The remainder were each under five hundredweight, with the exception of the cylinders, engine bedplate, boats, and steel masts. Of course the boiler could not be

subdivided. It weighed nine and a half tons, and was brought up the Zambesi and Shiré rivers on a barge. Part of the long journey to the lake had to be done overland, and four hundred and fifty natives were harnessed to the boiler-which was mounted on traction wheels-and pulled it safely home.

The question of transport is, indeed, one beset with difficulties. Every possible method has been tried-men, horses, ponies, bullocks, barges, canoes; and in the northern latitudes a capital conveyance has been found in sledges. Too often it happens in the course of a weary progress through tropical forests and swamps that packages have gone amissing or that white ants have been making a pleasing meal of hardwood boxes. And when the destination is reached after months of toil, the death of the expert in charge may leave the building-up a more or less haphazard performance. As natives are employed for the labouring work, and as they have never probably even seen a steel or iron ship before, the work is slow and tedious. Where sections are not adopted, the launching has often caused much trouble; and in Russia it is not unusual to construct the steamers on the ice, and leave them to find their way into the water as the ice thaws in the summer-time.

Needless to say, special care has to be taken by the builders at home that nothing is missing when the shipments are made. When the craft has to go in plates and bars, all the various parts to make up the vessel are shaped and put together in the yard; but no rivets are used, only bolts and nuts to hold temporarily the framework together. To the unskilled eye the steamer has all the appearance of being ready for launching, except that the hull is distigured by large letters and numbers painted on it; and, to make matters worse, the two sides of the ship are painted in different colours. It is by the colour of the paint that the fitter-up in Peru or China knows where to allot the struts and plates, and the numbers and letters tell him the exact position.

There was put on board a steamer at Leith for Shanghai some time ago a miscellaneous collection of steel girders, plates, bars, braces, and machinery. All these will be dumped down on the quay when they come to hand. Soon, however, there will be evolved a patent slip on which ships of nearly three thousand tons can be hauled up by electric-power engines in order to have their hulls repaired.

A curious-looking object was temporarily erected in a Glasgow yard, and then taken to pieces and sent to Rio de Janeiro. It was a steel caisson weighing one hundred and eighty tons, and having a boiler and duplex pump for emptying and filling the different compartments, and cost three thousand pounds. Much is heard in shipping circles about water-tight compartments; but it is a more difficult task to secure oil-tight compartments. One of Messrs Alley & M'Lellan's orders was for the building of an oil-carrying barge for India. It carries one thousand and fifty tons of oil, and floats in five feet one inch of water. Long and flat (two hundred and

fifty-five feet by forty-four feet beam), the barge is divided up into fifteen oil-tight holds, and cost in this country four thousand four hundred pounds.

Very many hopper-steamers are forwarded to foreign buyers. These are expensive vessels, and a steel barge for sand-dredging to carry four hundred tons will cost four thousand pounds. Floating piers, pontoons, horse-ferries, are constructed for rivercrossing purposes. A powerful salvage-boat for the River Plate was shipped to Buenos Ayres. In this case there was an extra amount of machinery to put together-pumps, steam winch, engines, circular saw, smith's hearth, and so on. But the specialists in supplying light-draught steamers take in hand specifications for any kind of craft. Even the dahabeeahs which we read about as peculiar to the Nile are now sent out from this country in packages all in readiness to put together, including the singular whip-like yard for the great sail, and the quaint deck-fittings and beautiful cabin furnishings.

Motor-boats are now finding a market abroad. For mission work in Africa one has been despatched from Dumbarton; and these handy craft are certain to be desired for inland waters. There is, all over, abundance of work in hand this year for foreign and colonial buyers. Where formerly the trader was content to get his merchandise conveyed on the lakes and streams by the most primitive native craft, he now must have steel steamers with the best machinery and all appliances for loading and discharging. Passengers, too, cannot now tolerate the old-time leisurely progress, and besides speed they want comfort. On board all passenger steamers economy of space is a first consideration; but with these small river and lake craft the utilising of every corner is a science. And the ingenuity displayed in the making of cabin furniture and appliances is marvellous. Undoubtedly the Scottish designers and engineers can hold their own in this branch of the shipbuilding trade.

STARLAND.

Our own little Earth, with its oceans and mountains, Its forests, its vales, and its clear-flowing fountains!

They tell me that planets more mighty than this is Are rolling through depths of these midnight abysses,

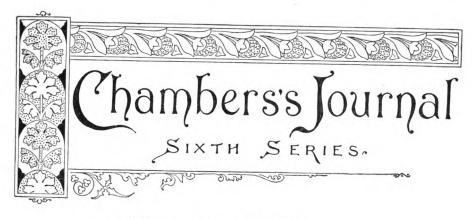

Whose citizens look upon scenes that are rarer, Suns that are larger and moons that are fairer;

They hint me a hope that, when vanished from here, Perchance I may dwell in such loftier sphere.

Ah, well! let the others roll on as they say, Give me our own orb at the springing of May,

Its sweet-scented airs and its songs in the grove, Its trees and its flowers and the beings I love.

I ask nothing better than only to see The Earth with its daisies, my dear one, and thee. T. P. JUHRSTON.

HOLIDAY SWINDLES.

By T. C. BRIDGES.

75 N.

> ALF a century ago the average middleclass family rarely left home, and even a week at the seaside was by no means an annual event. The ever-increasing facilities of modern

travel have changed all that, and nowadays people think no more of running down to Brighton or Bournemouth for a week-end than they once did of an afternoon's tramp in the country. One result has been the creation of a class of swindlers who prey upon the holidaymaker. Their tricks are many and various, and some account of a few may be found useful as a warning to possible victims.

The scene was a southern coast watering-place, and one of those fussy little excursion steamers was just starting from the pier. Having scrambled aboard at the last moment, a tall young man passed along the deck, looking for a seat, and finding an empty chair, appropriated it. He was in the act of lighting his pipe when a deck-hand came bustling up. 'I say, sir, do you know you've been and sat in some paint? My, what a mess! Your coat's all over it! It must have been on the chair. But never mind. I'll run and get some benzine. That'll take it off.' The sailor was turning, when a long arm shot out and seized him by the collar. Next instant the tall young man was standing up, the sailor was perched in the painty chair, and with a crash a bottle of benzine burst on his head, and the ill-smelling liquid poured down his neck. For a moment the attacked one was too surprised to speak; when he found voice he began a furious protest. 'You'd better dry up,' remarked the tall young man coolly. 'You know jolly well you painted the chair yourself. Say any more and I'll take you to the captain.' The fellow shut up like a knife. The fact was that the tourist had been 'had' before, and what made him certain of the deck-hand's guilt was the sight of a benzine bottle sticking out of his coat-pocket. Swindles of this kind are known as 'sea-draughts,' and comprise many moves similar to the one described,

No. 503. - Vol. X.

whereby the wily players (the crew) reap fat harvests in the shape of tips from the passengers.

At the seaside one's hands are always in one's The visitor is everybody's victim. A guileless little scheme is that of the longshoremen who work a small seine between a boat and the sands. Naturally, a knot of interested spectators collect to watch operations. To them the man in charge of the net suggests that perhaps one of them would like to make a blind bid for the haul. 'What do you say, sir? Half-a-crown! Oh no; there'll be more than that. Look at the sag of the net. Five bob, sir. Any advance on five bob?' There is none, and the net is hauled. In its inmost recesses are four small dabs and two bass of about half a pound each, the whole lot worth, even at retail price, not more than eighteenpence.

Then there is the man with the puppies, veritable little mongrels, but washed and combed and brushed until, as an American girl said of them, they looked sweet enough to eat. Nine people out of ten, even if they do know a spaniel from a setter, have not the faintest idea of judging a puppy, and the seller has the most marvellous pedigrees at his finger-ends. He usually succeeds in getting ten shillings apiece for miscellaneous little curs which a kindly dog-fancier would have drowned before their eyes were open.

The prices in the daintily arranged shops are simply appalling. Bond Street has nothing to compare with them. That the fancy traders and jewellers should try to reap a harvest during the season is not perhaps surprising, but at many a seaside-resort every shopkeeper is an extortioner. A visitor has only to enter a shop to be at once victimised. Soles at half-a-crown a pound, cream at three-and-six a quart, cauliflowers at sixpence apiece, miserable little mock ices at a shilling each, sixpence for a bunch of violets, and five-and-six for a straw hat which anywhere else can be purchased for three-and-six: these are but samples of a thousand other ridiculous charges.

The seaside landlady has always been a valuable [All Rights Reserved.] JULY 20, 1907.

asset to the comic paper. Though slightly more civilised and less tyrannical than of yore, the lodging-house shark still exists and battens upon her victims in the good old-fashioned style. While the 'cat' that always used to finish up the strawberries as well as the poultry is no longer so much in evidence, that item known as 'extras' is at least equally annoying to the lodger and profitable to the landlady. Fifteen shillings apiece a week for two rooms, cooking, and attendance does not sound an exorbitant charge; but wait till the bill comes. Coal at eightpence a box, baths at sixpence apiece, lamps at sixpence each a week, hot water a shilling a week, boot-cleaning a penny a pair, clean towels a penny apiece, together with charges for soap, bedroom attendance, cruet, and goodness knows what all besides, will very nearly double the Some of these women exercise conreckoning. siderable ingenuity in extorting money from their victims. In one case cheap china ornaments were actually balanced on an insecure shelf where a mere touch brought them all down; and not only were the broken articles charged for at quite five times their value, but an item was also inserted in the bill for putting up the shelf afresh, which this time was done with heavy brackets, though previously a couple of nails had been considered sufficient.

It is worth mention that the worst of these extortionists invariably hire touts who hang around the station entrance and pick their victims with unerring sagacity. The tout gets a commission upon each visitor whom he lures into the clutches of the harpy who employs him. Hotels, too, frequently employ indirect methods of obtaining visitors. A new hotel, unless it is a very large one belonging to a company that can afford a splash and big advertisements, often has much difficulty in procuring patronage. A not uncommon method of groundbaiting is to approach some impecunious young bachelor of title, and offer him free quarters for the use of his name. The principle is exactly the same as that on which company promoters act when they secure titled guinea-pigs to figure upon their Board. A titled bachelor, even an 'honourable,' is worth very much more than his keep to the hotel which invites him, for wealthy nobodies with plain-faced daughters invariably keep a keen eye upon the visitors' lists, and a title draws them like a magnet. When such a useful lure cannot be obtained the hotel-keeper is sometimes driven to inventing one. A certain Russian nobleman who has lately come to England to live was motoring in Devonshire last summer, when the car broke down near a small seaside place. He left it to the chauffeur and strolled into the village, where he lunched at a small hotel. While he was idly turning over the pages of the visitors' book, imagine his amazement at finding that he had stayed there himself three summers previously! At least, the book contained his name, and by cautious inquiry he found that some oneapparently a harmless individual enough - had

actually personated him for the time, and evidently at the instigation of the hotel-keeper. He himself had been travelling in the Far East at the date mentioned. Clergymen and retired naval officers are always considered good drawing cards by the proprietors of small hotels and the owners of large boarding-houses or pensions.

The motor-car press has recently been full of correspondence about the exorbitant charges made at country inns and the villainous accommodation provided. It is quite true that the hotels in many of our small towns are the worst managed and dearest in the world. The cooking is primitive, the attendance bad, the bedrooms musty and unaired, sitting-rooms conspicuous by their absence, while the charges are from three to four times those of the delightful little inns which one finds in almost every village in France.

The better type of hotel at a fashionable wateringplace is often the haunt of sharpers of a very dangerous type. These are men of good address and smartly attired, who live well and tip well. Their bribes enable them to find out a great deal about the visitors, their position, and their means, and they then set deliberately about choosing a victim and fleecing him. In such cases two men work in collusion. In public the pair appear to be complete strangers; but their plans are well worked out beforehand, and their ingenuity in devising new tricks when old ones have been blown upon is endless. One of the latest is briefly as follows: Swindler No. 1 casually mentions to his chosen victim a good thing which he has heard of, and adds how annoying it is that he must miss such a chance of making money, as he is overdrawn at his banker's. Ten to one the visitor asks for particulars. No. 1 tells him of a wealthy African mining company which has worked up to its boundary. The next concession is held by a needy company, and the wealthy company is desirous of buying up the other's shares, but is working quietly for fear lest the news leaks out and prices be rushed up. What he (the speaker) has discovered is that a man staying in the hotel owns five thousand of these shares, which, naturally, he would sell cheap, as he knows nothing of the plans of the rich company. No doubt a three months' option could be had for a hundred pounds. Cunningly No. 1 works upon the cupidity of his victim until the latter suggests finding the money. Of course it is Swindler No. 2 who is the supposititious owner of the five thousand shares. When approached he seems suspicious, and declares that he must first wire to his brokers and find the latest price before granting the option. By this time the would-be buyer is on the tiptoe of expectation. Need one continue? No. 2 sends his wire, gets his reply, and agrees to grant the option; the money is paid over, and before the purchaser can learn how he has been swindled the other two have departed without leaving any address.

While foreign hotels are, as a rule, cheaper and better than British, it need not be imagined that

the tourist who travels abroad never loses his money or property by tricks. Over and over again visitors have been warned against the gangs of well-dressed thieves who work on the French railways, and especially on the Riviera. Their happy huntingground is the line between Mentone and Nice, and their pet prize the breast pocket-book, the idea being that it contains notes for play at Monte Carlo. The passenger is hustled while entering or leaving the train, and in an instant his coat is unbuttoned and the book gone. At one time as many as seven or eight empty pocket-books were picked up daily in a tunnel between Mentone and Monte Carlo.

We hear a good deal of luggage-stealing at English stations, but Italy is undoubtedly the paradise of the luggage-thief. In this country the integrity of the railway officials themselves is seldom, if ever, questioned. In Italy luggage registered through from one place to another is frequently opened en route and all valuables extracted, the trunk being then reclosed and strapped. Only a few months ago an unfortunate traveller wrote to the daily papers describing how his luggage deposited in the custom-house at Naples had been opened and ransacked! One of the smartest luggage-thefts on record occurred some years ago at Bale. When the express train from Paris arrived at Bâle the passengers found outside the station a well-appointed omnibus bearing the name of a large and wellknown local hotel. Obviously it was waiting to convey passengers and luggage to the hotel. After the usual delay for passing the douane, a quantity of baggage was taken out and piled upon the vehicle, which thereupon, without waiting for passengers, drove off; and that was the last seen or heard of it. One unfortunate man, a diamond merchant, lost nearly a thousand pounds' worth of samples, and the value of the whole haul was estimated at fully three times that sum. A 'pirate bus,' with a vengeance !

Travelling abroad with invalids, the tourist should be extremely careful as to what hotels he puts up at. At certain fashionable resorts hotelkeepers practise a most cruel swindle in case of a death occurring in their hotel. A notable case happened a year or two ago at Nice. A visitor, who had spent more than three hundred pounds during

his stay at a hotel, died, whereupon the proprietor made a claim for a hundred pounds as compensation. As the deceased's executors refused to pay this exorbitant sum, the proprietor impounded the dead man's luggage. This is by no means the only recent case of the kind. A similar claim was made last year against a visitor at a Swiss hotel where her only son had died quite suddenly. The poor lady, distracted with grief and by no means well off, found her troubles doubled by this insolent demand for heavy compensation.

There are also certain Belgian hotels-one near Ostend in particular-where one's bills should be very carefully scanned before payment is made. The management have a peculiar habit of inserting wines, &c., which the visitor has not ordered or enjoyed; while, in order to make the swindle pass unnoticed, the bill is not presented until the very last moment, the idea of course being that the visitor will rather pay than miss his train. A wellknown London doctor staying at another Belgian hotel found his daily bottle of claret, which had been marked two francs fifty centimes in the winelist, charged on his bill at three francs fifty centimes. He demanded to see the wine-list, and found that in the hour which had elapsed since his last meal every wine-list in the hotel had been carefully altered, the two being scratched out and three inserted in its place.

A favourite theme for the old-fashioned melodrama was the lonely inn where travellers were done to death in their sleep by some diabolical contrivance, and their bodies hidden in a cellar or flung over some adjacent precipice. In August 1906 a Swiss deputy, M. Braunschweig, mysteriously disappeared, and detectives set upon his track made discoveries gruesome as any of those evolved by the brains of the most sensational playwright. The body of the missing deputy was unearthed near a little mountain inn not very far from Botzen; and in course of the search the decomposed corpse of another tourist was also found. During the past six years four other tourists have disappeared at or about the same spot, and two others have never returned from climbing a mountain above the place. It is almost beyond doubt that the Tyrolese family who used to keep the place are responsible for a long series of brutal and sordid murders.

MISS DENISON'S CHILDREN.

CHAPTER III.

was a question of diplomacy how best to bring about the desired result; but events at this time seemed to tread on the heels of one another.

Mr Anstruther had decided with Winifred to postpone his interview

with Miss Denison till the following day, as to go to her immediately after her confident rejection in order to confront her with her own mistakes almost touched on offence. Besides, it would give Winifred the opportunity of conferring with Everard and the laying of mutual plans.

Luncheon at Coombe Hall that morning was an unusually silent one; every one, more or less, was in a disturbed state of mind, The lady chatelaine had been considerably discomposed (more than she

would acknowledge to herself) by Mr Anstruther's proposal. She knew that both his social and financial position was assured, and his distinction in literature was of a kind to make it an honour for any woman to be sought by him. As a matter of justice, when felt bound to inform Winifred what had happened, and at the same time was very much averse to doing so.

Everard had also returned from a pregnant and agitating interview, and his mind and conscience were in a whirl of conflict. His sense of gratitude to his benefactress was acute, and he loved her with truly filial ardour. If Winifred loved him-and on this point he could reach no conclusion-did duty prompt, as Agatha declared, to submission? It must be remembered that he had been absent from home for two years under circumstances calculated to develop tenderness, and had scarcely had time for observation since his return. He recalled his passionate asseveration to Agatha; but to reconsider and revoke the most deliberate utterances is no uncommon humiliation for poor humanity. He never wavered in his intention to tell Miss Denison all the story of his relations with Mr Waring's daughter, but the disclosure must be postponed at her own urgent request. Enough of anxiety remained to make the curried chicken tasteless and to rob the generally approved Sauterne of its delicate

On one point he felt not the slightest hesitation: once convinced that Winifred's affection for him was only that of a sister, and he was prepared to follow the bent of his passion, overcoming Agatha's scruples at all costs—even to the cost of his inheritance.

Undoubtedly Winifred Leigh was the least harassed of the three; indeed, a sense of assured bliss lay at the root of her being; but she too had her anxieties; therefore it was not surprising that conversation lagged and stretches of silence prevailed.

Miss Denison watched her young people narrowly. Everard's moody abstraction made her very uneasy, but might be explained by the importance of the crisis; while Winifred's gaiety of manner and radiance of look convinced her that in dismissing the man of letters her penetration had not been at fault. Still, under all circumstances, it would be better to try to bring matters to some conclusion, and to throw the two into close personal intercourse would help the end desired.

Everard, after luncheon, had strolled with a cigar into the conservatory opening out from the drawing-room. Winifred had kept her seat at the table, hesitating whether she should follow him. Perhaps it would be premature, or Miss Denison might put a wrong construction on the action.

That lady, however, unexpectedly helped her to decision. 'My dear,' she said, 'I have an appointment with my steward this afternoon, and shall be very busy for an hour or two. Oblige me by

joining Everard and asking him to turn the smoke of his cigar upon my precious hoyia; it shows a tendency to blight?

tendency to blight.'

Everard was not smoking when Winifred entered the conservatory; he was sitting in one of the comfortable chairs provided to enhance the pleasure of this charming retreat, leaning forward with his cigar between his fingers in an attitude of deep cigar between his fingers in an attitude of deep and despondent thought. He looked up hastily at the sound of her light footsteps, and his face flushed.

'This is the most comfortable seat,' he said, rising; 'will you take it?'

Her face had flushed also, his reluctance and embarrassment were so obvious to eyes that had seen the light of love so recently; but there was a touch of light comedy in the situation which appealed to her sense of humour.

'Miss Denison has sent me with a message,' she said demurely; and she gave it, adding, 'I do not think it was the hoyia that she was most anxious

No, he said; 'she thinks naturally that we can have no greater pleasure after our long separation than to be together. You know what is the desire of her heart—what she implied last night in her after-dinner speech. I have a question that I dare

not ask, and a confession that I dare not make.'

'Then I will help you.' She had difficulty in preventing her lips breaking into smiles, but controlled herself out of respect to his knitted brows and set expression. 'The question our dear mother wishes you to ask should take something of this form, Everard; if you wished to please her, you should say to me, "You and I have loved each other all our lives; do you love me enough to be willing that we should pass the rest of our life together?"

together?"'

Now he caught the sparkle in her eyes and the twitching of her lips, and a rapture of relief came to him as though a burden had fallen from his shoulders

shoulders.
'Winifred!'—he caught her hand—'I understand

'I mean,' she replied seriously, 'that if you had -you mean'asked me such a question in deference to our dear mother's wishes, my answer would have been no uncertain negative; consideration for my feelings need be no stumbling-block in your path of honour. For the rest, dear boy-dear brother-I know your secret, but you don't know mine. Happily for both of us, the care of my future happiness is to be undertaken by some one else than you, and not in the character of a self-sacrificing martyr. Everard, I am the proudest girl in all England! Sit down here beside me'—she tapped the couch with friendly insistence—and let me tell you what has happened to-day. It will be necessary for us to consult together.'

Miss Denison had indulged the hope that either Winifred or Everard would have had some com-

munication to make to her before the day was over. She knew in some unexplained, occult way of the long scance in the conservatory, and it encouraged her greatly. She denied herself any attempt to elicit the truth either directly or indirectly as being a premature intrusion into the sanctity of young love; but she gathered the most favourable auspices from the undeniable fact that both were unusually cheerful, and that there was certainly a mutual understanding between them.

The announcement on the following morning that the man of letters was again in the house, and requesting an interview with her, surprised and annoyed her considerably; but at least it would give her the opportunity, were he come to renew his suit, of telling him that matters were already ripening to the desired consummation. She was naturally not aware that both Everard and Winifred had had speech with Mr Anstruther before she saw him.

Therefore, taking into account the favourable aspect of affairs, she greeted him with a cordiality that was touched with sympathy. When we get what another has desired our goodwill flows freely.

'I am in hopes,' said Miss Denison, with her delightful smile, 'that I owe the honour of this unexpected visit to some other motive than yesterday's.'

Then Anstruther, falling back anxiously upon his mastery of words, and with a gentle deference of manner that almost amounted to tenderness, told the story he had come to tell, and besought the lady to receive it favourably.

Miss Denison stiffened with displeasure and incredulity.

'It is inexplicable,' she said haughtily; 'you must be under some curious delusion—have mistaken Winifred's meaning utterly, as well as Captain Yorke's intentions. I have every reason to believe that the young couple came to a perfect understanding yesterday. Love blinds even a philosopher, Mr Anstruther. I am very sorry for your disappointment—more so to-day than I was yesterday.'

'I am grateful for your sympathy,' he said, and was going on to speak, when she interrupted him.

'Pardon me if I venture to say that your action in speaking to Miss Leigh after I had taken you into my confidence seems hardly consistent with a nice sense of honour.'

He interrupted in his turn. 'When the matter at stake is lifelong gain or loss a trivial scruple has no weight.'

She made a little gesture of dissent.

'Then,' she continued, 'I can quite understand, knowing Winifred's reluctance to give pain, that you mistook her meaning—her sweet consideration and sympathy—for a warmer feeling. I think, dear Mr Anstruther, you will have to disabuse your mind of—a mistaken impression.'

'I must indeed have abused it,' he replied, and turned towards the window; it looked out on the tennis-lawn, and he stood silent, surveying the scene as a cloak to his discomfiture—so, at least, Miss Denison thought, and respected his attitude.

After the pause of a few moments she saw his expression quicken, and the next he had turned again towards her in full possession of his self-command.

'Bear with me, Miss Denison,' he said, 'if I say that I still find it impossible to accept your view of the situation. If I have so flagrantly deceived myself as you suggest, you can scarcely object to my seeing Miss Leigh and hearing from her own lips that I was led astray by her indulgence. I see both her and Captain Yorke walking towards the tennis-lawn, racquet in hand. May I open the window and call them in?' He smiled. 'They cannot fail to convict one of us of error.'

Miss Denison hesitated. The proposal seemed to her crude and undignified. But Mr Anstruther had not waited for permission; he threw up the window and made a signal of invitation.

A few moments later and the three conspirators stood together in the room.

Miss Denison preserved a haughty neutrality, leaving the awkwardness of explanation to him who provoked it. But the man of letters did not seem aware of any awkwardness in the situation; his face was alight with animation. He went up to Winifred and took her hand—with deference, Miss Denison allowed.

'Dear,' he said, and there was an inflection in his voice that made the girl's heart leap, 'will you own me before your adopted mother as the man of your choice, your accepted lover, however unworthy? I do not wonder that she hesitates to accept my testimony.'

Winifred blushed divinely, but as she met the stern expression of Miss Denison's face a feeling approaching compunction dimmed the radiance of her own.

'It is true,' she said simply, 'that Mr Anstruther loves me, though no wonder you find it difficult to believe; and it has made me happier than I ever thought to be. Be kind to us, dear mother, and forgive us.'

She went up to her and tried to take her hand and kiss the averted cheek, but she was gently but firmly repulsed.

'I am to believe,' said Miss Denison, drawing to its full height her stately figure, 'that you love a man who is old enough to be your father, and who has lived his life before you, child, were born, in preference to'— she indicated Everard Yorke by an expressive gesture which seemed to say, 'Look upon this picture and on that;' but her feelings choked her eloquence, and she contented herself with laying an affectionate hand on the young man's shoulder. 'It is inexplicable,' she added.

'But, dearest,' expostulated Winifred, 'Everard will explain. It was good and generous of you to wish me to be his wife; but he did not want me. Are you not glad that I am not breaking my heart for him?'

'It seems to me,' was the answer, 'that I am in the land of topsy-turvy, and I must have time to adjust myself to it. You have deceived me, Winifred, I will not say with intention; or it is possible that I have deceived myself. As for Everardbut perhaps he has some startling disclosure to make?

'He has, but not now. I prefer to speak to my mother alone.' He spoke in a low tone, and there was a tender deprecation in his manner that somewhat soothed Miss Denison's hurt feelings. Besides, is not a woman's heart apt to be softer for

the son than the daughter?

'We will waive further revelations,' she said, 'and close the interview. You will allow me time, Mr Anstruther, to reconsider the situation before I commit myself to any definite opinion or settlement; and if I have been discourteous, forgive me. You will allow that it is hard for a woman to have the hopes and plans of a lifetime upset.' She bowed with dignity and quitted the room.

Everard turned to follow her, but before doing so he grasped the hand of the man of letters.

'I seem to have cut a poor figure,' he said; 'but my ordeal is to come. I am so happy to be able to wish you and Winifred joy; but my joy stands so far off that I fear I shall never overtake it.'

'It will come to you unexpectedly-soon, as my blessedness came to me, was the answer. 'Miss

Denison has a heart of gold.

It was to this heart of gold that Everard a few days later made his appeal. In that interval the man of letters had succeeded in winning his way to Miss Denison's favour. She perceived that his love for Winifred was no reasoned preference, but an ardent and exalted passion; and being herself a genuine sentimentalist - though she would have scorned the imputation-it won her approval, and consequently reduced her opposition. light of love in Winifred's sweet eyes was not to be withstood; her loveliness had taken on a higher charm, obvious to the world at large as well as to her adoring lover.

'We must let them be happy in their own way,' she said to Everard, 'though it is not my way, especially since you also are a rebel. Mr Anstruther shall have no occasion to complain of my darling's dowry, the more so as I am glad to see he has proper views as to settlements. And now, sir, I am ready

to receive your confession.'

'My confession is that I pledged my honour where I had given my heart, before I went to South Africa, to a girl whom you scarcely know, and who, I believe, has never been under this roof; and I am prepared to accept all the conse-

quences. I cannot justify my concealment,' he added; 'if straightforward dealing is due from son to mother, it was doubly due to you. No motherhood could have been more periect or generous than yours.'

'You will understand,' was her answer, 'that when I planned to make you my heir and to carry on my name to the next generation it was under the impression that she who was to share the inheritance was the girl whom I brought up as a daughter, and whose most intimate feelings I imagined that I knew. That arrangement does not hold good in respect to any daughter of Heth on whom you may have set your vagrant

affections.' 'That is all right,' he said with a grave smile, 'and I have always understood your intentions in that way. Still, you will allow that, however blamable I may be towards you, I am not responsible for Winifred's defection. Whatever my feelings had been towards her, she would not have accepted me as her husband at any price.'

Miss Denison shrugged her shoulders. 'Being a girl of discernment, she detected your indifference, and her slighted affections settled elsewhere. Shall we come to the point? Whom do you wish to marry?'

One who refuses to marry me. Will you be

good enough to read this letter?'

He offered a letter he had received that same morning from Agatha Waring, who was obviously ignorant of the turn events had taken at Coombe Hall.

The burden of her letter was a strenuous repetition of her entreaty that he would relinquish finally the idea of a possible union between them. She was bound to her father's service-in a recent and very painful interview he had made her duty clear to her; and Everard was bound, if possible by closer ties, to accept Miss Denison's wishes. Moreover, if such a noble girl as Winifred Leigh loved him, such obedience was an irresistible challenge to his chivalry, and would bring its own reward. 'Our intercourse has been very sweet, she added; 'and as the only sunshine of a shaded life I would plead that you will not cease to be my friend because you were once my lover.'

Miss Denison folded the letter accurately and returned it to its owner.

'It is the letter of a good and high-minded woman,' she remarked; 'and you will obey her, of course.

'No,' he said hotly; 'I am incapable of the intercourse of a friend with Agatha Waring The chief barrier between us is broken down, and I will wait till we are able to break down her father's selfishness; but I will be her lover until death.'

'A celibate till gray hairs for her sake, and that without reference to me?'

'It may be so, but at least I will be no other

woman's husband now that the shred of obligation to you and Winifred is brushed away. Perhaps we may win your favour in the long-run; but however that may be will make no difference. Neither will it make any difference, dearest, to the love and gratitude I owe you. Do not refuse to be my mother to the end, whatever else you take from me.'

He stooped to take her hand, with eyes full of tender appeal, and she did not refuse it. A smile on her lips gave him fresh courage.

'If you knew her you would love her,' he pleaded almost in a whisper. 'She is so sweet, and her life so hard.'

'I know more of Miss Waring and her way of life than you imagine, and it is her own fault that I have not known her better. Her people, when they came to the cottage, declined my civilities. The family is a good one, though the man is a fanatic. Shall I call upon your sweetheart, Everard?'

For answer, he pressed the hand he still held to his lips in a spasm of gratitude. Words would not come at his call.

Miss Denison twinkled a tear from her eye.

'And did you all suppose,' she asked, 'that when I had spent the flower of my life in bringing up my children to manhood and maidenhood, making them the equal sharers of my wealth, and teaching them to regard the future with perfect security, I should go back on such a past and coerce their inclinations to gain my own way? I repeat, it was the cherished dream of my heart that you and Winifred, as husband and wife, should reign at Coombe Hall when my sands were run out, but it was always under the belief that you cared for

each other. To threaten you with the loss of your inheritance against your inclinations would have been impossible to me.'

'I take shame to myself that I even thought it,' he said. 'Your nobleness humbles me. I can say nothing.'

'Well, I think I am behaving nicely,' and she smiled her illuminating smile; 'the more especially as it is aggravating to discover that I have been made a fool of all round. I honestly believed that the witch Winifred was head and ears in love with you. Of you I was less sure, but I meant it all to come right in the end.'

She rose a little impatiently, a tall and stately figure, and shook out reflectively the folds of her sweeping gown. Then she touched the young man sharply on the shoulder.

'How soon is it desired that the wedding-bells should ring?'

His face glowed, then fell a little.

'Ah,' he answered, 'it is plain sailing with Winifred and Anstruther; but with us it is different. Even you, my dear mother, will not be able to persuade Agatha to leave her father.'

She laughed ironically. 'When Miss Denison of Coombe Hall pays a visit to Mr Waring of The Retreat she flatters herself she will make all smooth at the first intention. Do you think he is too great a scholar and too big a fool to see what makes for his daughter's advantage? For the rest, we shall engage our man of letters to find for him an amanuensis who shall meet his most unreasonable requirements, and your wife, my dear Everard, shall pay his handsome salary out of her pin-money.'

THE END.

GAMBLING IN DEATH.

By T. W. WILKINSON.

HE success which has recently attended the efforts of those who aim at suppressing some forms of gambling inspires the hope that the legislature will soon check the least-known but

most repugnant and most pernicious of all—speculating in policies on human lives. Recognising the special evils of the practice, it long since expressly forbade it. No life insurance shall be made, the statute provides, unless the insurer has an insurable—that is, a pecuniary—risk; and it is further enacted that 'every insurance effected contrary to the true intent and meaning hereof shall be null and void to all intents and purposes whatever.' But wagering or speculative insurance is nevertheless carried on wholesale, especially in certain parts of the country—Swanses, Belfast, Blackburn, Glasgow, and a number of other towns having a large industrial population. Places such as these are full of what is known as

'speculative business,' thousands of people holding policies on lives in which they have no insurable interest.

Some working-class people are paying as much as twenty shillings or twenty-five shillings per week in premiums, while there are plungers who 'put' hundreds of pounds every year on 'good subjecta,' of whom, unfortunately, there is no lack in industrial centres. These are mostly shopkeepers in squalid neighbourhoods; and, knowing as they do practically everybody within a radius of a quarter of a mile, they are able to select their lives so that they run absolutely no risk, provided the insurance companies do not repudiate their agreements. Indeed, men of this class have made fortunes out of life offices which have gambled with them knowingly or unawares.

Many a shopkeeper also takes over policies from his neighbours, paying the premiums through the nominal insurers, and receiving through them

the benefits at death, and in addition purchases 'free' policies, which are granted by companies as consideration for the surrender of policies on which the holders are no longer able or willing to pay premiums. Perhaps an old man or woman has outlived all of his or her children and relatives, is alone in the world, and wretchedly poor to boot. Why, then-such is the argument-trouble any further about the 'funeral money'? So the policy is exchanged for a 'free' or paid-up one for, say, three or five pounds. Now, this is a good security, since it is transferable and indisputable; but a capitalist who deals in such things will give for it only about a sovereign, at which price, of course, it must return a very handsome profit.

As a rule, gamblers in mortality 'futures' are initiated into the arts of their despicable form of speculation by rascally agents who stick at nothing to get business. They badger people to insure anybody they know, preferably somebody with an obscure disease or a 'churchyard cough;' they themselves fill up the proposal forms with a callous disregard of truth unmatched by any class except witnesses in the Divorce Court; and, if need be, they find a disreputable, broken-down doctor to make the medical examinations. At their instigation and with their aid, persons disposed to gamble in death begin by insuring their friends and neighbours, and, when these are exhausted, perhaps fall back on old paupers whose shakiness warrants a prognosis favourable to their cupidity. Such denizens of life's backwaters are, indeed, favourite subjects in some towns, most of them being insured, generally without their knowledge, by one or more gamblers.

A common method of arranging a part of the preliminaries of an insurance on a female pauper is to get an old friend to invite her to tea the next time she is out. When she arrives she finds that her hostess already has visitors, one of whom is a man of much affability and with an inexhaustible stock of conversational small change. He is introduced to her as an old friend. So he may be; but he is there in a business capacity, having come to see her for insurance purposes. She, however, is not allowed to know that she is being 'seen' or to divine that in about a week she will be booked. That is a secret.

As a result of this and other tricks, about thirty or forty pounds is frequently paid to gamblers on the death of a pauper, while now and again they have a much greater haul. A case in point they have a much greater haul. A case in point they have a much greater haul. A case in point altogether one thousand pounds on wagering policies on the life of one man. Many instances are discovered by workhouse masters, who report them to the guardians, and thereupon an effort is usually made to induce the body-birds to defray the funeral expenses. In this the poor-law authorities are sometimes successful, not so much, perhaps, because gamblers care how a 'subject' is buried

—though a certain big operator, a woman, invariably paid for the funeral of the people she insured—as because they are either ignorant that such a claim cannot be legally enforced or fear that unpleasant disclosures may be made at a guardians' meeting. But gamblers who benefit by a pauper's death commonly refuse even to contribute to the cost of the funeral. Those who divided one thousand pounds among them displayed such meanness.

When traffickers in policies become more expert in their disgraceful trade they sometimes fly at higher game, and have thousands of pounds at stake on a few lives in which they have no insurable interest. It is not very easy to back Death for so large a sum when he is certain to win, with the assistance that his supporters can lend him, in a short time; but that the thing has often been done is unquestionable, and, what is more, there is every reason to believe that it is often done now. Some of the subjects for big insurances are technically styled 'professionals'-that is, men who for sixpence or a shilling will let anybody insure them. Pay their fee, and they will sign proposal forms all day. In real life they are mostly loafers, casual workers, or unskilled labourers; in the books of insurance companies they figure as persons of some substance.

A certain office once discovered that it had no less than twenty thousand pounds at stake on the lives of a number of these dummies. Hearing that it had accepted a lot of highly speculative business in a northern town, it made special investigations, which resulted in its unearthing a lot of such men. A so-called poultry salesman, who was insured for about nine thousand pounds in the aggregate, proved to be a market loafer; a pipe manufacturer, on whose life were policies to the amount of three thousand three hundred and eighty pounds, was in fact a vendor of clay-pipes - when not in the workhouse; a coal-dealer worth one thousand nine hundred pounds dead was virtually a pauper alive, the only justification for his description being that he had sometimes hawked coals in bags; and an undertaker and coach proprietor resolved himself into a cab-washer and stableassistant, though he was insured for four thousand pounds.

Altogether, there were more than thirty of such cases, in one of which the insured had recently died in a common lodging-house partly or wholly in consequence of excessive drinking. The scoundrels interested in his death had plied him with liquor as long as he could swallow it, pouring it down his throat till the pitiful end came—the catastrophe of a drama of drink full of Zolaesque horrors. But for the timely raising of the curtain there is not the slightest doubt that some of his fellow 'subjects' would have shared his fate, since they had all been well supplied with drink. One was given ten shillings, and sometimes more, at a time for this purpose; while another was found helplessly drunk

en a couch, from which he had not stirred for two days.

And yet these poor tools, being ignorant of the part they were playing-for, though they knew they were insured, they thought that the policies on their lives were for small sums-looked upon the conspirators as their benefactors! As it was, however, they were saved. Most of the policies were cancelled, and the others were dealt with in various ways. The gamblers, therefore, were hard hit; though, all things considered, they got off very lightly. There were some curious sequels to this remarkable episode. In some cases, for instance, the money paid in premiums was given back, not to the actual insurers—the gamblers—but to the insured, who thus received very welcome windfalls!

Another method of 'working' a big gambling insurance is sometimes adopted. Ostensibly to liquidate a debt, a shopkeeper suggests to one of his creditors - a man who could not truthfully be described as of sober habits — that he shall be insured, without mentioning the amount. The victim assents under the impression that the policy will be for only a small sum; but actually it is for a large one, perhaps five hundred pounds or more. Indeed, two or three large policies may be taken out in different offices, and some thousands of pounds be at stake on the life of the unsuspecting dupe.

Cases of this kind have also been discovered. In one the nominal policy-holder, described as an electrician, a brilliant Swivellerism for a labourer at a generating-station, was found recovering from a debauch, the cost of which had been generously defrayed by the actual insurer, who was a neighbouring shopkeeper. Though the man was supposed to hold a policy for five hundred pounds on his own life, he did not know the name of the office in which he was insured, and when he was told the value of that policy he was amazed. 'Why,' he gasped, 'I thought there was only twenty pound on me!'

That gamblers in death, whenever they play for big stakes, whether with the aid of a customer or a professional, have to encounter some difficulties is obvious. For it is one thing to take out a small speculative policy in the industrial branch, and another to make a wagering insurance for hundreds or thousands of pounds. How is the medical examination passed? What about the referees? These are questions which will occur to everybody, and answers to them seem hard to find, though they are not so. The doctor has been gulled in various ways; personation is not unknown, while more than one subject who has actually gone before him has been elaborately got up for the occasion, having been resplendent in a good suit, a silk hat, a watch and chain, and everything necessary to enable him to sustain the rôle he has been playing -that of a man in a position to insure his life for a good round sum. Gamblers in death lend their tools the clothes, &c., required to dress the part.

As for the referees, it has happened that one has been the speculator himself and the other the agent working hand in hand with him!

To what extent insurance companies are responsible for the prevalence of gambling in death is a very nice point. As a whole, they are certainly not blameless; for, while most offices not only decline to lend themselves to the practice, but do all in their power to suppress it, there are some which will take part in it, only they will fall back upon the law as may be convenient, as the keeper of a bucket-shop pleads the Gaming Act when sued. Lack of insurable interest is one of the reasons commonly assigned for the lapsing of young policies -a trick by which certain of such offices benefit very largely. Making a raid on a particular district, their canvassers take any kind of business, however bad; and after premiums have been paid on it for a few months, the most worthless is sorted out and dropped. Sometimes a policy-holder pays three pounds or four pounds before he is cut off. and yet he gets nothing whatever in return. If he makes a noise he is told he has no insurable interest, or quietened in some other way. Remedy then he has none, because the canvassers, being paid wholly by commission, are in law the agents of the insurers, not of the company, which is not, therefore, responsible for the statements they make in order to secure business.

The same plea-no insurable interest-is often raised if a wagering policy matures in time to show, on the face of things, a profit to a gambler, and the money is not paid, nor are the premiums returned. So the whole operation is glorified 'welshing,' or, as a magistrate once called it, a 'swindle on the public.' Small companies have been formed mainly for the purpose of exploiting gamblers in death, and have, for a time, prospered exceedingly.

Offices which issue wagering policies, however,

are not always prone to outbreaks of virtue at opportune moments. When they stand to win on a transaction they are the first to attempt to override the law. There was an amusing instance much to the point not long since. A woman effected several gambling insurances, and paid premiums in respect of them for a long period without obtaining a farthing in return, her subjects obstinately refusing to die. It seemed likely, indeed, that the premiums would ultimately exceed the gross amount payable on the policies. In the end she brought an action for the return of her money, on the ground, according to her evidence, that she had recently been told that the company would not pay on the policies, as she had no insurable interest.

the business of some companies was of a speculative character! Clearly, therefore, the present law affecting wagering policies on human life is ineffective, and

Defendants stated that though the policies were

wagering policies, they had all along been, and

were then, prepared to honour them, and that half

affords scope for much trickery on the part of insurers and insurance companies alike. It permits of the worst kind of gambling-gambling which leads to many evils and to moral murder of the same degree as that which Plimsoll so boldly denounced and so persistently worked to abolish.

For this reason the legislature should at least impose a penalty for 'every insurance effected contrary to the true intent and meaning' of the Act. Speculative insurances on infants are now practically unknown, and it is not impossible to make those on adults equally rare.

WITH THE NUBIAN TRIBES OF NORTH AFRICA.

PART IL.

N one occasion, while on a hunting expedition, I pitched my camp a day's march beyond Om Hajjir, on the Settit, which river was known in ancient times to the Greeks as the Astaboras, and is called by the

Abyssinians at the present day the Takazze. The country absolutely teemed with game-elephant, rhinoceros, giraffe, hartebeest, nellat, and koodoo (or, as the latter are called by the Nubians, tetal), besides a dozen varieties of other antelope; and of the feathered tribe, ostrich, bustard, and guineafowl were in abundance. No sooner was it known that a European had arrived with the intent of getting big game than parties of the Hamran Arabs, who occupy the land all along the Settit, kept continually arriving and pitching their tents of palm-leaf matting in the vicinity of mine. These people always, if they can, follow a hunter, especially in the dry season, when pasture is scanty and the milk of their flocks and herds is likely to run short. They come in the hope of being allowed to carry off such parts of an animal as are not needed or valued by the hunters and servants of the sportsman, and in this way are often able to procure a good supply of food.

During the dry season, when elephants resort to the few deep pools left at intervals in the dry bed of the river to drink and bathe, it is usual to erect a leafy screen near a pool, some three feet high, behind which the hunter sits on moonlight nights; and should a herd appear he has the chance of picking out the fiercest tusker at his leisure, and firing at a range of not more than fifty yards. In this manner I had shot an elephant on the night of my arrival; but as I was in need of food-the coarse flesh of the elephant, which is so acceptable to the natives, being utterly distasteful to myself-I sallied forth the next morning with one tracker only, my hunters being engaged in cutting out the tusks and dividing the flesh and hide of the elephant I had got the night before. I soon came across a herd of the spiral-horned nellat (the koodoo of South Africa), and on firing the thud of the bullet was distinctly audible. The animal fell, but recovered itself immediately, and following its herd, disappeared into the forest. My tracker took up the spoor, but after we had followed it for a couple of hours I thought it advisable to give up the chase, especially as every step was taking us farther and

farther into the Baza country—a dangerous land to venture into, as the natives are at enmity with the Arabs on one side and the Abyssinians on the other. They are, indeed, a hostile and inimical tribe, who wish to keep entirely to themselves, and their rule is to spare no one, either white or coloured, who

ventures within their borders. On reaching the banks of the Settit we descended to the bed of the river, which consisted at this season chiefly of sand and pebbles, with here and there flowing water. On reaching a pool we took a long and refreshing draught, and then refilled our water-skins. Just as we were about to set forth again for the camp my guide suddenly descried a large elephant feeding under the river-bank at a distance from us of about a quarter of a mile. Crawling quietly back towards the bank on hands and knees, in order to make ourselves as invisible as possible, my 450 Henry express slung round my neck, we quickly clambered to the top, and made our way towards a large tamarind-tree which we had noticed as being only about a hundred yards this side of the unsuspecting game. We proceeded as noiselessly as possible; but before we had reached the tree my guide looked over the bank and made a sign to me that the elephant had come rather nearer to where we then were, though he was at that moment standing perfectly still. I advanced a little nearer to the edge and followed the direction of the man's glance. There stood the magnificent beast lazily flapping his huge back and sides with a branch of a tree, from the leaves of which he had doubtless been making his breakfast.

Waiting until I had regained my breath and my pulses had quieted down—for I was anxious not to miss-I took a steady aim at his ear, and fired my right barrel, following it up immediately by level. ling the left barrel at his temple. Both shots were effectual; the grand creature sank without a sound, and rolled over on his side, 'tremendous still in death.'

Swiftly descending from the bank, we ran up to him, and I measured the tusks. I found that in all probability they would be about four feet in length, the ivory that protruded beyond the lips being twenty-five inches in length, and as a rule the same length is found inside the head.

This prize, at whatever risk, had to be secured The tusks were mine, and the flesh of the animal, when dried, would supply not only my own people but the camp-followers with food for a month. My guide at once volunteered to run back to the camp, which he could do in much less time than if I went with him, and bring men and camels to cut up and carry away hide, meat, and tusks.

'I will make a cosy nook up in the tamarindtree for the kkawajah [master],' said the man, 'where he can rest till I return. But,' he added, 'it would be best for master net to fire again, as the sound might bring a party of Baza to the spot—if, indeed, they have not heard the first two shots, and are not already on their way hither.'

The prospect of being attacked single-handed by a party of these unfriendly people was not reassuring; but the situation had to be faced : and reascending the bank, I climbed into the tree, and took up my position on an impromptu seat about twenty feet from the ground, which my tracker had ingeniously formed by twisting some small branches which he had lopped off in and out among the many larger ones that spread out in every direction. Planting my feet on a lower fork and placing my rifle securely in a niche beside me, I settled down, watched my guide depart, and awaited results. My man was quickly out of sight, for I observed that instead of following the winding khor, he took a bee-line across the open plain to the camp, and I was soon alone with my quarry and my meditations.

The scene below me was by no means unattractive, and peaceful in the extreme. To my right, in the dry, sandy bed of the river, which was nearly half a furlong in width, was a deep pool about an acre in extent, in which a family of hippos were enjoying their morning bath-swimming, diving, splashing, turning their large bodies over in the cool water, and bringing their noses ever and anon to the surface for a breath of air. Another smaller pool to the left had a margin of smooth sand on one side, on which half-a-dozen young crocodiles lay basking in the broiling sunshine. The intervening space between this pool and the next, a distance of eighty yards or so, was principally sand, with a strip of rounded flint pebbles in the middle. The water was flowing through the pebbles, but out of sight, there not being sufficient depth, as it ran, to cover them. Some isolated granite rocks formed an island just in front of me in the midst of the dry river-bed. The stillness was intense; nothing of life moved, and for some time there was not a sound of any kind to be heard. I was almost entirely hidden from view by the foliage surrounding me; but suddenly my attention was arrested by something that I had never heard before. Coming down from far above, a most peculiar loud rustling noise like shooooey, shooooosy? was audible, and peering through the branches overhead, I discerned an enormous vulture swooping through the air and alighting near the elephant. Again and again this sound was repeated, until another and another and another of these huge birds of prey were on the ground.

Though there had not been a vulture within sight, probably not within two thousand feet of the earth, at the moment the elephant fell, these scavengers had somehow ascertained the fact, and were now coming down in scores, dropping rapidly as if from the sky. It is almost incredible that at the great height to which these creatures soar they could have seen the elephant, keen as their sight is known to be. The probability is that they had been attracted by the kites, who from a lower level had seen the crows, who had evidently been the first to discover the prize; for, on watching carefully from my retreat, I observed that the carcass was already surrounded by these smaller birds, as well as by marabon storks, who had followed the general lead.

My attention now became riveted on what was passing below, the like of which I had never until then witnessed; and as the accounts of such scenes are rare, I venture to sketch it, at the risk of bringing an unwelcome vision-one which may, indeed, perhaps be termed revolting-before my readers. But a few minutes elapsed after the arrival of the birds ere a couple of wolves, half-a-dozen hyænas, and some jackals crept stealthily from the edge of the jungle, and warily casting cautious glances right and left, made their way towards the anticipated feast. The hyænas, evidently the pluckiest of the lot, were the first to commence the orgy. Pushing in with a snarling sound, they made for the legs and under part of the thighs where the skin was thinnest, and savagely tore pieces of flesh away, which they dragged off and devoured. The jackals and wolves quickly followed suit, attacking chiefly the parts below the ribs; and a scene of carnage ensued too horrible to depict. Half-a-dozen vultures had alighted on and near the head, and were fighting among themselves for the eyes, nostrils, lips, and all the succulent tit-bits they could procure.

Presently the fine head of a big lion protruded from the sedgy fringe of the island I have mentioned, and after reconnoitring for a moment or two, he emerged, followed by a lioness and two cubs. As the king of the forest approached it was marvellous to note how every other beast and bird of prey cautiously but quickly retired to a distance of several yards, where they waited in a sort of semicircle, leaving his feline majesty in sole possession. The lion sprang upon the carcass, and in one moment had ripped up a huge opening, into which, incredible as it may seem, he instantly plunged, being almost hidden from view inside the body. Soon, however, he reappeared, dragging with him the enormous heart and liver. These he commenced ravenously to devour, and on the approach of the lioness and her cubs he drove them away with angry and ominous growls. Repulsed but undaunted, they made their way to the head, where they quickly possessed themselves of the remaining portions that the vultures had left.

Shortly, however, quitting this feast, the lion

made a second dive into the carcass, and this time he actually disappeared wholly within it. Observing this, the lioness immediately darted upon the liver he had left, doubtless the recherché part, and dragging it some yards away, divided it between her young ones, occasionally bolting a lump herself.

Several times while the lion was below me I had raised my rifle to my shoulder and levelled it upon him, but, remembering the warning of

my guide, had refrained from firing.

The sun was now well past the meridian, and more than two hours had gone by since I had shot the elephant, when the lion, who was again in sight, began to show signs of apprehension and uneasiness, and at last, emitting a low growl, looked down the *khor* and moved slowly off. It struck me at once that his quick ears had heard in the far distance the trotting of the camels coming with my men from the camp; and as I knew that on their arrival I should have but little to fear from the Baza, and unable longer to resist the temptation, I threw my rifle up to my shoulder, and aiming at the back of his majesty's bushy head, fired.

The bullet had found its billet, penetrating the brain, and the fine beast fell motionless on the strip of pebbles which he had reached on his way to the island from which he had come. The lioness and her cubs, who were also making off, stopped for an instant, and going up to their fallen relative, sniffed round his dead body in a pathetically forlorn and nervous manner, and then, evidently understanding what had occurred, and filled with apprehension for themselves, bolted rapidly towards the island, where they disappeared.

No sooner did the whole audience of scavengers who were waiting hard by perceive that their great and dread enemy was no more, than they one and all hurled themselves on to the carcass, bent on completing the devastation they had com-It was undoubtedly clear that these creatures had never been shot at, for instead of rushing off at the sound of my rifle, they had not evidently even associated it with the fall of the lion, and had neither retreated nor hidden them-But a very short time, however, was allowed them for their work, for my surmise that the noise which had alarmed the lion was caused by the approach of my camels proved correct, and very soon I distinctly heard the soft pit-pat of the dromedaries on the loose sand. In a few moments more my hunters and guide were on the spot, and every quadruped at once slunk away; while the birds all flew up to the trees on the margin of the bank, eagerly watching for an opportunity to return.

My hunters—good fellows!—remembering that I had fasted since the early morning, had brought lunch for me, which they immediately spread out at the foot of the tree; and having descended from my somewhat cramped position, I was soon in the enjoyment of cold roast guinea-fowl, biscuits, and black coffee. My appetite appeased, I related the account of my solitary vigil, which they were all eagerness to hear. They warmly congratulated me on having bagged so fine a lion, and each one taking hold of a huge paw, they drew the body into the shade.

Meanwhile more men and camels from the numerous little camps of Hamran Arabs that had been pitched near to mine had arrived, and the work of cutting up the elephant commenced. The skin was removed in quadrangular pieces three feet square, the thicker part to be made into shields, and the thinner into sandals and sword-sheaths. The flesh was taken off in strips two or three feet in length, and laid on bushes cut down for the purpose, to prevent it from touching the sand, being ultimately tied in bundles for transport on the camels. The mode of procedure was in all particulars the same as in similar cases when an elephant has been secured. When the camp was reached the bundles were untied, and the strips of meat were thrown on to the thorny bushes of the zareba, where they were left till they dried. Before cooking, this jerked meat was pounded to make it tender, and the greater portion was then boiled down into a thick, nutritious soup, which was either taken by itself or as an adjunct to the porridge called lugma, which is made from durra. Nothing of the carcass was lost. The fat, of which there was a large quantity, was carefully collected and boiled down to be used as a substitute for butter, and the bones were used as fuel, burning fiercely to a white ash.

Everything was done with the utmost order and in a business-like manner; and when all was completed the camels were drawn up in line and lader with the spoil, one camel carrying the tusks (which weighed nearly one hundred pounds) and some of the heavier pieces of hide. Before setting out again for the camp the men asked permission to adjourn to the biggest pool for a bath, and in two minutes were in the water, splashing, swimming, and diving as the hippos had previously done, appreciating the luxury of cleanliness as fully as any European would, and far more than many do!

The return journey was accomplished in little over an hour; and as we neared the camp the women came out to welcome us with the zagharit, or cry of triumph (the el-elta of the Abyssinians), with which they often greet those who return successfully from

battle, foray, or chase.

WITHOUT DECLARATION OF WAR.

Le Plan est parfaitement résolu, concerté, mûri. - P. Fontin.

HE sentry yawned. It was exceedingly hot, and gate-duty was very monotonous. It wasn't like being 'on the gate' in barracks, where all sorts of people came to ask questions and go in or out, and there was an

occasional chance of parley with a pretty girl. For his own part, he couldn't see what use there was in being there at all, except that there was a fort inside those high spiky railings. There wasn't anything particular to look at—just the wind blowing and the grass growing; the sandhills were supremely uninteresting and monotonous, and looking at the sand rippled by the hot breeze and the grass nodding only made one feel the more thirsty. Besides, sand reflects the sun with peculiar efficacy.

Inside the railing the battery, a grassy mound, a sort of dumpling culminating in a couple of long guns—at close quarters heavy monsters, a little way off looking merely like long, thin, dirty things. They stuck over the top, pointing in a kind of helpless way towards the sea—a sea dotted here and there with boats, between which an occasional 'ditcher' flumped its smoky way. In the distance the confused mass of Falport, and some battleships lying at anchor both equally gray and ugly.

The 'dumpling,' like most such, was hollow. Indeed, though it might seem a mere mound of earth, it enclosed quite a fair-sized parade-ground; and ranged round with military neatness and symmetry were the casemates destined in war to become barracks, now sparsely tenanted by picks and shovels and barbed wire and spiders—especially spiders. Between the guns, sunk in the ground, the magazines and the machinery for bringing up shot and cartridges. Neat and desolate.

The sentry continued his reflections. Relief would not be due for another hour. Occasionally a murmur reached him from the guard-room. The detachment were playing 'house.' There were only eight of them altogether, including the corporal in charge, and it just made a good game, besides having the fascination of being a bit of a gamble. But even 'house' palled after a while. One thing to be thankful for was that the detachment would be relieved at the end of the month. Falport was certainly quite a different story. Falport, as T. Atkins put it, was good business after Barker's Point. A big garrison and dockyard town like Falport is the place to see the British soldier at his best, particularly while the fleet is away. Tommy would have called Barker's Point triste if he had known what it meant; but, having no French, he did not find any great difficulty in describing it with a rather limited English vocabulary. 'Ontont cordial,' which was his limit in the direction of French, called up misty recollections of a time when organised 'tamashas' took place by day, and

the evening was apt to dissolve itself into one long and glorious orgy.

They all seemed to have gone asleep inside the guard-room, and the sentry was feeling rather bored himself.

And yet it was but a little way to where Yo Harna was giving final instructions to his men. Yo Harna was nothing if not methodical; that was the reason why he had risen to the top of his peculiar profession. Perhaps his greatest personal advantage was that of being quite undistinguished in appearance; in fact, in this particular case he had been up till recently filling the position of a waiter at the Southcombe Hotel, and when you think it over you see that a waiter has quite peculiar opportunities, if he keeps his eye open and his ears alert, for seeing and hearing about many useful things. Waiters often travel a long way abroad too, sometimes to learn languages, sometimes to earn money, sometimes to get away from their own country. Yo Harna had been quite a good deal in South America—quite professionally and generally busy; he had also been in the Dutch East Indies and the Philippines, all in the way of business; but he didn't talk about these things to customers. Customers sometimes did remark that the headwaiter seemed rather a superior man, and quicker than most of these foreigners; but it usually ended with that. Actually, so far as I have been able to ascertain, he had not originally come over on business at all. But he always had an inquiring mind, and Falport had interested him-so had the position of Barker's Point. In fact, his walks round Falport had led him to study maps and even charts a good deal-in these seaside places every one takes some interest in sailing-but that was before he became a waiter. Finally, he had taken a ticket to the Continent. Yo Harna was one of those rare men who never seem to find any difficulty about getting access to the people they want to see, and this time it was quite an exalted person whom he went to see. Mind you, I don't know what passed; but there is no doubt that his project was received with approval. There is much in reading the political horoscope aright and appearing at the psychological moment. Guy Fawkes might have been a great man if he had not let himself be caught.

So it happened that one fine day, a few days before the events I am relating, a telegram came, and our friend gave up his situation.

There were his men—not a very striking-looking crew; indeed, a first glance might have led one to think them a party of harmless excursionists or one of those strange brotherhoods, like the Amalgamated Beetles or Independent Rovers, who permeate the country and leave a slight but well-defined track of empty beer bottles along the route

of their summer outings. They had, indeed, tin cases and haversacks that might have held provisions; but they were no peaceful excursionists. They had been together many times and on many strange errands, and this time it was perhaps a little more desperate than usual. The leader folded up the plan he had been explaining as he gave his final orders, and looked at his watch. Now!' he said.

It is quite easy to overpower and gag a sentry when you know how and have had a little practice. From a study of parliamentary debates one may ascertain that a surprise is not considered the orthodox way of commencing war; but I suppose surprising a sentry would be such a small thing as hardly to count. The sentry was gagged and disposed of. So far good. Yo Harna had made his first move.

Yo Harna had, in fact, taken in hand a difficult, one might almost call it a delicate, job, except that it seems almost absurd talking of delicacy when it is a matter of handling big guns and of starting war, and England has such a constitutional dislike

of anything to do with war!

Once inside the battery there were still the guard to be tackled. I must confess I am not very clear how that was done without any shooting. There seems to have been a bit of a mêlée and a certain amount of bludgeon-work; but experience is everything, and there was no contretemps except that one man succeeded in getting to the telephone before he could be stopped. That cry of 'Help!' and the gurgle following it, must have puzzled the man at the exchange a bit; but he heard no more: the new-comers took good care to disconnect the instrument.

One of the best ways to keep obstreperous men quiet is to peg them out; it is not exactly enjoyable for the patients, but it makes them quite safe. At the foot of the grass slope behind the guns there was plenty of room, and there was no risk of any noise they might make giving any trouble.

It had all been thought out beforehand; the men distributed themselves to their several duties. And sooner than you would think all was ready for what was to be a surprise, and a big one, to the British nation.

Major Percy was walking along 'the front.' He had just left his office, where he had spent what he called an 'ink-sling' morning elaborating an argument to prove by logical calculation that the number of men allotted to the garrison was insufficient for the work pending mobilisation. 'All very fine,' he murmured to himself; 'but no argument will convince a Government that has set its heart on economy. They'll only say that one must make the men do double duty, or some-

thing really practical like that!' A dapper little man this Percy; no butterfly for all that, but one of the soldiers of the new

school, who are neither plain fighting-men nor mere theorists, a man who has begun to see what a complicated thing modern war is. He was Staff-Officer for Defences, and the trusted deputy of the General, who had great faith in him, and often said, 'I'd never be able to go on when the day of Armageddon comes without a man like Percy. Why, he carries all the defence scheme in his head, like a portmanteau; and, indeed, if the gallant Major's head did not outwardly resemble a portmanteau, it was certainly well furnished.

Percy, however, having left his office, was wondering whether it would be safe to go home now and let things slide for the afternoon. 'These fussy Generals have a way of springing things on one, he thought; 'but I'll risk it.' There would be no one in the headquarter-office that afternoon, certainly; but the head-clerk could send him any wires that might come in, and the General had said something about being busy-which meant, sagaciously opined Percy, that the General intended going to a certain garden-party. Staff-officers often get to know a good deal about their Generals, and General Tarkington did like to shine in society now and then. After all, a General does give tone to what might otherwise be a mere seaport!

The Major passed on to the Esplanade. It was fine and sunny. If he went home he would be rather early for lunch; indeed, he might meet his wife on the way. But, on the other hand, a stroll on the Esplanade might mean meeting other people. There was no hurry. There on the sands were children digging ditches and throwing up sandcastles—surely the fortification instinct is strong in man; in mid-distance the glittering sea dotted with boats and a steady stream of shipping going out with the tide; farther off, half-distinct in the

haze, was the other side of the bay. In his mind he was running over his calculations. The spread of the defences from where he stood to the forts over there was a longish way. And even as his eye wandered idly across the bay a dull sound assailed his ear, and another. Firing somewhere! That was the sound of guns. He did not remember any orders about practice to-day. No doubt it was some old programme unfinished; and yet-he looked at his watch: one o'clockthere was something curious about it.

'Ah, Major Percy, how is it that you of all people are idle? I thought you were always busy. Come, you must join me, and tell me all about it.

Resistance was no good. Mrs Pennington was not to be gainsaid, and it was but a weak excuse to say that the sea-wall was a good place to think out

things, as indeed it is.

'No, it's no good your pretending, Major. You know quite well that those defence schemes you are so mysterious about are just a waste of time. Now, I myself could tell you lots of things happen ing in this garrison you know nothing about Not quite in your line, you say! You don't take me in that way. Why, you men are the greatest scandal-mongers of the whole place.'

Mrs Pennington was very nice, but her conversation really didn't mean anything at all; it could be safely allowed to go in at one ear and out at the other.

'I'll bet you a pair of gloves I know as well as you do who are firing those guns this morning. It's too bad of them, too, just when I want to wear my best frock this afternoon. They're sure to bring down the rain.'

Percy started a little. 'No, Mrs Pennington; I confess'—— he was beginning, when another voice intruded. It was a hoarse and business-like one, and proceeded from a red-faced orderly who had ridden up on a bicycle. 'Message for you, sir,' it said.

'Telephone message has just come up from the dockyard that shell, apparently from the direction of Barker's Point, has fallen in the erecting-shop. Have informed O.C. Southborough, and am asking for further information.'

'Go back and tell the Sergeant-Major I have got the message, and will give instructions. I'll telephone from the fort. Tell him to send a message to the General at once.'

The Major, as he spoke, was walking rapidly towards the fort. He brushed past the man at the gate, who pursued him with a book to be signed, and made straight for the telephone-room.

Telephones are proverbially irritating machines, and military telephones are rather worse than others; but this time—perhaps it was the tone in which the exchange was addressed—Southborough was got into connection with commendable promptness. Then a further delay while search was being made for the Colonel, who—good, easy man—had gone to lunch. Percy did not fume over the delay. He was speculating a little and making up his mind; but that didn't take long. He had been accustomed to making up other people's minds for them, and a little practice at that makes your own decisions fairly rapid.

At last Colonel Swiper was at the instrument. 'You have had a message from the office already, Colonel.'

'Yes; only got the wire this instant. I don't understand what it means, except that they've had an explosion at the dockyard, or something. What have I got to do with any affair like that?'

'You don't seem to have got the message right. I make out that some one's been firing shell into the dockyard from Barker's Point. I don't know what it means; either they've gone mad or some-body that oughtn't to be there has got possession of that battery. We can't stop to argue. Anyhow, the battery's in your war-command, and if anything's gone wrong there it must be stopped at once. I can't get at the General this moment; but I should say you were justified in sending a strong armed force to investigate.—Good heavens! here's

another message to say that more shells are falling in the dockyard. Can you hear the firing?

'Yes; we thought it was some extra practice. I tried to telephone and ask, but couldn't get through. How many men shall I send?'

'I think you'd better march off a company as quick as you can get them served out with ballammunition; and send an experienced officer.'

'I'll go myself,' said the Colonel.

'Prothero, you will go in front with the advance-guard,' said the Colonel. 'I'm afraid something is very wrong at the fort yonder. I don't know what to think; but either the men there have gone mad, or there has been some treacherous business. There, did you hear that shot? Push on as fast as you can, find out what's happening, and send back and report as soon as possible. We're taking the Maxims with us.'

'Oh, that's all right, Colonel; you know we can see right into the place from above where the road comes out of the plantation.'

Lieutenant Prothero pushed off his little party smartly. It was but ten men and a sergeant. One man was left a bit behind to form a connecting-link with the main body. The guard proceeded rapidly down the road. For one thing, the country was too close to spread out, and for another there were so many cottages and so forth about here that any strangers would surely have been noticed; but Barker's Point was more isolated among the sand-hills.

The young officer reflected as he walked along with his men. He had only a dim idea what the game was. It might, after all, be merely one of those sham schemes the General was so fond of, of which he was wont to make so much in his reports, 'laying it on thick,' as his subordinates used to remark, 'about the keenness and intelligence displayed by the soldier.' Prothero wondered how long this excursion would take. It was particularly annoying when he had been reckoning to bicycle off and see some one rather particularly, who, he believed, was looking forward to his coming. Indeed, it wasn't until this turned up to prevent him from going that he realised what a disappointment it was. He hoped she would believe he had done his best to come. Still, there was more in it than an ordinary 'surprise party;' it was carrying things a bit far to take out ball-ammunition if it were only some manœuvre they were playing.

Something of the same sort of speculation was passing through the minds of the men. Thomas Atkins, having got over the annoyance caused by a sudden parade without a decent interval after dinner, was indulging in inquiries as to how long it would last.

'Tell you what, Bill, this 'ere's going to culminate in a Grand Display of Fireworks and Illuminations on a Scale never before Attempted'—he was quoting from a recent advertisement. 'S'pose it means we shall find ourselves on the ranges at the

end of it, just to see what sort of field-firing we can make after 'avin' marched in the dust in full kit directly after dinner.'

'Garn, ye cuckoo! this 'ere don't lead anywhere near the ranges. I guess we're goin' to fire at a floatin' target just to show if we can't beat the navy at their own game. It's a dry old game, my boys, too. There ain't no beer promisc'us-like in this country.'

The country began to open out a bit, and an extension of the front put an end to the murmured conversation. Prothero called the Sergeant to him and gave some instructions. They were to halt just inside the plantation above Barker's Point Battery.

The firing was going on steadily, if slowly; almost at regular intervals came the bang of a gun firing, and one could mentally follow the buzz

of the shot as it whirled away in the air. The men were halted now, just in the halfshadow of the edge of the plantation. The Lieutenant crept forward quietly through the thick bracken, and emerging, saw below him the neat slopes of the battery among the sandhills, a sort of oval mound, hollow in the middle, with its two big black guns pointing away from him. It looked so close that he might almost throw a stone into it. There were the men clustering round the guns, silhouetted against the glitter of the sea, loading, aiming, traversing, and the group-commander walking up and down the parapet between, looking through his glasses now and then. It was all much as he had often seen them at practice.

They were training the guns at something; he couldn't see the target. Surely they were traversing very far over to the left. They couldn't mean to

fire that way.

Boom! From where he stood behind the battery he could follow the shot's progress. There was no doubt about it. The firing was aimed at Falport! It was an enemy!

Of course it was sheer madness. It was running into the lion's jaws; but I think we can understand it. Forgetting how far he had pushed on beyond his men, young Prothero dashed forward with a sort of war-whoop.

'Now, my boys, let's scupper these foreign devils!

But there was a long piece of open slope to cover before even reaching the gorge fence.

Yo Harna had seen rushes before-rushes by fierce savages who believed that to die fighting was to gain Paradise, rushes by desperate men who would cheat the gallows if they could; this single-handed dash amused him a little, for he had learned to handle a 'gun' in the West. and there it doesn't do to miss. Besides, every minute gained might mean so much more of his work done.

Prothero fell at the second shot—a limp bundle of khaki, just a young life ebbing out on the dusty grass; the first casualty of the day. It was ill to

interfere with this silent man, unless you were a long way too strong for him.

The foreigners had had it all to themselves so far. An hour or so uninterrupted in the battery had enabled them to loose off quite a number of shots and secure a pretty good percentage of hits, better even than they had reckoned perhaps, for a dockyard is a good big target to shoot at, and ships under construction or there for repair are helpless enough. Moreover, in war anything which delays the preparation or repair of ships may just make that difference in keeping a fleet on the sea which counts for so much—which counted for so much.

But retribution was to come quickly. If the leader of the advance-guard was to lose his life through undue haste, there were others more wary in his wake. Long-range fire to which you cannot reply is very demoralising to gunners, and Yo Harna knew it. He saw that the time had come to try and steal away as quickly as he could. Their task was done. It now rested with others to follow up on sea the initial blow dealt on land. But it was too late. Sell their lives dearly as they would, there was no passing unscathed through that gate by which they had so cunningly got in. The fence all round was everywhere equally effective an obstacle to egress as to ingress, the main body was closing up on the advance-guard, and a steady fire from unseen men in the bracken was directed on anything that showed. A lucky shot winged their leader. The troops, under the direction of the Colonel, were drawing near by degrees, one portion keeping up the fire while the other advanced.

But why tell again in detail the story of that day, obscured though it has been among greater matters, or recount again how the raiders were cornered like rats in a trap, and rats which bit till the last? War is war.

Yo Harna's name is forgotten perhaps. Just so has been the name of many a man who has laid the match to a mine, and gone up with it himself; but the day has not been forgotten on which the guns of Barker's Point were directed across the anchorage they were placed to guard.

COUNTERFEIT.

SHE seemed a thing of witchery and grace, Her sweet eyes smiled upon me day by day; If I was sad, she sighed; and was I gay, Her laugh brought lurking dimples to her face. If I would go, her soft voice bade me stay; And harmony so sweet betwixt us seemed That, on a day of which I long had dreamed, I told her, trembling, all my heart would say. Ye gods! can falsehood look enchantingly, Can lips so lovely utter such deceit, And Beauty stoop to play so poor a part ! Beware, ye fair ones, in your vanity! For I have learnt the art of counterfeit, And bear no pity in my wounded heart. V. CRAIGIR HALKETT.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, July 20th. | what

LK everywhere at this season of the year seems to turn quite naturally and easily to the subject of holidays, and where and how to spend them. One point that is suggested to the listener to much of this talk is that

the seaside is going out of fashion to some extent. Ten and twenty years ago no holiday was complete without the sea; but since then what we might almost call the excess of civilisation from which we are suffering has, as by a revulsion of feeling, turned the minds of many people, and particularly those who have to work for their bread, towards the desire for simplicity—towards simple Nature. All those whose business or whose pleasure gives them the opportunity of coming to a sure knowledge of such matters will tell you that not the students but the ordinary workaday people take far more interest in simple nature-matters—the fields, plants, animais, and birds-than they used to do. You do not hear so much of the seaside bungalow now as of the country cottage. The coast everywhere has been made too 'towny' and too artificial. Holidaymakers who go to the seaside go from one town to another that may be bigger, and that is almost certainly more 'up-to-date.' There are electric trams and motor omnibuses, gigantic towers, great wheels, the latest devices from America for manufacturing queer mental sensations, and so forth ad nauseam. What people need in these days more than anything else is nerve-rest, and they do not get it at the seaside towns that boast of spending two thousand pounds a year in picture-poster advertisements. So they are going to all the quietest little country places that they can find, and the agents will tell you that never has there been such a great demand for country cottages to be let furnished for a month or two, rooms in farmhouses in the home counties and in far-away Devonshire, as this year, while at the same time there are grumblings from the hotel and lodging-house keepers at the seaside places that things are quite bad, and that they don't know No. 504. - Vol. X.

what British people are coming to. This craving for quietness and for the sweet simplicity of Nature for just a few short weeks at the sunny time of the year may not be so pronounced among the people who live in provincial parts; but it is strong in the Londoner, who seems for the last year or two to have been living in a place which has become more and more in the nature of an inferno almost every week. I know many men who, two or three years ago, used to say that they were too wedded to London ever to think of leaving it. Give them the intellectual and social joy of the town, the life, the movement, so that they could breathe and expand! To-day they are no longer in London, but in places thirty or forty miles away. Those that remain are looking forward to the time when they will go also, and in the meantime they are doing their best to preserve their lives as they cross from one side of the street to the other, undertaking much the same risks as they would undertake if they attempted to cross the network of railway lines outside a London terminus, with express trains rushing to and fro in all directions, while they breathe through their mouths to keep from their nostrils the offensive stench of petrol that fills the air all through London. The danger, the noise, the stinks, the hurry: London is not what it was. The police, it is said, are worrying the motoromnibus proprietors and causing them much loss through rejecting newly made cars wholesale because they make too much noise and too much smell. Most people think that they do not reject enough; and if you took a plebiscite of the whole of London at the present time, I have some confidence that a majority would be found who would be willing to go back to the simple, slow horseomnibus, despite all the speed and the convenience of the motor. The motor-bus seems to have arrived at the limit of endurance of the Londoner. He says, 'Enough!' He wants no more science and machinery that make his life intolerable. If he would avoid the pandemonium of the streets, his only alternative is to dive beneath them, and travel JULY 27, 1907. [All Rights Reserved.]

from point to point in London through little pipes into which the carriage holding him fits like the carrier in a pneumatic letter-tube. The air is oppressive, and the electric lights are burning, though a few hundred feet above the sun is shining gloriously on mechanical, petrolised London. It is a terribly wearing life; it is far more so than it was ten years ago, and little wonder that the man of this great city who is thus suffering from over-civilisation is pining now for the green fields and the song of birds and the fresh foods that come to him from the garden and the dairy. He is a mere collection of nerves that tremble at the touch like the wires of a piano. If we continue with the motor-omnibuses and the petrol, and go further in this civilisation, one shudders to think of what the race of Londoners of the future will be like.

Some time since I held some conversation with one of the most distinguished physicians, a man who holds a high place as a Court doctor, and he spoke wisely of the need for the conservation of energy by people who live at the rate that they do in London now; not merely the people who move in high society and for four months of the year make the recognised round of gaiety, but the humbler folk who work all the time. Said this great doctor and keen student of human methods and manners: 'A man works for forty-nine weeks in the year in the City, and works hard, and then he spends his three weeks' holiday in Switzerland, roaming about from place to place, and keeping both mind and body continually at work. He prattles about the benefits accruing from change of scene, and so forth. Thousands of Englishmen do that in the belief that they are doing themselves good. It is a terrible mistake. Holiday-time in the case of such people should be made a special period for the conservation of energy, and the Switzerland excursions have the very opposite effect. How, then, should such people make holiday? Lie in bed all the time! That is the best thing for them to do, and would tend to the prolongation of their lives. Of course they won't do that; then they should holiday as near to that principle of perfect rest as they can.' I believe that there are a few places in the West End of London fitted up specially for the enjoyment of the rest-cure in the most absolute form. The person who is adopting this cure informs his friends that he is going abroad for a fortnight on business; and, having made the necessary arrangements, he simply takes a cab and drives to the rest-establishment, goes straight to bed, and gets up as little as possible during the entire fortnight. He lies in bed all day and all night, eats and drinks, and reads new novels. Courage and endurance of a kind are necessary for a rest of this sort; but its effects are said to be excellent, although at the end of his term the person undergoing the cure may feel the necessity of a week of strong air such as is to be found at Margate, just to put a polish

on his health. Some time since there was a kind of craze among City clerks for spending their holidays as farm-labourers. It is not so well known that some persons who could have afforded to buy fifty of such farms as these did the same thing, with their doctors' approval, working in the fields from morning until night for a wage of fifteen shillings a week. Four years ago an eminent doctor, who was himself suffering severely from nervous exhaustion, derived much benefit from being towed up the river from Staines to Oxford, and forthwith he advised patients similarly afflicted to take the 'towing cure.' Other men have been known to go in for what is called the 'lighterman cure.' For a very small sum one may obtain the privilege of being allowed to work a lighter from Wapping to Lambeth, and it is said that the advantages of this cure are that periods of tugging on the long, heavy sweeps, when every muscle in the body is at work, come in turn with periods of such perfect repose that there is absolutely nothing to think about as the tide swings the hulk along. Such are some of the possible holidays for jaded, careworn townspeople that have been indulged in by the more original among them. We are too artificial and conventional in our holidays, and, save for this present tendency towards the country life, there is an indication that we are becoming more so. The possibilities are dangerous. I heard not long ago, on the most excellent authority, of a French scientist of some note, a member of the French Academy of Sciences, who gets his seaside in Paris, so to speak. He does it in this way: In ten volumes of oxygenated water, containing a hundredth-part of ether charged with ozone, he dissolves two and a half hundredth-parts of sea-salt He distributes this liquid all over the room by means of a vaporiser at the rate of one hundred and twenty grammes per hour. The atmosphere of his apartment is said to become saturated with the scent of the sea, and a draught through the rooms thus permeated produces 'exactly the sensation of a briny breeze.' The scientist whiffs it as he is seated in an arm-chair with his eyes closed, and listens to the lapping of the waves, while he breathes their odour, achieving this end by holding to his ear one of those shells from the shore in which can be heard the faint echo of the sea. This savant has been known to observe that it would be absurd for him now to go to the trouble and expense of spending the summer at such a place as Trouville, when he can enjoy the seaside at home in his Paris flat!

There is one section of the community who will not enjoy their holidays as much as they have done aforetime—or who would not do so if they always took things as seriously as other people, and this they are not credited with doing—and that is the

section whose life centres round the Stock Exchange There seems to be no ending to the financial de-

pression that has prevailed for so long. First-class securities are amazingly low, and are going lower; those who hold them are smitten with a great fear, and are being led to sell and to cast them lower for other people; nobody is buying anything to speak of, and the middle-class speculator who has been one of the chief bulwarks of the Stock Exchange is almost extinct. Everybody is suspicious. There is felt to be enormous risk in the present position, and nobody is inclined to add to the risk to the extent of buying a hundred pounds' worth of shares. So there is little work for the jobbers and the brokers. Some of them fail and are 'hammered;' others try to kill care away from the City on their golf-links or in their motor-cars -for it is one of the mysteries connected with the Stock Exchange man that when things are at their worst with his business his outward appearances of prosperity are little, if anything, below their best. The life he leads trains him to an enduring optimism. A few years ago he was able to thrive on his commissions from clients' dealings in African and other mines. Now the man who would touch a gold-mine share is regarded as being either mad or engaged in some devious kind of trick with which other people would prefer not to be associated. Not merely the failure of South Africa from the point of view of a mining boom, and the general depression, are responsible for this state of things which hits the Stock Exchange man so hard and makes him fear the settling-days. Another reason, equally as potent, is that the general public feel that, to use a colloquialism, they have been 'had' times innumerable by those financial leaders who are generally referred to as 'the big houses,' that markets have been rigged for the purpose of deceiving the small speculator, and that these small speculators have been cheated over and over again, and have paid their differences too often into the pockets of organised gangs of riggers, whose smallness of moral sense is held to be equalled only by their sublime but ignorant belief in the permanent gullibility of the people. But all this apart, it is the prevailing impression among the most intelligent financiers that the fear that is almost universal of impending and sweeping changes in legislation in the direction of Socialism is at the root of the depression, which affects not only the Stock Exchange and the people who have direct dealings with it, but to some extent almost everybody who is engaged in any kind of trade or business. Go into any of the shops in London and become engaged in intimate talk with their heads, and you will be told that they yearn for the time when things will be better on the Stock Exchange, and in a simple process of reasoning as to cause and effect, these people come to the conclusion that the Socialists and those who support them are greater enemies to the welfare of the community than they have hitherto been considered to be, and a feeling is strengthening against them which will need to be taken seriously into consideration by

politicians and Ministers in the future-more seriously than it has been. The more or less passive attitude of the man in the street towards the Socialist is being cast aside. Faith in the most solid institutions is coming to be shaken. Consols will not rise, and it is said that the shrinkage of capital on first-class securities during the last ten years ranges from 20 to as much as 40 per cent. It is the same everywhere. The French Rentier, fearing the income-tax it is said, is selling out, some in London, and reinvesting his money through his brokers in Geneva or Lausanne or in Holland, preferring to endure the inconveniences of collecting his dividends across the frontier rather than endure the new impost. Socialism hangs like a black cloud over the whole world of commerce and finance. Strong and brave men are needed who not only realise the danger, but are prepared with energy and means to combat it.

* * *

Somehow, the South Pole does not seem to count for so much in interest with the general public as the North Pole. Most people have a knowledge of what has been done and what is projected in the way of attack upon the latter, and they regard these attacks as a kind of high sport, as indeed to some extent they are. Great authorities upon polar exploration have said that so far as advantageous knowledge is concerned we really need not trouble any more about the Arctic, as we know all that is worth knowing about it, or nearly. Thus Sir Clements Markham has observed that the geography of the Arctic regions can now be studied and understood, after gallant and persevering attempts to obtain the information which have occupied three centuries. Sverdrup placed the last stone on the last pinnacle of the edifice of Arctic knowledge. It is, said Sir Clements, in this completion of the work that the great importance of Sverdrup's discoveries consisted. He forged the last link. There are interesting bits of work to be finished in places, 'but the work of centuries is finished; and we may now turn to the other and still unknown polar region, with the glorious cry of Southward Ho!' In such circumstances it is for some reasons a little unfortunate that the public, having been trained to affection for the North Pole, and being steeped in the romance of the pursuit of it, particularly by such tragedies as that of the balloonist André, fail to be properly attracted by that cry, for there is undoubtedly work of great scientific value to be done in the Antarctic-work which, if well accomplished, may result in substantial commercial advantage. I was closely interested, unofficially, in the British National Antarctic Expedition that went out a few years since under the command of Captain Robert Scott in the Discovery, and which, under enormous difficulties, accomplished splendid results; while, as a mere tale of daring, endurance, and adventure, there is nothing in the whole of the literature of

exploration that is more deeply interesting than the commander's record of that enterprise. This was more or less in the nature of a pioneer expedition. Others had been made before, but none in recent times organised in any very thorough manner, such as this one was. Captain Scott penetrated farthest south, but he had to cease his onward movement when still some hundreds of miles from the Pole, though the going, so to speak, was not by any means so bad as might have been expected, consisting largely of level plains of frozen snow. So far as could be seen there was an open road to the Pole; but it was not part of the original programme actually to reach it, and the means of traction that were available were insufficient. These means consisted entirely of dogs, which gave out rather badly towards the finish of their work. When I had had an opportunity of studying the official reports of the circumstances under which the sledge-journeys were made I could not help thinking that motortraction might be of immense service in undertakings of this kind, and the suggestion was made to Sir Clements Markham, who was the father of this expedition, while I published an article embodying it in a leading London journal. No doubt the same idea must have occurred to Captain Scott when he was engaged in his southern progress. With all the advantage of the experience gained on this

expedition, a new one is going out this autumn under the command of one of the chief officers of the other, this being Lieutenant E. H. Shackleton; and it is particularly interesting to hear that it has been definitely decided to employ a specially constructed motor-car, with the object of reaching a much higher latitude than was or could be attained by the use of dogs and sledges. The experiment, in which Mr Shackleton has great confidence, is a deeply interesting one, and I believe that the commander of the new expedition is not unhopeful that, if no worse conditions are encountered than those with which they had to contend on the last expedition, he may even reach the Pole itself. In the matter of general public interest to which I have referred, the last expedition was considerably hampered by want of funds, or rather, one should say, would have been if it had not been for the strenuous efforts made by Sir Clements Markham while it was in the middle of its work. The expenses of the new expedition, it is understood, are being guaranteed by friends of Mr Shackleton. Other nations will at the same time be directing efforts towards further Antarctic exploration, and thus there is some international competition in the matter, and all the more for this reason the progress of Mr Shackleton should attract the close attention of all at home.

THE HEIGHT OF THE OCCASION.

By SAMUEL GORDON.

CHAPTER I.

ETROV PETROVITCH had been married for over three years, but that did not prevent him from being still very fond of his wife; and therefore he noticed with great and

growing disapproval that she smiled rather significantly at the red-whiskered gendarme, and that the red-whiskered gendarme smiled still more significantly back at her. Petrov had little faith in his own powers of argument, and knew it was useless to attempt to make his wife see reason; and therefore he felt convinced that his only chance of restoring his domestic equanimity was to approach the gendarme. For some time he pondered how that could be done most expediently, until he bethought himself of the rusty old musket which lay stowed away in his lumber-room. The musket had been in his family for nearly a hundred years, having been left behind with them by one of Napoleon's soldiers on that murderous march from Moscow. Petrov polished it up, oiled the lock, and found that the weapon was still in perfect working order. That was how he would argue with the gendarme. In these troubled days of alarms and excursions, with the whole district practically under martial law, anything might happen. A gendarme more or less would make no difference. So, one very dark night, Petrov took his musket, ambushed himself in the very dark doorway of an empty house near the end of the town, where he knew the gendarme had to pass, and waited to see what would happen.

In contrast to the blind windows of the empty house, those in the first story of the large tenementdwelling farther up the street showed brilliantly illuminated. And there was every good reason for that; for on this same night Tania, the only daughter of Leib Gutmann, was being betrothed to Shaya Sheratz, and there had been no such great event in the town ever since the new rabbi had been installed. Much had been expected of Leib Gutmann on the occasion, but his efforts surpassed all expectations. The rejoicings had started at four in the afternoon, and now at ten o'clock the enthusiasm of the guests showed no abatement, and the store of good things seemed unending. No; something was running short, and that was the musk-brandy, of which Shaya's father was so very fond. Tania, demure, blushing, quivering from head to foot with the excess of her happiness, noticed it with one of the rare sidelong glances she darted at her enraptured lover. What a misfortune her Shaya's father to go without his favourite beverage! That must be remedied at once. But

how? Easily enough. Why, of course, there was Gimpel. She looked round for him. There he was, right in the thick of the guests, bubbling over with mad merriment, abandoning himself in a very transport of exultant joy. The dear, faithful fellow! Tania's eyes filled with tears. What a red-letter day this must be for him, to know his master's child entrusted safely into the hands of the man of her heart! Presently she caught his eye—it was not difficult, for it was rarely that she did not find him peeping at her—and beckoned him. With a bound or two he was at her side.

'Quick, Gimpel, some more musk-brandy. Run to Granny Gittele's and get another bottle.'

Gimpel's face fell.

'Granny Gittele's? But that's right across the common, and it's so dark!'

'Yes, yes, I know you don't like going out in the dark; but—but you're not going to refuse me anything to-night, are you? Or, if you do'—and she raised her forefinger in smiling menace—'if you do, I won't let you dance with me at my wedding.'

'Oh, I'll go, I'll go; I'll go anywhere,' cried

Gimpel engerly.

'And don't drop the bottle for fright,' Shaya

called after him with a happy laugh.

Half-way down the staircase Gimpel came to a stop. It was not to consider that, being, for all his thirty-three years, nothing but the errand-boy to Leib Gutmann's household, it was only what he should expect, to be sent away from the feast to go and fetch whatever was required. Nor was it to reflect that he was once more, in addition to other innumerable occasions, laying himself open to ridicule for the physical cowardice which, great hulking fellow though he was, he had never been able to control. He stopped because he was halfchoking with the spasm of pain that racked his heart. It was all very well up there among the fierce whirl of the merrymakers, whose contagious gaiety had made him forget himself for a few moments; but now he was alone, and need wear no mask as he stood facing his own misery. Oh, God in heaven! was it really true? Tania, his little Tania, now belonged to some one else. He could claim no further share in her. All that was left to him of her were those happy memories of the past, the delightful little secrets they had held in common, the childish pranks she had played on him, the help and consolation she had allowed him to bestow on her in her petty troubles. He might even remember the dumb, half-unconscious adoration with which he had watched her expand into gracious womanhood. But the future promised him nothing. All that her future would contain she would give ungrudgingly to her husband. Not only that, but not even the mere sight of her dear face, the sound of her happy laugh, was to be vouchsafed to him. For Shaya was taking her away to a distant town-Shaya the robber, the interloper.

With a stifled sob, Gimpel stumbled forward on his way. Shaya or no Shaya, he must not disobey

her behest, or else she might really not dance with him at her wedding. And suppose she did not? Then his heart would break, and he would die at once, and that would perhaps be much the best. Ugh, how dark it was, and how lonely the street! No; there was some one coming along. Gimpel recognised the clank of spurs and of a sabre, and his heart sank. He would have to pass the redwhiskered gendarme, who would call on him to stand by, and would clout him. Gimpel seldom escaped the gendarme without a clout. With chattering teeth he crept along towards the oncomer. Now but a yard or two separated them. Gimpel got ready a protective hand, when suddenly a crash and a flash, almost in front of his very eyes, a deep, gurgling 'Dog's blood!' from the collapsing gendarme, and then some one scurried past Gimpel, tumbling him headlong to the ground.

For a few seconds he lay still, for he thought he was dead, and he knew that it behoved dead people to keep very quiet. But presently a sudden stab of horror goaded him to his feet, and with a broken scream he bounded madly away, he did not know whither, but only away, away from the inert mass which huddled so hideously, face downwards, just where it fell.

CHAPTER II.

OR two days and nights Gimpel skulked in the outskirts of the neighbouring forest, feeding on roots and berries, but in reality kept alive and alert by his panic fear and the haunting recollection of the dreadful thing that had happened. What he had to fear he did not exactly know. What he did know was that Petrov Petrovitch-it had not been so dark but that he recognised Petrov-had shot the red gendarme, and he had been there to see him do it. Such a thing could not possibly remain without consequences of its own. Once or twice he had attempted to creep back into the town to find out how matters stood, but after a little way his courage had failed him. But then it was absurd to speak of courage in connection with Gimpel, and Gimpel knew it. On the third morning, however, he saw, to his joy, Mendel Elterkind, the timber-dealer, with his spavined horse and rickety cart, making straight for the forest. Eagerly he ran forth to meet him.

'What news, Mendel?' he quavered.

'News?' groaned Mendel. 'Such news may my enemies hear every day of their lives. A ruin, a black ruin, has come over the congregation. Every one of us that has only a hand and a foot has been arrested for shooting the red pig of a gendarme.'

'Every one arrested!' echoed Gimpel, pale as death.

'They started with all the guests at Leib

Gutmann's party, because it was almost outside his house that the murder happened. Then they took the rest of the street, and finally they laid hands on the whole town. But yesterday again they let most of us go—or else I shouldn't be here, should I?—and only kept a dozen of the young men behind.

'And have they kept Shaya?' broke from

Gimpel.

- 'May Abraham our father intercede for him!' said Mendel mournfully. 'Shaya is worse off than all the rest. There is a black mark against him.'
 - 'A black mark?'
- 'Once, when he was on a journey, his passport was a day overdue. Oh, woe, woe! A cholera has come on us!'

'And what's going to happen now, Mendel?'

- 'Anything may happen. They say at the police station that unless we deliver up the murderer out of our midst all the prisoners will be court-martialled.'
 - 'Mendel, what's a court-martial?'
- 'What! don't you know, you fool? A court-martial is a court-martial—what else should it be?'
- 'I see,' said Gimpel. 'And perhaps they will send Shaya to Siberia.'
- 'If they don't send him farther. May God have pity on him! And now, don't keep me here chattering. A man must make a living, even if everybody else has to die.'

Across Gimpel's dazed brain one thought flashed clear and bright. Shaya was out of the way. They would exile or even hang him. Tania was all his own again. He could now go back to

But when he eventually saw her, it was difficult for him to believe that this was the Tania he knew. All the pretty roses had gone out of her cheeks. Her face was white and hard and strained, and it was in a hard, strained voice that she spoke to him:

'So you've come back. Quite right; why shouldn't you run away and leave us to our fate? What are you to us, or we to you?'

He gazed at her tongue-tied, stiffening in every limb.

'Only, as you did not do your errand,' she continued, 'I must keep my word, and not dance with you at my wedding.'

'T-Tania!' he stammered.

'Because, Gimpel—oh! because I shall have no wedding.'

From Tania's words, and more so from the sudden gush of hot tears which at last thawed her hard, icy look, two things were apparent to Gimpel: first, how much she despised him as a coward; and, secondly, how much her heart was breaking for her Shaya. That must never be. What use to him was a Tania with a broken heart? Tania without her rippling laughter was

no Tania at all. Incontinently and absolutely something must be done to bring the roses back to her cheeks and the laughter back to her lips. The real murderer must come forth, or else Shaya, Tania's Shaya, would be hanged. Of course, the most obvious thing was to go and denounce Petrov Petrovitch to the police. But what use would that be? Was it possible that the word of an infidel Jew would be taken against that of an orthodox Russian? Besides, Petrov could enlist bureaucratic influence on his behalf. A brother of his was a ticket-collector on the railway. No, no, Petrov must be made to serve his purpose in a more diplomatic way.

Gimpel went to his money-box and took from it the eleven silver roubles he had saved. It was safer to keep one's fortune in silver, especially when there were such alarming rumours of national bankruptcy in the air. With the eleven roubles he went to Petrov Petrovitch.

'Petrov, can you keep a secret?' he asked. He knew, of course, that Petrov had shown his capacity for keeping at least one secret; but it was just as well to ask.

Petrov looked at him cunningly through the spyglass with which he was examining the interior of a watch that had just been brought him for repair.

'That depends,' he at last answered ponderously.
'Well, I want to ask if you haven't a shot-gun
of some sort you could sell me.'

What for?' asked Petrov, shrinking back suspiciously.

'Oh, you know, in these days, Petrov, one never knows what may happen, and it's best to be prepared. You also know that we Jews may not buy any weapon from the gunsmith without an order from the police. So we must do it quietly. Come, I'll give you five roubles.'

Petrov's avarice got the better of his prudence, ousting all considerations of detection that might attend the sale of the weapon. Five roubles for something that wouldn't fetch fifty copecks as scrap-iron! Three minutes later the gun and the roubles had changed hands. But Gimpel was not finished yet.

'And now, Petrov, I'll give you another six roubles if you will swear to take oath, should you be asked, that the gun was stolen from you a week

An uncanny feeling came over Petrov. The fellow was mad; there could be no doubt of it. But his money was sane enough. So out came the tarnished old crucifix, and Petrov kissed it, apologising to it profusely under his vodka-reeking breath for disturbing its repose over this transaction with a heathen, and promising it a new coat of gilt varnish for compensation.

Joyously Gimpel went away with his purchase, which he had carefully wrapped up to conceal it from the attention of passers-by, and by devious ways he hurried back to the forest. When he had got there he set himself to dig a hole in the ground

near a crooked elm standing away from the other trees, and in that hole he deposited his musket and stamped the earth down tightly upon it. Then, more leisurely, for he still had to think out several things, he proceeded back to the town, making no halt till he had come to the police station. He drew one deep breath, and then he entered briskly.

'What do you want?' the clerk-orderly accosted

'To give some important information concerning the murder of the gendarme, your Excellency.

'I should advise you not to trifle with the law,

'I'm not trifling. I know who murdered him.'

'Well, who?'

'I did, your Excellency.'

CHAPTER III.

HE next day Gimpel, heavily laden with irons, stood in court before the commissioner of police and the colonel of

the district garrison. The latter was reading in a nasal, monotonous tone from a dossier in front of him, and the gist of what he read was that Gimpel Gimpelovitch had confessed to the murder of the gendarme Stalubin. The prisoner had told his story with an amount of circumstantial detail which left no doubt of his guilt. He had pointed out the spot where he had hidden the gun with which he had shot the gendarme, and had described the weapon minutely. He had accounted for the possession of it by admitting that he had stolen it from Petrov Petrovitch, and Petrovitch had stated in his evidence that he had missed the gun for a week. He had not given notice of the theft to the police because the musket was so old that he did not think any mischief could be done with it.

At this point Gimpel almost laughed with pleasure. So Petrov had kept his word. Although in the place to which Gimpel knew he was going roubles were not current coin, it was a great satisfaction to him to know that he had had his money's worth for them.

'There is only one point I wish to put to the prisoner,' continued the colonel. 'What reason had

he for killing the gendarme?'

Gimpel was taken aback. He had not thought of that question. What should he say: that the gendarme had boxed his ears? That sounded so paltry! Perhaps they would not accept it as a motive, and get suspicious of the truth of his statements, despite all his other precautions and manœuvrings.

'Will the prisoner say what reason he had for shooting the gendarme?' the officer repeated im-

patiently.

'Well, your Excellency, does one need a reason for shooting a gendarme?' Gimpel blurted out.

The colonel nodded, drew to himself a document, and signed it.

'That man shot the gendarme no more than you or I did,' he said in an undertone to the police commissioner.

'And yet you signed-that,' replied the other, pointing to the document.

The colonel shrugged his epauletted shoulders.

'Que voulez-vous, mon cher? The rabble must have a victim. "Blood for blood" is the dictum both of law and lawlessness.' He paused and gave a short laugh. 'That's how these Jews always get the better of us. Their resourcefulness is unlimited. Whatever the crisis or occasion, they usually manage to rise to the full height of it. Look, here they are in a bit of a mess, and at once one of them comes forward and drags them out of it by the rope round his neck. Upon my word, I am beginning to admire them. I certainly admire that fellow over there. He's a brave man if ever there was.'

"Well, couldn't we show him a little mercy?" said the commissioner thoughtfully.

'No; but we'll show him all the honour we can.—Remove the prisoner's chains,' he continued aloud.

Gimpel heard the words, terrified. They had found him out; they were going to set him free. They would keep Shaya after all. He took a convulsive step forward.

'But it was I who shot the gendarme. I swear

'I have not the faintest doubt of it,' replied the colonel calmly. 'And therefore you will be shot at three this afternoon-shot instead of hanged. The execution will be public.'

And surely enough, at a quarter to three, Gimpel was on his way to the common, the common he had so dreaded, and to which he was now going on a journey still more dread. But this time he did not feel afraid. Why should he? Was he not escorted by a detachment with bare sabres and loaded rifles to watch and take care of him, just as though he were a person of real importance? So he held his head up and kept a sharp lookout. Yes, certainly, just as he expected, there at the window stood Tania, her head on Shaya's shoulder.

'You were quite right, Tania; I sha'n't dance at your wedding after all,' he shouted, waving both his free hands at her.

A few weeks later the Imperial Gazette announced that the colonel of the district garrison and the police commissioner had both been decorated for the promptness and cleverness with which they had nipped in the bud a formidable conspiracy by apprehending and executing the ringleader, a notoriously dangerous agitator. Petrov Petrovitch read the announcement, reprinted in the local paper, and chuckled at the absurd roundaboutness of things. He wondered if the colonel and the commissioner would ever know that they would never have got that decoration if his wife had not been a coquette.

THE WONDERFUL 'SIXPENNY.'

By JAMES MILNE, Editor of The Book Monthly.

E may call the modern sixpenny reprint the Universal Provider of Literature. It is countless in number, like the waves of the sea, and—like them also—its vogue goes round the world and back again. It is

the small coin of the realm of books, and hence is it so much in use. Go where you will, you will find a sixpenny edition of some sort to buy or to borrow, even if there is no book bound in cloth within a hundred miles. The 'sixpenny' is as triumphant as it is wonderful, an institution now as fixed as Parliament itself.

What was the origin of this 'sixpenny'? It is very hard to trace a stream to its source, because when you get near there you probably find several trickles of water coming together, almost in a casual way, to give birth to the subsequent river. So it is when you inquire into the origin of the 'sixpenny,' for, as in the instance of Topsy of Uncle Tom's Cabin, it 'grow'd' rather than sprang fully equipped into the book-world. No doubt two influences gave it birth: the cry of people for good reading at a low cost, and the desire of popular authors to be widely read. It was the business of the publisher to bring these two desires into touch, to gratify both by providing an inexpensive vehicle of literature.

There were papers, such as the old London Journal, which had big circulations because they provided fiction of a sort-mostly the sensational sort-'all a-blowin',' as a cockney would say-for a copper or two. Partly that fact may have pointed the way to the paper-covered reprint-great ends being often reached by devious paths-just as the 'shilling shocker,' which is now almost out of fashion, was something of a half-way house on the road. The 'shilling shocker' was a new book as, let us recall, The Mystery of a Hansom Cab. which had a tremendous sale twenty years ago or so; the 'sixpenny' an old one in a new dress. Old lamps for new, a reversion of the phrase! And the flood of magazines was a great influence in the change of things, first by helping to shove out the 'shocker' and the 'yellow-back' novel, then by causing, in turn, a revulsion in favour of the complete book as presented in the 'sixpenny.' You cannot march to a throne without slaughter, and the 'sixpenny' has strewn its triumphant progress with some wreckage. But it took a good long while to win its victory, unless, indeed, this slowness is interpreted as the method of conquering which makes every step of the road sure and secure.

At first, of course, the 'sixpenny' was a reprint of some masterpiece of literature which had been long out of copyright, a story at the disposal of

any enterprising publisher who could put it on the market for a song and still make a little profit. In the early sixties John Camden Hotten published a series of the Waverley Novels at sixpence in a form not very far removed from that in which we know the popular reprint to-day. The venture did well, but still the 'sixpenny' did not take root with the firmness of a later crop. Its second advent in the eighties was in a different form, as a quarto -that is, a paper-bound volume about the size of a copy-book. Folk who have not the disadvantage of extreme youth will remember Lady Brassey's Voyage of the Sunbeam and other popular books which appeared in this quarto form. There was quantity for the money, and there were customers for the reprints; but they faded out of fashion, never, one judges, to be revived, because their size was unhandy. Even the American pirate, who invented the quarto reprint for the reason that it could be most cheaply produced, has long given it up and turned his genius to other ways of pirating. It was a small, a tardy piece of vengeance on him that a few of our publishers should have made a little money here by adapting his idea of the copy-book reprint; or was it merely that the means for providing very cheap books offered no other plan in those days? Perhaps!

Meanwhile the art of printing had, as the phrase is, been advancing by leaps and bounds. New and improved machinery had come in which made it possible to produce popular books at a cost that would have been impossible and would have seemed laughable twenty years ago. Further, the public for cheap books had grown by similar leaps and bounds, thanks to the creation of the English School Boards-Scotland had always had her own excellent system of education-which made millions of potential buyers and readers. It is those circumstances -the extreme economy with which paper-covered books can be manufactured and the constant growth in the army of readers—that have really enthroned the 'sixpenny' on its high seat of the mighty. Its position in literature may be likened to that of the halfpenny paper in journalism, and, in fact, the comparison, if it were worked out in detail, would be found to be very marked.

'Who,' it will be asked, 'reads sixpenny reprints?' One replies, in the Scottish habit—if it be the Scottish habit, which is doubtful—by asking who does not? They are bought by everybody, high and low, read by everybody, and then most readers and buyers throw them away. If you happen to be in a compartment of a long-distance train, just notice how your fellow-passengers are armed with reading for the journey. You will find that the daily newspapers, sixpenny reprints, magazines, and popular journals almost evenly divide their favours. If two

passengers out of six have bought 'sixpennies' at the bookstall, you can see what an enormous sale this means for such literature. It does not matter whether our typical passengers are travelling first, or second, or third class; the 'sixpenny' holds its place from one end of the train to the other. Why, if the guard were not a man vastly occupied otherwise, he would probably be found to have a 'sixpenny' stowed away in that bag where he carries his signal-flags and other chattels.

When people are on a journey they read to make time pass quickly, for entertainment, and this applies generally to all readers of the 'sixpenny.' They get it to be amused, to be diverted, for relaxation; only, there is ever the smaller crowd who read for information, and there the 'sixpenny' has also been equal to the occasion. Many books classical in literature, famous in religious thought, high-placed in the scientific progress of the time, have been printed as 'sixpennies' and have sold widely. Those which have religion, in some form, for their subjects have come next in popularity to stories pure and simple. We live in an age when humanity is curious about the eternities as well as about itself, when men and women are keen for information; and when they can buy, really for fourpence-halfpenny, some work which appeals to this instinct they do it. Probably that work is not thrown under the railway seat, but is taken home and read and again read.

Allowing for that, it is the novel which is the backbone of the commerce in the sixpenny reprint, and there we come to its latest and largest development. In other words, novels which make a great success are now issued at sixpence within a short period of their first appearance. There can scarcely be a popular novel of the past ten years which you cannot buy at sixpence, or, at all events, they are few and far between; the vital point being that a royalty has to be paid by the publisher of such a 'sixpenny' to its author, whereas if it were a case of Waverley or Oliver Twist, or any other master romance of the past, there would not be that extra expenditure to contend with in producing the 'sixpenny.' It is, then, a test of how cheaply the papercovered volume can be put into the hands of the reader that it can bear this charge and still be profitable. The living author who has a popular story issued in sixpenny form could not get less than a farthing a copy of royalty. If he be a big man or woman, whose reputation justifies an edition of, say, a hundred thousand copies, he or she will probably get a halfpenny. Count up a hundred thousand halfpennies and you have a sum which would represent a year's salary to many a hardworking professional man. No book can very well be issued at sixpence unless it is sure to have a sale of fifty thousand copies, and some publishers fix the minimum for a 'sixpenny' at a hundred thousand copies.

It is not difficult to estimate what book will sell as a sixpenny reprint, because there is fairly

precise evidence to go upon. First, you assume an author who has the ear of the reading public; secondly, that the particular book which you propose to publish at sixpence has had a popular success at a more expensive price-has been hallmarked, as it were, by public approval; and, thirdly, you satisfy yourself that the elements of the story are of a kind which will directly appeal to the 'sixpenny reader.' The standing of your author and the previous hall-marking of his book give you a 'jumping-off place,' as was said about the Jameson Raid; but if the 'sixpenny' is to be a huge success its contents must be mixed in the right proportion. And what should these contents be? Well, you must have a story of the elemental human qualities, one that appeals directly to the heart, if need be, rather than to the mind of the reader. You must, in a sentence, have human drama or you will not win the suffrages and the sixpences of the multitude, which does not look for literary style, for fine phrases, for the language of a master of style. It seeks to be touched, to be made to feel, to be given a book which has the throb of living and of life.

The workaday world is ordinary and drab, and folk who live in it want, when they read, to be taken into another world, a different world; only it must always seem human and real. Nobody, not even the nursery-maid, wants gorgeous guardsmen and beautiful duchesses portrayed as if they were paper patterns. Everybody wants real people, the real romance of life; but, if it must be said, they prefer these decked out in a little sensation. Mrs Henry Wood's East Lynne, Wilkie Collins's Woman in White, and Charles Reade's Cloister and the Hearth are three novels typical of the qualities which make a triumphant 'sixpenny.' Or in the region of romance and adventure, take Mr Blackmore's Lorna Doone, which has sold successive big editions at sixpence, and which will go on selling others so long as print and paper can bring the doings of John Ridd into the mean streets of London and Glasgow and our other great cities.

There is scarcely any department of literature which has not been honoured by the patronage of the 'sixpenny.' It has even dallied with poetry, though there the frank confession must be made that it has scarcely achieved a large success. The truth is that the elect, the choice minority, who care for poetry desire to have it in a form which is permanent. The 'sixpenny' in its latest state is not to be despised for its print or for its paper, but the trouble is that you can scarcely hope to keep it in a decent state of preservation. It readily gets torn, and it gets dirty still more readily, and after a little you come upon it in this state and you incontinently fling it away. Good! the maker of 'sixpennies' will say, the salvation of the business, because it is clearing a path for other 'sixpennies; and that is just what happens. You might have a 'sixpenny' put into a cloth binding, and there is one man of our acquaintance who has almost collected a library of modern fiction in this manner.

He admits, however, that he might more wisely have spent the money, such an amount as it has been, in buying the dainty pocket editions, bound in all the which so terms one in the book shore.

in cloth, which so tempt one in the book-shops. Moreover, quite the most recent revolution in reprints is the 'sevenpenny'-'Scotland for ever!'admirably bound in cloth in pocket size, a revelation of the value that can be given for the money. We shall now have to speak of the 'sevenpenny' as well as the 'sixpenny;' but there is a clear-cut distinction between the two classes of book. What you buy for fourpence-halfpenny you buy to put under the railway seat when you have finished with it-the average man does that; what you buy for sevenpence you keep after you have read it, and very well worth keeping it is. The 'sixpenny' is a movable feast, something to be strapped into your portmanteau, while by tradition we place a certain material value on any volume that is bound in cloth, however little we may have paid for it. The position, then, of the 'sixpenny' is pretty secure against all comers, if only because you get back a penny-halfpenny out of sixpence when you buy it -three halfpennies, which will secure as many newspapers. At cheap sales most of the bargains are marked two shillings and elevenpence three-farthings or three shillings and elevenpence three-farthings, and so on, a charming trick which seems to reduce the price in an enticing way-especially to women. So with the 'sixpenny'-the change does it; and for that reason the woman-reader will always have a particular thought for the 'sixpenny.' Ask your nearest bookseller and he will tell you how a trifle of discount appeals to a woman. She may be so far removed from the majority of her sisters as to love books for themselves, and to be willing to sacrifice a little of her pocket-money on them instead of on lace for a pneumonia-blouse. But she remains a woman, and she likes to make a bargain, or, what is scarcely the same, to think she has

made it. The summer is the great season for the 'sixpenny,' although it now threatens to annex the whole year; and why not? It is when the sun shines, however, that it sells most thousands-nay, its millions. A simple explanation of this is that people are travelling more in summer, are going about more, and that they lay in a stock of 'sixpennies' to read when they go on their holidays. In this respect the 'sixpenny' has scarcely been a friend to the little subscription libraries which one finds in seaside watering-places; but then everything is not for the good of everybody even in this best of worlds. The 'sixpenny' was at first resented by the small librarian, and the bookseller was not enthusiastic over it, because he had to handle many copies to make a small profit. To-day the local librarian sells the 'sixpenny' to those visitors who have not provided themselves with it already, while most booksellers sell it by the score, and some issue lists of the books available at the magic figure.

A strange thing about the 'sixpenny' is that it

has, almost as a matter of course, to be printed in double columns, the result perhaps of nothing better than established fashion. It began its reign in double columns, did the 'sixpenny,' and people have grown so accustomed to a divided page that they take unkindly to one printed straight across. This is an instance of the surface prejudices of human nature even in regard to such inoffensive things as books. Do a thing for years on end in one manner and you revolt when somebody does it in another manner, even if the latter plan be better. But there is a second and a practical reason why the double column is all-prevalent in the 'sixpenny,' and that is the question which has cropped up so often of cost. The type of most 'sixpennies' is now set not type by type as in the case of a book, but by the linotype or one of the other time-saving inventions which have come into printing-offices during recent years. Machine-setting, as it is called, is more expeditious and therefore cheaper than hand-setting, and the man who buys his sixpenny for fourpencehalfpenny is deeply indebted to the science of modern mechanics. He has also reason to bless the advances made in processes for illustrating books, for these provide him in many cases with illustrated 'sixpennies.' The pictures may not always be things of beauty and a joy for ever, but at least they are pictures, and not at all bad pictures either, if it comes to that.

Certainly it is the Wonderful 'Sixpenny'wonderful in a hundred ways-and yet you meet people who shake their heads over it, and say it is bringing literature to the dogs; surely a very selfish view. It is better that books should be read in sixpenny form than that they should not be read at all, better that the mass of the people should have an opportunity of making the acquaintance of our masters of literature even in paper covers than that they should never know what those great masters have written. Once on a time the 'man in the street' -inevitable person-only knew the name of our great novelists as echoes, dimly and from afar; while at the beginning of the twentieth century he may buy their books for the equivalent of a tram-fare. Can it be doubted that he often does so even if, as a result, he may have to walk home after his day's work? The Scottish saying about the pursuit of literature on a little oatmeal meant the acquisition of books by a process of saving the pennies until enough had been got together to buy fairly expensive volumes. The sixpenny reprint is a new application of that famous saying, a new pursuit of literature on a little oatmeal. Thanks to it, you can walk in the golden fields of literature even if you be as poor as the proverbial Scotch student of the oatmeal legend. If you can afford to buy well-bound books, do so and thank God; but if you can only afford six pennies' you still have reason to be grateful. They are stepping-stones to higher things; and there we strike a serious note of the 'sixpenny,' as almost a department of the popular education of the country. True, as has been made perfectly clear, the average sixpenny reader is in quest of 'thrills' and recreation; but there is the other reader who, while not indifferent to amusement, is in search of knowledge bound in paper covers at sixpence, less a penny-halfpenny discount.

What, one asks fearfully, becomes of all the 'six-pennies' which are sold in the course of a year in these blest isles of ours? Many go out to the Colonies to brighten homes in the bush and on the prairie and in the far islands of the Pacific. Many more go into the homes of our own rural population, yet more are sold casually in large cities, and the greatest proportion, as has been seen, is consumed by the traveller on land and sea. And what is the end of

all the 'sixpennies' so distributed over the face of the globe, tons and tons and tons of paper and print? It is a weird thought.

One thinks of that sea of darksome fable to which all the wrecks of all the oceans are supposed to be drawn, and in which they sail, ghastly relics of their former selves, until they gradually drop one by one to the bottom—a dead man's sea. Is there such a place, somewhere on the face of the earth, to which the 'sixpennies' go, a Sahara where they are as numerous as its sands, and as lifeless? Or is it merely, and plainly, that they wear out, as clothes or boots do, and so disappear in dust and particles, which the four winds scatter?

RECENT DIGGINGS INTO THE RUBBISH-MOUNDS OF THE LONG PAST.

By SARAH WILSON.

OTHER EARTH has always quietly covered with a green growth the various unsightly accumulations left in rubbish-heaps by her children in the course of ages; and now antiquaries never tire of removing this

beautifying covering and bringing to light from depths below the various articles that were considered worthless and thrown away or abandoned hundreds and thousands of years ago. This is a pastime or pursuit common to the learned of most nations, for we hear of Danish scholars probing and sifting old prehistoric middens, of French antiquaries taking count of bones in caves in France, of archæologists of other nationalities dredging lakes for items from old dwellings upon piles in them, and exploring tombs in Egypt and sites in Jerusalem; and at the present day we are minutely and diligently examining rubbish-mounds in Sparta and in Oxyrhynchus. These last-mentioned tasks may not be crowned with the satisfaction of finding the sandal Jason lost as he went down to Iolcos or those Athene gave to Perseus, or castaway strings from the lyre of Orpheus, or tangled lengths of the clue of thread Ariadne gave Theseus, or other items from the old familiar stories; but the investigations yield actual belongings of the real people we always associate with the old Greek heroes and their gods and goddesses on high Olympus-the people who lived immediately before and after the commencement of the Christian era.

For some years wise and wide explorations have been made by the British School in Athens; and quite recently ancient Sparta has been laid bare, so to say, with the spade, and other excavations have been made in Boeotia and Palaikastro. The visit of the King and Queen to the scene of some of these operations last summer, combined with the world-wide attraction of the revival of the Olympian Games, has brought the interest of this

old-world quest home to us. Professor R. C. Bosanquet gave an account of the work of the past year to members of the School at their recent annual meeting in London, and mentioned the various investigations of the more experienced scholars in different directions. One student has taken two journeys of exploration in Asia Minor, in the course of which he came upon a well-preserved Roman bridge across the river Aesepus. Two others have journeyed through the Greek and Turkish islands, and collected manuscripts, and also took notice of a particular carnival in Thrace that seemed to have in it a survival of the cult of Dionysus. A fourth collected information concerning the development of Greek embroidery, which yielded fresh light upon that branch of art. A fifth has studied the arrangement of Greek drapery. The sculpture of Damophon has occupied the attention of another student, with the result that he has been invited by the Greek Government to help in the re-erection of that sculptor's colossal group at Lycosura. Another inquirer has looked into the circumstances of miraculous cures in pagan and early Christian churches. Many drawings of excavations have been made, plans of buildings made out, and the topography of the battle of Delion ascertained.

With regard to Sparta, it is shown that the modern town is not on the site of the ancient one, which is now covered with a light soil and laid out in gardens and fields, and has a mill-stream running through it, cut from the river Eurotes. When the Romans arrived on the scene after the place had been sacked by the Goths they must have found it without fortifications, for they built a wall round the Acropolis hill out of the materials ready to hand, as the inscriptions on it certify. Portions of this wall indicate its former height and the position of some of its gates. The explorers have been rewarded by finding evidence of an early temple in connection with a building that has

hitherto been considered simply a Roman theatre. Further, some boys playing about the stream mentioned found several small leaden figures, and when this clue was followed up a large deposit of similar items was found about eight feet below the surface. The mill-stream was diverted and about an acre and a half explored. There proved to be two layers of deposits. The upper or later one, to quote Professor Bosanquet, teemed with lead, gold, bronze, and ivory figures, and there was a large quantity of very curious terra-cotta masks; the lower yielded geometric pottery and exquisitely carved ivories, considered to be the work of the seventh century B.C. Some of these ivories had 'affinities' to those found at Ephesus. The little lead figures, from ten to fifteen thousand in number, represent various objects, such as a double axe, a chariot, a hunter, a rider, goddesses, and Pan. The masks are chiefly grotesque, some life-size and some so small as to have been only of use for offerings, and all chiefly remarkable for their large hooked noses, as probably indicating a characteristic in these features of the old Spartans. It is thought likely they were used in mystery-plays in the temple.

Of equal interest are the accounts given by Dr B. P. Grenfell and Dr A. S. Hunt of the explorations at Oxyrhynchus. For five seasons workmen, lately a hundred in number, have systematically opened mounds on this site and brought to light an enormous quantity of papyri, chiefly letters, accounts, contracts, and official documents; till at

last, one evening just at sunset, they came upon a whole basketful of writings of a literary character that had apparently been thrown away out of a scholar's library two thousand years ago. Most of them had been torn up, but there were a couple of scores of rolls containing entire columns identified as belonging to the second or third century. Two of these manuscripts are stated to be works of Pindar and Euripides. A portion of a second classical library was found a few days afterwards, larger in quantity, but more broken up, some of the fragments having but a few letters upon them. This collection includes lines of the works of Sappho, among other poets. The same mound in another part, twenty-five feet deep, yielded first and second century documents, interspersed with literary pieces all too much affected by damp to be continuously deciphered before they are cleaned. Our authorities mention, moreover, the recovery of pages from fourth to sixth century books of papyrus or vellum from a Byzantine mound, among which is a vellum leaf with lines on it from a manuscript of a lost gospel. The fragment relates particulars of a visit of Jesus to the Temple of Jerusalem, when a Pharisee reproached Him and His disciples for not performing the ceremony of purification on entering it, as he had done; and Jesus replies with an explanation of the superiority of inward to outward purity. Some hundreds of boxes of the fragments found in the mounds opened have been sent to London, and more excavations are intended.

SCIENCE AND ARTS. MONTH: THE

EXPLOSIONS UNDER ROADWAYS.

HE newspapers make frequent reference to somewhat mysterious explosions which occur without any warning in the underground connection-boxes of electric-light and power systems. It is usually ex-

plained that an accumulation of coal-gas due to leakage from adjacent gas-mains has been accidentally fired by a spark from the electric conduits. Thus the electric light companies shift at least half the responsibility upon their special enemies the gas companies, and the explosions continue to occur, to the great discomfort and even danger of the innocent wayfarer. However, if a recent discovery is to be credited, the electric companies must bear all the blame themselves for these mysterious accidents. Dr Bassett, speaking before the Society of Chemical Industry, placed on record a case of the production of metallic potassium and sodium by the electrical leakage from a subterranean cable of which the insulation had become faulty. The leakage occurred at a point where the negative cable had been joined, and, according to Dr Bassett, the

electrolysis of the surrounding water containing potassium and sodium salts had resulted in the production of a liquid alloy of the two metals. As everybody knows, either of these two metals will burst into flame if brought into contact with water; and as it is evident that during the electrolytic process considerable quantities of hydrogen must have been formed at the same time, all the materials for an explosion were ready to hand. The inference is that the coal-gas mains are innocent in connection with many of these underground explosions. Electrical leakage through moisture must result in the electrolytic decomposition of the water, and the product must be oxygen and hydrogen gases mixed in the most explosive proportions Given a connection-box or other fitting in which the explosive mixture can accumulate, the smallest spark would precipitate an explosion, and even the spark would be unnecessary if either sodium or potassium in the metallic form had also been produced by electrolysis in even the smallest quantities.

A LEAD-EATING INSECT.

Apropos of the leakage from electric wires supposed to be thoroughly insulated, a discovery is

reported to have been made in Chicago which throws a suggestive light upon the subject. According to a recent number of Popular Mechanics, an innocent-looking little insect has developed an appetite for lead. It is suggested that its ultimate goal is the india-rubber insulation inside the lead; but this implies either an intimate knowledge by the beetle of electrical engineering methods or an eyesight keener even than that which Sam Weller disowned on a historic occasion. However that may be, the beetle is reported to have been discovered in the act of gnawing its way through the lead covering of some telephone wires in a Chicago stockyard; and as it is hardly likely that it would discriminate between telephone wires and those conveying a current of higher potential, it seems probable that this beetle-if, in truth, it really exists-might easily be the cause of fires by destroying the insulation of electric-light wires. Aluminium has been suggested as a substitute for lead in order to resist the ravages of this beetle; but perhaps it would be as well to know something more of the insect and to have its credentials very thoroughly examined before giving way to panic in the matter of insulated cables.

OZONE.

This peculiar gas, whose health-giving properties are vaguely believed in by everybody, bids fair to come into the active service of mankind in hundreds of ways hitherto undreamed of. It is described by chemists as an allotropic form of oxygen. While a molecule of oxygen is said to consist of two atoms, one of ozone consists of three, and this extra atom endows the gas with special and valuable properties. Ozone is willing to cast off its extra atom, as it were, and to revert into ordinary oxygen on very slight provocation. It is thus an exceedingly powerful oxidising agent, whose value is only gradually becoming recognised in a great number of industries. Now that ozone can be produced in very large quantities and at small cost by the action of the silent discharge of electricity upon ordinary air, it may be expected to take a prominent position in numerous arts and industries and in hygiene. An exceedingly interesting and complete paper upon ozone, its properties, production, and various uses, was read before the Franklin Institute in March last by Mr James Howard Bridge; and those who desire further knowledge of this valuable gas are referred to the published reports of the lecture.

ANOTHER USE FOR CONCRETE.

Concrete is one of those things for which new and unexpected applications are constantly being found. The latest application hails from America, where concrete has been successfully used in repairing the breaks in the hull of a sunken steamer, so that the vessel might be salved. The George W. Elder was sunk in the Columbia River, and remained under water for many months. It had struck on a sunken rock and torn several holes in

its iron hull, one hole being thirty-five feet across. The rock projected into the hold through this hole nearly eleven feet, and neither it nor the vessel could be moved. In salving the vessel, the divers built a bulkhead forward of this break and another aft. They then placed heavy canvas over the rock which projected into the ship, and daubed concrete over the canvas until it was heavily covered. A big concrete beam placed across the vessel served to support this concrete dome against the outside pressure of the water. The other and smaller holes were similarly treated, the water pumped out of the hold, and the vessel floated and towed in safety to a dry dock forty miles away. According to the contract, the salvage firm was to receive six thousand pounds if successful, but nothing in case of failure. The wreck had been originally sold for about two thousand pounds, and the cost of the repairs was about four thousand pounds. When the ship was ready for service an offer of over thirty thousand pounds was made for her.

A CURIOUS GAS-MANTLE.

According to a report in a German paper, an ingenious inventor has applied for a patent for an incandescent gas-mantle of a distinctly novel sort. The gas-burner is a modification of the Bunsen type used in ordinary incandescent systems, and the mantle is nothing more or less than an ordinary egg-shell, and its preparation consists merely in making a good-sized hole at each end. The eggshell is placed entirely over the burner, and the flames impinge upon it from the inside, so that it becomes brilliantly incandescent. It is reported that the glowing egg-shell spreads an agreeable and pleasing light. If the results are good, this new method of illumination should be popular, for it is obvious that the mantles can be renewed by anybody with very little trouble and expense, but it is difficult to see exactly where the patentee expects to find his remuneration. The patent is said to be specially applicable to acetylene gas.

THE WELLMAN POLAR EXPEDITION.

Whether Mr Walter Wellman be successful or not in his determined attempt to reach the North Pole by air-ship, the attempt will be memorable if only for the gigantic scale on which all the details are being carried out. The balloon itself is the largest ever built, with the one exception of that constructed by Count Zeppelin. Its capacity is two hundred and sixty-five thousand cubic feet of gas, which gives a total lifting-force of nineteen thousand five hundred pounds. Some idea of what this means may be gathered by glancing at a few of the things which are to be carried to the North Pole and back. The car consists of a framework of steel tubing one hundred and fifteen feet long, ten feet high, and eight feet broad. The bottom or keel of the car is formed by a steel tank eighteen inches in diameter and running its full length, and this tank is designed to contain twelve

hundred gallons of petrol. The motor for propelling the ship is of seventy horse-power, and has a weight of nine hundred pounds. Then there is the weight to be considered of a dozen men and as many dogs, and a sufficient number of sledges to bring the party back again across the ice if for any reason they are unable to return by air-ship. Added to this is some three thousand pounds of food, sufficient to enable the crew of the air-ship to subsist for about ten months on their own supplies. It is calculated that the weight carried will diminish at the rate of about six hundred pounds a day by the consumption of petrol and food, &c., while the loss of lifting-power by leakage of gas should not exceed one hundred and fifty pounds in the same period. There should thus be a nett gain of liftingpower of about four hundred and fifty pounds per diem; and as it is considered a pity to waste the gas and throw away good fuel, arrangements have been made to consume the surplus hydrogen in the motor so as to economise petrol. Mr Wellman contradicts the impression that the expedition made an attempt last year and failed. It was never intended to make an attempt upon the Pole last year unless the preparations progressed so rapidly as to make it advisable. In the course of the experiments various improvements suggested themselves, and it was deemed prudent to take every possible precaution against failure, and to leave the actual journey until this summer.

BORING THROUGH QUICESAND.

In the issue of Chambers's Journal for October of last year a suggested means of tunnelling beneath the beds of rivers was described. The idea was to bore a small pilot-tunnel, and then freeze the surrounding moist sand solid so that it could be worked without danger of the tunnel collapsing from the pressure of water overhead or bursting through the counterbalancing pressure of air within. A similar method of dealing with quicksand has been employed with signal success in the sinking operations at the new Dawdon Colliery, Seaham Harbour, where the main coal-seam has been reached at a depth of one thousand three hundred and seventy-one feet. The shafts had to be sunk for a considerable depth through what was virtually a quicksand. In order to make it possible to sink the shafts through this material, Messrs Gebhardt and Keonig, of Nordhausen, the contractors, undertook the freezing of the ground to a depth of nearly five hundred feet. Twenty-eight small boreholes were made in a circle around the ground to be frozen, and sunk to a depth of four hundred and eighty-four feet, and a double tube was inserted to the full depth of each hole. Intensely cold brine was then pumped down the central tube in each of the borings, and forced upwards through the outer tube, which was in contact with the moist earth. The freezing operation was continued for one hundred and eighty-five days at one of the shafts, while at the other the solid ice was over a

year in forming. The ground around the shafts was maintained in a frozen condition for a sufficient time to enable the shafts to be sunk; and at a depth of three hundred and seventy-one feet, where the sand was first encountered, it was found to be frozen so hard that it resembled hard gray freestone, and blasting had to be employed throughout the deposit.

THE NAOSAURUS.

One of the most remarkable beasts which ever dwelt upon this wonderful globe has been laboriously reconstructed bit by bit by Professor Henry F. Osborn of the Department of Vertebrate Palæontology in the Museum of Natural History, New York. The main parts of the skeleton were found by Mr Charles Steinberg in 1896 in north-western Texas. The arranging of the various portions of the very elaborate fossil skeleton, and supplying missing parts, in the almost complete absence of any reliable data to go upon, was a remarkable achievement calling for the very highest skill. The result is the bony framework of a mammoth lizard eight and a half feet long, having a huge fin-like structure upon its back in the form of immense projections on each of the vertebræ. These projections bear a faint resemblance to the square-rigged masts of a ship, and the weird beast has been christened the ship-lizard in consequence. Science is absolutely at a loss to explain the use of this immense dorsal structure, and only a few wild guesses have been advanced to account for it. The naosaurus was a carnivorous reptile, and judging from his formidable array of tiger-like teeth, he must have been a very ugly customer to encounter at close quarters. He lived-so they say who have studied him-some twelve million years ago. The age of mammals is reckoned as occupying some three million years, in which the fifty thousand years of the age of man is comparatively negligible. It is a wonderful thought that after the lapse of a hundred and twenty thousand centuries this strange creature's bones should have been built up again-probably not absolutely correctly-and mounted for exhibition in a New York museum.

HYDRAULIC AIR-COMPRESSION.

A singularly direct method of converting water-power into compressed-air-power for use in driving the various machinery of a mine is in operation at the Victoria Mine in the northern part of Michigan. Instead of the water-pressure being utilised to drive a turbine, and thereby actuate an air-compressing plant, the water itself compresses the air directly without the mediation of any machinery whatever. In this way much expense of maintenance is avoided and a far higher degree of efficiency obtained. The Scientific American states that a loss with a water-turbine of 10 or 12 per cent. would be remarkably good efficiency, while there would be a further loss of at least 30 per cent. in converting the power into compressed air. But in the hydraulic

air-compressor in question the total loss is said to be only 18 per cent. At a point on the Ontonagon River where there is an available head of water of seventy-one feet, a vertical shaft has been sunk through the solid rock to a depth of about three hundred and fifty feet, where it ends in a vast subterranean chamber. From the bottom of this immense underground cavern another tube slopes upwards to the tail-race some two hundred and eighty feet above. Through the first-mentioned vertical shaft the water pours in headlong torrents, carrying with it myriads of air-bubbles drawn from the atmosphere above through an immense number of tiny tubes by the suction of the stream. As the water traverses the subterranean lake in the cavern the air-bubbles rise to the surface, and the air is trapped in the domed roof of the chamber, while the water flows away up the inclined tunnel into the tail-race above. It will be seen that the vast quantity of trapped air in the chamber is held at a pressure of one hundred and fourteen pounds to the square inch, due to the difference in level of the water in the cave and that in the tail-race. An ingenious device serves to cut off the supply of air at the intake when the pressure in the air reservoir exceeds this amount. The compressed air is led from the chamber through a twenty-four inch pipe to the mine, where it is distributed to the various points at which the power is required. At the Victoria Mine there are three intake shafts, each fed with air by eighteen hundred little tubes of three-eighth inch diameter. When all are working, five thousand horse-power is developed and available for use in driving the machinery of the mine. One great advantage of this system of compression is that the large amount of heat always liberated when air is subjected to pressure is carried off by the surrounding water, so that the system is practically isothermal.

NOTES ON DOMINICA.

From a little book, Notes upon the Island of Dominica, by Mr Symington Grieve (A. & C. Black), we learn that, with its noble forests and temperate climate, it is one of the most delightful and charming places in the world. There are people who, having travelled over the globe in search of health, have found it here at last, and discovered that life was worth living. There is a heavy rainfall, but the temperature seldom reaches ninety degrees Fahrenheit, and ranges from seventy degrees to eighty degrees on the coast. Roseau, the chief town (with a population of about six thousand), is the hottest place in the island, the total population of which is slightly over thirty thousand. Mr Grieve gives information on the fauna and flora, with hints for intending British settlers and the investment of British capital. Blenheim and Picard, the cocoa-estates of Messrs Rowntree of York, are the largest estates in Dominica. Coffee and sugar seem to have fallen out of cultivation; but limes, oranges, cocoa,

bananas, tobacco, rubber, mangoes, and various spices all do well. Mr Grieve writes with high appreciation of the white men settled there, who can of course only develop the island by aid of the black men and their wives and families. There are no dangerous wild animals, although the interior is almost without roads and covered with primeval forest.

LIGHTING AND EXTINGUISHING STREET LAMPS AUTOMATICALLY.

What is known as the Bamag system of lighting or extinguishing gas-lamps simultaneously is being tried at Rochester and Newcastle-on-Tyne, where six dozen lamps have been fitted with the apparatus, which so far has proved successful. The lamps are lighted simultaneously by the simple action of increasing the pressure of the gas for a few minutes as it enters the main at the governorhouse, and they are extinguished in the morning by a similar operation. A portion of the lamps can be extinguished at midnight or at any other time determined on. This pressure gas-lighter is actuated by a gas-pressure wave given from the gasworks by means of the governor or an auxiliary device. It consists of a strong iron case fixed beneath the burner. The case contains a diaphragm, the motion of which is utilised to turn on the gas; the by-pass flame is regulated by a set-screw. is made in Berlin, but the London agent is Mr M. Schwab, 40 Sydenham Park, London, S.E. The system of Dr Rostin of Berlin is in use at Tottenham and Edmonton, and is said to be a success. Messrs Alder & Mackay, Edinburgh, have their system also, and there are several others. An apparatus for a similar purpose has been patented by Mr James Hepburn, plumber, Moffat, which also either lights the lamps automatically or reduces the flame to a small pilot light. Any of these devices, if successfully introduced, would have the effect of rendering the lamplighter superfluous.

THE TOURIST'S INDIA.

Last year Mr Eustace Reynolds-Ball contributed an article, 'The Complete Tourist in India' (page 420), in which he gave an interesting and accurate bird's-eye view of that subject. Now he has published a volume, fully illustrated, with excellent map, The Tourist's India (Swan Sonnenschein and Company), which presents an epitome of all that is most picturesque and interesting in the beaten lines of traffic most affected by tourists. It appears that the fashion of going eastward towards the end of autumn by people of means and leisure, to spend the winter months in India, is becoming more marked every year. It is beginning to take the place, with some, of the Riviera and Egypt, the latter country, although overridden by the tourist, seeming 'intended by nature to be the world's sanatorium.' The Indian season for the traveller may begin in October and last till March. For those in robust health, India-which has an epitome over its vast

continent of all the climates of Europe-is most delightful and profitable, for invalids dangerous, and for quasi-invalids doubtful. The chief dangers to the European, so far as climate is concerned, proceed from chills. The great show-cities afford abundant interest of a historic, archæological, and artistic kind. There is presented in this volume information of the most varied and useful sort. Ideal motoring can be had, and the road between Calcutta and Peshawar of fourteen hundred miles has the finest long-distance cycling track in the world. Travancore also affords good tracks. Mr Ball is sensible on racial prejudices, which he traces to an inherent antipathy between white and black, and a failure to assimilate. A list of authorities is given for the sake of those who wish to read more discursively on the subject. Under 'Babuisms' we have the following: 'A Hindu clerk in a small Indian city had permission to keep two cats to keep down the rats, which were damaging Government papers. The head office at Calcutta received this despatch : "I have the honour to inform you that the senior cat is absent without leave. What shall I do?" No answer came, and in a few days the Hindu sent off this proposal: "In re absentee cat. I propose to promote the junior cat, and in the meantime to take into Government service a probationer cat This clerk, who had learned on full rations." his red-tape lesson so well, surely also deserved promotion!

DUST AND VENTILATION SCREEN.

In these days the dust problem, especially to those who live near a highway with much motorcar and other traffic, is a serious one indeed; and anything that will lead to its mitigation ought to be welcome. Messrs Smith, Fletcher, & Company, of 172 High Street, Edinburgh, have put on the market a dust and ventilation screen which is easily adaptable to any window, and may be inserted either at top or bottom. The fresh air is freely admitted, the force of the wind is broken, while flies, wasps, and motor dust are kept outside. The screen is made of fine mesh wire-gauze, in a metal-bound frame, and, being telescopic, can be adjusted to various sizes of windows.

SEASONING BAMBOOS.

Bamboos play a very important part in the life of the Indian people, being an almost never-failing accompaniment to materials for household furniture. As the majority of the people, the Indian Textile Journal remarks, live in cottages, bamboos have not a little to do with the forming of their thatched or tiled houses. Hence the value of the bamboo is very great. The loss to the people when such an article is made worthless by the beetle is very great indeed. Mr E. P. Stebbing, of the Agricultural Department, has a suggestion to make in order to prevent deterioration in the quality and (what is more) to prolong the life of bamboos. The method has been determined

after performing a number of experiments. His recommendation is that, in order to protect the bamboos, they should be soaked for five days in water and be allowed to dry for several days in a covered shed, and after drying should be soaked for forty-eight hours in common Rangoon oil. Bamboos treated in this manner were used for the field-telegraph posts in the Tibet Mission, and remained unattacked. As the result of the experiments and observations made, it may be taken that the oil-treatment prolongs the effective life of the bamboo by at least two and a half years, which, considering how largely bamboos are used in India, means by the prolongation of their usefulness a large monetary saving.

SUMMER DREAMS.

Sing to me, sweet, of the summer days When we wandered hand-in-hand O'er the gorse-clothed hills by a slumb'ring sea, Dreaming in Love's Homeland!

Sing of the dreams we spun, my sweet-Dreams of a future gay-Where our castles, built in the summer mists, Were ne'er to crumble away!

So we said; and the swallows seemed to mock, As they darted to and fro Where the streamlet slept in the wood's embrace In the green vale far below.

What did we care though the summer world Should laugh at our castles fair! Hope was enough to build the walls, And Love was dwelling there.

Sing to me, sweet, of those summer days Which can ne'er return again; The gray mists hide our castles fair, O'er the hill blows summer rain.

Ere the mists have covered the vale and hills At the close of the summer day, Sing to me, sweet, just once again Of the dreams that have passed away! MURIEL RAIKES BROMAGE.

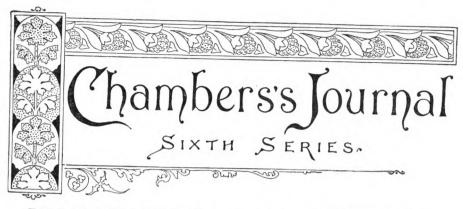

. TO CONTRIBUTORS.

at. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

Srd. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice of otherwise, should have the writer's Name and Address written upon them in will.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE ROMANCE OF FLOATING DOCK. \mathbf{A}

By Andrew Marshall, Author of Comedy East and Tragedy West, &c.

CHAPTER I.

Some shallow story of deep love .- The Two Gentlemen of Verona.

O one of the twenty American republics is more generously endowed by nature than Moyocuil. It is warmed by a tropical sun, cooled by the perennial snows of its sierras,

and refreshed by the showers which the trade-wind-punctual as a Scotch gardenercarries unfailingly to its valleys. Its forests are always dressed in green, its flowers bloom throughout the year, the young leaves push the old ones off, and blossoms and fruit hang together on the trees. The seasons are mingled into a perpetual summer, which is also a perpetual spring and autumn. Winter alone is unknown. The lazy Moyocuileño rouses himself once in a while to tickle old mother earth with a hoe, and she is ready to laugh with a harvest before he has lounged many weeks away.

This earthly paradise, where every prospect pleases and man alone is vile, used, as everybody knows, to be torn by political factions. It was from it that the French consul's wife wrote to her sister, 'I take out baby in the evenings when there isn't a revolution.' But Moyocuil is now as peaceful as Kilkenny, and bloodshed is only resorted to for purely private ends. The reason is that, on the advice (enforced with cannon) of an astute president, the factions have sunk their differences to adopt one common policy. That policy is a simple and yet compendious one. It is euphuistically called 'The Introduction of Foreign Capital.' The Moyocuileños find themselves growing rich under it, and have nothing to fight about. Certain financiers in London and New York are also growing rich by means of it, and so too imagine themselves a great many foreign bondholders. But these last have as yet only grown rich in hope, which, as the native proverb says, is a good article and cheap, only you can't cook it.

Moyocuil, however, has got railways, and telegraphs, and electric light, and tramways, and acre-No. 505. - Vol. X.

wide market-places roofed with English plate-glass supported on German steel pillars. She has got an army (barefooted, to be sure, but armed with Mauser rifles), and a navy-of a sort. But the coast-line of Moyocuil and her sea-borne commerce are not yet important.

At the end of the nineteenth century the effective navy of the Free and Sovereign Republic consisted of two barges and a second-hand French gunboat. This last vessel, which was named the Libertador, was accustomed to lie at anchor for three months in the harbour of Puerto Nacional, and then ramble comfortably down the coast to lie for three months in the harbour of Alacrán, looking out the while for smugglers from beyond the republican frontier. The tropical waters in which she floated swarmed with life, and after a while her hull became encrusted with a marine collection which so impeded her progress that her nominal ten knots an hour were reduced to a bare four and a half, and the contrabandistas found it scarcely worth while to bribe her officers any more. These worthy men, whose insignificant pay was always spent in anticipation and received in arrear, complained to the Minister of Marine. The Minister, after taking counsel with a visitor of alien race, resolved that the remedy should be a floating dock. He laid the matter before the Cabinet, pointing out that other naval powers had floating docks in which ships could be refitted and have the barnacles scraped off. He also laid before the Cabinet certain other considerations even more convincing, which were not made public; and it was unanimously resolved that a floating dock should be built.

The contract was given to the famous firm of Levi & Solomonson, for reasons. They had bribed highest, and bribed in the proper quarter; and they were willing to receive payment partly in the customary 'concessions,' and partly in Moyocuilean bonds (at a suitable discount), having facilities, through other great firms of their nation, for the disposal of these securities in the European markets.

[All Rights Reserved.]

AUGUST 3, 1907.

Messrs Levi & Solomonson then, having thus arranged matters with the Government of Moyocuil, and having received their guarantees, their concessions, and their first instalment of bonds, sent a representative skilled in the ways of South American republics to take a general charge of the business, and one of their clever young engineers to superintend the practical work of the construction of the dock. Neither of these gentlemen had had anything to do with the original bargain between the high contracting parties. That belonged to another department of the business under the direct personal control of its chiefs.

This story only concerns the young engineer He was known among his whom they sent. friends as Jim Sandford, and officially as James Robert Sandford, B.A. Cantab., M.I.C.E., &c. He had been engaged for a year or two on the firm's work in Spain, and had a fair knowledge of the language of the country; but he was ambitious of employment on one of its great South American undertakings, and had applied for and got the post of constructing engineer of the Moyocuil floating dock in order to familiarise himself with transatlantic Spanish and the ways of the Latin American.

Sandford, with a modest outfit and a medicinechest, arrived at Puerto Nacional (which used to be Puerto Real before the revolution) by the mailsteamer which calls there on its way south; and Brandon, his colleague, Messieurs Levi & Solomonson's financial representative, who had already been in the country some months, went out in a boat and brought him ashore. After leaving his luggage at the hotel, they dined at the Lonja Mercantil, spent the afternoon in bringing up to date their knowledge of each other's affairs and of common friends, and in the evening went and sat on one of the coral benches in the plaza to listen to the band, and to see Puerto Nacional society taking its daily promenade under the electric lamps.

They smoked the excellent cigars of the country and discussed the merits of different tobaccos while they watched the separate circles of promenadersladies and gentlemen strictly apart and moving in opposite directions, the ladies in the inner circle. They saw the dark-eyed girls, innocent of hats or corsets, in their freshly starched muslins-some with artificial roses, some with living fire-flies, stuck in their dusky hair-as they swam along in pairs and trios, a few gaily chattering, but the majority silent and self-conscious; and their talk turned to the subject of women.

'I sometimes wonder,' said Brandon, 'if one of these beauties would think of marrying a respectable foreigner.'

Sandford removed the cigar from his mouth, shook his head, and emphatically answered, 'Heaven forbid!'

There was a slight crash behind them at a little table where one or two ladies and gentlemen were seated. A glass had fallen, and, amid some laughter

and low-voiced banter in Spanish, a waiter came and picked it up. Sandford scarcely noticed the interruption, and continued to speak. On things of real importance—his work, his plans in life, his family, his religion-he was instinctively reticent; but on indifferent matters, such as politics-of which he did not know much-and women in general-of whom he knew next to nothing at all -he would state his views with the freedom of irresponsibility and the confidence of ignorance.

'A man,' he said, 'should marry a girl whom he knows well, and whose people he knows well, or he may have to pass his life with-perhaps a fool, per-

haps worse.'

"God Almighty made them to match the men," quoted Brandon.

'The women here for the men here, then, but not for you or me. An Englishman should marry an English girl-yes, and one in his own set, too.'

'Well,' said Brandon, flicking the ash carefully from his cigar, 'I dare say it might be comfortable; but when I see, if I ever do, a girl I wish to marry, if she happens to be a foreigner I'll have to consider how much I care for her'-

'You won't care for her if you stop in time,' said Sandford; 'and you can always stop in time.'

'Can you?' said Brandon.

'Easily,' answered Sandford.

'Authorities seem to differ about that.'

'What authorities?'

'Oh, well, Shakespeare, for example, and-and Browning, you know.

'Oh, bar poetry. Life is prose.'

But here Brandon's attention was interrupted by a movement of the party behind them, who were rising. When they were out of hearing he turned to Sandford. 'That was the Comandante,' he said, 'and his wife, with some friends.'

'Does he understand English?' asked Sandford.

The Comandante's party joined the promenaders. As they passed, Brandon stood up and took off his hat, and Sandford followed his example. One of the ladies returned Brandon's bow.

But Sandford only saw her companion, a young girl. She was different from the crowd of blackhaired, black-eyed young women, with chocolateand-cream complexions, who were passing along She was taller, her hair was chestnut, and, though her eyelashes were dark, her eyes were blue, and there was a delicate pink under the ivory of her cheeks. He had seen chestnut-haired, blue-eyed men and women in Spain, but had not expected to see one among the mixed race of Spanish America

The girl was dressed in white, and, instead of a bonnet or hat, which indeed none of the ladies had, she wore the scarf which is called the rebono. Hers was of some pale, amber-coloured silk texture. It covered the back of her graceful head, and had an end lightly thrown over her shoulders.

She met Sandford's look gravely, neither appear ing to stare blandly through him at something in the distance beyond, nor instantly turning away her glance. Instead, her eyes and his held each other for a moment or two, almost as if with recognition. Sandford stopped breathing. The girl grew rather pale.

The two friends did not sit down again after the ladies had passed. The crowd of promenaders was thinning fast, the band started the national hymn, and the cantina waiters began to clean the glasses.

'Come,' said Brandon, 'it is time to go to bed. We do not keep late hours here, and we have an early start to-morrow.'

Sandford crept inside his mosquito curtains and laid his head on his pillow. He was a little excited by the novelty of everything, but his nerves were as yet unjangled and he could sleep like a gipsy. He closed his eyes, but instead of going to sleep in a moment, as his habit was, he thought of the girl with the amber scarf. How enchantingly simple it was! And how absurd the fantastic things girls at home put on their heads! He recalled her eyes, and the look with which they had surely lingered on his. The remembrance made his heart beat faster. He felt his face grow hot, and calling himself a fool, he resolutely turned his thoughts to his journey of next day. Yet he could not keep them there. The girl's face kept coming back, and he lay awake a long time. But at last fatigue prevailed; his bed seemed to rock, as his cot had done for the last few weeks at sea, and he was asleep.

CHAPTER II.

HE hot sunshine streamed into Sandford's room, and he awoke as from a good dream, or like a man who has received some joyful news at night, and when he wakes in the morning cannot remember for a moment or two why he is so happy. Then he thought of the girl, and closed his eyes again that he might see the glance with which for a moment she had met his look. A clock outside struck five. It was time to rise, but he lay still trying to realise her image more distinctly. What was she like, then? She was like this—yes, like this—the scarf, the hair, the eyes. Her face came at his urgent effort and floated before him a moment. The clock struck a quarter past. He sprang up, astonished at his own thoughts, and more than half ashamed. The window of his room opened on a little balcony overlooking the plaza, and he unclosed it and looked out. The jays were screaming as they darted from tree to tree, the swallows twittered on the electric wires, a refuse-cart drawn by three mules rattled along the rough street, and the carrion vultures swooped down on it from the roof of the great church, one side of which was still in shadow. There was the seat on which he and his friend had sat, beside the broad black-and-white marble pavement. He drew back in annoyance. Could he not dismiss this 'native' girl from his mind? It was preposterous. He dressed quickly and went down to the street to have his morning coffee at fresco, as is the fashion in Puerto Nacional. Brandon was waiting for him.

'Good-morning, old fellow,' he said. 'You'll have to hurry. We row out to the Garapatas boat, and she starts at six.'

The dock, a huge structure of steel tanks, was to be built at Garapatas, some twenty miles up the majestic tideway of the Mariposas River. It might have been built more conveniently at its ultimate destination, and quite as easily at Alacran or Culebras. But these towns had each already received some of the good things that were goingharbour works, or a railway, or a custom-houseand in the republics of the New World it is understood that favours should go round. Garapatas accordingly was to get its turn. The building of the dock would mean the presence of two or three hundred workmen, and a proportionate number of foremen and directing engineers, chiefly foreigners, all with money to spend. They would have to be supplied with house-room, food, tobacco, amusement, and who could tell what else? They might be induced to buy all sorts of things, to invest in local adventures, to speculate, to gamble, even to purchase virgin land, the republic's staple commodity. Cash would circulate. There would be a general stimulus to life and traffic for a year at least, and a multitude of opportunities for individual gains, direct and indirect. Garapatas turned in its normal sleep and almost half awoke. Orders were sent to correspondents for tinned provisions and bottled liquors. Butcher-meat rose in price, and people began to try to fatten their goats so that they might pass for mutton. A new interest awoke in printed muslins and cheap looking-glasses. Energetic women, and even lazy ones, prepared to take in boarders. The town jail was enlarged. A subscription was set on foot for the rebuilding of the theatre, whose blackened walls had stood crumbling unheeded since the fire ten years before, a superfluous church having meantime been appropriated to the indispensable Thespian performances. And a person of extraordinary enterprise, greatly daring, started to build a hotel, which was completed about the time the grass had grown again on the mud slope over which the dock had been slid into the water.

Garapatas stands on the edge of a wide alluvial plain, and, like the house of the foolish man in the Scripture, is built upon the sand. A firm strip of greensward lies between the river and its long rows of dazzling white houses. Its streets are thickly grown with grass, which is never cut by the wheel of any vehicle, and its porticoed footways of red brick are raised a foot above the street. In the time of the late summer rains the river occasionally comes up over the grass and laps these side-walks, sometimes even spreading as far as the lagoon be-

hind the town, in which uncounted billions of mosquitoes breed. The dwellings and storehouses of the merchants face the river, and the traffic to and from the great canoes and the casual steamers is borne on the backs of men and mules.

The journey from Puerto Nacional gave Sandford time to recall that life is prose. So he had told Brandon. But now he told it to himself with a graver heart than when he had tossed the apophthegm lightly to his friend. He tried his best to banish from his mind the remembrance of the girl he had seen on the plaza at Puerto Nacional, but he was continually thinking of her. He reflected that it was unlikely he would ever see her again, and this gave him a satisfaction which covered a latent pang. He resolutely turned his mind to the details of his work, and immediately caught himself trying to recall her face to his memory. And he discovered, to his disgust, that he was every now and then drawing a deep breath, which he had to admit to his own soul was in the nature of a sigh.

Brandon and he arrived at Garapatas in the evening, and found a room at Doña Concha's boarding-house on the river front. The chamber was large and lofty. There was nothing between the red bricks of the floor and the red tiles of the roof, and the tiles overlapped, without touching, the high, thick, whitewashed walls, leaving a wide air-space for ventilation. The furniture consisted of an iron wash-stand, two wooden chairs, and two camp-beds. Each bed was but a couple of yards of canvas stretched on trestles, its mattress a thinly woven rush mat, the bed-clothes a thin cotton sheet six feet by three, and a light scarlet rug neatly folded and ready for the shivering lodger to draw over him in the early dawn, when the mercury sinks to seventy degrees and the cold awakes him. For one shivers in the dawn at seventy degrees after melting in the afternoon at one hundred and seven. On light frames were fixed the indispensable mosquito curtains. The buxom brown landlady, as she ushered the two into the room, professed a polite surprise to see the floor covered with an army of black ants. She called a dusky maid with bare feet and a pink paper rose in her hair, who brought a can of petroleum, which she poured on the bricks, and while the enemy wallowed in the flood she quickly set it alight. The holocaust only occupied a few moments, the ashes of the martyred were swept out, and Doña Concha expressed the hope that her guests would now be comfortable.

Next morning Sandford, accompanied by Brandon, went down to the scene of his work. A short distance below the town a wide space had been cleared beside the river, with a gentle slope to the water's edge. Here the dock was to be built and launched. The steel frames and plates had not yet arrived from England, and the bulk of the workers too were still to come; but the foreman and a junior engineer who was to be Sandford's assistant were there, most of the needed sheds and machinery had

been set up, and there was some show of activity in

preparation. Grounded on the bank of the river were several rafts of timber which had been brought downstream to build the capacious scaffolding required. One or two logs had been hauled up to the sawmill, and were in process of being squared.

'I should like you to look at this wood, Mr Sandford,' said one of the foremen.

Sandford examined it. It was light, spongy, and

'This is useless,' he said. 'Our scaffolding may have to stand a year. This will rot before the end of the rains. Who supplies it?'

'I gave the contract,' said Brandon, 'to a merchant here. His name is Diego Lopez. He was recommended by the Minister of Marine, he added with a slight smile. 'The contract is all right, I assure you. It stipulates for sound cedar logs.

'I shall look up Don Diego this afternoon, said

When they returned for Doña Concha's eleven Sandford. o'clock dinner they found a peon waiting at the door. He held a handsome horse by its halter. Taking off his hat and bidding the gentlemen goodday, he led forward the horse, and said to Sandford, Don Diego begs you to accept him, senor, with his

Sandford looked at the horse. It was a grey compliments.' with black points, a fine specimen of the race, perfect in temper, pace, and endurance, which has descended from the barbs brought to America by the Spanish conquerors. Its Arab blood showed in its full eyes, small head, and light, strong legs. It was unshod, for the horses of the sandy plains need no shoes. Over a gaudy folded blanket it had a great vaquero saddle heavily plated with silver, and, besides the new white halter, a tasselled headstall and a knotted bridle of twisted white and scarlet cord. Sandford's admiration showed in his face, and the peon smiled in sympathy.

But a moment later Sandford's face flushed and his mouth hardened. He turned to Brandon.

'Do you understand this?' he asked.

'Is not this Don Diego the gentleman who sup-

'He is,' said Brandon, speaking in English, and plies the timber?' glancing round to see that no one besides the peon was within hearing. He lowered his voice and added, 'He of course bribed the Minister to recommend him for the contract, and now he proposes to bribe you to accept inferior wood."

'Well,' said Sandford, 'he has lost no time.

What does the rascal take me for?'

For such an one as himself. That is, a man of sense according to Moyocuilean standards. It is just as well that this has happened now, for the sooner you understand the ways of the people here the better. They respect themselves highly, I can assure you. Their civilisation is indeed but a varnish, and scarcely dry yet at that. They have

the same code of honour as ourselves. Don't imagine that they have not. And, being more or less Latins of a sort, they flaunt it more in your face than we do-in talk, that is, as you'll find. In practice—well, they're more simple and primitive than we perhaps are now. They are more like what we were in the days of the late Mr Samuel Pepys, whose famous Diary you may have read. Now this-gentleman (I won't mention his name in the peon's hearing) is a pushing fellow, and what he has done is considered quite legitimate here. You can't kick him,' he added, 'unless you want to get a knife in your ribs; and if you show yourself indignant he will only think you are acting a part for my deception, or that you are sticking out for a higher bribe.'

'I see,' said Sandford; 'and the moral is-?'

'Oh, practise the wisdom of the serpent. To quarrel would be utterly useless. You might as well quarrel with the law of gravitation.'

Sandford got out his writing-case, and after considering a little he wrote:

'MY DEAR SIR,—A thousand acknowledgments of your kindness in placing at my disposal a horse.

I have, however, no stable, and I must beg you to keep him in yours. When I need him I shall let you know.

'At the yard to-day I learned that the cedar logs purchased from you have not arrived. Some unsuitable wood has been delivered, no doubt in error. May I beg that you will remove it and hasten delivery of the cedar?—Your faithful servant,

'J. R. SANDFORD.'

He showed this note to Brandon, who nocided. Then he took it to the peon.

'The horse is a beauty,' he said.

'Si. señor.'

'Well, you see,' he continued, 'I have no stable. So you will take him back to Don Diego's stable now, and you will give Don Diego this note, and then you will do me a favour to go and drink a copita to my health—no?' and he put a dollar into the man's hand.

'Mil gracias, señor,' replied the peon, taking off his hat and showing a perfect set of teeth in a broad smile; 'I go to do it.' And bowing again, 'With permission, señor,' he said, and led the horse away.

(To be continued.)

LOVERS OF BOOKS.

By Lady Catherine Milnes Gaskell.

OME months ago I happened to be at York, and visited there the Home for the Blind.

The building where the poor children are lodged is a beautiful old Stuart palace, and is known as the

King's Manor. There James I. rested with his Scottish train, on his road to London, and there later both Charles I. and the great Earl of Strafford lived. Over a door remain the Earl's arms quartered with those of royalty, and on the mantelpieces and over the lintels of the doors are carved the Royal Rose and the Thistle of Scotland.

Now the King's Manor alone has traditions of kings and queens, for it is given up, as I said, to little boys who are taught to make an honest livelihood by weaving osier-branches into shapes, and selling such as baskets. Whilst I was there the kindly master called a boy to his side. 'This lad is a great reader,' he said. 'What are his favourite books?' I inquired. 'The *Iliad* and the *Odyssey*,' came back from the boy, and he looked at me and smiled out of his sightless eyes.

Thanks to those wonderful stories, the poor blind boy had stood by Andromache and Hector at the Scean Gate and had heard their last tender farewell. He had followed silver-footed Thetis, and had heard in his soul the forging of Achilles' mighty armour. He had wandered, I found, in heart, with Odysseus, and heard the Syrens sing; he had watched prudent Penelope, and had heard

the words of the nurse Eurycleia. Like Lord Macaulay, he had wept over the sorrows of Achilles and of Priam; and the characters and descriptions of an old ballad-maker who died nearly three thousand years ago had carried him out of his dull routine of basket-making, and had filled his soul with beautiful images and many gracious fancies.

From all time Homer has been the loved companion of noble souls. Alexander the Great, it is said, found once a beautiful casket amongst the treasures of Darius. He reserved it as a shelter for keeping his copy of Homer in, saying as he did so that he had ever found that author 'the faithfulest counseller in matters of war.' Montaigne loved him also. 'Are not our children,' he exclaims, 'still called by the names that he invented?'

My love of books is personal. I feel about them as if they must be conscious of slights and ill-usage. I cannot but marvel at the rashness of youth which dares to deface the learning and wisdom of all time. It hurts me to see Shakespeare crumpled up before the fire, Plutarch flung across the room, or to witness Bacon dog-eared, or Milton or Malory tattered or torn. It makes but little difference in what edition I find these master-spirits; they are always to me my loved masters, the dear friends of my happiest hours and the joys of my leisure moments. We all have, it is said, our special forms of stinginess. Dear lovers of their gardens hate to pick their flowers, careful people untie their parcels and

save the string, whilst Charles Darwin is said to have felt genuine displeasure with any one who threw away a spill into the fire after lighting a candle. And so I do not like to lend my books unless I am sure they will be treated with all reverence and due respect. I cannot bear to think that they will lie out on benches amid summer showers, or face in winter the ardent glow of roaring fires. Few people are honest about pencils or pins, almost none about books. 'Giving is dead,' wrote George Herbert, 'and restoring very sick.'

Amongst the malefactors of books, it is recorded that Thomson the poet spoilt his volumes by cutting them open with candle-snuffers, whilst Catherine of Medici counted upon poisoning Henry de Navarre by his well-known cubbish habits as far as books were concerned. 'He will lick his fingers in turning over the pages,' she is reported to have said, 'and so shall I be delivered of an enemy.' Hogg declared that Shelley, if lent a book, never returned it. 'To give Bysshe a book,' he wrote, 'is to take leave of it for ever.'

Books, like friendships, grow into our lives, modify and stimulate them, and are sometimes their brightest sunshine. It is curious to note how we change and what our tastes are at different ages. Not less curious is the change of fashion in books. Who would commit suicide now after reading Werther, or who would wish to model the education of his children on the teachings of Rousseau? I have a copy of Sir Philip Sidney's Arcadia by me. Who now condemned to die would carry it with him to the place of execution? Yet Charles I. found in it a strange consolation on the scaffold, and for this act excited the puritanical fury of Milton. It is now the fashion to read Kipling and Stevenson. Will they live, or fade as so many flowers of fiction have faded after their time? Who knows? Books to live must have something of all time in them, something that belongs to all generations, that is human, alive, vibrating, that belongs to both past and present.

Much of Sir Philip Sidney's fascination belonged to his time; but we can still imagine his personal charm, his stately gravity, his chivalry, and his holy death. We can even feel the shiver of the country's lyre when the news was known of his early death, and in our mind's eye see a whole nation clad in reverent mourning. But while the memory of the man is sweet, what his pen wrote is lifeless, faded, and rather matter for the student's eye than wholesome food for the ordinary reader.

Sometimes, as has been truthfully asserted, the simplest records live longest; and Madame de Sévigne's letters, mostly written with unpremeditated art to her daughter Madame de Grignan, have a charm which nothing can efface. They tell the tale of little nothings, of petty scandals, and of everyday occurrences; but they are as much alive as if they had been penned but yesterday, and they belong to the immortals. They are human, gay, and tender, real and witty, in turn, and will live as

long as the French language is spoken, as long as a charming woman can please and talk as well on paper as by word of mouth. 'L'homme est le même partout:' this is the secret of their perpetual youth and of the delight we all experience in reading them

One of the most devoted lovers of books was them. England's ten-days' queen, Lady Jane Grey. When only fifteen years of age Roger Ascham visited her. He found her alone, seated in her chamber with a volume of Plato open before her. 'She read it,' wrote Ascham, 'as some gentlemen would read a merry tale in Boccasse.' When asked why she did not disport herself with the rest of her family in the park, she replied, 'I wis all their sport is but a shadow to that pleasure that I find in Plato.' This sweet child of tender years loved her hours of study. 'I think myself in Hell,' she said, 'till such time come when I must go to Mr Aylmer, when I think all the time nothing while I am with him;' and she declared with the strange gravity of the little Tudor maidens that 'al else but learning was full of grief, trouble, and fear.' Very learned was this slip of girlhood. Hebrew, Chaldee, Arabic, French, Italian, and English were all languages that she spoke or read. Hollingshed, in touching words, gives us the story of her death. 'A lieutenant led her forth,' he tells us, 'to the place of execution. When she appeared her countenance was nothing abashed, neither were her eyes moistened with tears. In her hand she carried a book wherein she prayed until she came to the scaffold.' He mourns over her death and over her many gifts both of learning and knowledge, and ends by saying 'she was as patient and milde as any lambe at her execution.'

This is not an age when men or women read much, or when books are often a living power to boy or girl. Few people would now cry with Cowley, 'Come, my best friends, my books, and lead me on;' or exclaim with Mrs Inchbald that books are 'the calmers as well as the instruction of the mind.' Hurry, games, and movement are the great forces that influence and stir the pulse of modern life; and as Sir Nathaniel says, 'Many have never fed of the dainties that are bred in a book.'

This was not always so. There was a time when men and women loved their books, devoted many hours to them, and found in them a companionship that did not wear out and that ended alone with life. Sir Thomas More, saint and scholar, loved his books exceedingly, and read them almost to the end. He is said to have begged those who carried them away from his cell 'to remove them with care and kindness.' When Erasmus heard of his death he wrote of him: 'He is dead whose breast was purer than snow, whose genius was excellent above all his nation.' Mary Queen of Scots is said to have loved her books deeply. It is told of her that she read favourite passages alond, whilst her Maries embroidered. Her best-loved

books she kept always at hand, and they went with her into her long captivity. One book in which there were some blank pages she reserved for her friends' and enemies' signatures. 'The Countess of Schreusbury' (as she transcribed herself) and Walsingham both wrote their names therein, to which were added the names of Fr. Bacon, Sussex, and the Earl of Nottingham, and in a shaky, trembling hand that 'of your most unfortunate Arbella Seymour.'

In the Middle Ages, we know, Lanfranc spent long hours with his books, as did Anselm, of whom it was written 'that he was chaste and lettered from childhood.' Lord Falkland pitied men 'who loved not reading on wet days.' Alas! had he lived now he would have to extend his pity to many. Of Charles V. of France it is recorded that he had a passion for reading. Tradition says that he had thirty chandeliers lighted in the chamber of the Louvre where his books were kept, so that he might read night or day as it pleased him.

James I., according to Rastell, 'was muche given to study,' and, if Burton can be believed, 'regretted that he had not been chained to one of the shelves

of the Bodleian Library.'

Montaigne, in writing to the Lady Diane of Foix, Countess of Gurson, wrote: 'Learning, joined with true knowledge, is an especial and graceful ornament, and an implement of wonderful use and consequence.' The writer of the famous Essays tells us that he did not seek 'to toss over books, but to read them for honest recreation, and above all to be guided by them how to die and how to live well.' Montaigne's books were nearly all classics. Virgil, Lucretius, Horace, and above all Plutarch's wonderful Lives were his storehouses of wisdom and of pleasure. Of more modern books, history, he tells us, was his special and favourite study, and it was with delight that he wrote of the memoirs of Eginhardt (Charlemagne's Chancellor), of Froissart's Chronicles, and of Philippe de Comines' Biography. Had Montaigne known the story of the Duke of Anjou's theft of our Edward III.'s copy of Froissart he doubtless would have found some sympathy for the strong and vituperative language employed on that occasion by that

'Why has the love of books so little place in modern life?' one is often tempted to ask. 'We have so many books, and so many are bad,' is one of the answers that I have received; and, again, 'Few books now feed our imagination or develop our understanding.' But, after all, if we have no beautiful literature it is our own fault, and we only get what we deserve.

I once made the acquaintance of a country miller. 'I reads, missus, but two books,' he told me: 'the Bible and Shakespeare, and outside I let books come and go and don't turn my head.' He was a very happy, prosperous man, who got up at five summer and winter alike, saw to the working of his mill, and 'minded' the management of his team

of roans that bore his sacks of flour to the farmers and to dealers of the neighbourhood. In the evenings he sat in his old Charles I. arm-chair and read, with the aid of broad-brimmed tortoise-shell spectacles, his Shakespeare on week-days, and his Bible on Sundays. Once he went to London for a holiday, but he returned the next day. 'When I wants an outing I walks with the dog in the fields,' he told me; 'and when I seeks for pleasure I finds it in that there Shakespeare.' His knowledge of England's greatest poet was wonderful. Not a character but what he knew, and many of his favourite passages, to use the miller's own expression, he could 'reel off first class.' His praise of his beloved master was characteristic: 'For all as the old un has been dead these hundreds of years,' he said, 'he's full of natur' and of the best that's grown.' He reminded me of Henry Hastings, of whom Gilpin wrote, who, whilst he loved the company of hawk and hound, read of an evening from his 'Church Bible' or dipped for pleasure into Foxe's Martyrs.

Perhaps the joy of reading is a good gift dropped into our cradle by some friendly fairy; anyway, unless it comes to us early it seldom belongs to man

or woman in later life.

Charles I. not only loved music and pictures, but was also a keen and studious reader. During the dreary months of his last captivity his books became his dearest friends. Amongst his favourites, Sir Thomas Herbert tells us, was first of all his Bible, which he speaks of as 'his best instructor and delight;' and he then makes mention of Laud's book against Fisher the Jesuit, Hooker's Ecclesiastical Polity, and Dr Hammond's Practical Catechism.

A pretty story is told of how, when Charles II. was but quite a lad, his father took him and the Palsgrave to Little Gidding. When they arrived the King asked for the 'Great Book.' When they brought it forth, the Duke of Richmond, who was in attendance, said, 'Hardly, sire, would one of the greatest of your guards carry it.' It was so heavy that no one could hold it and read its contents standing, so the big volume was laid upon a table for the King to see and read. In the quaint wording of the times, 'the Great Book' was said to 'have a fine garnish of pictures.' At last, after several hours' diligent reading, the King pronounced the book to be 'a jewel and fit only for a prince,' and, turning to his son, he said, 'Charles, this is yours.' The scene is a pretty one to imagine: sweet Mary Collet, with her pale Madonna face, looking on in reverent awe, and the King giving her gracious words about her task and handicraft, and hoping that the divine Spirit would enter into his little son if he gave him 'so beautiful and excellent a book.' What was the ultimate fate of the 'Great Book' I have never been able to discover; but during the parliamentary wars many of Mary Collet's and Nicholas Farrar's beautiful books were destroyed-torn to pieces and burnt by Roundhead hands, it is said, for being what the rabble termed 'popish and malignant things.'

Another great lover of books was Archbishop Laud. In the Articles of his Impeachment he was charged with reading 'from a prayer-book that bore upon it an embroidered crucifix,' and also for using 'popish missals as a scholar.' In a lighter vein we all know charming Dorothy Osborne's many mentions of books to her lover, Sir William Temple.

Besides the books themselves, the place where we first got to know their secrets has its charm. Who that has been brought up in an old country-house does not love the memory of its silent library, with green trees waving outside all the long summer afternoons, and remember with envy happy, quiet hours spent amongst its old dusty folios? Silent hours so spent are hallowed hours to look back to.

Recollections of the first thrill of Scott, the laughter of Dickens, the gentle heart-in spite of the biting satire-of Thackeray, are all golden memories. Such quiet hours teach more than any professor can, for they bring the flagon of living

water to youth's own lips.

Of course we can love the beloved masters in any disguise, however unworthy; but old books that bear upon them some mark or the imprint of some human document of the past are infinitely interesting. Who has not felt the pathos of holding in his or her hand an annotated copy of some great man's or beautiful woman's book? As we do so a vision of half-forgotten things seems to rise up before our eyes. Scott's proof-copy of the Talisman it was my fate to hold, in which his hero bears another name from that he later assigned to him. Then only last year a volume of Redoute's Roses belonging to the Empress Josephine was brought out for me to hold and see. Another time a friend put into my hand a volume of Shelley's with verses in his own writing; and once, in an old library which has since perished by fire, with the house to which it belonged, I held a volume of Sir Henry Wotton's which had belonged to Izaak Walton, and in which the author of The Compleat Angler had written his thoughts on the margins. As I held these links with the past I felt thrilled by a hundred memories. I thought of Sir Walter's life so sweet and good, of his happy childhood at Sandyknowe, and of the joy and glory of his great success. And then a moment later, as I turned over the pages, I thought of the sadness of his financial difficulties and disappointments, of his old age, and of his many sorrows. I recalled the names of his favourite dogs, and thought of all the country-folks that he knew and loved so well. And as I looked with love and affection at his book, I remembered a West Riding story that I had heard from an old Wakefield man who as a little lad had been taken by his father, a plumber, once to Abbotsford. The imp, prompted by some spirit of mischief, had turned the taps of water on in the house during the dinner-hour. Great had been the mess and the disorder caused by the overflow of water. But when this deed of

naughty daring was told him, Sir Walter only laughed, and, calling for the culprit, wandered of into the garden with him and filled his pockets till they ran over with apples, saying as he did so, 'Next time you come to Abbotsford you must try and be a good lad.' 'There war' none but he as wud have behaved so,' the old man always

When I took Josephine's book in my hand the said. thought of her in the island of Martinique flashed through my brain. I recalled the slave's strange prediction; I imagined the splendour of her Court at the Tuileries, then the retirement to Malmaison; I thought of her love of flowers, and of her fidelity to the Emperor's cause after Waterloo, even to the end. When I turned over Shelley's book, a vision rose up before me of the strange boy-poet: I thought of his precocious genius, of his revolt against society and custom, of his life with Mary, and of the last boating expedition with his friend Williams; of the strange ceremony when the bodies were burnt, of the collecting of the ashes, and of the violet-covered grave in the cemetery at Rome. When I touched Sir Henry Wotton's Reliquiæ Wottonianæ in the old library of a house which is now but a memory, I thought of the sweet and studious face of the writer as I have seen him depicted in old prints and portraits, of his ideal leisure, of his loyal service to his master, and of his graceful verses to the unfortunate 'Queen of Hearts' on the occasion of her marriage with Frederick the Elector Palatine. I thought also of how Sir Henry enjoyed the pleasures of rod and line, and delighted in that sport even as his friend Izaak Walton did, whose hand had penned the notes on the margins of his book. 'My idle time not idly spent' was how Sir Henry talked of the time he passed in fishing.

Yes, books and the thoughts that surround them bring back not only many old-world echoes of laughter, but also sometimes the tears of the past On the fly-leaf of a book of Marie Antoinette's, some pious book of prayer, if I remember rightly, was found inscribed these words, written by that unfortunate queen shortly before her execution, 'Mon Dieu, ayez pitié de moi. Mes yeux n'ont plus de larmes pour prier pour mes pauvres enfants.

So our life, and many lives, flow away, friends go, and ties are broken; but our books remain on musty shelves, but full—in spite of tattered pages and crumpled bindings-of the perpetual spring of youth and joy. Around the brows of the great masters are wound wreaths such as the immortals wear, which can never fade or wither; for who can grow weary of friends who never bore, who always give their best, and who meet us in the same glad or lofty spirit both in sunshine and in storm?

Before I end let me recall John Milton's assertion that 'a good book is the precious life-blood of a master-spirit embalmed and treasured up for a pur-

pose to a life beyond life.'

A MARRIAGE OF CONVENIENCE.

By IXYL OSTRAKOFF.

CHAPTER I.

OT to put too fine a point upon it,' said Lord Tallantyre, smoothing the back of his immaculate head with a strong, well-kept hand, 'I am a ruined man. You can't eat your cake and have it, though you

do get a kind of moral indigestion out of the kind of cake I have eaten. The indigestion in my case takes the form of parting with an estate which has been in my family since before the Conquest.'

He bit his lip, then laughed, but there was no mirth in the laugh.

Israel van Zyll, financier and speculator, glanced at his client with a look that partook somewhat of the look with which a cat regards a captured mouse which it plays with before killing. The financier's black eyes and hooked nose, together with a slightly nasal intonation, would have proclaimed him as a descendant of Abraham had not he himself carefully informed all acquaintances—he had no friends—that his ancestors had been bankers of Amsterdam, Dutchmen of pure and unsullied race, who had migrated to England in the days of an indefinite Charles. He continued to inspect the young man opposite to him with the same feline regard, apparently debating some course of action within himself.

Hartley Gordon, Earl of Tallantyre, was a tall, well-built man of thirty, with crisp fair hair and steady gray eyes, the latter very tired now, with dark lines beneath them. His clean-shaven face showed a firm, well-shaped mouth, with square, determined chin. It was a type of face common enough in Cumberland, where many of the inhabitants are directly descended from the Northmen who, after the departure of the Romans, settled in that unquiet country so often harassed by the visitation of marauding moss-troopers and Border cattle-thieves from the Debatable Land.

'You will make no further advance?' he queried at last, with a glance by no means of affection at the financier opposite him at the other side of the portly business-table littered with papers.

Van Zyll put down a meaningless row of figures on the blotting-pad in front of him.

'On one condition I will buy in the mortgages and burn the deeds—as a wedding present,' he said slowly, running his pencil through the hieroglyphics on the stout blotting-pad.

Tallantyre's thin face flushed. He raised his

'What on earth are you driving at?' he demanded hoarsely. 'Have you got some American heiress up your sleeve?'

'No,' said Van Zyll brutally; 'I've got a daughter. On the day you marry her the mort-

gage deeds on Tallantyre shall be destroyed. If you will give me your word to carry out this contract I will set about redeeming them this very day.'

Tallantyre glanced quickly at Van Zyll, noting his Semitic nose, his dark Oriental eyes, a cast of countenance auguring but moderately for the appearance of the daughter in whose hands apparently the fate of Tallantyre rested. Then desperation seized him, and the love of the land of his forefathers swept over him in a great wave of feeling. His heritage before all!

'I will carry out the contract if your daughter will have me,' he said quietly.

The descendant of the Dutch bankers smiled.

'I don't think she is likely to say no,' he remarked.

It is probable his smile would not have been so

It is probable his smile would not have been so unctuous had he been aware how near Tallantyre came to kicking him for it. Before, however, the younger man could speak, the man of money continued his discourse.

'I will set to work on my part of the business at once,' he went on; 'you will commence yours—let me see—we will say this day week. Yes, a week to-day you will dine with me at my house in Park Lane, and I will tell you how I have fared, and you shall lay siege to the affections of my only child. It is the desire of my heart to see her well married.'

He smiled again, and again Tallantyre felt his toes tingling.

'Very well,' he said shortly and, it is to be feared, ungraciously. 'To-day week, 200 Park Lane, at eight o'clock, I suppose.'

He noted the engagement in a daintily bound book which contained many similar entries, then got up slowly from his chair, nodded to his father-in-law elect, and, finding hat, gloves, and stick, went out of the sumptuously furnished office without offering to shake hands with that gentleman, who, however, did not seem to notice the omission.

As the door closed behind his client the financier chuckled

'I shall have a peerage before I've done,' he muttered. 'My money, his position—an ideal combination. He is a man of his word, I can trust him for that, and he has had more than enough of the follies of life.'

He unlocked a strong-room door and brought out a bundle of deeds, neatly docketed and tied together.

'Your wedding present, my dear Hartley,' he said aloud; 'a very handsome present indeed!'

Meanwhile Hartley Gordon, in a hansom west-

ward bound, was cursing the fate which had made him a participator in what he regarded as a piece of villainy.

CHAPTER II.

WEEK later the Earl of Tallantyre stood in the hall of Van Zyll's florid mansion at No. 200 Park Lane, and a few moments later saw him being ushered into a still

more florid drawing-room, overburdened with mirrors, gilding, and brocaded hangings and furniture, an apartment in which Hartley Gordon felt

himself to be singularly out of place.

Van Zyll, gigantic diamonds blazing in his shirt-front and on each short, thick little finger, greeted him with just that degree of familiar warmth which Tallantyre felt he could best have dispensed with, and the stony expression in his eyes would have frozen any one but the inextinguishable

Suddenly the glance thawed as a gracious figure appeared from behind the financier's bulky form.

'My daughter,' said that gentleman suavely .-

'Beatrix, this is Lord Tallantyre.'

The girl—she was little more, twenty perhaps at the most-came slowly forward, and shook hands with the man who, her father had intimated to her in no gently veiled terms, was to be her future husband. As she stood there in the glare of the electric lights, Tallantyre saw that she was very fair, tall, and lithe, with fair hair, and eyes of heaven's own blue. She was simply dressed in white, a simplicity that Tallantyre's cultured eye told him was due to the genius of Paquin or Worth.

She, on her part, was agreeably surprised. This tall, grave, silent gentleman, with his lean, strong frame and kindly, tired eyes, was something very different from the usual guests of her father's whom she had entertained before-stout, flashy gentlemen they were, recking of the money with or concerning

which all their days were spent.

The steady gray eyes rested inquiringly on her sweet face, and the rosy colour flooded her cheeks

and neck.

He made a few commonplace remarks, trying to put her at her ease, and was rewarded by a grateful glance from those big blue eyes, which had in them a half-cowed expression which conveyed to him the impression that Van Zyll was not the most indulgent of parents. The girl apparently had no

Van Zyll, solidly planted on the enormous bearskin in front of a fire, watched them complacently beneath his half-lowered eyelids. As a matchmaker he felt that he was a success, and he already augured social advancement from the capture of so exalted a son-in-law. 'Baron Van Zyll' already figured largely in his thoughts, and the heraldic authorities were even now engaged in compiling for him a suitable coat of arms and motto.

As the endless dinner, with its succession of rich dishes, its priceless wines, dragged its weary way along, Tallantyre began to feel really interested in the beautiful, child-faced girl who sat, nervous and obviously ill at ease, at the foot of the table, with its gorgeous plate and glass, its snowy, heavily embroidered damask. She was fairly well educated, he gathered; indeed, she had been till lately at an expensive school in the south of England. Beyond that, her knowledge of life and men and manners was nil, while of her own country and its beauties, save London and Hastings, she knew nothing. The blue eyes glanced at him with shy gratitude as he chatted amusingly to her of the Cumberland he so evidently loved; of strange, faroff countries, of savage beasts, of outlandish men, and rough miners and prospectors and hunters he had mixed with in those distant lands.

At last Tallantyre and his host were alone, smoking the cigarette of peace over coffee and

'The deeds are all in my hands,' said Van Zyll abruptly, as the deft butler and his satellites left the room. 'It only remains for you to complete your part of the contract for them to exchange lodgings in my strong-room for the fire.'

Tallantyre considered the ash of his cigarette,

then he looked across the table at his host. 'Your daughter seems to know very little of England, he said in indifferent, conversational accents. 'My mother would be pleased to see you both at Tallantyre, and I should be delighted to initiate the young lady into the beauties of the lakes and mountains. Would next week suit you?'

Van Zyll's boot-button-like eyes twinkled with satisfaction. This man with the resolute chin and steady eyes was proving unexpectedly tractable.

'Tuesday would suit us admirably,' he replied unctuously. It was not every day one received and accepted invitations from earls.

Tallantyre nodded courteous pleasure at this

information.

'I will go and see my mother to-morrow,' he said as they crossed the great hall to the bleak drawing room, where the pathetic figure in its robe of expensive simplicity waited—evidently under orders for them.

Tallantyre went straight up to her.

'Your father has promised to bring you to see my northern stronghold, he said, a glance of respectful admiration resting on her delicate face. 'My mother will be so pleased to have you, and I shall so enjoy showing you the country-side.' A deep flush of pleasure flooded her face.

'Oh, how splendid!' she cried. 'Lord Tallan-

tyre, do you really—really mean it?'

'I do really, really mean it,' he said, shaking hands as he bade her good-night. 'Now, I have another engagement, so good-bye, au revoir, till Tuesday.—Good-night, Van Zyll.

(To be continued.)

IN THE FORMOSAN CAMPHOR-FORESTS.

AN INDUSTRY AT WAR.

By an English Resident in Formosa.

HAT so simple an announcement as that the price of camphor was rising could be in any way associated with the dread issues of life and death would never enter the mind of the ordinary reader. That the morsel

of the fragrant drug which acts as the sentinel of our wardrobe against the invasion of predatory moths may stand for the death and dole of those who won it in the dark Formosan forests-may in very deed represent some dreary human tragedy, and have been the occasion of great joy in some wild hill-village when the hunters returned with the freshly severed heads—is hidden from all but a few. But to those of us who know Formosa and the camphor-trade, with its terrible dangers, the little semi-transparent blocks which we purchase are invested with a very real and even tragic interest; and when we are told that the price of camphor has risen, it is as though the diminutive cakes we handle were sensitised with telepathic power and vibrant with the intimation of tragedy.

No doubt, of course, the Japanese may nowadays control the market; but it is never so certain that they can control the head-hunting savages of the hills, and the development of this valuable industry depends equally upon the success of their measures for encountering and suppressing these determined and as yet unconquered tribes.

Formosa, which is shaped somewhat like a huge sole, has a rugged, mountainous backbone in which Mount Morrison towers into the clouds to a height of twelve thousand feet. Throughout the wild penetralia of these mountains lurk a number of warlike tribes of varying strength, whose lives are devoted to hunting, fishing, and fighting with one another, their one community of interest being a passionate ardour in the collection of human heads, whether of their tribal enemies or of the Chinese and coolies who live on the verge of the hills or are engaged in the camphor industry.

The Japanese, who—well organised and determined as they are—have not yet succeeded in effecting their conquest, have already had some desperate encounters with these irreconcilable enemies, and parties of soldiers have even been surprised and slaughtered and their heads borne away into the dark recesses of the mountains. For although these singular people have been known to welcome the white stranger to their villages with the greatest cordiality, with the camphor prospector they will hold no intercourse, regarding him as the avant-courier of a foreign yoke, and his severed head in their remote villages is typical of the only terms on which they will ever consent to meet him until

the final conquest of their mountain stronghold is achieved.

Thus, while Chinese heads were at one time most eagerly sought for, the growing danger to their continued independence created by the presence of Japan has invested their actions with a newer rationale. Consequently the young braves, in qualifying for the dignity of matrimony by the collection of heads in proof of their valour, may now pose as champions of their race when gratifying their blood-lust upon some belated and outnumbered little party of camphor-men, who at a moment of fancied security have been suddenly taken unawares by their merciless foes. These, quite possibly, have been watching and counting the heads for some time previously, for a headhunter will lie in wait for days for his victim, who, he knows, will take a certain path some time or other. Then from among the dense foliage and undergrowth he shoots his victim at point-blank range, and with savage exultation severs the precious head of his quarry, whether alive or dead, carrying it back to his village, where he is received with inconceivable honour and rejoicings.

A desperate adventure which befell a couple of Japanese soldiers not long ago exhibits both the cunning and determination of the highland savages. Four soldiers had been deemed sufficient guard for some small camphor-workings, shortly to be discontinued, at a point in the hills where for some time previously a close examination of the surrounding country had failed to discover traces of any savages. Two soldiers had departed the previous day with some coolies carrying camphortubs, and the last two proceeded to follow with the remainder.

They pursued their way safely in the trail of their comrades of the day before until they reached a defile with high, precipitous sides. They had only penetrated this for a short distance, when they found the path partially blocked by an apparent fall of lumber and rocks from the heights above. Although this was somewhat startling, they were proceeding to surmount the obstacle, when one of the coolies, a Hakka man, uttered a low warning sound, and picked up from the ground a stave of a broken camphor-tub. This was quite sufficient to dispel any previous confidence in their immunity from danger. That they were confronted by the work of the head-hunters they quickly decided, and as speedily realised the horrible fate that had evidently overtaken the party of the day before.

Everything now depended on the two soldiers, who prepared for instant action, and these, like true Japanese, rose to the occasion. They knew that the non-arrival of their murdered comrades

and themselves would speedily bring up a force to their succour, and the main thing, therefore, was to avoid an attack in the rear and to get back into the open, where they could make a stand in a good

position to use their rifles with effect.

The whole party had commenced a retirement, when suddenly a swarm of some fifty painted and befeathered savages burst from a patch of dense scrub in which they had awaited their advance, and came plunging down the defile in pursuit of the escaping quarry. The Japanese instantly ran back to the barricade, and opened a rapid and well-aimed independent fire on the charging mass. Man after man went down as the bullets ripped through and through the naked bodies of the savages packed closely in the narrow way, and the survivors turned and fled. The little convoy then quickly extricated itself from the defile, and at once occupied an unassailable position for the night, where all were discovered next day by a force under an officer sent out to search for them.

The headless remains of several of the earlier party were subsequently discovered, as well as the preparations which had been made to overwhelm the second detachment with an avalanche of rocks and lumber had they proceeded another

few yards.

Such incidents, which are only too frequently associated with the production of camphor in its earlier stages, should at least render the consumer more tolerant of any occasional rise in the price of

so hardly won a commodity.

The tree from which camphor is obtained is a species of laurel indigenous to Formosa, and it is on the mountains overrun by these terrible hordes of head-hunters that the extensive forests from which practically the world draws its supply of camphor are found. Of nearly seven million pounds obtained annually, this small island produces all but about six hundred thousand pounds, half of which comes from Japan, a third from China, and onesixth from Borneo.

Allowing for a reasonable increase in the world's demand, it is estimated that Formosa contains sufficient camphor to supply the world for another hundred years and more, for Japan scrupulously plants a new tree for every one cut down in pursuit

of the industry.

Let me take my reader to a camphor-camp in the mountains where our heads will be in no danger, for it is well guarded by Japanese soldiery. Many of the best camphor-forests still lie beyond the protected zone, in disputed territory, and into these the Japanese are gradually working, as they require the trees, by a system of block-houses from which their small posts can resist any attack by the savages. Even the nearest of the camphor-stills are several hours' good marching from the lower slopes of the mountains. These rise in a beautiful suc-

cession of tiers, one above the other, to where the highest peaks are sharply outlined against the

cobalt blue of the sky. The valley by which our path ascends presents the most enchanting alternations of scene, sometimes opening out into lawns and meadows or cultivated patches, at others narrowing to rocky gorges, through which a little mountain stream rushes down to the sea. The natural asperities of the hill scenery are softened by a redundant vegetation of palms, bamboos, tree-ferns, plantains, and oleanders, the face of the rocks themselves being covered by a soft verdure of beautiful mosses and small creeping plants. By-and-by, after a steep and slippery climb, we reach the camp for which we have been making.

The whole air is pervaded by a strong odour of camphor, and a big camphor-tree about four feet in diameter has been felled and sawn longitudinally. Two men with adzes are cutting off six-inch chips to feed the retorts of the camphor-stills, which, having received the redolent fragments, are heated by a slow fire. The camphor vapour which is thus given off passes by a tube into a cooling-box partially immersed in water, where the sublimated camphor condenses in snow-like crystals. The chips are renewed every twenty-four hours, and every eighth day the fire is put out and the crystals removed from the box. The crude product is then dumped into vats furnished with holes for drainage, and beneath, in vessels placed for the purpose, is gathered the yellow camphor-oil, for which there is such a universal demand. The camphor itself, still containing some oil, is then conveyed to the refining factory at Taipeh, the oil being sent for a further elaborate treatment to Japan.

At the Taipeh works the crude camphor undergoes a number of further processes, consisting of drying, heating, and evaporation, until it becomes refined A-grade camphor. This has generally realised in the foreign market ten pounds fourteen shillings per picul of one hundred and thirty-three pounds, and the value of the monopoly to Japan is represented by something like three to four hundred thousand pounds per annum. The actual workers, who so frequently pay a horrible toll for their industry, receive the high pay of three pounds per picul in consideration of the risks to

which they are exposed. Japan is devoting herself with energy and success to the development of her Formosan colony, and in time no doubt will gain the mountain interior and subdue the ferocious guardians of the camphorforests. Meantime the high price of camphor is in the nature of a blood-toll—a price which we shall not grudge if we consider that the actual cost of our fragrant purchase may be represented by a few dried human heads set up in a far-away village in the Formosan mountains.

-

'DICK SEDDON.'

By Mrs Gorges.

N the tenth of the sixth month of 1906 the Hon. R. J. Seddon, passenger from Sydney to Auckland, expired, and after careful examination by the ship's surgeon he pronounced the cause of death

to be heart failure.' Such is the extract from the log of the steamship Oswestry Grange, the ship on which Mr Seddon had stepped after an arduous month in Australia, tired certainly, and rejoicing in the prospect of going home to the country he so dearly loved-'God's own country,' as he called it in the last telegram he ever sentbut still, to all appearance, strong for many a battle yet in the great cause of humanity. Hardly did those who were nearest and dearest to him, and who watched him most anxiously, recognise how the years of strenuous, unremitting toil and thought had undermined even his great strength, till he lay 'magnificent in his repose, his hands clasped and his brow without a wrinkle,' sleeping his last, long sleep on board the great liner, which, when his death occurred, had put back for Sydney, its flag flying at half-mast. A little later its voyage was resumed, and that which was mortal of the great New Zealander was borne back to be laid to rest in the country of his adoption. 'There goes a man, the like of whom is only born once in a long time,' said the captain of the Oswestry Grange, as, standing on the deck with head uncovered, he watched the hearse bearing the body of Mr Seddon pass from Glasgow Wharf, Wellington, at an early hour on Sunday morning, June 17; and these few words sum up the secret of the extraordinary hold which Mr Seddon had on the people. Other men of great political distinction have fallen, deeply regretted and missed by those of their own political party; but no feeling of political differences interfered with the universal sorrow manifested when the sudden death of Mr Seddon was announced. Everywhere it was felt that not only a great man had fallen, one who had been the main factor in the development of New Zealand as a nation, not merely as a colony, but also that a friend was gone—a sympathiser with the poor of the earth, a just man, and a patriot in the truest sense of the word.

It seems a fitting time for a sketch of this great personality, because of the recent issue of The Life of Richard J. Seddon, by James Drummond (Siegle, Hill, & Co.), and also because England has just been visited by the representatives of those great colonies beyond the seas which still cling to her and call her mother.

To England the honour of his birth belongs. Richard John Seddon was born, of a Lancashire farming family, at Eccleston, near St Helens, Lancashire, on June 22, 1845. Fairly educated as a boy, he went to work at a very early age. At eighteen he had already served his time as an engineer, and was working at a Liverpool foundry as journeyman. It was then (1863) that he made up his mind to leave the old country, feeling that a newer, freer land would give him more scope, and in that year he left England for Victoria, which was then well known at home through the fabulous wealth reported to have been won at the diggings. He landed at Melbourne, and here life under the Southern Cross began for him.

Physiognomists have said that he was born to greatness; but of the steps whereby he achieved it has been written: 'He had opportunities of achievement, and let none slip by him; but he also made many of them himself, and by his marvellous energy he overcame stupendous obstacles—obstacles that the majority of men would have blanched at and never attempted to conquer.'

On landing at Melbourne he lost no time in getting work at his trade; but the reports of the lucky finds made by the miners induced him to throw this up, and take to pick and shovel. But not here did fortune await Dick Seddon; other men found gold, but he did not. Realising this, he wasted no time at Bendigo in a fruitless search for wealth, but returned to Melbourne, and got work at the Victorian Locomotive Works at Williamstown, there remaining till 1866. It was there he met the lady who afterwards became his wife, and who, by giving him the home happiness and help which many less fortunate miss, secured, as he himself averred, the possibility of his attaining the high goal at which he aimed.

In 1866 he left Williamstown for New Zealand, and, landing at Hokitika, made his way to the Waimea goldfields, and here his success began and his untiring energy found a profitable outlet. 'With his party'-I quote from a sketch of his life in the Auckland Weekly News, to which I am much indebted—'he introduced hydraulic sluicing on a large scale, and constructed dams and flumes and races, and worked the auriferous terraces at the right-hand branch. He was connected with the famous Band of Hope Water-race; and, encouraged by the success of this and other races, he urged the Government and the Westland County Council to construct large water-races themselves, which have since proved of enormous value in developing the gold resources of the colony.'

Having made a great deal of money by these mining ventures, he now entered into business as a storekeeper, returning to Victoria, as soon as he had placed his affairs on a firm commercial basis,

to claim his bride. This was in 1869, and in the same year he came back with Mrs Seddon to the west coast, where they settled down.

This year also witnessed his appearance in public life as a member of the Arahura Road Board, after which he became chairman of various councils, Mayor of Kumara, with other local offices. In 1875 he had his first fight for a seat in Parliament, but was defeated. Although he realised, perhaps, that his time had not yet come, he also perceived that the way to enter Parliament was to merit the support of his party. His enthusiastic and successful efforts for the election of Mr Seymour Thorne George as member for Hokitika won him the gratitude of Sir George Grey, who, when later on Mr George transferred his services to Rodney, and a candidate was again wanted for Hokitika, sent a telegram to Mr Seddon: 'You are worthy. Stand yourself.' He did so, and took his seat in the Parliament of 1879, never again henceforth to suffer defeat.

At first he was by no means a popular member; in fact, he had to fight prejudice aroused by a certain roughness of exterior and of speech, while his powers of endurance, which in later years became the admiration of the House and of the whole colony, in those days were the 'subject of many maledictions.' He blocked many a Bill, and held on with bulldog tenacity to what he himself believed the right course. But even then there were those who discerned his strength of character; and among them was Mr Ballance, who, when in 1881 his Government came into power, nominated Mr Seddon Minister of Public Works, Mines, and Defences. This was an unpopular appointment, and one for which many predicted failure. But from the first Mr Seddon's power as supreme head in his own departments made itself felt. Another surprise awaited the House when, a year or two later, Mr Ballance falling ill, Mr Seddon was appointed Acting Premier. But by the time of Mr Ballance's death there was no room for surprise; Mr Seddon fell naturally and by common consent into the position of Premier.

The death of Mr Ballance occurred in 1895, and for some time after becoming Premier Mr Seddon retained his various portfolios, subsequently relinquishing the Mines Department to Sir A. J. Cadman, and becoming instead Minister for Native Affairs. In 1896 he met Parliament with a reconstructed Ministry, reserving to himself the work of the premiership, the Treasury, Labour, and Defence, but soon adding to these the control of the Government Insurance Departments and the Public Trusts Office, and, from 1902, Education and Immigration. The history of Mr Seddon's thirteen years of premiership is also a history of the Liberal Party's rise and predominance in New Zealand, during which its people, with Mr Seddon as their leader, found a way of their own to settle many of the questions which to-day are pressing upon this country. Their way may not be ours, but the

course they have taken of recent years is at this moment of peculiar interest in England. Therefore the biography just published of Richard Seddon means far more than the study of a great and remarkable man; it is of imperial as much as of colonial interest, because 'for almost the whole of his Government's action Mr Seddon was responsible.'

This biography is prefaced by a vivid sketch of its subject, written by Sir Joseph Ward:

'Physically powerful, vigorous, and imposing, with a keen and fearless eye, Mr Seddon was a man who compelled respect and attention whenever and wherever he spoke. There was a stern and fighting glint in his clear, straight eyes that said, as Carlyle said of the Abbot Samson, "Let all sluggards and cowards, remiss, false-spoken, unjust, and otherwise diabolic persons, have a care; this is a dangerous man for them." And as the Sage has written elsewhere of that same grave old abbot, it could with exactitude be said here of my old chief that he was a skilful man, full of cunning insight, lively interests; always discerning the road to his object, be it circuit, be it short cut, and victoriously travelling forward thereon.'

Outside of the domain of politics, Mr Seddon, by being what he was, has left a life-lesson for those in all spheres of life who, coming after him, desire to live so that the world may be the better for them. Mr Drummond shows him as a man who them his earliest days disregarded his yesterdays; from his earliest days disregarded his yesterdays; to-day and to-morrow for him were all; the past was but a prologue. Guided by this rule, how many an ordinary life would be saved from wreckage and misery!

One of the first 'reforms' which he carried through was women's suffrage, and the ultimate success or failure of the experiment in New Zealand will greatly influence the question of its settlement in England. To those who believe that women are leaving the sphere for which God intended them, and from which they have really influenced the world—that they are putting themselves in the position of the dog who, grasping at the shadow, lost the substance—to such it is consolatory to find that Mr Seddon had this Act passed because he regarded the matter 'rather as a legacy from his predecessor than a reform in the immediate need for which he himself believed.' Added to this, his fighting instincts were aroused by the opposition which he met from the Legislative Council-the one thing wanted to make him think the matter urgent!

Some of the most important Acts of the Seddon premiership were passed when the Industrial Conciliation and Arbitration Act was first placed on the statute book. The State at that time also came to the help of the Bank of New Zealand by passing the Act which guaranteed interest on two million sterling of new capital. The Land for Settlements Act was passed, 'giving the Crown for the first time power to take privately owned estates compulsorily for the purpose of closer settlement.'

The Railway Commissioners were abolished, and the management of the New Zealand railways was placed in the hands of a Minister of the Crown.

Much of this legislation owed its initiative to the Ballance Government, but its success to Mr Seddon. He spared neither time nor labour over the working of these measures, so that for years scarcely a session passed without the appearance of a Bill for some alteration or improvement in them. Amending Acts for the Conciliation and Arbitration Law were passed in 1895, 1897, and 1898, and even later; while of his final Factories Act of 1901 an English critic has written: 'It is a model of exhaustive foresight and detail, one which, in view of recent slipshod drafting, home legislation itself may well bear in mind.'

But the Old-Age Pension Bill, which in 1898 became an Act of Parliament, is perhaps the most remarkable feature of Mr Seddon's premiership, the most daring of the many Acts whereby he made history. He first introduced it in 1896; but it met with much opposition, and was not passed without a hard fight, in which he battled every inch of the ground. Mr Seddon never accepted defeat, and so it came to pass that this Bill, relieving the aged and deserving poor, whose only refuge hitherto had been charity, public or private, 'scraped through the House' at last, and became the law of New Zealand. In 1905 he was instrumental in getting the old-age pensions increased from seven shillings to ten shillings weekly.

In the same year his care for the working-classes was shown in the Workers' Dwellings Act, by which the Government became house-owners, renting the dwellings at such a rate as would recoup the country for the capital expenditure and at the same time enable the tenant to secure a home for himself by instalments paid as rent. Tenders for these homes in Auckland were to close on the Friday following his decease.

To the last day of his life he was striving to help and brighten lives hitherto spent in the hopeless struggle against circumstances which ground them to the earth. He got the Teachers' Superannuation Bill carried. The national pension scheme, which he ardently hoped to see in operation, was designed to enable every one in the colony, on the basis of an annuity, to make provision for the future by small money payments, which would be subsidised by the State. Always thinking out great schemes and striving to perfect them, he personally introduced upwards of five hundred and fifty Bills into the House of Representatives.

In 1897 Mr Seddon visited England, on the occasion of Queen Victoria's Diamond Jubilee, and was the guest of Her Majesty. It was the time of the first Colonial Conference, and this visit marked his development as an Imperialist. He became identified with the larger interests of the Empire, and gave a splendid proof of this when, in 1900, he was the first Premier to offer the mother country a colonial contingent at the

time of the Boer war to serve in South Africa, and no less than ten contingents did he send to fight side by side with the soldiers of the old country.

Mr Seddon again visited England in 1902, and was present at the Coronation of King Edward. He had been made a Privy Councillor by Queen Victoria, and a similar honour was now conferred upon him by the King. He was offered other honours, which he declined; accepting, however, the freedom of the city of Edinburgh and of the ancient City of London, also of the borough of St Helens, Lancashire, his native place, and of his mother's birthplace, the royal burgh of Annan. Perhaps as much as any of these honours did he prize the recognition of the Maori chief Keruru of the Urewerss, who before his death handed over to Mr Seddon the taiaha or sceptre of the tribe, the Tuhoe natives recognising him from that time as their chief rangatera.

In London Mr Seddon's great interest was in making New Zealand better known to the people at home, and in this he met marked success.

Early in 1894 Mr Seddon became extremely ill, suffering acutely from a general breakdown of health, due to overwork. It was a warning to rest : but when was warning taken by one so eager in spirit, so bent on working while the day lasted? With a constitution which seemed to be 'composed of steel and bronze, he took liberties with his health that few ordinary men would dare to take. In September of the same year he celebrated the twenty-fifth anniversary—the silver jubilee—of his entry into political life by a visit to the west coast. It was a triumphal procession, the population in the various districts turning out to receive him, the people in the townships waiting for him at their doors and in the streets. Energetic, fearless, passionate in his opposition to anything that savoured of trickery or an attempt to take advantage of the labourer, Mr Seddon was a man greatly beloved, as was shown then and on other occasions before the great burst of sorrow which met the announcement: 'The Premier is dead!'

Here, in the country of his early experiences, he was no longer the Right Honourable, but became 'Dick,' chatting with the elderly people, and telling anecdotes of his old digging days, when he was one of the many great wrestlers of the west coast. He visited his old home, where the trees had been planted by his own hand, and the paddock cleared and scrubbed in days when the keep of a horse cost thirty shillings a week and pasture was valuable. At Hokitika he was presented with a silver tea-service in honour of his political jubilee, and in a speech acknowledging this he remarked that he could honestly say that he was 'a humbler man than when he had entered Parliament twenty-five years ago'—a true mark of greatness this!

The months went on, and, despite all warnings, he continued the same strenuous life; but the strain was bound to tell. Again premonitory symptoms of a breakdown occurred, and Mr Seddon, with his wife and others of his family, went to Australia for change and in hope of rest; instead of which, finding that there was work to be done, he worked to the end, his last work practically being the completion of an agreement for reciprocity between Australia and New Zealand.

Fêted, lionised, made the subject of an ovation which was his crowning triumph, Mr Seddon was so bright, so genial, so free from nervous irritability, that no one suspected how his vitality was being sapped by the strain. When he stepped on board the Oswestry Grange at three o'clock on Sunday morning, after his last and hardest day in Australia, he yet exerted himself to say a few words to the steerage passengers on board in acknowledgment of the cheer with which they greeted him. They were on their way to what they called 'Seddonland,' drawn thither by the account of what he had done for the country. A simple, brief speech it was, but only he and the God who made him knew what it must have cost the weary man in this his weariest hour. When, a little later, he went to his berth, the friend with whom he had been sitting in the saloon reflected that he had never seen human weariness epitomised so clearly in one face; 'he had drawn on the well of endurance to its deepest limit.'

He got some sleep, and, though not very well in the morning, he seemed refreshed and better in the afternoon. He was chatting cheerfully to Mrs Seddon and his private secretary, when he suddenly put his hand to his heart, and, turning toward his wife with the exclamation, 'Oh mother!' sank back in a fainting condition. A few seconds afterwards he breathed his last, apparently without suffering.

All New Zealand was stirred as the brief message announcing his death passed from city to city, and the heart of the people was moved; they had lost a friend.

'Died in harness,' said one man in the street; 'died in harness, as he always said he wished to do. God bless him!' 'Ay, he's gone,' said an old man, addressing a stranger, 'and we could ill spare him; he did a lot for the people.' A third said, 'Well, we've lost a true friend. I'm glad he was "Dick" to the end, and died game.' And indeed, through the profound grief, the absolute consternation, that prevailed, there mingled a curious sentiment almost of satisfaction that the Premier had 'crossed the bar with all sail set, as he wished to do, passing out with the day.' Very deeply was felt the pathos, and even more the unconscious prophecy, of that last message, 'Leaving for God's own country;' for surely it was to this country that, a few hours later, the call came.

Human honour seems little in the presence of death; yet even to Mrs Seddon in her hour of anguish, as she brought home her dead, the tributes which flowed in on every side from the highest and greatest must have given a throb of pride and

pleasure, showing as they did the appreciation he had won from those who did not give it lightly, the keen and universal sense of personal loss. On all hands the greatness of his work was acknowledged; rich and poor met on common ground to pay their tribute to the man who had 'stood to' New Zealand for over a quarter of a century. He had not forgotten the children. The chairman of the City Schools Committee came forward with his tribute: 'Mr Seddon's work for the children, socially and educationally, showed that he loved the children, and no man had done more for the children of New Zealand than he had.' Almost his last thoughts were for them. A moment or two before his death he had been telling Mrs Seddon that the children must all have a special holiday when they got back to Wellington.

Mrs Seddon's sorrow was, indeed, as Sir Wilfrid Laurier said, 'shared by millions of men all over the British Empire.' Nor let the touching messages from the Maoris be forgotten: 'Farewell, oh our Premier! ever generous to your Maori people. Depart, oh our father! and may your Lord provide for you.' From another tribe: 'Farewell, oh Father of our Maori people! Depart to join our greatly beloved Queen Victoria. Farewell, oh White Crane of one Flight, the Great Forest of Tane, the Father of the Maori!'

He rests from his labours. 'Mr Seddon was not a man who wore his heart on his sleeve; but no man ever won the love and affection of multitudes of men who had not in him the love of God.' So said the Reverend R. Walker, preaching in Auckland—an utterance to which the heart of man answers Amen!

SHADOW AND SHINE.

'Turn to me, Mary,' comes floating the song, Blown ly the echoes the moorland along. Twilight is falling, night darkens the sky; 'Turn to me, Mary'—and bid me good bye.

Gray loom the mountains, the moorland lies gray; Mantled in mist to its rest goes the day. Sadly I dream of a desolate sea, And a sail that is waiting—is waiting for me.

Dear, through the darkness the gleam of the light!
Gold shall the dawn break though gray be the night.
Hark! the clear call borne afar o'er the foam:
'Turn to me, Mary'—and welcome me home.

Set like a gem on the bosom of spring, Summer is shining, the nightingales sing. Blue these gray hills, in the rose of the dawn Golden the moorland with blossom of thorn.

Oh, the love-mist in your eyes as you stand
In your kirtle of green, with a rose in your hand!
Oh, the white sail that beats up from the sea!
'Turn again, Mhairi dhu," turn ye to me.

C. M. STEEDMAN.

THE ROMANCE OF INDIA-RUBBER.

By THOMAS NORTH CHRISTIE.

HERE are few more interesting substances in nature than india-rubber; but so readily do we take for granted what we have been accustomed to and rubber comes in with the feeding-bottle!—that its curious proper

ties are just accepted by the multitude with as little thought as the schoolboy bestows on the deus ex machina of the catapult lurking in his breeches pocket. Yet, think what a lovable substance it is; compare those gentle, yielding molecules, detesting noise and strife, with the harsh, clanging, obstinate ones of a resentful, even death-dealing metal.

If an oyster may be crossed in love, one need not question that a vegetable product may have a romantic history. This romance began when, over four hundred years ago, Columbus and his followers found the inhabitants of Hayti playing a game with balls made of the gum of a tree, and observed that the balls, although large, were lighter and bounced better than the wind-balls of Castile. Later on the Spaniards in the New World used the juice of the ulé-tree (since identified as the Castilloa elastica) to waterproof their cloaks; but the Old World knew nothing of it, and in England, save as a rare curiosity, india-rubber was unknown and unnamed until Dr Priestley in his work on perspective, published in 1770, called attention to it, and said: 'I have seen a substance excellently adapted to the purpose of wiping from paper the marks of blacklead pencil. It must, therefore, be of singular use to those who practise drawing. It is sold by Mr Hairne, mathematical instrument maker, opposite the Royal Exchange. He sells a cubic piece of about half an inch for three shillings, and says it will last several years.' Who could have imagined that a product so petty as to be named after its insignificant only use was destined ere long to find its way into every department of civilised life, to minister in no small degree to the comfort and well-being of the human race, and to become indispensable to the progress of the world in the triumphs

No. 506. -Vol. X. [All Rights Reserved.]

which man has achieved in electricity and locomotion?

Here, perhaps, ends the first volume of the romance; and this article may take up its purpose and introduce the second volume.

In 1823 Charles Mackintosh, of Glasgow, almost by accident, stumbled on the idea of dissolving rubber in naphtha, thereby producing a waterproof varnish which could be spread between sheets of cloth. Twenty years later his subsequent partner, Thomas Hancock, discovered that with the addition of a little sulphur and the application of heat india-rubber could be 'vulcanised,' and so made to retain its singular qualities for a prolonged period. With these discoveries came an immediate and rapid extension of the uses to which the substance could be put, and the term 'mackintosh' became synonymous with a rainproof overcoat.

In 1830 the imports of rubber to England were but twenty-three tons; they are now over twenty-one thousand tons, and the annual value of the world's consumption of raw rubber is about twenty-five millions sterling. Practically all this is collected from wild trees in the forests of the Amazon basin or from the jungles of Africa and Asia; but the supply has not kept pace with the demand, and the price of india-rubber has doubled itself within the past few years.

A hundred years ago the rubber which came in small quantities from India (Assam) was found to be derived from a species of Indian fig-tree—Ficus elastica—the plant with large, stiff, glossy leaves now so well known to us as a window ornament, the Malay variety of which, distinguished by its handsome red sealing-wax tip, was conspicuous last summer in the beds of the Edinburgh East Princes Street Gardens.

It is strange that the British have never had any share of the great business connected with the collection of the wild rubber (not a very savoury business in the Congo State, if all tales be true), which is in the hands of Americans, Germans, and Brazilians; but it is gratifying to know that the Reserved.

reverse is the case with the cultivation of rubber in the East. It is entirely a British industry, for the recent small plantings in the Dutch islands are as nothing compared to those of Ceylon, Malaya, Borneo, and South India.

Perhaps the first serious attempt to cultivate india-rubber was made more than twenty-five years ago in Ceylon, when many planters, the writer amongst them, took it up, growing a variety called Ceard as a subsidiary product. But when the tree reached a suitable size for tapping it was found to be impossible to extract the rubber in paying quantities, and in a few years the cultivation was given up. It was known at the time that there were other varieties of rubber-yielding plants offering much more prospect of success than the Cearà had ever done; but the impossibility of obtaining seeds or plants of these other varieties in commercial quantities, and the disappointments of Ceard, ended all the enthusiasm, and further cultivation was not attempted.

India-rubber-or caoutchouc, as it is, perhaps, better, although somewhat uncouthly, called in most countries - is present in many plants, from the humble poppy upwards, and the wild supply is gathered from various trees and climbing plants; but practically only one kind, the Hevea brasiliensis,

is cultivated in the East.

In 1876 the Indian Government, alive to the advantages of rubber as a cultivated product, aided by the authorities at Kew, decided to make an effort to obtain seeds of the tree which, it was known, yielded most of the high-quality rubber collected in the Amazon basin and exported from Para. Several thousands of seeds of this tree (Hevea brasiliensis) were secured in Rio Tapajos by Mr Wickham, who was sent out for the purpose, and some hundreds of resulting plants were despatched to the East from Kew, as well as a hundred plants secured by Mr Cross, another collector. At the wish of the Indian Government, these valuable plants were landed in Ceylon, with the intention that they should supply in due time plants for transmission to Burma, where the Indian Government contemplated having plantations. Thus, very literally did this far-sighted action of the Indian Government (which cost them but one thousand five hundred pounds) sow the seeds of the rubbergrowing industry, which bids fair to become one of the most important in the British East; and generously indeed have these plants repaid Ceylon for the hospitality extended to them.

Landed in Ceylon in 1876, the plants received no particular attention, and many seem to have perished. But a year or two later some cuttings were sent to Singapore and parts of the Malay Peninsula; and, as seedlings became available, a few were planted on some of the low-lying tea estates in Ceylon. Time passed, rubber advanced greatly in price, and experimental tappings, both in Ceylon and Malaya, showed that this Para variety would in its new home, at a comparatively early

age, yield rubber of the same excellent quality as in South America, and in very paying quantities. As this became realised in Eastern planting circles, considerable areas, particularly in Malaya, were planted up; and their success being demonstrated, the demand for seed and land grew apace, until a rush almost comparable to a goldfield rush set in to the rubber El Dorado, the Federated Malay

'What and where are the Federated Malay States. States?' many a reader will exclaim; and such ignorance is not so appulling, for it was but ten years ago that the protected Native States of the Malay Peninsula-Perak, Selangor, Sungei Ujong (officially called Negri Sembilan-Anglice, 'Nine States'), and Pahang-were federated into a territory a little larger than Scotland. They are but little off the traveller's beat, and they are within hail of those 'swift shuttles of an empire's loom' which unceasingly throb to and fro in the Straits of Malacca. In theory they are protected Native States; in practice they are British possessions, although quite distinct from those crumbs of land sprinkled over Malaya known as the Straits Settlements. Little more than a generation ago they were the home of the Malay pirate; to-day they supply the world with tin, exporting six millions sterling worth in the year, and their capital, Kuala Lumpor, may claim in several ways to be a model town of the Empire. Lastly, they have no public debt, and the sole anxiety of the local Chancellor of the Exchequer is to be able to spend the revenue without contracting a reputation for extravagance.

Selangor is the state which has taken the lead in the new enterprise, and the favourite land for rubber-cultivation has been the alluvial flats running back from the tidal rivers and creeks, up which in 'the good old days' many a pirate had his lair and found safety from the pursuing gunboats. When the jungle was being cleared on an estate owned by the writer, half-a-dozen rusty cannonballs were picked up, betokening the scene of some long-forgotten skirmish and pursuit. These swamplands, when cleared and drained, grow the Heres brasiliensis very well, and undulating slopes in the interior are also much in favour. The rubberplants are planted at varying distances, but from one hundred to one hundred and fifty plants to an acre of land may be taken as the average. After five years from planting it is found that a considerable percentage of the plants show a girth of twenty inches, measured three feet from the ground; and that is at present the size at which tapping is

There are several systems of tapping in vague, commenced. varying in the number and shape of the cuts; and it is still a matter of opinion how long the tapping of an individual tree should be continued during any one year. A description of one system—the halfherring-bone, as it is called—will suffice. A narrow strip of bark is removed vertically for about three feet, starting close to the ground, and leading

into it side-cuts are made about six inches apart, at such an angle as will cause the latex or milk to flow into the vertical channel and down it to a small tin cup placed to catch the trickle. The lactiferous ducts in which the latex is secreted are close to the wood of the tree, and care has to be taken that the cuts, while reaching the ducts, do not cut into the cambium, and so interfere with the regrowth of the bark. These side-cuts are reopened every second day for a month or so by taking off the very thinnest shaving from their lower surface; at the following tapping, which may be in some months' time, although a longer period for recuperation is very desirable, the cutting is continued below the first scar. The latex is like rich milk in appearance (and it is comforting to know that it is not the sap or life-blood of the tree), with the caoutchouc or rubber present in it in minute globules like butter globules in milk. The flow lasts for an hour or two after each opening of the cut, and comes much more freely in the early morning. There is no uniformity in the yield. One tree yields freely, another sparsely, and from the same tree there is great variation of flow on different days. The cups are left on the trees for some hours, and their contents are emptied into pails and brought into the curing-house.

In the simple process, the latex is poured into pans or dishes and left for a night, during which the caoutchouc particles all coagulate into a soft, spongy mass separated from the watery whey. This coagulated mass, still milk-white, is then squeezed of much of its moisture by the pressure of rollers, and dried either naturally or artificially, during which process its white, curd-like appearance disappears, and it becomes translucent. To economise time and space, machines of various kinds may be used which hasten coagulation and drying, but in these matters, and even in tapping, no planter can at present say that he is other than a learner.

It is said that plantation rubber hardly equals the wild product in lasting qualities and 'nerve,' although it is greatly superior in purity; but whether that alleged difference is due to inherent qualities in the caoutchouc or to a virtue in the native method of coagulation and drying (in which smoke is used), or to age, has not been determined. The planter is content to see his rubber top the market, and the price for some years past has generally been close to six shillings per pound.

It is difficult as yet to speak with any degree of certainty as to what the yield per acre of a rubber plantation for an average of years will be in Ceylon or Malaya. Most of the trees hitherto tapped have been grown under conditions which differ from those incidental to large closely planted areas, nor have they been tapped for a sufficient number of years to justify quoting their yields as average ones. A tree in Ceylon over twenty years of age has given twenty-five pounds of rubber, and there are thousands of trees from seven to

ten years from which the yield has been two to four pounds in the year. If it turns out that on an average of years plantations generally yield only one hundred pounds per acre of marketable rubber in the twelve months, there will be no real cause for complaint, and at anything like present prices the profits would be large; but such a restricted estimate of yield would not be accepted to-day in rubber-planting circles, and except on the too-goodto-be-true principle, it is difficult to deny enormously greater possibilities. Be that as it may, the very encouraging results obtained from trees now being tapped-and these trees must number a good many thousands to have produced over a million pounds of rubber from Ceylon and Malaya in 1906—have attracted great attention to rubbercultivation. The shares of the older companies command very high prices; those of the premier concern, which has a Glasgow habitation, sell at eight times their par value, and the shares of an Edinburgh company are not far behind at six times. Such companies as these, it must be remembered, began some years ago, and are capitalised at very different rates from those prevailing to-day. More recently numerous companies have been formed, both in this country and Ceylon, and millions sterling have been subscribed to acquire existing properties and to open out fresh lands. Many of these companies have excellent prospects, and their shares are at a substantial premium; but when, as at present, a boom takes place, the investing public would do well to be very discriminating.

At one time the world's record for the highest value in agricultural land was held by the celebrated vineyards in the Cantenac, Margaux, and other communes of the Bordeaux district. These values, seldom over one hundred and twenty pounds per acre, had gone long before the advent of rubber plantations; but at their best they would have paled before the three hundred pounds per acre, at which rate fairly mature rubber works out in the prices actually paid for shares in some of the Malayan companies.

It is possible to frame almost any estimate of profit from a rubber plantation if the returns actually given by single trees or small plots be taken to represent average figures. Single trees have given in a few months twelve to twenty pounds of rubber, worth over five shillings per pound, and small areas have given returns equal to more than sixty pounds sterling per acre profit in the year. The planter knows, however, that when he has to deal with more closely planted trees, and has to take the average for some years of large areas, the figures will be different; although still in his slumbers dreams born of avarice are more likely than nightmares of poverty!

So far the Para tree has been wonderfully exempt from serious pests; but it will have to face all the usual risks of agriculture, and will undoubtedly have its ups and downs. At present above all others in the 'upe' is the market price, five to six shillings per pound; but no one ungifted with the power of prophecy can say what the prices ruling for rubber a few years hence may be. On the one side is the ever-increasing demand: the noisy motorbus (which seems to have no noiseless ingredient in its whole composition except rubber), said to consume two hundred pounds of rubber in the year; the high-powered motor-car, using up, it may be, a hundred pounds' worth of tires in the same time; cycles, no longer a fashionable craze, but necessaries to vast numbers of workers; and all the thousand-and-one older uses to which the substance is put. The demand, already ahead of the supply, must surely increase, and increase greatly; while the natural sources, large though they are, do not seem, even under the stimulus of high prices, to be sufficiently expansive.

The future range of prices will probably depend on two contingencies: (1) whether a commercially successful means of producing rubber synthetically be discovered; (2) whether the demand will increase in proportion to the plantation supply. The bogy of a synthetic rubber was raised anew by Professor Dunstan at the last meeting of the British Association, and he gave it as his opinion that such a product would be in existence before the British Association met again at York; but in planting circles there is a comforting feeling that Nature keeps her secrets very closely, and that the workings of her laboratory are subtle in the extreme. For how many centuries has the problem of inducing the pennyworth of carbon to take unto itself the form of a priceless diamond baffled and worn out the human brain! The present position of the synthetic rubber problem is that a hydrocarbon product called isoprene, prepared from oil of turpentine, if kept for some time, gradually passes into a substance having the characteristic properties of caoutchouc (and conversely, isoprene can be got from caoutchouc); but isoprene is only present in turpentine in such minute quantities that, even if the resulting substance proved in practice to be capable of being put to the same uses as rubber, it could not be produced in commercial quantities to compete with natural rubber.

Overproduction is not an impossible contingency; and it is certain that the plantation production will increase by leaps and bounds. At present it is a mere drop in the bucket—say, six hundred tons against the sixty-five thousand tons which come from natural sources; and even if the area planted

at the end of 1906 in Ceylon and Malaya is taken at one hundred and twenty thousand acres, and if the average yield six or seven years hence be put at two hundredweight per acre, the total would be but twelve thousand tons, or less than a 20 per cent addition to the present annual consumption of the world. It is difficult to-day to imagine that such an addition would not be readily absorbed. Still, if labour to open and work new plantations can be obtained, overproduction will in the end take place, unless the yield of the tree is checked by agricultural mishaps, although it may be as far off as the next meeting of the British Association at York!

In spite of these risks, agricultural and market, the prospects of rubber cultivation are very alluring, with their vastly profitable possibilities. The Federated Malay States, with a larger area of suitable virgin land, may attract more capital for purely rubber plantations than Ceylon can do; but the latter colony in many ways leads the industry. Those who know its planters will have confidence that they will be eager learners, apt pupils, in all that relates to their new industry. With praiseworthy enterprise, they, willingly aided by the Government of Ceylon, recently initiated a Rubber Exhibition, the first the world has ever known. In the lovely Peradeniya Botanical Gardens special buildings were erected, fittingly almost under the shade of the historic Para trees from which the new great industry has sprung, and there for a couple of weeks Queen Para of the dynasty of Caoutchouc held her Court. Wise men came from the East and from the West to teach and to be taught, and crowds of enthusiastic subjects, and strangers longing ω be naturalised, thronged the precincts. Botanists, chemists, and experts of low and high degree were there, while the prize-awarding judges were representatives sent out by the leading London rubberbrokers. Rubber was exhibited in many forms, beginning with the latex, a daily supply of which could be seen in the process of coagulation; and machines and implements used in the cultivation

were shown.

The second volume may well close at this point; and who will deny the romance of a life beginning with the Cinderella-like work of cleaning pencil-marks, and reaching an exhibition throne all to itself, with crowds of worshippers, and the historian's record that it has become the most valuable agricultural product in the wide, wide world?

THE ROMANCE OF A FLOATING DOCK.

CHAPTER III.

FTER dinner Sandford and the astute Mr Brandon took further counsel together. Brandon was of opinion that Don Diego would play the game of procrastination till there should be no time to get the wood

elsewhere, when, with copious lying backed by candid bribery, he would hope to force the acceptance of his rafts.

'You might, of course, order the wood from another man here,' he said, 'but you would only get into another bog of lies. These fellows are connected with each other by all sorts of family and business ties of which we know nothing. They'll all speak you fair, and cheat you secretly, apart or in combination. You are here to-day and gone to-morrow, a foreigner, and therefore everybody's natural prey. They live here, rivals among themselves no doubt, but allies, open or secret, against the stranger. The other fellow would pretend sympathy, promise all you want, play you till the last moment, and end by delivering Diego's identical logs—at a higher price.'

Sandford could not doubt it.

'Yes,' continued Brandon; 'and if you let yourself be cheated by him you will be cheated on every hand, and never get the work done at all. Better be bribed than that. If you take bribes you will at least be respected as a man of sense, and will gain something for yourself, whether the dock gets built now or the year after next, or never.'

'Oh, well,' said Sandford, 'I'll tell this fellow if he does not deliver the right stuff in ten days I'll get it from the United States or from England. It won't cost more in time and money than to renew the scaffolding before the dock is built, as I should have to do, and at the risk of a big smash first.'

'I would not do that just yet,' said Brandon. 'But stop a moment.' He looked round. 'Well, they don't know English, but we'll be safer outside.'

They went and strolled across the open sward.

Even then lowering his voice, Brandon continued: 'I would not quarrel with Don Diego or anybody else. You have given him polite notice that his logs won't be accepted. Now you'll find he will do nothing at all, but just wait for you to write again or try to see him; and he will take care to keep out of your way, for he thinks time will be on his side. A masterly inactivity will be his game. He'll lie low and let you fret. If you manage to get hold of him he'll promise everything you wish, but he'll never do anything. He'll tell you the cedar logs are on the way, that they are ten leagues off, two leagues, any plausible lie. But you will never see them, now that he has bought and delivered the others. And he hopes that at the last

moment you will be driven to take the trash he has sent rather than stop the work.'

'He will find himself mistaken.'

'Of course. Now put your hands in your pockets and look at the scenery. Don't let people think we are hatching a conspiracy. But listen without looking at me.' He took out a fresh cigar, and, turning away his head from Sandford, said, as he very deliberately examined it, manipulated it, cut off the end, lit it, and, after a puff or two, held it up and examined it critically, 'We have to go slow in this country, very slow, slower than they do, or we get left. It sounds paradoxical, but it's true. Crede experto. Now, between ourselves-have one of my cigars, and don't start-between ourselves, the steel plates have not left England, and won't either till they 're covered by our second instalment. The firm will wait my cable before shipping. The worthy Government here and I keep "manœuvring for position." I have the weather-gage just now, and of course I mean to keep it. It only needs plenty of patience and the art of holding your tongue in polite Spanish. You have to pretend to believe everything and at the same time believe nothing; and you must act as if you had a patriarchal lifetime before you. If they think you are in a hurry you are done for, and may as well pack your trunk and go home. Most fellows who come out here are in a hurry, and they expect promises to be kept too. Therefore they fail, and break their hearts. I knew a good man who believed them, and made his people at home believe them, and when he was swindled went off his head and shot himself. You must fix in your mind that the people here lie as naturally as they breathe; also that time is of no value at all. Everybody has far more than he has any use for, and can always spend more than you can.'

Their talk was interrupted by the loud whistle of a steamer in the river. The Puerto Nacional boat, the same that had brought them to Garapatas, was again approaching. Sandford and Brandon walked along to the landing-place, where the usual crowd awaited her arrival. Among them were several well-dressed gentlemen, plainly leading inhabitants of the town, and as soon as she touched the bank these hastened on board to salute one of the passengers. They greeted him with noisy effusion. Elderly gentlemen put their arms round his body and patted him on the back with both hands, while he returned their embraces with friendly cordiality.

'It is the manner of the country,' said Brandon.
'I wonder who he is.' He asked a bystander.

'It is Don Santiago Velasquez,' he replied. 'He is returning with his wife and daughter;' and the speaker hastened away to add his welcome to the

At length the passengers began to come ashore. Sandford was standing near a gangway by which some ladies landed. One of them was accidentally jostled, and a book which she carried fell from her hand. He sprang forward to pick it up, wiped the sand from it with his handkerchief, and, as he handed it to her, recognised the girl of the amber scarf.

She received the book with a faint smile and 'Mil gracias, señor.' Her eyes lingered gravely on his for a moment; then she passed on.

Sandford turned away, temporarily forgetting Brandon's existence. His emotion at the sight of this girl was strange and new, and even awful to him. It was some minutes before he rejoined his friend.

That night he slept badly. Before dawn he was peering from his window, trying through the darkness to make out the river-bank where she had landed. With a laugh at his folly, he lay down again. What could she be to him? The daughter, the sister, perhaps the wife, of such an one as Don Diego Lopez. Yet when he remembered her face the thought seemed sacrilege. His moods kept changing. He could not rest. He began to fear he must be taking ill. The daylight and his bath All day he braced him to defy his weakness. busied himself with his work.

The evening was very warm, and a little before sunset he and Brandon went out and strolled through the town. They sat down at one of the little tables on the pavement in front of a café. A little way along the street stood a square house of two lofty stories. The windows on the ground floor were few and small, and protected by thick iron bars. But the upper ones were many and large, and had shaded balconies with flowers trailing over their parapets. Sandford noticed the house because in the street before it a man rode continually backward and forward on a handsome horse, going no farther than the street corner and returning, fretting his beast with spurs and bit, and making it plunge and curvet so as to display his horsemanship. He was

dressed in the extreme of charro fashion, his big sombrero laced with heavy bullion, his short, tight jacket showing the white shirt between its lower edge and his blue silk sash, his closely fitting trousers ornamented with a row of silver buttons down the side and spreading widely over his lacquered shoes, his big silver spurs clanking with every movement. As he turned at the corner and came towards them Brandon recognised him.

'It is our Don Diego,' he said. 'He is evidently doing his pasear.'

'His pasear?' 'Yes, that's what they call it. It is what you have to do when you court a young lady here. He'll go up and down like that before the house as long as there is light enough to see him. The girl is supposed to be captivated like a hen pheasant when the cock struts before her.'

'But don't the neighbours laugh?'

'By no means. It's the custom of the country; and besides, a sense of humour is not their strong point here.

'Can't he make an afternoon call?'

'He would never see her. Men don't call on girls here. Very likely he has not spoken a dozen words to her. Probably he likes her looks and knows her father to be well off, as he must be to live in that house. After a few weeks of this sort of thing, if he takes her fancy she'll throw him a flower, or even speak a word or two to him from the balcony. He'll never see her much closer till they're married.—Diego's a clever, successful young man, by their standards, he continued. 'He's getting on. I suppose he'd be thought a fair match. Do you see any one on the balcony?

No one was visible from where they sat, but the daylight had almost gone. Brandon stopped a

'Whose house is that?' he asked, pointing it passing waiter.

'That is Don Santiago's house, señor. He arrived yesterday with the senora and the senorita.'

(To be continued.)

OF THE BRETON COAST. WRECKERS

By CLIVE HOLLAND.

THOUGH the infamous trade of wrecking has almost, if not quite, disappeared from the wild Cornish coast, where in the early part of last century it used to flourish, it is by no means an extinct one.

Quite recently, indeed, a wine-ship from Oporto to the Thames was lured to destruction upon the coast of Finistère by the untamed and almost uncivilised fishermen of that wild district. An account of the orgy which followed the coming ashore of the casks of wine and spirits washed out of the doomed ship as she broke up amidst a seething

cauldron of wild seas and jagged rocks appeared in many English papers. Few, however, made any mention of the fact that this vessel was undoubtedly tempted to its ruin by the wreckers of that wild strip of coast on which she was cast away.

Notwithstanding the strenuous efforts made by the French Government to put down this terrible calling, it still exists, if it cannot exactly be said to flourish, on the south-west and west coasts of France, among the scattered fishing hamlets which lie lost from the world in creeks and crannies of the coast, where very little control can be exercised over their inhabitants.

In one of these little villages, which we will call Gomport, the old spirit such as animated the Cornish wreckers survives, and little or no disguise is made of this fact, although the actual operations are naturally conducted with as great secrecy as possible. Comes a wild night, and on the rise above the village two posts, some thirty metres apart and some four or five metres high, are erected, and on them is hoisted a line, hung fairly slack, to which are attached at considerable intervals ships' lamps. This is the lure by which the brave but callous fishermen of Gomport seek to draw to destruction any vessel which by stress of weather may be beating her way along the rock-bound coast. Placed on a low promontory scarcely above reach of the driving spray of broken Atlantic billows, these lanterns dangle and sway upon the line to which they are attached like 'riding' lights of ships safe in harbour.

On one such night as we have described, not ten years ago, a huge merchantman, bound from an Eastern port to Amsterdam, was drawn on to its fate in this way. Driven by terrific seas shortly after midnight on to the ledge of rock which runs north-westward almost across the mouth of the little haven, she was pounded to fragments ere dawn broke, and the rich bales of her cargo came in with the morning tide upon the sandy stretches of beach which lie north and south of Gonport, and are uncovered at low-water.

It was many hours before the 'authorities' even heard of the wreck, and several days ere any steps were taken to investigate the truth of the information received. Needless to say, long before the officials had made up their minds to take action much of the spoil had disappeared, hidden away in caves and holes known only to the wreckers and their families. For some months afterwards there was no lack of finery on the fisherwomen of Gomport; and the few summer visitors who, on cycling trips or in search of quiet, came to the little hamlet must have been mystified at the rich Indian shawls and stuffs with which on Sundays and the saints' days the belles of the village bedecked themselves.

Père Pierre, a fine, handsome old Breton, with a snowy beard and keen, hard eyes, can tell many tales of vessels which have come ashore during the last half-century. So accustomed is he to wreckers' ways and wreckers' craft—possibly in his veins runs piratical blood of past generations—that he sees little cause for shame or the hiding of details of such crimes committed by the villagers and by himself. Only once did Père Pierre feel compunction over the business, and that is a tale he tells himself with a stolid pride in the callousness which enabled him so soon to overcome his scruples and once more engage in what has been called 'devil's work.'

It was well back in the middle of last century, when he was a lad of eighteen or twenty. One night in November there blew a terrific gale outside the saw-like reef which lies across the mouth of the bay. Just as the sun was setting, but before the light entirely failed, a large, full-rigged ship was seen beating her way, headed north. All was excitement amongst the fisherfolk, and speculation ran rife as to whether the large ship, which was gradually becoming dimmer and dimmer in the fading light, would pass the haven ere it was dusk enough for the false lights to be shown.

On this occasion it was a couple of cows that were chosen to lure the vessel to destruction. Lanterns were hung to their horns and then they themselves turned adrift on the cliff-side to wander where they would. Night fell, and on the swart, wind-blown turf of the upper cliffs two lights were seen passing slowly to and fro, or merely rising and falling as though by the heave of the sea.

For some time this went on; then far out at sea in the driving wrack there burst a flash and the report of a gun, and then another flash and another report; and then a 'flare' of intense brilliance lit up the rigging and tattered sails of a huge ship driving full in towards the cruel rocks, with those aboard her only just becoming aware of her danger.

When morning broke, men, women, and children of Gomport-and old Père Pierre, then a stripling, amongst them—were to be seen along the coast north and south of the little haven like black ants upon the gleaming strips of sand which had been uncovered by the receding tide. Old Père Pierre was one of the first to find anything of value amongst the wreckage which strewed the shore. All day long bales and barrels and wreckage came floating ashore from the ship, which at low-water looked like a blackened skeleton upon the outer reef. But bales and merchandise were not the only things which came to enrich the Gomport wreckers and their wives and daughters. At the turn of the tide body after body floated ashore, and amongst them were those of the women who had been on board the homeward-bound East Indiaman-probably wives and daughters of returning English officers, for men in uniform and some in scarlet coats also lay bright patches on the silvery beach. Pierre himself found, entangled in a piece of one of the vessel's masts, the body of a young lady, and with a keen eye accustomed to rapid searching for valuables, he soon detected the presence of rings upon her fingers and jewelled rings in her ears. It was whilst pulling these off that he received a fright from which he did not recover for some days. For whether it was a mere relaxation of the stiffening limbs, or what, none can say; but to Pierre's perhaps excited imagination the body appeared to turn towards him with resentful, if appealing, eves.

'There was still one ring upon the finger of the woman's left hand,' old Pierre says when telling the story; 'but I left it there, and took to my heels faster than I had ever done before or since;' adding, after a pause which is dramatic and significant, 'And when I returned for the ring it was

gone!'

Several of these rings, taken without remorse from the dead woman's hands, were worn by Pierre's wife and afterwards by his daughter. And although the curé of the village—or rather of the little district around Gomport—preached in those days against the sin and crime of wrecking, and more especially of robbing the dead, his admonition fell upon deaf ears.

Tradition asserts that as early as the middle of the sixteenth century the wreckers of Gomport were celebrated for their skill and good fortune in tempting vessels to destruction; and there is a story current of the wrecking of two Armada galleons on a ledge of rock which juts eastward about half a league to the south-west of the haven itself. In a measure, these wreckers of olden days profited but little by this particular piece of work, for the galleons' treasure was mostly metal and jewels set therein; and so, instead of floating ashore, most of it sank fathoms deep as the high-pooped vessels slipped back into the ocean from off the shelving reef. But ever since, at a certain setting of the tide, gold doubloons and other coins of Philip of Spain have been picked up on the sands along the coast near where the Armada vessels were wrecked; whilst upon the altar of the little church, which is set back from the coast a full two miles, and serves for the district round about, gleams a golden crucifix of early sixteenth century Spanish workmanship studded with gems, which doubtless came out of the treasureroom of one of these ancient vessels; and round the necks of some of the women of Gomport hang old-time gold pendants and tiny crucifixes, some of them strangely worn as though fretted by sea and sand, which also tell the story of the wreck of the Spanish ships.

After a storm the stretches of beach along the coast near Gomport are scoured by women and children in the hope of finding treasures washed anew from the holds or boxes of the galleons. Sometimes their search will be rewarded by a thin disc of gold or silver which once bore the effigy of Philip of Spain, but now has been ground to almost unidentifiable smoothness by the action of sand and sea. Seldom nowadays does more substantial treasure reward their industry; but as recently as four years ago a golden crucifix—from which the figure had disappeared, and with bent arms fretted thin—was cast up and thrown into the melting-pot, which has so many times proved a convenient means of getting rid of unpleasant evidences of robbery and crime.

Along this strip of rock-bound coast are other hamlets whose inhabitants are by no means guiltless of wrecking, and at one of these villages is still to be seen a beam jutting from the cliff and overhanging deep-cut caves, once used as a crane by means of which cast-up goods were hoisted into the security of the caves of the wreckers themselves. On it was also hung, in mid-air, the lamp used to lure unwary craft to speedy destruction. But, notwithstanding their old profession, the people of this hamlet are singularly courteous to strangers, and have a mild-

ness of disposition which ill-accords with the many nights of cruel work in which they and their forfathers have indulged.

It was here that a collision occurred in the early seventies between the French coastguards and the wreckers who had succeeded in treacherously inviting a large bark to her doom. By some means or other the authorities got wind of the wreck, and sent several officers with a small detachment of gendarmerie to take possession of anything which might be cast up by the sea. Although they were early on the spot, a huge quantity of goods had vanished or had been buried already, for the wreckers were afoot almost before it was light, and the gendarmerie found them busy, many of them up to their waist in surf, dragging bales and casks and portions of the wreck ashore. As may be anticipated, the fishermen were not willingly deprived of their prey, and upon the gendarmerie attempting to interfere a fierce struggle ensued, during which several of the latter were severely injured by blows from pieces of wreckage seized by fishermen as weapons, and not a few of the wreckers were either wounded by sabres or shot, one unfortunate lad falling mortally wounded just before his companions were finally overpowered.

But though such tragic incidents as the one just described are of comparatively rare occurrence, it is by no means an isolated case. The wreckers farther down the coast towards Oléron were in ancient times notorious for their crimes. In the reign of George IV. two rich East Indiamen, a part of a convoy bound for the Thames, were lured to destruction during a fierce gale in the Bay of Biscay, in which they had been separated from the other ships. One was specially richly laden; and although much of her wealth was in specie, and went to the bottom without benefiting the wreckers, they derived a rich harvest from the bales of Indian stuffs and other merchandise which floated ashore. Amongst the inhabitants there still remains a tradition of the wealth which came to the hamlet on this occasion, and in not a few cottages may still be found odds and ends of Indian ornaments, relics of the two

unfortunate vessels.

The old curé of a little Breton fishing hamlet has a story to tell which reads far more like an incident of romance than literal truth. It is this:

On a dark March night in the middle of last century the wreckers of Merpré (as we will call the hamlet) were on the qui vive to pursue their dreadful trade. The then young curé once more exhorted them to remain within doors, but, as on previous occasions, in vain. A horse was led down to the beach, and on it, with a lamp strapped to his shoulders, was mounted one of the boldest fishermen of the village. Over the stretches of sand which formed a wide beach blew the foam from the incoming Atlantic rollers, which raced in a mad tumult inwards to the shore over an outlying ref. Soon in the inky night, eastward, a dark mass could be distinguished by the keener-sighted of those upon the beach, indicating the presence of a ship in dis-

tress, or at all events one driven out of her proper course. Into the very edge of the breakers rode the man with the fatal lamp. Up and down a short strip of beach he went, with the horse starting halffrightened at the swish of water around its fetlocks. Soon the vessel commenced to burn 'flares,' as though hoping to attract the attention of some one ashore, or perhaps to enable those aboard to see the supposed harbour's mouth. For some minutes she appeared like a phantom craft, part of her masts and rigging silhouetted against the dark sky by the lights burnt aboard her, and then she could be observed rushing shorewards under mere rags of canvas towards the terrible reef over which the waves were rushing in a boiling cauldron of foam. As she struck the rocks her masts went by the board with terrific crashes which even the howling of the storm could not entirely drown. A few minutes later, and the young curé came rushing down the gully which led to the beach, distracted by the evil work the fishermen were engaged upon. Along the shore itself were scattered nearly all the inhabitants of the hamlet-the only absentees being the very young and the very old-engaged in watching with keen eyes the ship upon the reef and the incoming waves for wreckage and portions of her cargo.

By dawn little remained of the unfortunate vessel, while the shore was littered far and wide

by wreckage and merchandise washed out of her, and amongst the former were several bodies of seamen, drowned whilst lashed to the spars. In vain the young curé attempted to dissuade his flock from their work of plunder. Men, women, and children were eagerly engaged in seizing the bales and casks as they floated within reach. At length, so the curé's story goes, he was attracted to a certain part of the beach by the fierce cries of one of the wreckers; and on turning his steps he saw him standing beside a dark object on the shore, near which knelt a young woman, his wife, wringing her hands and crying piteously, 'Mon frère! mon frère!' By some strange coincidence the vessel which her husband had assisted to draw to its destruction was that on which her only brother was a sailor. 'For a time,' remarked the curé when he had finished telling us his story, 'this incident did more to check the terrible business of wrecking than all my preaching and all my exhortation. But,' he continued, 'like most tragic impressions, this one wore off, because the spirit of wrecking is in the blood of these people.'

Many tales and romances are also to be told of the Cornish wreckers of old time, who equalled, if they did not excel, their brothers of the Breton coast in the ingenuity and the recklessness with which they

pursued this terrible trade.

A MARRIAGE OF CONVENIENCE.

HAPTER III.

ADY TALLANTYRE sat knitting shooting-stockings with elaborate tops for her idolised only son. She was a tall, white-haired woman of some sixty years, upright, gracious-mannered, kindly-natured, loved

and respected by rich and poor alike.

The sitting-room she usually occupied was an upstairs one in a turret which formed an angle of the quaint old block of buildings perched on a ledge of the steep fellside from which the Lords of Tallantyre took their title. It had started in life, like so many of the houses of Cumberland, as a peel-tower, and round the peel by degrees other towers had grown, till the present imposing manusion of mellow red stone was the outcome.

Two diamond-paned, mullioned windows, with deep, cushioned window-seats, overlooked the narrow strip of fertile dale through which, like a silver ribbon, a brawling river hurried from the heart of the mountains to the sea. The mountains just now were a perfect mass of glorious autumn colour—golden beeches, ruddy cherry-trees, green larches, mingled with brown bracken and gray crag; and far away to the right the sea sparkled blue in the sunshine, dotted here and there with the brown sails of fishing-boats.

Lady Tallantyre, sitting in one of the window-

seats, put her knitting in her lap, and gazed out over the fair prospect, a bitter sigh rising to her lips. There seemed no hope of salvation—this old home of an endless line of Tallantyres must fall under the hammer. She almost dreaded what her son might have to tell her when he arrived, for he had wired to her to expect him home that evening. As she looked wheels grated on the wide gravel sweep, and she knew that he had come. In another minute or two his quick, firm step ran up the spiral staircase, and he stood in the low arched doorway of the quaint tower-room.

'May I come in?' he asked. His face did not look so tired, Lady Tallantyre noticed, as it had done when he left her a fortnight ago. She rose and held out a hand of welcome, eager question in

her eyes.

'There is just one tiny chance,' he said gravely, warming his hands at the wood-fire crackling on ancient dogs on an open hearth; 'like a fool, it never occurred to me before. Matrimony, my dearest mother; and kind fate has thrown in my path a pretty and amiable girl with prospects that solve the question. I have asked her to come here next Tuesday with her father. We must make ourselves very agreeable, dearest.'

Lady Tallantyre's face looked very troubled.
'There is no other way?' she asked. The hands

that held the shining knitting-needles shook, and she dropped several stitches.

'There is no other way at all,' he returned, and his mother knew that finality lay in these words.

She sighed and picked up the stitches.

'We will do our best,' she said, and her son heaved a great sigh of relief, for he had feared greatly how his mother would look upon his last resource. He did not perhaps thoroughly understand how great was her love for him, or how unselfish that love was.

'And how is every one?' he asked in a lighter

tone. 'Any fresh news?'

'Cicely Grant is at home,' responded his mother. She looks very pretty indeed. She is a nicely

behaved girl for these mannerless days.'

'She didn't inherit her manners, then,' said Tallantyre with one of his rare smiles; and, indeed, the vicar, the Reverend Septimus Grant, was about as morose a person as one could well come across, who invariably contradicted and bullied his long-suffering wife and daughter.

Suppose, mater, we ask her to come and keep my heiress company. They must be about the same age, though Miss Van Zyll is a child compared

to Cicely in knowledge of the world.'

Lady Tallantyre's face grew long with horror.

'Do you mean she is quite uneducated, Hartley?' she asked.

Hartley Gordon smiled again.

'I don't mean that she eats with her knife, you know,' he explained, 'or drops her h's; only, she has been very strictly secluded, I gather, and is very shy indeed. She is very well educated-at least, expensively educated, I should say. I expect Cicely's cheap learning acquired at high school and college is far ahead really. Anyway, they will amuse, and I think like, each other. It will be a charity to Cicely, and you know you like any excuse for getting her up here. Write a note to Mamma Grant, and I'll put on my best manners and take it. She can't very well say no with me on the doorstep.'

Lady Tallantyre obediently wrote the note, and twenty minutes later saw her son striding off through the larch-woods down to the little red

vicarage-house nestling near the river.

As he unlatched the gate a girl came flying impetuously out of the stable to greet him. She was very simply dressed in tweed homespun, with a white flannel shirt and no hat. Her hair, rippling in heavy masses from a broad, low forehead, was rich brown, in which gleamed coppery lights. Under the delicately pencilled, arched eyebrows was a pair of merry, dark-brown eyes, and her mouth, too, was full of mirth and mischief.

'Welcome to the prodigal!' she cried gaily. 'If you will come to luncheon to-morrow I will slay the fatted chicken'-she pointed to a fine young cockerel strutting proudly about in happy ignorance of his impending doom-'in your honour. Father is going to say a few plain words at a congress, or

something, of clerics, so he is out of the way all right, though I am afraid the congress will not

She stopped from want of breath, and Hartley hurled himself into the conversation while he had the chance.

'Mother wants you to come up to the castle and stay with us all next week,' he said, giving her Lady Tallantyre's note for Mrs Grant.

'Hurrah!' shouted Cicely. 'Come along and have some tea, Hartley, and let her give you a polite note for Lady Tallantyre.'

She opened the front door and waited for him to pass in before her.

'Oh! it is nice to be back, and to have you at home too,' she said as they made their way to the tiny drawing-room, where a bountiful north-country tea was presided over by Mrs Grant.

CHAPTER IV.

ICELY GRANT was the first arrival at Castle Tallantyre upon the appointed day. She was determinately merry, and it seemed to Lady Tallantyre ostentatiously cheerful.

When the smile left her face, the great eyes wore a wistful expression which brought a sigh to the elder lady's lips. Tallantyre himself, too, was not quite natural; he was restless, ill at ease, nervous, and his eyes wandered constantly to Cicely's sweet face. If only Cicely He nipped the thought in the bud. Love of home came even before love of Cicely; and Cicely, loyal and true, understood. She loved Tallantyre well enough to sacrifice her own happiness for his welfare. She sat in one of the window-seats of a deep, mullioned window,

'Here comes the bus,' she cried, interrupting her chattering gaily. flow of nonsense, and a moment later a butler threw open the lofty door.

'Mr and Miss Van Zyll,' he announced.

Beatrix advanced shyly, flushing and paling, as Lady Tallantyre came forward to greet her.

'Why, you look quite frozen,' said her hostess kindly, drawing the girl near to the blazing fire of logs. 'You are not used to these northern wilds, my son tells me. This is Miss Grant, a very old friend of ours.'

The two girls shook hands, their eyes meeting for a moment with unconscious antagonism, which suddenly died out, engulfed on Cicely's part in pity, on Beatrix's side in admiration. Cicely was quick to note the sudden shrinking of the girl's slight form as her father's unctuous accents replied to Tallantyre's well-bred greeting.

'She shall have a good time here, anyway,' was Cicely's inward resolution. 'It strikes me that old pig has bullied her most shamefully. She looks like a spaniel that has had all the sense thrashed

out of it.'

The arrival of a footman with tea caused a welcome diversion. Mr Van Zyll seemed likely to prove a very wet blanket conversationally, and Lady Tallantyre was blankly wondering how they were to amuse a guest who neither shot, fished, nor rode. She began to feel very sorry for her son, who had to combine his courtship of the daughter with the entertainment of literally a heavy father.

'Let me make tea, granny,' said Cicely persuasively.—'Come along, Miss Van Zyll, and sit on this little chair between me and the fire.—Hartley, give me some more water in the teapot. Whoever brewed this tea had no regard for our nerves. Now, give Miss Van Zyll some hot scones.—The House of Tallantyre prides itself on its scones, Miss Van Zyll. There is a legend that the cook once won a medal at Carlisle for scone-making.'

'I wish it was the custom in polite society to eat 'em with a knife and fork,' said Tallantyre, helping himself gingerly. 'They are not fit to eat unless they are soaked in butter, and butter is such beastly stuff for springing a leak all over the shop.'

Beatrix looked from one to the other with a smile of admiration. Her pinched little face looked already happier, Lady Tallantyre thought, as she strove to make conversation with the financier while keeping an unobtrusive eye on the group by the great silver tray, while the ruddy flames from the fire rose and fell, throwing strange, fantastic shadows over the long, low room, with its thick walls and deeply mullioned, iron-barred windows.

'Now,' said Cicely as tea at last came to an end, 'I am going to take Miss Van Zyll to her room. It is the Blue Room, isn't it, Lady Tallantyre? I expect her maid will have nearly done unpacking by now.'

Beatrix followed her silently through a labyrinth of passages, along a gallery to a suite of rooms on the south side of the castle, one of the doors of which she opened, showing a great room furnished entirely in a soft gray-blue and white. In a dressing-room beyond, Beatrix's maid knelt before an open trunk reducing a chaos of beautiful clothes to order.

'Here you are!' said Cicely kindly. 'You have one of the best views from the castle in this room, and if you want anything, I am next door. Oh, I say, what heaps of pretty things you've got!'

Beatrix looked uninterestedly at the open drawers, each loaded with silk and lace.

'Have I?' she said. 'Oh, Miss Grant, what a glorious view! I've never seen anything half so beautiful—so wonderful. Lord Tallantyre is good to let me see such a revelation as this.'

For a moment the mention of Tallantyre's name brought the shadow into Cicely's brown eyes; then, chasing it resolutely away, she went over to the other girl's side, and they stood together gazing into the valley beneath and far away to the majestic crags that rose blue and shadowy in a rosy sunset sky which here and there tipped a gray crag with pink and turned the bracken into a ruddy brown.

'It has been so lonely alone in that great house

in London,' went on the girl, half to herself; 'and at school the others all looked down on me because I was only the daughter of a Jew money-lender.' The sweet young voice grew very bitter; the past insult had evidently stung deeply, and Cicely's heart ached for her. 'I have never had any friends—no one to speak to as a friend—just had to live all alone in myself. Miss Grant, will you be a little friendly—not look down on me?'

The voice was very sad and very wistful. Cicely the impulsive took the little, white hand in her strong, brown one.

'We are going to be real good pals,' she said warmly; 'and,' she added bravely, 'Tallantyre is a friend in a hundred.'

CHAPTER V.

B

ENEATH the great overhanging fell, from the side of which Castle Tallantyre gazed out over the fertile dale, nestled a long, straggling hamlet of whitewashed, thick-

walled, rough-cast cottages. Just beyond this hamlet, down a few yards of muddy lane, stood an ancient farmhouse known to the neighbourhood as The Outgang, to which was attached some seven or eight hundred acres of rich, low-lying valleyland and a wide stretch of 'heaf' or upland pasture on the fells above. The farmer who occupied The Outgang was not a tenant of Tallantyre's; he was what is known in Cumberland parlance as a 'statesman,' and the farm and its surrounding acres had been in the possession of his family for many hundreds of years. Rothery Crone, the present representative of his family, was a young fellow of some twenty-eight years, with a considerably better education than most of his class, for he had studied farming not only in Cumberland, but in Denmark, Germany, and France.

He lived alone in the great, rambling house, save for his hinds (farm-labourers), servant-maids, and an old great-aunt who kept house for him. Both father and mother were dead, and the young man had neither brother nor sister, nor indeed any near relative.

He came out of the muddy lane one sunny morning, and turned towards the hamlet. In appearance he looked what he was, a country gentleman of the agricultural type, a sturdy, broad-shouldered, lean figure of a man with the unmistakable fell-man's walk, his dress a well-cut riding-suit of gray-green homespun, the spotless white stock (secured with a tiny gold pin) gleaming snowily against the healthy bronze of face and throat. Beneath his cap one caught a glimpse of crisp fair hair and steady, honest gray eyes. The clean-shaven face showed a firm, well-shaped mouth, with square, obstinate chin, and his nose was of the regular chiselled type that is common in this part of Cumberland. Two

ladies who passed in one of the castle victorias

glanced with approval at his neat figure.

Rothery raised his cap in response to Cicely's smiling nod, and Beatrix turned to her companion with the evident question of his identity. Suddenly -without any sound or warning-there hummed through the village a large, noisy motor, startling the two horses in the carriage. There was an oath from the coachman as the driver of the motor crashed on his brakes to avoid collision, too late, however, for the terrified horses to recover from the

fright. Half-mad with fear, with a sickening lurch they spun round, shooting the luckless coachman from his box on to his head in the road, where he lay stunned, while the horses, the reins of course dangling at their heels, set off the way they had come at racing speed, their collar-bells jingling, the victoria rocking and lurching on its silent, Certain disaster, possible rubber-tired wheels. death, stared the two girls in the face.

Cicely, white but quite self-possessed, laid a hand on Beatrix, who half-rose as if to jump from the

swaying carriage.

'Sit still,' she said sharply; 'you'll be killed if

you jump.

Beatrix sat still, and, as suddenly as they had started, the horses stopped, giving both girls the opportunity of jumping out, an opportunity of which they very promptly availed themselves, seeing as they did so that they owed their deliverance to the young 'statesman' from The Outgang, who stood in the middle of the road, the maddened horses plunging and rearing in his iron grip as he soothed and petted them into something like tranquillity.

'Thank you, Rothery,' said Cicely, the colour beginning to creep back to her white face. 'We should have been in a hole if you hadn't risked your

life to save us.'

'Rubbish!' said Rothery, colouring hotly with annoyance, and glancing at Beatrix, who, though very quiet, stood with her breath coming and going quickly, and a very white face. 'Your friend looks shaken, and we must see after Charles. Suppose we lead the horses up to The Outgang, and you can rest there while we ascertain the extent of his

Without waiting for an answer, he started down the lane to the farm, leading the now quiet, though still sweating and trembling, horses. The two girls followed him in silence. As they entered the great yard a groom came out, and, with a hurried word, Rothery handed over his charges, and led the girls through an ancient arched doorway into a panelled

hall, and from thence into a cheery, chintz-furnished

Cicely sank into one of the beautiful old chairs, and Beatrix into another.

'By the way,' exclaimed Cicely, suddenly awaking to the exigencies of life, 'you neither of you know who you are.—He is Mr Rothery Crone, Beatrix; and she is Miss Van Zyll, Rothery.'

Beatrix's dark eyes smiled up into the gray ones that looked so straightly and squarely into hers.

'I sha'n't forget Mr Crone in a hurry,' she said, and indeed there was a vibration in her voice of real and deep feeling.

'Please don't make much of trifles,' entreated Rothery. 'Now I am going to see if Aunt Dinah

is about, and see, too, after Charles.'

He went quickly out of the room, and in a few minutes they heard his footsteps on the cobbled yard, as an upright old lady entered the room, followed by a stalwart, though neat and trim, maidservant bearing wine and cake on a massive old silver tray. She was dressed in black, this old lady; on her head a black coal-scuttle bonnet, in whose shadow her still keen, bright eyes glowed and twinkled. Her complexion, though her face was wrinkled, was still soft and delicate, and her finely cut, aristocratic features were very like those of her great-nephew. Cicely jumped up and kissed

'Miss Dinah,' she cried, 'I'm always turning up with a tale of woe and disaster.—Last time my bicycle skidded,' she added to Beatrix, 'and Miss Dinah cut the mud off me with a carving knife in the yard. It wasn't our fault this time, though By the way, I wonder where that motor disappeared to.—Miss Dinah, this is my friend, Miss Van Zyll, who is staying with Lady Tallantyre.'

Miss Dinah's keen old eyes rested kindly on Beatrix as they shook hands; then she pressed refreshment upon them in true Cumberland fashion.

They chatted merrily, and all were sorry when Rothery's head appeared again in the doorway.

'Charles is all right—only "shook up," he says,' he announced. 'I'm going to take you up to the castle, if you don't mind trusting yourselves to my

'No, of course we don't,' answered both girls at driving. 'And,' added Cicely, 'we must hurry up, or we shall be late for lunch, and Lady Tallantyre may hear of the disaster and get frightened about us. En avant, mes amis! Let us haste to the castle. The horses are not likely to run away uphill, that's one comfort !'

(To be continued.)

THE SCOTTISH PROFESSOR IN LIFE AND LITERATURE.

HERE is a widespread belief that a Scottish professor has a royal time is to be envied for his leisure, great opportunities for recreation and selfculture, and the high and honourable position in our educational

system. Some English folks are inclined to smile at the amount of respect paid by the Scottish people towards professors; James Payn did so while resident in Edinburgh, and he mentions how Alexander Smith the poet was pointed out to him as anything but a modest man because he had spoken of a professor by his surname. Mr J. M. Barrie thinks Payn might have been more reverent had he seen Professors Sellar, Fraser, Tait, and Sir Alexander Grant marching abreast down the Bridges from Edinburgh University, 'an imposing sight. The pavement only holds three; you could have shaken hands with them from an upper window.' The observer was himself of diminutive stature, and to him the four tall professors would be sufficiently imposing. David Masson was more greatly impressed when, a youth, he chanced to see Dr Chalmers (who very deeply influenced him, white-haired and reverend), John Wilson (yellowhaired, like a savage lion), and Sir William Hamilton (dark-haired, robust, athletic), all on one platform. Such another three men, he believed, could not be seen in any other capital in Europe.

There are delightful glimpses of happy home-life in the Recollections and Impressions (Blackwood) of Mrs Sellar, wife of the late William Young Sellar, Latin professor at Edinburgh University, which cover half a century, and introduce many interesting and distinguished personages, about whom she chats pleasantly. Newspaper men, with their keen scent for good stories, have already fallen upon the volume as lawful spoil, and made the best anecdotes current coin. But something of interest still remains; and, stimulated by its perusal, we have gleaned something further regarding the Scottish professor in life and literature.

There is a fine literary flavour and rich fullness of life in the Recollections by Mrs Sellar. The dignified leisure of a long recess was used well and wisely by her husband, who has left as fruit of his literary labours works on The Roman Poets of the Augustan Age, on Virgil, and on Horace and the Elegiac Poets. To the first his nephew, Mr Andrew Lang, prefixed an adequate and loving tribute. Tennyson thought Sellar one of the best Latin scholars of his day, most keenly and critically sensitive to the individual beauties of each author, as he found by conversing with him and reading his essays. Mrs Sellar is profoundly thankful for her life experiences, and is inclined to suggest that there be inserted a clause in the thanksgiving prayer for 'the best and dearest we have known on

earth, also for the great beauty that Nature has spread around us so lavishly, the two things that have given us the most enduring happiness while here we sojourned. Every page of the book breathes this spirit, and the reader catches its flavour insensibly as he turns over the pages. The retrospect covers life in Glasgow, St Andrews, and Edinburgh, sandwiched between delightful holidays at Ardtornish on the Sound of Mull, Harehead in Yarrow, Kenbank in Galloway, with some Continental tours thrown in. Then the people we hear about are interesting in themselves, and include Tennyson, Carlyle, Ruskin, Jowett, Dr John Brown, and Sellar's brother-professors, Veitch, Shairp, Masson, and many others.

Amongst the brightest and wittiest friends of the St Andrews period was Mrs Ferrier, wife of Professor Ferrier. If James Hogg the Ettrick Shepherd was the most remarkable man who ever wore a plaid, then Mrs Ferrier's father, John Wilson, the Christopher North of Blackwood's Magazine, was one of the most remarkable men who ever filled a professor's chair in Edinburgh University. His career (1814-1854) was over before Sellar came to Edinburgh. Other men may have known more of moral philosophy, but for a combination of brilliant gifts he was unrivalled. The Quarterly Review said he was beyond compare the most popular man in Scotland of his day with high and low, rich and poor. The wildest rhapsodies which came from his pen were received with favour. He was brilliant alike in writing and conversation, which flowed in an apparently exhaustless torrent. No other professor that ever lived came to such fame as a magazine writer. His contributions to Blackwood between 1826 and 1852-and this does not comprise his whole record—fill about six thousand pages, on every conceivable subject, from 'Streams' and 'Christopher North in his Shooting Jacket' to a review of Tennyson's early poems, which drew forth the following now dropped poem:

You did late review my lays,
Crusty Christopher;
You did mingle blame and praise,
Rusty Christopher.
When I learnt from whom it came,
I forgave you all the blame,
Musty Christopher;
I could not forgive the praise,
Fusty Christopher.

Wilson, it has been said, could not have laboured more for *Blackwood* if it had been his own property, although he was never its editor, as has been often erroneously said. How the students did cheer and adore him, says David Masson, as he came in to the University class-room and launched forth in some rich poetico-philosophic medley in all the styles of Christopher North! His reading was a

kind of continuous musical chant. 'Yellow was Wilson's colour-the hair yellow and mane-like, the face blonde, the look wildly noble, the bust magnificent even as he sat, but more magnificent when he rose and the height was seen.' Charles Dickens, who met him in 1841, he appeared a 'bright, clear-complexioned, mountainlooking fellow, as if he had just come down from the Highlands, and had never in his life taken pen in hand.' He put his whole strength into his magazine contributions for the time being. To Carlyle, Wilson seemed by far the most gifted of all the literary men of his day, and yet he had written nothing that could endure. He recalled him as seen in Princes Street about 1814, a tall, ruddy figure, with plenteous blonde hair and bright-blue eyes, as if in haste towards some distant object. 'The broad-shouldered, stately bulk of the man struck me; his flashing eye, copious, dishevelled head of hair, and rapid, unconcerned progress, like that of a plough through stubble.' He also recalled supping with him, or rather witnessing his supper: 'ten or twelve tumblers of whiskypunch, continued until the daylight shone in on him and us; and such a firework of wildly ingenious-I should say volcanically vivid-hearty, humorous, and otherwise remarkable, entertaining, and not venerable talk.' Breakfast would be swiftly despatched, when he would shut himself up and begin to write, and never stir until the greater part of a Noctes or a brilliant essay lay in picturesque confusion, written down on the sheets which littered his study. While so engaged a dinner of boiled fowl and potatoes would suffice him, about 9 P.M., with no wine, only a glass of water. After dinner he might go on until midnight. These were spasmodic efforts, and could never have been kept up, while he wrote more in a few hours than many men could write in a few days. Never, it has been said, was periodical literature so happy in a votary. The task accomplished, he was human once more, the John Wilson of the happy home-circle, the moral philosophy class, or Christopher North on an angling excursion to Tweedside or a Highland loch.

Mrs Sellar is silent regarding John Stuart Blackie of the Greek Chair, who once described his occupation as business, blethers, bothers, and backgammon. His used to be a familiar figure in Princes Street, with head well thrown back, flowing white hair, the staff grasped in the middle, jerked backwards and forwards, and his plaid flying in the breeze which generally blows in Edinburgh. He had a very pronounced individuality, and was many-sided outside his class-room, in lecturing and begging for the endowment of a Gaelic Chair to the tune of twelve thousand pounds; he busied himself in translation, in writing poetry, newspaper correspondence, politics, or the grievances of the crofters. No one who ever heard him lecture could soon forget the melange of sense and nonsense-clever nonsensewit and wisdom. He is at his best in a little

book for students called Self-Culture: Intellectual, Physical, and Moral, which gives the condensed wisdom of a lifetime. Healthy and cheerful, active in mind and body to the last, he had completed his eighty-fifth year when he passed away in 1894. Here is one of his characteristic utterances: 'An absolute Tory is generally a clod or a fool, a Tory with sense is generally a Liberal more or less, a Liberal with sense is a Tory more or less, and a Liberal without sense is a Radical.' R. L. Sterenson once wrote: 'It is but a fallen university to-day; they have Professor Butcher, and I hear he has a prodigious deal of Greek; and they have Professor Chrystal, who is a man filled with the mathematics. And doubtless these are set offs. But they cannot change the fact that Professor Blackie has retired and Professor Kelland is dead.'

Lord Rosebery happily styled Professor Masson, the late occupant of the English Literature Chair, as the 'Grand Old Man of Edinburgh.' The friend of Carlyle and author of a great Life of Milton, he began his career as journalist, and was editor of an Aberdeen newspaper at nineteen. How he travelled from Aberdeen to Leith by steamer in 1839, with a glowing first impression of Edinburgh, is set down in papers in Macmillan's Magazine for 1864, a periodical of which he was editor for seven years. He was for three years on the literary staff of Messrs Chambers (1844-47) before he went to London, where he succeeded the poet Clough in the English Literature Chair in University College. Some five or six thousand students passed through his English class, amongst whom were J. M. Barrie, S. R. Crockett, and Ian Maclaren. The students under him were aroused to enthusiasm for what was best in life and literature. 'I seem to remember everything Masson said, says Barrie, 'and the way he said it. He masters a subject by letting it master him; for though his critical reputation is built on honesty, it is his enthusiasm which makes his work warm with life. Sometimes he entered his class-room so full of what he had to say that he began before he reached his desk. If he was in the middle of a peroration when the bell rang even the back benches forgot to empty.' In his series of papers in Macmillan, 'Dead Men I Have Known,' he has given very strong, realistic sketches of famous Edinburgh professors. Mrs Sellar has an account of a 'crush' at the Massons' when Browning was present for the tercentenary celebrations of the University.

Principal John Campbell Shairp and Professor Veitch figure in Mrs Sellar's record as fellow-professors at St Andrews and as intimate friends of her husband. Shairp was of a mixed Highland and Border blood, and both loved nature in Highlands and Lowlands with the calm, lifelong passion well exemplified in the poet Wordsworth Shairp edited Dora Wordsworth's journal of her tour in Scotland in 1803, and wrote, amongst other poems, 'The Bush aboon Traquair' as the result of a walk from Harehead, where the Sellars were

residing, over Minchmoor to Traquair with Dr John Brown and Mr Lancaster. Mrs Sellar says that Shairp always brought with him a breath of fresh, stimulating air from the mountain heights in which his mind habitually lived. He was full of enthusiasm and moral fervour. Few knew Scotland as he did from long, lonely wanderings over her more picturesque scenes. Veitch has related his first introduction to Shairp at Tibbie Shiels's, near St Mary's Loch. 'A fair - haired, ruddy-faced, and manly man, with open light-grayblue eyes, frank and affable, with ready recognition. But what attracted me most was that he was very wet-trousers, stockings, and boots all fairly soaked. There was no waterproof trash of gearing in those days, and more probably he despised it. He had just come in from the upper hills, and had waded from one glen to another, with a delightful sovereign contempt for the plashing of the burns through which he had made his way. This went to my heart at once.' Both men had to be out of doors from time to time, and put themselves in touch with pure, free nature, and gain something that would put freshness and suggestion into their hearts, and drive away the fag of work and sense of worry. While occupant of the Logic Chair in Glasgow University, Veitch had his holiday-home at the Loaning, Peebles, from whence he would saunter forth with his knapsack and disappear from human ken for a week at a time, across the hills. 'Oh the joy! Oh the glory! The herds' wives will give me scones, and I shall get nooks to sleep in here and there. If, as may happen, I yield up the ghost at the back of a dike, then twa corbies on a stane will point to where the bones are to be found.' Veitch's great book is The History and Poetry of the Scottish Border, which he knew so well.

Mr J. M. Barrie says that Sellar's treatment of his students was always that of a fine gentleman. Few got near him, but all respected him. You could never tell from his face what was going on within. William Young Sellar was born at Morvich, near Golspie, Sutherland, on February 22, 1825. His father had been a factor or estate agent to the Duke of Sutherland, who purchased the estates of Ardtornish and Acharn on the Sound of Mull. There are many pretty glimpses of the mother in these Recollections. She had a great love for literature, which she retained until an advanced age, and the family doctor in Edinburgh, Dr John Brown, used to say she would die in the act of writing to one or other of her numerous sons, of whom there were seven, and not a black sheep amongst them. At the age of seven Alexander Sellar was at Edinburgh Academy, and at the early age of fourteen gained the gold medal and other prizes. His nephew, Andrew Lang, in his fine tribute, wonders that Sellar's mind was not worn out in youth by the early drudgery, unrelieved as it was by little or no healthy recreation. Things were bettered in this respect when he was at Oxford,

where he rode, played cricket, and whist, in which he excelled. The friends made there were for life, and included John C. Shairp, George Lawrence (author of Guy Livingstone), Mr (afterwards Sir Alexander) Grant, T. C. Sanders (who became a Saturday Reviewer), and F. T. Palgrave. Jowett and Shairp came closest to Sellar, and we hear a good deal about both in the Recollections. Sellar took a distinguished degree at Oxford, an Oriel Fellowship, and went to Glasgow to assist Professor Ramsav in the Latin Chair. In Glasgow he met his future wife, Eleanor Dennistoun, and, says Mr Andrew Lang, 'a happier marriage, and one which gave more happiness to a larger circle of people, was never made.' Sellar left Glasgow to assist the Greek professor at St Andrews, whom he succeeded in the chair (1859-63). He came to Edinburgh in 1863 as professor of Latin, and held this post until his death in 1890.

He kept perfect order in his classes at St Andrews and Edinburgh, and Andrew Lang, who came to the former town with no purpose of working, left of another mind, and to his uncle he owed the impulse that made him a man of letters. St Andrews of forty or fifty years ago had one cab and one cook; society there, as elsewhere, had simpler tastes, simpler pleasures, with more real merriment. Great fun was occasioned by Mrs Sellar or others, at social gatherings, personating some one else, as described in John Brown's Mystifications. The students thought Sellar shy; half-a-dozen at a time would be asked to breakfast now and again at 15 Buckingham Terrace. And so the years passed with daily work at college, and for recreation walking, riding, and whist. It was at St Andrews that the caddie said to Sellar, 'Ye may teach laddies Greek, professor, but gowf needs a heid!'

The most interesting event here chronicled, and one most enjoyed, was the visit made by Palgrave and Tennyson to Ardtornish on the Sound of Mull, where they stayed a few days. Tennyson wandered on the moors, made nonsense-verses, and read his own poems in the evening. This, says Mrs Sellar, was the 'realisation of a dream, and we felt that for us earth could confer no higher honour, and I don't think anything that has happened in after-life has left a more lasting and delightful impression.' Herbert Spencer was another visitor, full of fads and fancies about his health, and afraid to get into an argument lest it disturbed his 'somniferous' faculties. A favourite Sunday walk while the family was in Edinburgh was to Sir John Skelton's house at Hermitage of Braid, where Mrs Sellar met Froude, Sir Noel Paton, and Huxley, who told her daughter there, while talking of lack of appreciation, 'Well, my experience is that if all the undeserved appreciation one gets were weighed in a balance against all the undue depreciation, the first would so outweigh the latter that it would kick the beam.'

There are pleasant references to Dr John Brown, who lent Mrs Sellar the manuscript of Rab and his Friends, which she took to Selkirk, and got

little sleep after reading that prose idyl, so haunted was she by its beauty and simplicity. She says of Dr Brown: 'The rugged humour of a carter, the grace of a delicate, high-bred woman, the wit of a man of the world, the innocence of a child,' were all dear to him, and she is thankful for the years during which he came in and out of the house as family physician. Little time was wasted in professional talk; humour interpenetrated all his speech, and played a soft lambent flame over his saddest thought, for he had his seasons of gloom and gladness. To young Ian Hamilton, who had been reading in a corner of the drawing-room, Dr Brown said abruptly on leaving, 'Well, good-bye. I hope you're as good as you look.' Mrs Sellar had been bride's-maid to Mrs Thomas Stevenson. She remarks that after calling at 8 Howard Place she found young R. L. Stevenson a fractious little fellow, decidedly pretty, with his dark eyes and fair hair; although, later, some of the Sellar family regarded him, with his long hair and black shirt, as affected, 'not to say intolerable.' Oliphant was bright and vivacious, unaffected and simple, but with no very striking personality to the casual observer. Of George Eliot, who married her cousin, Mr John Cross, in 1880, she says: 'Nothing could exceed the kindness and graciousness of her manner, and no one could resist the charm of the earnest, deep musical tones of her voice, and the constantly changing expression of her impressive countenance; but of this the pictures give little idea.' Jowett must have had many people outside the bounds of his sympathy, for he had a general prejudice against all persons who did not succeed in the world. Dullness and shyness were also unforgivable sins in his eyes.

The most impressive scene Mrs Sellar ever witnessed was that from the front gallery of the Edinburgh Music Hall when Thomas Carlyle as Lord Rector, looking world-wearied, addressed the students of the same university in which he himself had been a student fifty-six years before. She had a glimpse of him the year before he died, at Cheyne 'When I entered the drawing-room,' she says, 'I thought it was empty, but I saw the coverlet on the sofa move, and on going nearer, Mr Carlyle-shrunk and attenuated-was under it, with his face to the wall. He put out his hand over his shoulder to shake mine, and on my asking him how he was, he answered, "Waiting for my latter end." "I hope without pain and discomfort," I said. "With a considerable degree of both," he replied. He then asked about my husband, and referred to his visit to Edinburgh as Lord Rector, and again to our having met last at the station at Dumfries in the midst of "screaming engines and other infernalities."

Reform is in the air, and it may be that changes are looming ahead in regard to some of the methods of university teaching. At the last graduation ceremony in Edinburgh a professor said he did not think it possible to defend the overwhelming place

which the Scottish lecturing system held at the present time. The ancient professor was a walking commentary when books were few; now that books are plentiful, a professor has to compete with books, and on unequal terms. There was little or no real teaching in the circumstances. The professors were so busy lecturing that they had no time to teach, while the students' faculties were occupied in transferring words to paper. He suggested, therefore, a large development of the tutorial system. Carlyle in Sartor Resartus has said the worst of the lecturing system. About forty years ago Professor Masson pointed out as a distinction of Edinburgh University that it always has had two or three professors of admirable working ability, of exceptional genius and greatness; and that there was action and reaction of mind and a kindling of moral and intellectual enthusiasm from the lectures of a good professor, while the old lack of access to books has been greatly minimised. There may in future be a mingling of what is best in both methods of imparting stimulus and knowledge.

OFF THE COAST OF PORTUGAL.

A CLOUDLESS sky, a summer breeze,
The royal-blue of southern seas,
A lonely bird, a passing ship,
The distant courtesy of a 'dip.'
O'erhead the shady awning swings
To music of a sea that sings,
In gentle murmurs soft and low,
The song of ages in its flow.

O'er these same waves in times long past, With fettered oars and creaking mast, Sailed galleys of Imperial Rome, Unconquered yet on land or foam. With breaking heart, but dauntless mien, Has floated past this sunny scene, From Albion's shore, full many a slave Whose lingering eyes scarce saw thy wave.

Columbus here his sails unfurled
To find anon another world.
And here again the might of Spain
Forgathered on her smiling main;
Nor e'er returned, but—torn and tossed—
Was scattered to the winds and lost.
Another such a day as now
Saw Nelson's fleet these waters plough.

This placid sky beheld the doom
Of noble ships amid the boom
Of cannon' roar, wild shrieks of pain,
And tearing of the bullet-rain.
It is the grave of countless brave,
These peaceful seas that soothe and lave,
These gentle waves whose heave but seems
The breath of peace, the sigh of dreams.

So days may come, so ages go, Yet thy blue depths for ever flow, And coo or thunder, as they rise, The song of ages to the skies.

P. S. GRAYES.

HARDSHIPS OF THE NEW ENGLAND HERRING-FLEET.

By P. T. M'GRATH.

TERALLY and in most terrible guise death comes ice-clad to the Yankee 'herringers,' whose fishery on the coast of Newfoundland has been the subject of the modus vivendibetween England and America which

provoked so much diplomatic disputation in September 1906.

They begin this hazardous venture when the furious autumnal gales make cod-fishing on the Grand Banks impossible, and in October each year start for the Newfoundland bays, where they secure cargoes of herring, and convey them to Gloucester, Boston, New York, and Philadelphia, all through the pitiless winter months until April, braving perils and enduring hardships which fall to the lot of no other seafarers who go out on shipboard in the stormy North Atlantic at this season of the year.

The annals of this herring-fishery form one endless chapter of hardship and disaster. Every man engaged in it has faced death time and again. These waters are the most northerly then navigable in the upper latitudes, for the mighty fields of flinty arctic ice are swept south over the Grand Banks and through the Gulf of St Lawrence, rendering these ocean-areas untraversable, and forcing every form of sea-going vessel to find routes across the Atlantic in 'the strain of the roaring forties.' Yet, through billows crested with masses of ice, amid gales fierce as tropic hurricanes, and in frosts so keen that they coat the little smacks with whited spray till they look like icebergs, these plucky fisher-boats and their gallant crews make their way to and from this rugged island seaboard, every mile of their voyages pregnant with conditions which make for marine catastrophes of the most distressful kind. Sometimes they are dashed against the rocky coastline, and hulls and men battered into fragments; at other times they are engulfed in the ocean's depths, and no soul survives to tell the tale of their undoing. Occasionally their spars are torn out

No. 507.-Vol. X.

by sheer weight of wind and sea and ice, and men are swept from their decks into the angry waters and never appear again; and the crippled craft, with maybe maimed seamen as a result of the encounter, stagger into some friendly harbour like broken-winged birds, telling a tale of danger surmounted that almost makes the blood run cold. Or, again, a whole crew will be seared with frost-bite, and unable to work their vessel owing to the manner in which she is encased with ice; and then, unless some friendly sail appears to take them off the unmanageable craft, they will endure a period of bitter misery, only to perish at last amid the wild waste of waters and add another to the ocean's mysteries.

For nearly sixty years the New England fishermen have been prosecuting this industry in Newfoundland waters-in Placentia and Fortune Bays on the south, in Island and Bonne Bays on the west, and in White and Green Bays on the east coast. The fish are cured in two ways: by salting until the frost sets in, and then by freezing. About sixty American and many Canadian and Newfoundland vessels engage in it; but the former, because of their longer voyages, experience the most fatalities. The vessels, though averaging only one hundred tons burden, are of the very finest and staunchest in rigging and equipment, for no others could stand the dangers they have to face; and neither skippers nor crews will take any smack for a herring-cargo which they are not satisfied with. Indeed, they will frequently test a vessel's gear in a preliminary cruise, and if found faulty will 'chuck her up.' This is not surprising when it is remembered that six or eight men have to handle these craft during trips that represent constant, unceasing battles with death, amid weather the worst in the year, with frosts and floes to add new hazard to the navigation of waters dangerous enough at any time. The rigours of a Newfoundland winter are but poorly imagined by those unfamiliar with its climate and coastline. Yet it AUGUST 17, 1907. [All Rights Reserved.]

is only in this season that the herring are to be found in these waters—the one part of the Atlantic seaboard where they resort then; and since they are used as bait for the American vessels which fish off the Nahant Peninsula, as well as for food purposes in all the eastern cities, they must be had, no matter at what cost to ships and men, because only at this season can they be frozen by exposure to the bitter night-air and carried to the American ports in the vessels' holds without refrigerators or other artificial accessories to retain them in this state.

Fogs at the first, blizzards at the last, and robust gales all through are among the factors in contributing to the tragic death-roll of this industry. Early in October 1906 the Edna W. Hopper, one of the finest of the Gloucester (Mass.) flotilla, struck the Newfoundland coast in a fog, went to pieces, and nearly every soul on board was drowned. Three weeks later the Louis H. Gilis, another staunch Yankee craft, dragged her anchors in a gale in Humber Inlet, and the thirty men aboard had a desperate struggle to escape from the sundering hull as it was flung against a rocky islet. In fishing among the inlets large numbers of Newfoundlanders are employed, and this adds to the risk of an appalling roster of the victims when mishap is met with there.

Amid the storms that attend the winter solstice at Christmas-time many pitiful tragedies are enacted. It was on a Christmas Eve, while crossing Cabot Sea, between Newfoundland and Nova Scotia, that Captain John O'Brien and his son were swept from the deck of the Senator Frye and sank before a hand could be raised to help them. It was on the night of Christmas itself that two others were flung over the side of the Albatross and met a like fate. About the same period the Alice M. Jacobs drove on to a reef near Cape Ray at midnight, and the half-clad crew escaped from the doomed hull to the naked rocks, where for hours they remained shelterless, frost-covered, and miserable. At daybreak one courageous fellow plunged into the icy water and swam across to the mainland, where he apprised the settlers of the peril of his mates, and they brought round a boat and rescued the castaways.

Where could a more thrilling tale of man's escape from the wrath of the sea be found than that of the herringer Yosemite, which went ashore on Ram Island at nightfall a few years ago while running home with a cargo from Fortune Bay? Her nine men got on to the rock; but one was afterwards swept off. The skipper had both legs broken, yet the others gripped him fast; and, the severed hull forming a breakwater, seven held this coign of vantage till daybreak, though the eighth perished of cold and exposure. When the light served, Pat Rose, a Newfoundlander, swam across to the mainland with one end of the log-line, which had washed ashore, round his waist, and by its help the others—even the helpless captain—got across. Here they found a fisher's hut, with a stove that

lacked a funnel; and by pulling down part of the place and using their last three matches, they contrived to get a fire going, and remained a second night-for the storm still continued-without food, and enduring intense misery from cold and exhaustion, especially the hapless skipper, with both legs fractured, for the frost was twenty degrees below zero, and a roaring fire barely sufficed to impart a glow to their chilled bodies through their brinesoaked clothes. Next morning settlers in the vicinity, seeing their fire, came to their aid and housed them comfortably. The skipper recovered, but, strange to say, met his death in the same industry two years later, when his vessel, the Eliza M. Parkhurst, was entombed beneath the seas of Cape George in Christmas week, with every man aboard. She and the Independence were running out of the gulf fully laden, driving ahead for all they were worth in the effort to reach home and a market first. Suddenly a snow-squall swept down from the headland, and when it had passed the Independence was many miles distant and badly rumpled from the encounter, for she had been 'hove down,' and barely escaped going under. There was no sign of the Parkhurst, though this was not considered serious, as she might have reduced sail; but she was never sighted again. Not till the next summer, when the cod-fishers observed the surface of the water to be oily, owing to the herring below, and, suspecting the tragedy it denoted, let down grapnels and brought up some of her wreckage, was the mystery finally solved.

No heroism could be greater than that of the Liberator's crew when she was dismasted off the Bay of Fundy and a big ocean freighter bore down upon her, seeing the reversed ensign fluttering on the stump of her spar, while the surges swept the sodden hull, and not a sign of life was visible on her decks. A boat was got out, but was splintered against the steamer's side as it took the water; the second fared as badly; and a third was being launched, when the tattered signal on the stricken smack was hauled down. This strange proceeding only stirred the steamer's crew to even greater exertions to rescue the unfortunates, and the third boat was safely launched, which, despite the tremendous sea raging, got to the craft and took of the five humans still aboard her, three having been already washed overboard by the tempest which dismasted her. The reason the survivors gave for hauling down the flag was that they feared the boat's crew would drown, and they preferred rather to perish themselves than witness any fatalities in the endeavour of the rescuers to save them.

Rarely, though, does a herringer's crew imperilled in mid-ocean escape. There is one other case recorded, which is worth noting, because it illustrates the coolness and daring of sourceful fishermen. A steamer bound for St John's sighted off Cape Ray two schooners, one dismasted and sinking, the other taut and trim. She approached, and witnessed a singular scene.

former, the Laura C. Crosby, from White Bay, with herring, had been disabled by a blizzard, and after all the pumps had been worked for sixty-four hours. had been sighted by the Margaret, bound there for a cargo, which, after taking off the crew, was now transferring the derelict's deck-load, barrel by barrel, to herself by means of her dories. Surely it would be difficult to imagine a more conclusive evidence of the character of these men than the fact that they should calmly proceed to unload the craft in mid-ocean, hoisting every barrel over the Crosby's side into a frail skiff, and then rowing it to the other vessel, where it was hoisted aboard again: these operations being performed on turbulent waters, amid frost keen enough to make every foothold slippery and insecure and every rope stiff as an iron bar.

The man, however, who has seen a herringer make port in midwinter ceases to be surprised at anything in seafaring life, for almost beyond belief are the experiences of the craft which make these hazardous trips. The vessels are filled with herring, packed between layers of salt or frozen or covered with ice, till they are full to the hatches. Then these are battened down, and the cabin at the stern is filled in the same way. The deck is next covered with barrels full of fish preserved in pickle, and lashed securely to ring-bolts. Over these barrels planks are placed to enable the crew to move about, and they all-skipper and men-live in the forecastle. By reason of the cabin being filled, the bow is elevated out of the water somewhat, a circumstance which usually accounts for the craft surviving the perils which encompass her as, leaving Newfoundland in this trim, she worries her way in all sorts of weather, like a game little terrier with a bone in her teeth, until she reaches home. She is little better than a mere raft on the ocean, her rail scarcely two feet above the sea. When she encounters tempests and frosts the spray freezes on her decks and bows, and weighs her down as if armour-clad. Day and night the men must pound this off and throw it overboard, for if it should accumulate it would speedily sink the craft. For use against it, every vessel carries long-handled wooden mallets, which are wielded incessantly, with axes and shovels, to keep her clear of the deadly crust. Frequently, with bitter frost and head-winds, the gelid spindrift will cut the faces like lancet-points, and the men have to wear cloth masks to be free to carry on this work. Even then, with waves breaking over the bows every minute, short spells alone are possible at this arduous task or at the wheel; and men have to be changed frequently, lest they fail before this terrible zerocold. Sails, rigging, and spars are frost-rimed, till the craft looks like a swift-driving iceberg; and, no matter what changes of wind come, she is helpless to meet them, with every rope and block frozen solid, and mayhap some, if not all, of her men frostburnt. Hence the frequency of wrecks among these vessels. Some are overwhelmed and vanish, while

others drift against the nearest coast and go to pieces; but a few strike a warm wind, thaw out, and thank good fortune for their escape. The Aloha entered Gloucester two years ago more heavily crusted than ever a ship had been seen to be before. The Nourmahal was sixteen days battling with such conditions, and had every man of her crew badly frosted. The Makonna endured ten days of it, and was enmeshed in an icefloe as well, where the contending masses threatened to crush her sides. The Whyland was ice-clad, then nipped by a floe, started leaking, then settled down in the water. had her rails and foremast carried away and one man with them, drove helplessly before the breeze with over half her men pounding the ice off and the others pumping her for several days, all being badly frosted and without sleep, till a steamer sighted her and rescued the crew, having to wait eight hours till the storm abated sufficiently to allow a lifeboat to be launched.

To get nipped in the frost is almost ruinous. The Fernwood, which had the previous season sailed nearly six hundred miles with a jury-rudder, was so beset two seasons ago. The floes being forced against the land, the ice 'rafted' high above her sides. and the crew had to abandon the ship and tramp shoreward across the rugged crystal plain lest they be swallowed up with her. They were three days on the journey, dragging after them a dory (rowboat) laden with food, to use when crossing watery places amid the pack. The vessel went to pieces, and the men reached the coast footsore and frozen. The Nicholson's crew left her in similar case, and had an equally trying experience; but the wind changing soon after, the vessel escaped, and coming near another part of the coast, was boarded by five Newfoundlanders. They in turn were carried off in her by a new 'slant' of the breeze, and were fiftynine days drifting about the gulf in the grip of the ice, nearly starved, till spring came, and they were able to work her back to land and secure substantial salvage.

The daring of the herring-fishermen themselves contributes sometimes to disaster. They take the greatest risks, especially when the vessels are loaded, because they want to reach market speedily; and conditions that would stay a cautious navigator deter them not at all. Long familiarity has bred in these mariners the supremest contempt for the storms that assail them; and though in nine cases out of ten the unrelenting forces of nature ultimately overcome them, the long death-roll each season causes no diminution in the army of recruits to fill the gaps in the crews. When two or more vessels are homeward bound, and in sight of one another, none will shorten sail while daylight lasts; though at night various tricks are devised. One vessel will put out a dory with a light at the masthead to represent a vessel lying to, so that the others may shorten sail and leave the originator of this plan free to run at good speed all the night. But if the trick is discovered, additional

efforts are made by the aggrieved ones to reach the objective first, and the craft will race southward through weather that a steamer would hardly face. Under such conditions the Imogen was 'hove down' by a gale once, and tilted over till the lantern washed out of the lee rigging, and fifty barrels of herring from her deck; while she was also dismasted, though by means of jury-spars her crew got her into port. Through a similar cause the Leander was, another time, driven ashore on the Nova Scotia coast; and though most of her men escaped, one was swept overboard by a falling mast, and another drowned just as his dory reached the shore.

No phase of the industry is without its attendant risks. Even in the inlets where the fish are taken there is constant danger from storms and floes. The gales drive the bay-ice against the anchored craft, frequently damaging them so that they cannot put to sea, while if they are caught among the islands which give the principal Western Bay its name they run the risk of being crushed with the craft or staving on the lonely rocks.

Some years ago five men, survivors of an inbound herring-vessel, got ashore on an islet there, the other five perishing. As a terrible death from hunger and cold was almost certain, four of them contrived to improvise a skiff out of wrecked wood and canvas, and by its aid ferried themselves across twenty miles of turbulent water to the mainland. Their companion died of exposure and lack of food before they left, and only their strength of will prevented a resort to cannibalism, to such straits were they reduced, having been a week without food.

Cases of extraordinary personal adventure are equally frequent. Two years ago a fisherman of the Maggie May, while working at some herringnets from the ship, found that a sudden drop in the cold froze her fast to the ice in the creek where she was lying. That night the wind drove her and the floe some miles down the coast. Next day he tried to reach land, but upset the ship against an islet. He saved a small bag of flour and a bottle of molasses, and on these subsisted for three days. His matches had got wet, so he could not light a fire to keep

himself warm and fight off the deadly frost-stupor, and he spent his time cutting down trees. The second night his feet got frosted. He had no shelter but an improvised 'shack' of sticks and boughs. The third night he had to keep crawling around all the time lest sleep and death overcame him. The fourth day he sighted a smack in the offing, and tried to signal her, but without avail That night the sea froze, and he started towards the cove where she harboured. His feeble cries were heard in due course; a rescue-party came forth; he was found helpless and badly frozen, and after being fed and cared for, was drawn fifteen miles on a sledge to the nearest surgeon, who had to amputate all his toes.

Last year James Martin, of the Gloucester schooner Senator Gardner, was caught in the ice at Bay of Islands while out in a dory at his herring-nets, and, a gale rising, was swept forty miles along the coast before he could again reach land. He was adrift for two days and nights, exposed to the fury of the storm and the rigour of the cold, without food or shelter, wandering about the floe to keep himself even comparatively warm. Both his hands and feet became frozen, and when he got a chance to go ashore he could barely make a landing. Descrying some houses at a distance, he endeavoured to get to them, being so weakened that he had to crawl on his hands and knees Before he had covered the distance he became unconscious. Here he would have perished had not some men returning from the forests with firewood discovered and conveyed him to their

Many a poor fellow is not so fortunate as these. home. Their boats driven off or frozen in the floe, they perish miserably of cold and hunger. Among the most gruesome features of this fishery is the finding of corpses, chilled and blackened from the frost, in boats or on the floe. To work actively, the men cannot go clad in a manner that would be demanded for their full protection, and must trust to the warmth engendered by their exertions to maintain their bodily heat. Hence, when a mishap occurs they are quite unprepared to resist the attacks of a frost often thirty-five degrees below zero.

A FLOATING DOCK. THE ROMANCE OF

CHAPTER IV.

DAY or two passed. No answer came from Don Diego. Sandford called at his house. He was not to be seen. A polite clerk shrugged his shoulders and answered all inquiries with the non-committing Latin-

American formula, 'Quien sabe?' ('Who knows?').

'Will Don Diego be back soon?'

Quien sabe?'

'Is he procuring fresh timber for us?'

On Saturday evening some one mentioned in Doña Concha's that a mail had arrived. People have to call for their letters in Garapatas, and after his early coffee on Sunday morning Sandford went to the post-office.

The postmaster of Garapatas reclined in a rock ing-chair, looking over an English illustrated paper. He had selected it from the mail and withdrawn it from its addressed cover, which lay on the counter

beside him. After getting Sandford his letters, he glanced at the wrapper of the illustrated paper, saw that it too was addressed to Sandford, glanced in a leisurely way once more at the paper, then folded it clumsily, and, without attempting to return it to its cover, handed paper and cover to him also, with a smile and a bow. Sandford received them with equal politeness. Brandon had told him that the Moyocuilean postmaster regards as a perquisite of his office the perusal of any newspaper which may interest him-all illustrated ones doand that a man would be regarded with disfavour who made any fuss on happening to see his paper in the hands of one of the postmaster's private friends, or even in that official's favourite café, before he received it in the course of a day or two over the post-office counter.

Sandford left the post-office and strolled along the street. A morning air that brought a little freshness was breathing from the broad river, but the sun was already hot as he emerged from the porticoes of the side-walk on a wide square. He crossed it to the open door of the large and wellkept church, the Paroquia of Garapatas. Throwing away his cigar, he entered, grateful for the shade and comparative coolness. Mass was going on, and a number of people, nearly all women, were on their knees. Protestant though he was, Sandford could pray in a Catholic church, and he knelt down too. He felt unusually lonely and distant from home. When the service was over and the small congregation dispersing, he rose. He had a moment's friendly talk with a passing sacristan, who told him that the second mass of the day was just over. 'The third will begin immediately,' he added as he went on his way.

People were already assembling for it, and Sandford went out. As he stood for a moment in the porch he saw a girl approaching. She was dressed in black now, and a light scarf of black covered her head; but he knew her instantly. One ungloved hand held the end of her scarf over her breast, and in the other she carried a book.

He had not put on his hat, and he stood aside to let her pass. She looked at him, raising her head a little, and again she did not turn away her eyes at once, but let them rest on his with a serious look, while a faint colour rose in her cheeks. Almost imperceptibly she seemed to breathe a single word, 'Adios!' Then she lowered her eyes and bent her head and was gone into the church.

He walked away trying to rally his intelligence. Did she really speak to him? And if she did, was her word a greeting or a farewell? More than one unknown Indian passing him on the road had taken off his sombrero and said, 'Adios, señor.' He knew that it might be merely a salutation by which wayfarers as they pass, with pious courtesy, commend each other to the care of God. And then he was not sure that he had not, after all, but imagined her to speak.

Telling himself for the hundredth time that he

was a fool, he returned to Doña Concha's, and seated himself in her porch with a pipe and a book. He tried to read; but the lovely, serious face of the unknown girl came between his eyes and the page. His pipe went out. He felt as if some strange, almost spiritual, acquaintance had risen between them. She knew nothing of him, he nothing of her, yet it seemed to him now that they were friends, the dearest friends in the world. There was a link between them although they had never spoken. Something told him that she too knew it. It was as if between two ships far at sea with electrical receivers and transmitters tuned in syntony a message sprang across from each of them to the other. It was no articulate signal, and neither knew enough to read it clearly. Yet consciousness answered consciousness with a strange and happy

He started up from his chair. Was he awake? Was he hypnotised? How could he dream such nonsense? What spell had been cast over him? He shook himself as if to throw it off. This was the way in which a man made an ass of himself thinking about a woman. 'You can stop it if you take it in time,' he repeated to himself. He would get away, and new scenes would occupy his mind. This girl was a foreigner, and of an inferior race at that; a Roman Catholic too—an impossibility. He thought of his book. Like Schiller, he would have only one rule of conduct—the strictest. He would never see her again. This resolution seemed to clear the air. He put the book in his pocket and went to look for Brandon.

'Brandon,' he said, 'I have been thinking.'

Rather hot for that, isn't it?' said Brandon.

But Sandford continued: 'It seems impossible to get hold of that Don Diego.'

'Yes,' said Brandon; 'he won't materialise, as the Yankees say.'

'Very well. Suppose I take a trip up-river and see whether I can't fall in with what we want? There is plenty of time.'

'Not a bad plan,' said Brandon. 'I believe the forest belt begins some sixty miles up-country, say a hundred by the river. There must be plenty of cedar and oak, for plenty comes down. If you can make a bargain for what you need, you could send a couple of the foremen up to see it rafted and brought down. I think you will succeed. But we must not say a word to a soul here. Everybody hears everything, and Lopez may find means to foil you.'

'I should not wonder. How does one get up-

'The steamboat company here occasionally sends up a launch, I believe. The freight-canoes take weeks, and they all belong to the merchants. Let us go along by the company's office and inquire. Or perhaps you had better go by yourself.'

A little way up the street a signboard over a low doorway bore the words in gilt letters, Compañia de Navigacion. A placard on the doorpost caught Sandford's eye. In blue pencil it announced that

the steamer Vigilancia would leave at four o'clock next morning for Espiritu Santo, San Tomás, Valverde, and intermediate points on the Carrizal River. Sandford knew the Carrizal to be an affluent

of the Mariposas.

A barefooted porter in a tattered shirt showed him into the office. The smiling manager bade him good-morning. He learned that the Vigilancia would arrive, bar accidents, at Valverde, the end of her journey, the same evening; that she would return on the third day, and would make the trip again in about a fortnight. He made no further inquiries, and in a few minutes he was again in the street, a written ticket for the journey in his pocket, and the manager beside him pointing out the little steamer lying by the river-bank.

Bidding the manager, who wanted to get back to his siesta, a courteous good-bye, he strolled over

to look at her. She was about the size of a frigate's launch. Her boiler and engines occupied half her interior, and there was space behind them for halfa-dozen passengers. Over her from stem to stern she had a substantial fixed wooden awning, through which her funnel protruded. The awning was supported by brass poles, much battered. The name of a French builder was on a brass plate. She was neither new nor very clean, but seemed a strong and serviceable boat.

'Go in a riding-suit,' counselled Brandon, 'and take no more baggage than you can carry with you on a horse. Take your revolver too. The law permits travellers to carry arms. Just let it be visible, and you will have no occasion to use it. But if you meet a drunken Indian or two it will

be as well for them to see the handle.'

(To be continued.)

JOURNALIST. COMPLETE THE

QUALIFICATIONS FOR JOURNALISM.

URNALISM is the one vocation which above every other exercises a fatal fascination over the youth of the world. Other callings may offer more valuable prizes in life, more security, and more ease; but none

can compete in charm with the career of a 'gentleman of the press.' The reason for this is obvious. To the young and uninitiated, journalism holds out the most alluring prospects. It casts hypnotic spell with equal potency over the two most pronounced types of ambitious youth-the literary and the adventurous. What youth, for example, with a love of literature has not felt his heart throb faster while reading those well-known and seductive words of Anthony Trollope: 'If a man can command a table, a chair, pen, ink, and paper, he can commence his trade as a literary man. It requires no capital, no special education, and may be taken up without a moment's delay'? Less literary but more hazardous spirits succumb to the same fatal flair. The variety, the excitement, the constantly recurring opportunities to visit new scenes, to meet famous people, and to undergo novel experiences, envelop the profession in a seductive glamour to which youth easily yields. And can we wonder? To become a part of that vast, indefinite, and mysterious potentiality which the public both dreads and worships; to step from the door of dull domesticities, or the cribbed, cabined, and confined limits of an obscure or conventional existence, into a world of living interest, a world that furnishes a livelihood while it entertains so royally-can we wonder that youth is beguiled by the siren's sweet

Mr Arthur Lawrence, author of that helpful little book, Journalism as a Profession, in the 'Start in Life Series,' gives various illustrations of the

common bewitchment. He tells, for instance, of the scion of a noble house whom he found keeping the books of a newspaper, and another at work on ingenious acrostics upon which he relied for quadrupling the sale of a weekly review. The first man that he met upon a weekly journal with which he was connected had purchased a thousand shares in the paper in order to obtain a minor post on it. These are typical cases, and may stand for the myriads of young hearts bent upon climbing the journalistic ladder to the heaven of their hopes, They see not the seamy side of the enchanted calling. Their eyes are filled with bright visions of honour and success, and the dazzling glory shuts out the surrounding darkness. They see not the gray ghosts that haunt the shadows of Fleet Street, seeking work that is seldom given, dying at last in penury and despair; or the no less pathetic figure of the man who has grown old in a business which has no place for old age, and where to grow old is accounted almost a crime.

This article, however, is concerned more with the tools of the trade than with its dangers or possibilities. What is the young journalist's best equipment? Which is the right road for him to take? Unfortunately, the youthful aspirant is beset with perplexity from the very beginning. He is perplexed with a plethora of guides, and, alas! few of them competent or successful guides. In no other calling, perhaps, are there so many practical failures who take upon themselves the task of pointing out the way of success. Little does the eager aspirant fancy that the dainty and compact little book called How to Become a Journalist, The Young Journalist, The Journalist's Vade-Mecum, or some such title, was written by a man whose private drawers are crammed with rejected manuscripts 'declined with thanks' by urbane and courteous editors. None the less boldly, however, does he proffer the weight of his counsel to innocent and unsuspecting confidents.

It is well, therefore, and interesting to turn from these self-constituted advisers to those who are authorised to give advice by reason of ripe experience, assured standing, and unqualified success; and luckily there is no lack of counsel from such sources at the disposal of all who care to avail themselves of it.

Perhaps no greater representative of the journalistic profession could be named than the late M. de Blowitz. For over thirty years Blowitz was the Paris correspondent of the greatest newspaper in the world, the London Times. M. de Blowitz was justly jealous of the honour of his beloved vocation, and ever ready to lend the weight of his vast wisdom to all struggling aspirants. At one time he seriously encouraged the idea of an International School of Journalism for the training of young men of promise. But the project was a blossom of Blowitz's fertile mind that never came to fruition. Beyond the advantages of academic or technical training, he emphasised the necessity of an inward 'call.' He looked upon journalism as a secular priesthood to which men are ordained by a positive commission, and that no man must profane by insincere or perfunctory attachment. Here is his definition of the qualities which a man should have who would be a journalist: 'The man who would enter a school of journalism should feel a positive "call" to this vocation, should have in him the unwearying vigilance which is an absolute condition of it, the love of danger-of civil danger, that is, and a real peril-a boundless curiosity and love for truth, and a special and marked facility of rapid assimilation and comprehension.'

The late Sir Leslie Stephen emphasised rather the necessity of sound knowledge. 'When my young friends,' said he, 'consult me as to the conditions of successful journalism, my first bit of advice comes to this: know something really—at any rate, try to know something; be the slaves of some genuine idea, or you will be the slaves of a newspaper—a bit of mechanism instead of a man.'

Dr W. Robertson Nicoll's name is justly famous as the editor of the British Weekly, one of the most successful journals of the day. When asked for a word of advice to would-be journalists, he delivered himself of the following dictum: 'I think the real test of a good journalist is how far he is interested in reading papers. A very large class of people don't care to see papers, or are content with one paper, or one magazine, or perhaps no magazine. Others cannot see too many papers; they are interested in everything that appears. And the latter class is the class out of which journalists are drawn. Then, if a man is to be a journalist he cannot have too much information; it does not matter what, every kind of knowledge he has will come to be of use. He ought to have universal curiosity, and one hobbyone subject he knows.' Dr Nicoll also refers to the need for enthusiasm. 'A journalist must love his work, and be proud of it. No matter how humble his department is, he should make the very best of it.'

No living man is better qualified to advise newspaper aspirants than Mr W. T. Stead. Hardly a week passes, he tells us, in which he does not receive letters from unknown correspondents from all over the world. As might be expected, Mr Stead, like M. Blowitz, postulates a 'call.' He says: 'I don't think any one should dream of becoming a journalist-except of the bread-andbutter order-any more than he should dream of becoming a minister of religion, unless he has a vocation. The first thing that a man must ask himself before he decides to become a journalist is this: If I am to teach, what am I to teach; what is my message; what have I to say that is worth saying; why should I, out of all the millions of my countrymen and countrywomen, be selected to fill the post of public preacher to the daily congregation?' Assuming the would-be journalist feels a clear 'call,' Mr Stead goes on to say: 'The first qualification of a journalist, if he would be a real journalist, is the possession of a heart. Hence I would say to any one who wanted to become a successful journalist: Be sympathetic. Avoid cynicism and indifference as the very devil. Regard indifference to any subject whatever as a proof of ignorance, and therefore of incompetence. Touch life at as many points as you can, and always touch it so as to receive and retain its best impressions. If you don't feel strongly you will not, as a rule, be able to write powerfully; and if your sympathies are deadened and the eyes of the understanding are dulled, you will become a bore and an abomination, whose copy will descend into the waste-paper basket. For the first duty of a journalist is to be alive, and he who does not feel does not live.' Mr Stead's second counsel is: 'Remember, time is everything. The maxim of any one who wants to get his foot into journalism from the outside is to be "on the nail," and to be up to date. Getting an article accepted by the paper is like catching a train. If you are not there in time you might as well not have been there at

The Hon. Whitelaw Reid, the American Ambassador in London, is one of the present-day statesmen who have graduated in journalism. For two years he edited a paper in Ohio, and when the war between the North and South broke out his messages to the New York Tribuns revealed to Western readers the brilliant opportunities of war correspondence. At the close of the war he joined the editorial staff of the Tribuns, and since 1872 has been its editor and chief proprietor. It is this fact of long and varied experience, and not merely his eminence as a writer, that gives value and authority to his views. Writing on 'Modern Journalism as a Profession,' Mr Reid, after pleading for the news-

paper office as the proper place to learn the newspaper business, says: We may next look for whatever will facilitate wide acquisition and persuasive expression. One must first know things and where to find things; and in your reasoning about them, knowledge-real knowledge, not a smattering-of the history of your country is indispensable, and no historical knowledge will come amiss. Constitutional and international law, at least, one must know, and if one can take a full course so much the better. Modern languages will be most helpful, and in our great newspapers a reading knowledge of at least three of them-French, German, and Spanish-becomes every year more desirable. The literature of your own language should be studied until you learn to use the noble tongue to express to the best advantage and in the fewest words whatever you have to say. You should know your own country. You should know foreign countries, and thus chasten the notion that wisdom began with us, and that liberty and intelligence hardly exist elsewhere. You should know the people, the plain, everyday, average man, the man in the street—his condition, his needs, his ideas, and his notions-and you should learn early that he is not likely to be overpowered by your condescension when you attempt to reason with him.'

Mr George W. Smalley always referred to journalism in the most judicial terms, as if apprehensive of bringing a hornet's nest of angry critics about his ears; but this reserve made his remarks all the more impressive. One quality, he tells us, must be born in the journalist: 'instinct or intuition; flair, a keen scent both for news and other things. He must know what the public will want to read about to-morrow morning. These delicacies of perception are feminine, but require to be controlled by masculine judgment.' On the question of style Mr Smalley observes: 'If I were asked for a piece of practical advice to the young writer of English, I would say to him, "Read French, and do not read German; and read Pascal above all other great French writers."' He takes strong exception to Thiers's cynical saying that 'journalism is a very good profession if you get out of it soon enough.' 'For,' says Mr Smalley, 'journalism unfits a man for other duties in the majority of cases. Once a journalist, always a journalist-that is the rule.'

As one who through sheer force of merit and personality has won his way to a foremost place in the profession, Mr T. P. O'Connor's views on journalism are of exceptional value. To the aspirant Mr O'Connor says: 'First of all, be certain that you possess a distinct gift for writing. As a test, try your hand at amateur reporting, and submit the copy to a competent judge.' The best kind of education for a journalist should include 'history, Continental languages, and the masters of style in his own tongue, especially Macaulay, J. R. Green, De Quincey, Newman, and Kipling.'

Mr Arthur Lawrence, author of the admirable little manual already mentioned, singles out initiative, resource, and adaptability as the best guarantee of success in a journalistic career.

From these various opinions of representative journalists it is possible to focus two or three fundamental qualities essential to the make-up of the 'complete journalist.' These may be described

under three main divisions:

First, a physical, mental, and temperamental fitness for the work, attached to it by the enthusiasm of love. In journalism, more than in any other calling, anything that is worth doing at all is worth doing well; but a high standard of serious endeavour can only be maintained by the motive-power of intense devotion. Miss Friederichs of the Westminster Gazette, when questioned about the special qualifications which a girl would need in order to become a successful journalist, replied, 'There are no special qualifications; but there is one "extra-special" qualification without which she will never be a successful journalist, nor anything else successful for the matter of that. It is love of her work.' The remark applies with equal force to the sterner sex. Given this passion for the work, and journalism is easily the most interesting and absorbing vocation in life; but without that inspiration it means miserable drudgery. In a passage of pure and sustained eloquence, Mr Whitelaw Reid, after detailing the difficulties and discouragements incidental to the journalist's calling, says: 'But to him who is called, the opportunity is beyond estimate. To him are given the keys of every study, the entry to every family, the ear of every citizen when at ease and in his most receptive moods, powers of approach and of persuasion beyond those of the Protestant pastor or the Catholic confessor. He is by no means a prophet; but, reverently be it said, he is a voice in the wilderness preparing the way. He is by no means a priest; but his words carry wider and farther than the priest's, and he preaches the gospel of humanity. He is not a king; but he nurtures and trains the king, and the land is ruled by the public opinions he evokes and shapes.'

Secondly, knowledge. In journalism pre-eminently, knowledge is power. Like Dr Whewell, the young journalist should seek to know something of everything and everything of something It is an ideal impossible of attainment; but, like Bacon, he must try to take all knowledge as his province. Every issue of a newspaper represents a battle—a battle for excellence; and the man who can marshal the most knowledge in a clear, concise, up-to-date, and reliable fashion wins. But over and above this grounding in general knowledge, the young journalist should seek to make one subject peculiarly his own. Let it be the Tariff Question, Continental politics, local government, &c., it will always pay in the end. Dr Robertson Nicoll remarks: 'I consider that there is a great opportunity for young journalists who would go to France or Germany and thoroughly familiarise

themselves with the political life and personages and aspects of the Continent. That is a kind of knowledge exceeding rare in this country. It always commands its price, and will do so more and more as the Continent gets nearer to us.' It was the absence of specialised knowledge of this kind that M. de Blowitz was accustomed to deplore so deeply. He said: 'The lack of knowledge and authority in French journalism is most strikingly seen in the matter of its treatment of foreign affairs; and this lack has already had the most unfortunate consequences. Men of a scarcely conceivable lightness of character and irresponsibility, altogether lacking in knowledge, caring only for their own ephemeral and personal success, have succeeded, by the merest accident and with a stupefying self-assurance, in becoming the mentors of the French public on international questions; and they find no contradictors, simply because their own inadequacy, if not surpassed, is equalled by all who have adopted the same speciality as they-that is, the instruction of the French public on international questions. They propagate thus with impunity the most dangerous errors, and establish doctrines which are a real danger from the point of view of the public.'

Thirdly, ability to write, for that, after all, is the alpha and omega of the working journalist's craft.

M. Veuillot, editor of L'Univers, the great Ultramontane journal in Paris, says: 'The journalist who writes a sentence which does not convey its full meaning to the reader at first sight-a sentence which has to be read twice-does not know his business.' No other qualifications, however shining, can make up for the lack of this primary and allessential gift. The writer is acquainted with a young journalist who went to London in search of employment loaded with testimonials and references. 'My dear sir,' said one editor, 'I don't want to see any testimonials. A man may be the biggest criminal in Europe, but if he can write he is good enough for me.' The language was perhaps exaggerated, but it points a moral. Let the would-be journalist learn to write; let him at all costs make up his mind to master the grammar, the secrets, the resources, the method and music of his mothertongue; and, finally, let him remember that in journalism there are no trifles. He that is faithful in that which is least is faithful also in much. The smallest paragraph can declare the man as plainly as the leading article. To quote Mr T. P. O'Connor once more: 'Journalism is one of the professions where one ought to be really good. Mere moderate ability does not bring sufficient remuneration or sufficient certainty of work to make it a good profession.'

A MARRIAGE OF CONVENIENCE.

CHAPTER VI.

HE victoria drew up at the main entrance of Tallantyre just as the great gong boomed its tidings of a waiting luncheon forth through the house.

Simultaneously with the arrival of the carriage, Tallantyre and the squat form of Van Zyll reached the doorstep from another direction.

Cicely leaped forth, all explanation.

'We've nearly been killed, Hartley!' she cried.
'The horses bolted, only Rothery grabbed hold of them and stopped them, so we're here instead of being on shutters, having inquests held on us. Charles fell on his head, and Aunt Dinah is keeping him quiet before he comes back, because he is all muzzy and shaken up.' Here her breath gave out, and Tallantyre, whose face had been gradually whitening, managed to strike in hurriedly, anxiety written large on his face.

'You're not hurt?' he questioned.—'Miss Van Zyll, you are sure you are no worse?—Rothery, my dear fellow, how can I thank you for what you have done?'

He helped Beatrix from the carriage, her colour rising as his eyes rested on her longer perhaps in his agitation than good manners, strictly speaking, allowed. Rothery climbed from his box, and patted

the erring steeds, as a groom came to relieve him of his charge. Before he could speak, however, Tallantyre had asked him to come in for some lunch, and they all trooped into the hall, where Lady Tallantyre was somewhat impatiently waiting for them.

'My dear Rothery,' she said as Cicely retold the story of their adventure for her benefit, 'are you sure you are all right?'

'Quite,' returned Rothery with his short laugh.
'It was nothing really, you know. I managed to get hold before the horses were really off.'

His steady gray eyes wandered away to Beatrix's sweet face, and the girl's colour rose. There was some inexplicable attraction between them, and Rothery knew of a sudden that he had met the only woman for whom he could ever care, whom he could ever ask to go through life by his side as his wife. It was a bad case of love at first sight.

After lunch the party broke up for a wander through the grounds, dividing themselves by accident into couples not perhaps most skilfully assorted. To Lady Tallantyre fell the task of entertaining Mr Van Zyll, while Beatrix and Tallantyre, Rothery and Cicely Grant, formed the other two pairs.

Presently Tallantyre and Beatrix found themselves in the seclusion of an orchid-house, gazing rather perfunctorily at some glorious dendrobiums just bursting into their tropical exuberance of bloom. Suddenly Beatrix found that one of her hands lay in Hartley Gordon's strong, well-kept ones; he was speaking to her in a hoarse, shaking voice, in which she could not recognise his ordinary well-modulated tones.

'Miss Van Zyll,' he said very low, 'will you be

my wife? Will you marry me?' His keen, steady gray eyes, alike, yet curiously unlike, those other eyes that she had seen for the first time in that moment of deadly peril, gazed down upon her. This was not the lovemaking of which she, like all girls, had dreamed. It was only of marriage he spoke, no word of love. Her father had told her he loved her, this kindly man of a station far removed from hers; her father had told her she must marry him. Also, he had been kindness itself to her. Was it not he who had rescued her from the awful deadly dullness of her life in London, who had shown her what a delightful thing life might be? She turned impulsively towards him.

'Yes,' she whispered, 'I will marry you if you

wish it, Lord Tallantyre.'

Tallantyre bent his head and kissed her broad white forehead with gentle reverence. She had saved the honour of his home, and he was very

'I do wish it,' he said, a vibration of deep feeling in his soft, Cumberland voice. 'Dear child, I will devote my life to making you happy.' And so these two took their fate in their hands, neither of them quite understanding to the full the hardness of the task they had set before themselves. Ouly Hartley Gordon thought vaguely of Cicely Grant, and groaned. He thought again of those deeds in Israel van Zyll's strong-room, and he thanked God that through Beatrix and Van Zyll's ambition a way of saving Tallantyre had been given to him.

CHAPTER VIL

HE days flew by apace, as days well filled have a habit of doing. Tallantyre, Beatrix, Cicely, and Rothery spent those speeding days, some on the moors, some by the side

of the mountain stream that foamed through the valley beneath Castle Tallantyre, some driving and seeing the beauties of the surrounding country-side. Always they lived for the present, each with an unacknowledged pain tugging at the heart-strings; each, under the merriment of the surface, with a secret regret that fate had so tangled the threads of their four lives.

One day in late September they wandered, seeking rabbits to shoot with rifles, in the great woods of Tallantyre. For once the quartette, which usually clung together desperately, got parted, and Beatrix and Rothery Crone found themselves together, alone in a great glade of larches, their

soft tread inaudible on the scented carpet of firneedles. Suddenly the girl caught her foot in one of the spreading roots, and would have fallen, probably breaking her leg, had not Rothery caught her deftly. The touch undid him, and he held her close to his beating heart, his strong arm round her slender form, she clinging to his coat, his lips among her sunny hair with the coppery lights shimmering in the dying sunshine as it struck down through the tall, straight larch-trees.

'My darling!' he whispered; 'my darling!' Then he gently turned her face up to his and kissed the quivering lips. There was no need to tell his love, to ask if she loved him. They understood each other only too well, these two. They knew too late the love they had for each other.

Suddenly Beatrix remembered. She put up her two little hands against him, striving to push him

away from her.

'Rothery!' she gasped, horror-stricken at her own action in forgetting that she was already betrothed. 'Oh Rothery, I am going to marry Lord Tallantyre! I promised.'

Rothery smiled and kissed her reassuringly.

'I will explain to him,' he said. 'He is a good chap. I am sure he will release you when he knows that you care for some one else. I'm awfully sorry for him losing you; but whatever it costs him, he will give you your freedom at once.'

'I know he would; it isn't that,' said Beatrix. But, Rothery, we must not ask him. We can't. He has been so good and kind to me. You don't know what my life was before I met him. I can't reward his goodness by ruining him.'

'Ruining him?' repeated the bewildered and slightly indignant Rothery. 'Why ruining him?'

Beatrix's face looked piteous; but the steady gray eyes were bent sternly on her dark ones, and she felt that she must in justice tell him the truth. She knew she could trust to his honour that what she told him would go no further.

'It is money—all money,' she said bitterly. 'My father has got Hartley in his hands. He could ruin him at any time he chose by foreclosing all the mortgages he has bought in. He has promised that on the day I marry Hartley he will burn every deed he has concerning the Tallantyres. He told me if I didn't marry Hartley he would—he would do his

'Old beast!' burst out Crone furiously; then the worst!' pain in the sweet, downcast face made him control himself. After all, this vile Jew money-lender was, by some strange freak, the father of this girl whom he loved with all his heart.

She took hold of his coat and turned him gently towards her. His hands were clencned; his lips refused their office; great drops of sweat stood on

'Rothery,' she said, taking a late rose from his his forehead. button-hole and putting it in her belt, 'will you do something for me?'

He nodded grimly.

'Well, then, I want you, if you can, to go away for the present-I couldn't endure life if you were always near me-just for the next few months.'

Her voice broke helplessly, and he kissed her again gently.

'Hush, darling! hush!' he whispered. 'I understand. Of course I will go as soon as I can. Perhaps, later on, when you are married, it will be easier. Things won't hurt so desperately after a time. Good-bye, sweetheart; good-bye. God keep you!'

And Beatrix van Zyll stood alone under the awaying larch-trees, watching Rothery's broad back swinging down to the homestead in the valley below, and the bitterness in her heart was great, for she loved him even as he loved her.

Two days later Tallantyre opened a wire as they sat in the great hall at tea. He gave a sharp exclamation.

'Rothery has enlisted in the Yeomanry!' he cried. 'Hesails for South Africa-for the front-to-morrow. Gad, I wish I could go too! He must have settled things up very quickly.'

No one noticed Beatrix's colour fade quickly. leaving her deathly white. So he had obeyed her, this simple, strong man of the fells. He had gone to fight his country's foes that she might find her struggle perhaps a little easier. As she sat there by the fire she breathed a little prayer for his safety. that he might after a while, when the war was over, return safe home.

(To be continued.)

IN AND AROUND PORT SUDAN.

AST year there was printed in Chambers's Journal a short article upon 'Port Sudan in the Making.' What follows gives an impression of this new Red Sea harbour by a resident. It is taken from the letter of a con-

tributor to these columns, and affords a striking picture of this little-known country.

'PORT SUDAN, June 10, 1907.

'Very many thanks for your remittance, which I found lying on my table with your kind letter when I returned from an mex shoot. I had spent a few days at a place called Khor Arbat (Khor signifying a watercourse, dry or running). In this case it is a beautiful purling stream, which rises in a wonderful mountain gorge, flows for about six miles, and then disappears into the thirsty desert. It is the only running water in the district, and it is situated about twenty-six miles from here. It takes about six hours on a good trotting camel to get there. The route traverses at first a dreary expanse of stony desert, but it becomes less monotonous as it enters the labyrinth of foot-hills. At length you reach a pass called the "Bab el-something," and two great perpendicular walls of rock stand out. All round the bases of these is a soft carpet of sand, through which glides an ever-lessening stream of water. All around are heaped great wild masses of mountains, the main features of which are the enormous boulders poised in the most extraordinary and insecure-looking positions (strongly reminiscent of the Matoppos). This is the home of the ibex. I have seen at sunset troops of these beautiful creatures skipping from rock to rock, and finally descending into the river-bed, where they quench their thirst. At dawn, too, thousands upon thousands of sand-grouse come to drink their fill. These birds come from all directions in parties of from four to two hundred. When a large flight comes a couple of scouts lead the way some distance in front,

uttering a cry like "Witchu! witchu!" It is a beautiful, joyous note-a note which suggests Freedom, the Dawn, Happiness; a note which produces a strange sense of elation in the listener. These birds slow up as they reach the neighbourhood of the water; and shortly a tremendous screaming and whirring of wings strikes the ear, and the whole flight comes into view. They float for a moment in mid-air, and then slide with an indescribable grace of movement down into the bed of the stream, where they drink and disport themselves-the cock birds crowing and strutting about after the fashion of pigeons.

'As you follow up the stream, the water increases in volume all the time until the sources are reached; and here all sorts of beautiful grottos reveal themselves, or rather lie hidden, in the dense undergrowth. You are now right in the heart of the gorge; but the beautiful oasis ends here. Bevond are the terrible sun-baked ranges of mountains, peak rising over peak until they are lost in the blue distance. It feels good to be down here listening to the babbling brook instead of wandering, perhaps lost and thirst-stricken, in those awful fastnesses. The Government (never at a loss in Egypt or the Sudan to cope with a water difficulty) is thinking of constructing a huge dam across the gorge and pumping the water into Port Sudan, the watersupply of that place being small and bad. To this end excavations on a large scale have already been commenced. Fancy this place, which has lain silent for so many thousands of years, or which has only echoed the hoarse cries of the camel-drivers and goat-herds!

One day the modern Romans (the British) decide to build a town on the coast; and shortly after this a small party of military engineers rides down on camel-back, takes a look at the stream, casts a few glances of passing interest upon the wild-looking shepherds, and decides upon the fate of

Khor Arbat.

'I rode back by moonlight one evening, starting at 5 P.M. As darkness came on and the moon came out, revealing the desert pale and soft all round, I rode on ahead of my guide, and soon became wrapt in the irresistible charm of my surroundings. The moonlight, the silent mystery of the desert, the regular "velvet footfall of the camel"-all contributed towards this. I began to think of the saintly Gordon and his long, lonely rides in the province of Darfour. One can picture him thuscalm, dispassionate, trying to work out the problems committed to his care; one imagines his quiet smile as he thinks of the man at home who "gets up and asks questions in Parliament." Poor Gordon was perhaps too great a Christian to be a very successful man in a country that was honeycombed with intrigue.

'There are still Britishers in the Sudan, and there are still people who ask questions in Parliament. Probably they all (even the latter) serve useful purposes. "Out of the mouths of babes," &c.

'Port Sudan continues to grow as far as the Government buildings are concerned, but not otherwise. The wily Greeks consider the conditions of land-tenure too hard, so no one will put up permanent houses. This place is an enigma to every one. Fabulous sums of money are being spent upon the port. There are huge customs-sheds, electric cranes, wharves, water-tower, power-station, lighthouses, dockyard, and even a costly rolling steel bridge across the harbour of the very latest pattern (which is being put up by the Cleveland Bridge Company). In short, it will be the finest port in the East, and will be equipped with a plant of which a European port might not be ashamed. But, cui bono? It will take an awful lot of gum to keep five electric cranes going, not to mention steam cranes besides. (Gum seems to be the only real staple product at present in the Sudan.) Government works keep the place going at present. Beyond that there is absolutely no business whatever.'

DESTINY.

By OWEN OLIVER.

HE mind holds anticipations as well as memories. When I saw the castle lying among the hills, like a white bird in its brown nest, I knew that I had always been destined to see it, and that something touched

my life there. I debated with myself whether I should turn back; but I knew all the time that I

should go on.

I will not set down the place or even the country, and the castle shall have no name. I was holiday-making in my motor-car, and had lost my way among the foreign mountains. It was near sunset, and I had no oil for my lamps. I must put up somewhere, I argued, and the castle was the natural place to try; but this was merely an excuse to myself. I had often slept in the car in preference to taking inhospitable lodgings; and I felt so sure that the castle and its neighbourhood were inhospitable that I slowed down to about ten miles an hour, and looked round me cautiously as I advanced. The story—and it is the story of my life—turned upon this anticipation that caused me to travel slowly.

When I had crawled along the winding road for some time I reached a small village. It was like dozens of other villages where I had been welcomed by a friendly crowd gaping at my car, for motors were then unknown in those parts; but here the peasants in the road ran hastily to their doors, and those in the houses flew out to them. The women screamed, and the children clung to their mothers' skirts. The men took their pipes from their mouths and

used them to point at me.

'The Englishman!' they cried. 'The English-

man!' And when I spoke they did not answer me, but called excitedly to one another.

'It is destiny!' they declared, and some crossed themselves; and the women wailed about one Gretchen. They called her 'our Gretchen' and 'Little Lady.'

'Is this the way to the castle?' I demanded when the hubbub died down a little. I spoke the language fluently.

'The castle!' they repeated, nodding meaningly at one another. 'He is going to the castle!'

'He is going to the castle in the devil's car without a horse,' a hunchback pronounced, rubbing his hands and chuckling. 'Ho, ho!'

'Stop him,' some younger men advised, making a half-hearted show of movement toward me.

'You cannot stop him,' pronounced a graybeard leaning on a stick. 'It is destiny.' He shifted his weight to a doorpost, so that he could point along the road with the stick. 'That is the way to the castle,' he announced, glaring at me and nodding his head.

'Is there another way back?' I asked. I thought that I would seek a more hospitable route if I was refused shelter at the castle.

The old man chuckled fiercely, and shook his stick at me.

'There is no way back,' he said; and the hunchback rubbed his hands and laughed maliciously. 'No way back,' he said. 'You can ride to the devil in the devil's car!'

'The devil's car!' the villagers shouted; and some began to gather stones to throw at it; but I shrugged my shoulders and started.

An old crone peeped at me through a hedge, and

cried to me shrilly to go back, and pointed to two wooden crosses in the field.

'He died just here,' she warned me, 'the one who came last, and they buried him there; and the one who came before. I was a child, but I remember. They were black-bearded men like you - mad Englishmen. She died at the cross a year after; but that was the last time, I remember.

'Tell me about it, mother,' I said, flinging her a coin; but when she had picked it up and tested it with her teeth she shook her head.

'They gave me money,' she mumbled, 'but they would not go back. They were big men like you; but they died. You go to your fate, mad Englishman 12

'If a man does not go to his fate, his fate comes to him, mother,' I told her. 'What is it?'

But she only mumbled incoherently. So I moved the lever and went forward, still slowly. The crone wrung her hands and shricked that it was destiny.

Presently I reached the castle gates. They were tall gates of wrought-iron, and they stood wide open. A man who was sitting there smoking dropped his pipe and ran to the lodge and called his wife; and she came and stared at me, and shrieked as the others had done, and crossed

'It is the Englishman!' she cried. 'Gretchen!' She had been Gretchen's nurse, I learned afterwards. And she swayed, and her husband picked her up and carried her in.

So I passed through the open gates into a broad avenue, rising sharply, and toiled up to the castle.

There was a terrace in front of the castle, where a dozen peacocks strutted by a fountain. Some twenty ladies and gentlemen stood there. They clutched at each other and pointed to me as I approached them at a crawl. A slight young girl with blue eyes and yellow hair stepped out a pace, and stood watching me like a pale statue. I was not interested in women as a rule; but it seemed to me that she was wonderfully beautiful, and I noticed that they called her Gretchen. An older lady drew her back as I came in front of them; and a large old man put himself in front of her. I bowed, and he returned my bow stiffly but courteously.

'This is private ground, sir,' he said.

'I have lost my way,' I explained, 'and I seek a roof for the night.'

'You are English?' he asked sharply.

'I am English,' I owned; and they looked at each other and shook their heads; and an old lady gave a groan.

Send him away, several muttered; but the big old man, whom I took to be the lord of the castle, waved them aside.

'He must stay,' he said. 'It is destiny !-- Your name, sir ?'

I had never seen reason to deny my name before; but something whispered to me to do so then.

'Davidson,' I said.

'Not Deland?' the old man asked suspiciously.

'Not Deland,' I said steadily; but that was my name. I remembered that my father's brother had been lost in these parts when I was an infant in arms; and now I was turned thirty; and I thought that destiny had a long arm.

'Not Deland,' I repeated; 'but my name does not matter. Since I am evidently unwelcome here, I will seek lodgings elsewhere. Perhaps you can direct me to an inn?

'No,' cried the old man fiercely; 'you must stay here.

He nodded to the men, and they closed round me. When I started the car, however, they sprang They were evidently afraid of it, and I could have escaped them easily; but I caught the girl's eyes, and if ever eyes said 'Stay,' hers said it plainly. And I thought that perhaps my destiny was to help this pretty, pale maiden. So I circled round in the car slowly, and came back to them.

'If I am to accept your hospitality, permit me to run the car under shelter,' I said. 'It is heavy to push, and it would rust in the open air.'

'We will show you the way,' the large old man offered.

A young man led on, and I followed. The rest of the men walked beside me. At my invitation the old man entered the car. He asked me many questions about it. He had heard of them before, he said, but he had not seen one, and he thought that they went faster.

'It will go as fast as a carriage,' I told him. 'The large racing cars, that you may have heard of, go faster, but this is only a little touring car.' It could, in fact, cover nearly thirty miles an hour; but I thought it well that he should not know how readily I could escape in it. I heard him repeat the information to his companions while we put the car inside the coach-house; and I gathered that they regarded it as bearing in some way upon their treatment of me.

The baron-he was a baron, I found, but I must not give his name-conducted me to a couple of rooms in a wing of the castle. They were well furnished and comfortable; but their small, barred windows gave them the look of a prison. It was forty feet from the windows to the ground; and I noticed that the passage was closed by a massive door studded with iron, and that two sturdy men with swords sat on a settle outside.

'It seems that the claims of your hospitality are to be enforced, baron,' I observed carelessly.

He bowed low.

'For a couple of days and some hours, sir,' he said. 'You shall be free at half-past eleven to the second on Thursday morning. You have my word. Meanwhile, we will do our utmost for your comfort. I regret the necessity for detaining you.'

'I do not understand the necessity,' I protested. 'Ah!' he said, half to himself, 'then you do not

know. I wondered if you did. It is better that

you should not; but, believe me, the necessity exists. It is destiny that we fight against.'

'You cannot fight destiny,' I told him.

'We can try,' he said grimly. 'In other days we took a harsher way.'

And I remembered the wooden crosses in the field. 'Since you take a gentler way now,' I suggested, is it needful to confine me here if I give you my

word not to attempt to escape?'

'It is not only escape that we fear,' he replied, 'and not only yourself. It is for your own safety that we take these measures, as well as --- I cannot tell you more; but I am at your service in everything else. If you will favour me with your presence for a few days afterwards, the castle shall be at your disposal. Meanwhile, my servants shall study your wishes, and if you desire my company at any time I shall be honoured.'

'I shall be honoured and pleased,' I assured him.

'I will join you after dinner,' he promised. Then he left me.

I washed and rested, and ate an excellent dinner with an excellent appetite. I tried to enter into conversation with the old woman who waited on me, but she crossed herself whenever I spoke, and would not talk. After dinner I walked along the corridor, and found nothing but stone walls and the strong door. I discovered, also, that my revolver had been slipped from my pocket. So I resigned myself to my imprisonment, and sat down and read some of the books in the sitting-room. From the book-plates and coats of arms in these I ascertained the name of the castle and its owner, and found him to be the head of one of the most ancient families in the country.

The baron visited me as he had promised. He was a poor talker, and we bored each other till he mentioned chess. When he learnt that I was a player he unearthed a board and men, and we played several games. I was easily master; but he vowed that I should have a worthier opponent the next day in his cousin Rudolf, who 'lived for chess' and ranked among the minor masters. Then he left me, and I slept a dreamy sleep. I thought that destiny played me with a silken line, and drew me nearer and nearer to the pale, yellow-haired girl, who stood like a statue, watching me with her blue eyes. I remembered the girl wonderfully well, considering that I took little interest in women as a rule; and I judged that she was a fellow pawn of

The next morning I sat by the barred window, looking out upon a grassy plateau. It was at the side of the castle, and there was no traffic there; but presently the blue-eyed girl went rapidly by. Just before she passed from sight she turned and took a long look at my window; and when she saw me she flushed and bowed. She was scarcely more than a child-barely twenty, I supposed-but she was very pretty; prettier than ever, because she had a pink colour from hurrying. I thought that she would make a sweet bride for some handsome young

fellow like my cousin Dick; and if she too were fighting destiny I would be ready to help her, like an elder brother, if the chance came my way.

The baron's cousin Rudolf-a grizzled man of fifty, and old for his age-visited me in the afternoon and again in the evening. We played chess all the time, and did not finish till after midnight He was a good player, as players go; but I was very strong, and could hold my own with the real 'masters,' not merely the minor ones. I won six games and drew two out of nine, while he scored once only. In the last game I had the move, and he played the Two Knights' Defence. We selected the variation given in the ninth column in Steinitz's book; but on the fourteenth move-instead of P.Q.4, which only draws, or P-Q Kt 4, which loses-I played Q-R 4, and won. He had not thought that any one could beat him at that opening, he declared; and he warmed to me so that, at last, I induced him to tell me the circumstances which had led to my confinement.

'It is a curse that was laid upon the baron's house two hundred years ago, he explained. 'The baron of those days was a wild, dissolute fellow; and he ran away with a daughter of a neighbour, an English man who had settled here. The girl died about a year afterwards, leaving no children, and then the baron married again; and her father laid a curse upon their issue that the eldest daughter should never marry to her father's wish, but should love s

stranger of English blood.'

'I see,' I said. 'I am the stranger of English blood; and the pretty, slight girl whom they call Gretchen is the daughter; but I am not a marry. ing man, friend Rudolf, and she is a mere child. You need not have been afraid, even if you believe this old superstition of a curse.

'We have reason to believe it, Herr Davidson,' he said gravely.

'The baron's own daughter ran away with a captain of mercenaries—an Englishman, it is said, but I find no evidence of his nationality. His eldest granddaughter was carried off by an outlaw -he was certainly an Englishman-on her way to church to be married. Our record says that she was stolen without her consent, but the popular story runs otherwise. There is a song that the peasant lads sing to the maids at their windows, and the maids answer, that is evidently based on the story of the bold outlaw and Margaret. He reproaches her for putting on her dress and hood and shoes for her bridal, and she replies to each that she dresses for him, and he has only to be bold and wait by the lichgate—it is in ruins now and take her, and she is his. And, according to the story, he just rode up to the carriage and lifted her up with one arm and set her in front of him. From which I judge that he was either a very strong man, or she was a very willing woman, or both!' Good Rudolf rubbed his large red hands and laughed; and I laughed too.

'Your pretty Gretchen might not be so willing,' I said.

'Gretchen takes it for her destiny, of course,' he pointed out. 'However, I will continue the story. The following baron set himself to fight destiny, and caught his daughter's lover under her window, and hanged him; but she drowned herself. The eldest daughter of the next baron, his son, stole away with an Englishman on her wedding-eve; but they pursued them and shot him. He shot also, and killed several, and there was a great confusion; and in the darkness some one accidentally shot her too. The story says that it was her father who did it; but that must be pure guess. However it may be, it preyed upon his mind, and he was never himself again. The last-that was in my boyhood, and I remember it—was another Englishman, who came to the castle a few days before the marriage, just as you have done. His name'—— He checked himself. 'His name does not matter.'

'It does not matter,' I agreed; but I remembered the name that the baron had mentioned, and that my father's brother travelled to these parts, and never came back.

'Our Gretchen is her niece, and very like her. They kept him a prisoner, as they have kept you, so that he should not know her. They never spoke, but they changed eyes; and it is supposed that she got a maid to carry a note to him. He made a rope of his bedding—I saw it—and escaped from the window by night. Now they have posted two men on guard with guns.'

'Pool!' I said. 'I do not lose my heart by "changing eyea." In fact, I do not mean to lose it at all, for I prefer my liberty to a wife. I should have been a hundred miles away by now if they

had let me go.'

"So perhaps would he have been," said good Rudolf, with a sigh, 'but they kept him here. It was destiny. She escaped too, and joined him, and they fled. The barking of the dogs raised an alarm directly, and the baron and his connections followed swiftly. They took them to a field where there are now two crosses. Perhaps you saw them?' I nodded. 'The Englishman made a hard fight, but they cut him down before her eyes. She never recovered from the shock, and used to sit all day on his grave; and she died there just a year after it happened. It is strange that one could love a person with scarcely a word passing.'

'To me it seems impossible,' I said, with a shrug of my shoulders. 'I shall make no ropes to fly with your Gretchen, anyhow. Tell me, is she to

be married on Thursday?'

'At a quarter to twelve,' he said, 'at the church with one tall spire that you see to the right from the avenue. It is nearly five miles away, though it does not look so far. They start at a quarter-past eleven; and when they are beyond your reach you may go, unless you will stay and play more chess with me.'

'We shall see,' I promised. 'You are a great |

player, Herr Rudolf; and if I cannot stay, then I might return a little later. Is the marriage not to the taste of pretty Gretchen?'

He shrugged his shoulders and extended his hands.

'He is nearly as old as I! Girls have their fancies, and for my part—well, it would not grieve me greatly if you ran off with the child. She has always been my favourite, and if she prefers—she thinks you are her destiny, you see; and you are young and well-favoured; and so—— Can your devil's car without a horse go very swiftly?'

'About twelve miles an hour at a pinch,' I said

carelessly. 'Why?'

I thought he was only trying to draw me out; but I believe now that I did him an injustice, for I have learnt that he was very tenderly attached to Gretchen.

'They would be off their guard,' he said; 'and you might repeat the story of the outlaw and Margaret if you could overtake them. But you cannot; and you do not want to run off with our little Gretchen.'

'No,' I agreed, 'I cannot; and I do not want to run off with the child. But you need not tell her that if she asks after me.'

He nodded slowly.

'She will not ask; but she will look at me with her big eyes; and I shall tell her that—that the handsome Englishman called her pretty.'

'Yes,' I said with a laugh, 'tell her that. It's quite true, bless her! And if I could help the child in any other way than by marrying her I would. But this is the twentieth century, and bold outlaws are done with. Good-night, old chap.'

'Good-night, my friend,' he said, and went.

I went to sleep, and dreamed again of destiny drawing me to Gretchen with a silken thread. And when I woke I wished very heartly that I could take the poor, pretty, frightened child to England and marry her to a nice English boy, since I was a dozen years older, and not a marrying man.

I caught another glimpse of Gretchen from the window in the morning; but she was with an elderly lady who would not let her come near.

I found a pair of opers-glasses and watched her; and she gave many a look over her shoulder in my direction. Her look was such as might have set a younger man's heart afire; and it made me grind my teeth and think over the story of Margaret and the outlaw. There is something that grits a man in seeing a woman married against her will, even if he does not wish to marry her himself. The awkward thing was that if I carried her off she would expect me to marry her. If I had thought of marrying, I owned to myself that I should have liked the idea of marrying pretty Gretchen. But I was, I assured myself, a confirmed bachelor.

Herr Rudolf came in the afternoon, and he brought me a white rose.

'Gretchen saw you at the window,' he said, 'and she thought that you had no flowers here. She asked me many questions about the devil's car, and how fast it would go. It is natural that she should believe that'--- He paused.

'That we should run off and be killed?' I

suggested.

'That you should run off,' he corrected. 'The rest is no part of the curse; and if the devil's car were fast enough'-

'The devil's car is slow,' I said - infernally slow. And I don't see what I could do if it were faster. Let's play chess.' I was not sure that I could trust him.

We played all the afternoon, and he dined with me, and after dinner we played again. He said no more about Gretchen till he was going.

'If the devil's car went faster,' he remarked in my head sometimes, as one plays chess, instead

of going to sleep. Good-night.'

'And I sleep instead of making stories,' I told him; but it was a long while before I went to sleep that night. I could not stop thinking of the pale, pretty, unwilling bride, who thought it was our destiny that I should deliver her in the devil's car. I had more than half a mind to try; but the difficulty was what to do with her afterwards. Still, I thought I could take her to England to my mother; and some of my younger friends were sure to fall in love with her, because she was such a pretty girl-such a very pretty girl. And she would not think any more of me when she met some nice English boys nearer her own age. Probably she would like young Dick-confound him!

The baron called to see me the next morning. He apologised profusely for my detention, and in excuse retold the story which I had heard from his cousin. I accepted his apologies, and promised to make no fuss with the British Consul on condition that he would let me go to my car, under escort, and get it ready to start punctually at the appointed time. He agreed to this, and I prepared everything. I saw the bridal cortège go along the road; but it started from the other side of the castle, and the men who guarded me had no suspicion that I knew anything about the

wedding. At half-past eleven to the second my guards stood back and bowed, and I shot away on the top speed. I heard cries of astonishment and fright, and some cried that I pursued the Lady Gretchen in the devil's car; but I was soon out of hearing. I saw the one-towered church to the right, and turned that way when I was out of the gates. When I was about a mile from the church I saw the bride's carriage just ahead, and slowed so that I should catch them just as they stopped, for I was not confident of my power to take her with one arm, as the outlaw had done. In fact,

I would make no move to take her at all, I decided; but if the poor, pretty little thing sprang to me for help, destiny should have her way, even if there was another wooden cross at the end

A country cart was about forty yards behind the of it! carriage, and I lurked behind the cart till they stopped. Then the baron stepped down, and his wife rose to be handed out. Gretchen stood up behind them, and turned and saw me; and I shot forward and stopped just beside her, scratching the paint of her carriage and mine.

The coachman gave a yell, and the baron gave a roar, and the baroness gave a scream, and the people standing by the church—I can still picture the row of white-dressed girls with baskets of flowers—gave a great shout; and I gave a great

'Gretchen!' I said. And I held out my hand, laugh. and she took it and stepped lightly from the carriage to my car; and we were off and away before any one got within arm's-length of us.

Never was a bride carried off so easily!

We went at twenty-five miles an hour over good roads and bad, and round sharp turnings, and through narrow lanes; and I looked straight ahead, and so did Gretchen; but when we reached the top of the hills she turned and took her last look at the castle, lying like a white bird in its brown nest, and she caught her breath sharply. Then I took her hand. She was like a little white flower, I thought, tipped with pink. And I forgot the wise words that I had thought out to tell her, that she should choose a husband for herself in England.

'It is destiny, Gretchen,' I said, 'and I shall love you very much if you will marry me.'

'I shall love you too,' she said very simply, 'and I will marry you. It is destiny; and'-

She looked at me for a moment, and then dropped her beautiful eyes.

'And we are glad?' I whispered.

Gretchen nodded shyly, and I put my arm round her; and so we rode away in the devil's car on the road to heaven!

CONTRARY LOVE.

I SOUGHT for Love, and found him not, In silent wood, by sounding sea; Where miracle of rose is wrought, Afar, anear, 'mid slave and free. And to my lonely heart I cried, 'Ah, Love is not for me-for me!'

And, weary of my fruitless quest, I turned my loveless weird to dree; I hid my sorrow in my breast, And smiled for all the world to see. But when I ceased to seek for Love, Love came a-seeking and found me. M. HEDDERWICK PROWNS.

THE MODERN CRAZE FOR ATHLETICISM.

By F. KINLOCH.

many it may appear that the craze for athleticism of all kinds which seems to pervade the whole community is a new development in the national character. A hundred years ago, when we saved Europe from the

grip of Napoleon, we were sneered at as a 'nation of shopkeepers.' Nowadays the sneer might well be, not perhaps at a 'nation of athletes,' but at one devoted to athletic shows. And yet history tells us that this love of outdoor sports and pastimes is innate in the Anglo-Saxon race, and we have only to look round at all the quarters of the globe where the English tongue is spoken to see how history is verified. England may be regarded as the cradle of all manly sports, especially those in which a ball takes principal part. Gallic and Celtic races have not this natural love of games in their blood. Love of sport—such as hunting, shooting, fishing, stalking of game, &c .- they share equally with the Anglo-Saxons; but it is a curious and rather notable fact that in Ireland and in the Highlands of Scotland you find little of that intense devotion to outdoor games which is such a feature of the present day elsewhere in the United Kingdom; and while among the more advanced youth of France and Germany these vigorous athletic games are beginning to make headway, it would be impossible to conceive the average ouvrier of the Continent flocking in thousands to watch some athletic contest.

interesting article on the history of athletic sports in England in the 'Badminton' book on Athletics, one gathers a distinct impression that from earliest days sports of all kinds were popular among the people, as distinguished from the aristocracy. That this devotion to games caused some apprehension to the legislators, as interfering with the practice of archery, is manifested by the statutes enacted both in England and Scotland to repress the playing of football, and in the case of Scotland of golf also, No. 508. - Vol. X.

But to revert shortly to the past history of outdoor games in the United Kingdom. From a most

in order that more time should be given to national defence. Popular song shows how even as early as the sixteenth century the men of Lancashire were devoted, as they are now, to every kind of outdoor sport. A wandering minstrel of that age, one Randall Holmes, sings:

Any they dare challenge for to throw the sledge, To jump or leape over a ditch or hedge, To wrastle, play at stoole-ball, or to runne, To pitch the barre, or to shoote of a gunne, To play at loggets, nine-holes, or ten pinnes, To trie it out at football by the shinnes; At ticke-tacke, saw nody, maw and ruffe, At hot cockles, leap frogge and blind man's buffe; To drink the halfer pottes or deale at the whole canne, To play at chesse or pue or inkehorne, To daunce the morris, play at barley breake, At al exploites a man can think or speake, At shove groate, venter point, and cross and pile,

At 'beshrew him that's the last at any stile.

These are some of the accomplishments in which the Lancashire lads prided themselves in excelling. Most of them are now unknown; some have modern 'Stool-ball,' for instance, is said to be cricket. It is evident that the populace in Tudor times had their outdoor amusements. Then came the Puritan days, when these were considered sinful and to be stamped out with a ruthless heel. With the Restoration the natural reaction from gloom to gaiety led to a revival of athletic meetings at fair-times; but one gathers that many of the old sports had been forgotten; less is heard of games, more of athletic exercises. By degrees professionalism began to creep in, especially in footracing. In sport, as in letters, the grandees of the time looked about for likely men to patronise, and they had opportunities of noting who among their footmen were good runners (the footmen in those days used to run alongside of their masters' coach; hence the origin of the name). A particularly good runner would be singled out, and a match made with some other nobleman's 'footman.' Thus Pepys in his Diary makes entry: 'With Mr Moore and Creed to Hide Park by coach, and saw a fine [All Rights Reserved.] AUGUST 24, 1907.

foot-race three times round the Park between an Irishman and Crew, that was once my Lord Clay-

poole's footman.' From the Restoration down to about the beginning of the nineteenth century athletic games were the features of the annual fairs and wakes held in the larger villages. By degrees these fairs died out, for the villages had become too small, the workers having migrated to the larger manufacturing towns, where they had no time and no opportunity to do anything but labour. Those were Corn Law and Chartist days. Therefore, by force of circumstances, one hears but little of the sport and pastimes of the people during the first half of the nineteenth century. Cricket, ever the national game, kept creeping up in favour, though play was confined chiefly to the southern counties, Kent in particular; but football, except in schools, was Golf was confined to a practically unknown. favoured few in Scotland; lawn-tennis had not been invented; hockey was unheard of. This was about fifty years ago.

Just for one moment contrast the state of matters to-day. In the height of the football season, when the Cup-ties are being played, it is calculated that all over the United Kingdom and Ireland more than a million people are engaged in watching football on a Saturday afternoon, while over a hundred thousand have been known to attend a single match, the final of the English Cup at the Crystal Palace. The crowds at cricket matches do not mount up to such mammoth figures, yet the enclosures of the county grounds are all full when there is a big match on between the leading counties, and every ball is watched by a critical

gallery. The growth of the popularity of golf is almost as extraordinary as that of football, with this difference, that while the football enthusiasm has pervaded chiefly the masses, the golf boom has appealed mainly to the upper and middle classes. It is no exaggeration to say that for one man that played golf forty years ago there are a hundred at least to-day. Owing to the nature of the game, one cannot judge of the popularity of golf by the same Golf is not a standard as football or cricket. spectacular game, for youth and agility are required to watch a big match. Nevertheless, of late years a crowd of over twelve thousand people has been seen on the links of St Andrews.

Lawn-tennis and hockey have also contributed their quota to the love of athleticism of the present age, which spares neither old nor young, man nor

maid. It may well be asked what is the reason and what was the origin of this tidal wave which has swept the country, and which must, for good or ill, leave its mark on the national character. We have seen that the love of pastimes, as distinct from sport, has long been a feature of the Anglo-Saxon race, though for many years prior to this outburst it was lying dormant. Two reasons may be ad-

vanced to aid a possible theory. The first fifty years of the nineteenth century saw the greatest misery prevailing among the industrial population. With the repeal of the Corn Laws and more advanced social legislation, conditions began to improve among the working-men of the country. Some time and some money could be spared for recreation. Concurrently with this amelioration of social conditions came the increase of travelling facilities, the beginning of that network of railways which has turned large England into a little field. With these new facilities of intercommunication sprang up intercity, intercounty, international rivalries. Thus all was ready; only something was needed to start the flood. Looking to the extraordinary popularity of Association football, is it too much to say that that something was the institution of that form of football, and the organisation of the existing Association in 1863? Already by that time football was popular in Sheffield; but there were no recognised rules. In 1863 rules were drawn up by a central body in London, which gradually became accepted by all the clubs in the country; and this example was followed the next year by the Rugby footballers, who instituted that body known as the Rugby Union.

For the next eight years the torrent imperceptibly gathered force, yet did not burst its banks. First signs of its coming were seen in the institution of the first international match under Rugby rules between Eugland and Scotland in 1871, followed by Association players next year with a similar

Here was a game, which could be played in the fixture. short winter afternoons, having all the elements of sport which appeal to a British crowd, and by the aid of railways it was easy for rival towns to play against each other. Small wonder, therefore, was it that football began to grow rapidly in popullarity—Association football in the north, west, and Midlands; Rugby football in Wales, Yorkshire, and the north-east.

It was about 1874 that the provincial movement in Association football really began, and the rapidity of its spread, no less than the manner in which the players, drawn mostly from the mechanics or artisan class, acquired their skill in play, was perfectly wonderful. For instance, in 1874 there was only one club in the Birmingham district; in 1876 there were twenty; and the same ratio of progress applied to Lancashire. In the south the game was still confined to the amateur class, and the clubs, which drew their members from the schools and 'varsities, did not consider the north-country teams a match.

But now the professional element began to appear. Localities grew enthusiastic about their football clubs, and were determined to leave no stone unturned to secure their success; but the players could not find time to devote to practice unless they were paid for it, and thus the paid football player spring into existence. In 1883 a team composed entirely of professionals, the Blackburn Olympic, won the English Cup for the first time, and since then it has been recognised that the highly trained professional teams are as a rule considerably superior to the amateur teams.

It would be impossible within reasonable limits to trace the progress of the football craze; suffice it to say that from the Midlands it soon spread north to the Lowlands of Scotland, where the natives took very kindly to the game. It took longer to invade the south of England; but it is by this time firmly established in and around London and district, and even farther south. In fact, it is now difficult to find any village without its football club, and followers of the game are numbered by the million. Rugby football has never taken so great a hold on the masses, chiefly because of the stern face which the Rugby Union has set against professionalism, which caused a cleavage with the Yorkshire clubs some years ago. But the Rugby game has also a very large following, and possibly the Rugby internationals create nearly, if not quite, as much interest as those of the Association. The doings of the victorious New Zealanders, the 'All Blacks,' last year, and the successful tour of the South Africans this season, have done much to direct public interest to what is called the carrying code.

Though the football mania is by far the most prominent, it is undeniable that every kind of outdoor game has increased in popularity side by side with football. Take cricket, for instance. Whereas in 1870 it was a pastime, first-class cricket is now a serious business. Cricketers, whether amateur or professional, who play in county matches all season find this devotion a most serious tax not only on their time but on their energies. The spectators are ever so much more numerous, and very much more critical; the halfpenny press is unmerciful in its jeers if a ball is mishit or a catch 'buttered;' and altogether the bed of the firstclass cricketer is not one of roses. And yet such is the charm of the national game that men go cheerfully through the ordeal year after year, if so be that they are deemed good enough for a place in their county elevens.

There are three other games which we mentioned earlier in this article, and though they are altogether dissimilar one from the other, we may group them together for one reason—namely, that we here come upon another phase of the craze for athleticism: its participation by the fair sex. Ladies, while often keen followers, do not themselves, as a rule, play cricket or football, but they do play golf, hockey, and lawn-tennis. It may safely be affirmed that before the introduction of lawn-tennis there was no outdoor game in which ladies could take part except the primitive form of croquet. The introduction of lawn-tennis in 1874 first showed that ladies could share in a game which required active physical exercise. At first the early Victorian notion that any violent outdoor exercise was unfeminine and unlady-like died hard. The finger of scorn was pointed at the 'athletic girl,' but common-sense

triumphed, and it was realised that good, wholesome exercise, in moderation, was as necessary for a girl as a boy, so that nowadays the non-game-playing lady is an exception.

Incidentally it may be remarked that this regular outdoor training is having a marked effect on the physical development of the female sex, especially in the upper and middle classes. It is said that, generally, women of the present generation are stronger in every way than those of the previous one, and this is attributed by medical men to the more healthy lives they lead. Of course, their athleticism may be overdone, and it is open to question whether it is wise for young girls to join in the rougher and more violent exercises, such as hockey, especially if they are 'mixed' games.

While lawn-tennis and hockey, not to mention badminton and la crosse, have their many followers, it is in golf that the upper and middle classes have found a game which will give them enjoyment and exercise all the year round, and which is suitable for all ages. While the golf boom is of later date than football, the two are now running a neck-and-neck race. It may be said that golf began to be appreciated in England only about twenty years ago. The game, once known, spread like wildfire. Nowadays every bit of waste land, and much land that is not waste, near any big town is pressed into service as golf-links. The popularity of the game has spread all over the world, especially in the United States. A writer lately computed that the golf-balls used annually in the United Kingdom alone, if placed in a line, would reach from London to Edinburgh, a distance of four hundred miles. That fact in itself is proof of the extraordinary number of golfers, male and female, who derive a certain amount of pleasure and a great deal of health from this pastime.

We have endeavoured to show how the playing of games, and the interest taken in the playing of them, have grown since the ball was first set a-rolling by the institution of the body which codified the Association football rules, until at present the followers of football are as the sands of the sea, and a new profession with various branches has arisen; for, besides professional football players, there are also professional trainers, not to mention journalists whose chief matier is to report and criticise football.

Then, for those who can afford it, golf has come as a boon and a blessing, so that thousands who used to be at a loss how to get proper enjoyment out of their leisure hours are now devoted adherents to the Royal and Ancient Game.

Cricket, always the king of games, is still deepening its roots in national affection; while what—with due deference to their devotees—we may call the minor pastimes are also increasing in favour. And through the whole gamut runs the minor chord of feminine athleticism.

We have not taken into consideration the development of actual outdoor exercises, such as running and rowing and cycling, though these also, especially the latter, share largely in the national athletic boom.

What is it all tending to, and is it for the good or evil of our country? A large and important question this, which has its pros and cons. Let us take as broad and general a view as possible. In the first place, there is no doubt that it is much better that our youth should have a certain amount of outdoor physical exercise. We are not now alluding to public school life, where that has always been attended to-too much so, in the opinion of some; but it does seem a good thing that the boys in towns should have a chance of having the theory of games early implanted in them. For, be it remembered, the essence of the rules of all games is fairness. It is good to see the ragamuffins of our towns and big villages playing their primitive football on every kind of waste place they can get, for insensibly they come to know the rules of the game, and with them some knowledge of the rules of the greater game of life. In some schools the teachers themselves, out of school hours, play with the boys, and thus the principles of fairness are early inculcated. Then, again, nothing brings out the qualities either of leadership or of cheerful subordination more than participation in games. This brings us beyond the stage of small boys, to the consideration of youths' athletic clubs. If properly managed, nothing can be better for the moral and physical welfare of the community. The boys are kept away from loafing at street-corners or in public-houses, and their best physical qualities are tested; and from the juniors' ranks come those who propose to make athleticism their profession.

We touch here on what is a delicate point in this connection. Professionalism is all very well in its way, but it has now reached a pitch which to many is repellent. Players are mere chattels; they are bought and sold by their clubs, and the richest club is almost bound to have the best team; while never a man need be native-born. Where, then, is the pride of place, wherein lies the glory of victory? It is not to the native lads; it is to the gold that has bought the players. This, to our mind, is the unfortunate phase of professional footballism; and it applies, though in a much less degree, to cricket.

Another of the bad phases of the modern craze is the riff-raff who have never touched a football

or run a hundred yards in their lives, and who come in their thousands to watch the big matches, generally having a 'bit on.' 'Mr Punch' lately, with, alas! too great truth, took off two of these loafers discussing at a football match the question of rifle clubs: 'Alf.-" What! us-wasting our time shooting at a mucky rifle-range of a Saturday afternoon?" 'Arry (smoking a cheap cigarette)—"Not much!"

Thus the football mania has its bad as well as its good side; but, taking it all in all, the good predominates, for it gives the boys of our big cities and villages a chance of clearing their lungs and learning something of the ethics of life earlier than they would otherwise do.

We have dealt with football as the game which, appealing as it does to more people, is likely to have most influence on the coming generation; but the influence of other games is almost as great. The fact that outdoor exercise is ever so much more common among both sexes of the present day must tend to evolve a healthier race both in mind and

There is another side of this subject which is also body. all for good. It may be called the political side. We allude to the rivalries in every branch of sport which are beginning to spring up between all the English-speaking races. We look forward with intense interest to the visits of the Australian cricketers. It was a rude awakening to the national pride when in 1878 we found that Jack was as good as his master; but that discovery did our cricketers all the good in the world, and now the test-matches when the Australian or South African cricketers are here or a team has gone 'down under' are followed with nervous excitement. And as in cricket so in football, both New Zealand and South Africa have shown us that they can produce football players every whit as good as our own.

Then, again, the visits of the American athletesrunners, rowers, and golfers-to this country, and the interchange of hospitality and courtesies resulting therefrom, are productive of nothing but good. These things all tend to break down that barrier of haughty insularity which the ordinary Briton in his pride has built up for himself; and at the same time our visitors learn that once they have earned by their prowess the respect of the public, they will, whether victorious or defeated, be welcomed with open and hospitable arms by the impartial sportloving Briton.

THE ROMANCE OF A FLOATING DOCK.

CHAPTER V.

F, as certain philosophers declare, love is no more than a zymotic disorder, like smallpox, then the flirtations of youth may be looked upon as a kind of vaccination. They may not guarantee a man against taking the

real disease when he is exposed to it, but they will, especially if repeated at proper intervals, partially exhaust the sympathetic elements in his blood, on which, as is well known, the poison thrives, and so will attenuate the violence of the attack. Thus, if he is not (and it is said that in many cases he is) kept completely 'immune,' he at least takes the disease in a mild and not deadly form, so that it neither destroys his life, ruins his constitution, nor leaves indelible marks upon his face. In this manner calf-love, like calf-lymph, may protect one from serious danger at the cost of a passing inconvenience.

Sandford, unfortunately for his comfort, was without this safeguard, so beneficial to the majority of his fellow-men. The exigencies of his career had deprived him of the opportunity. From the time when he left school his life had been passed almost wholly with men, and the society of ladies was to him not much more than a memory of his youth. He had lived little in civilised towns, or even in houses; much in the open air, on surveying journeys and in construction camps. Having thus been out of the way of superficial passion, he had neither frittered away his finer feelings nor had his heart battered into callosity. And accordingly, when, like the shepherd in Virgil, he at last became acquainted with love, he too found him a native of the rocks, a pitiless savage, torturing his captive. In the daytime, when his work absorbed him, he could hold the wretch at bay, and at night sheer fatigue would give him an hour or two of sleep when he lay down. But his enemy waited by his bedside, and long before he was refreshed pulled him by the ear.

He wrote a letter or two and packed a small valise. He took leave of Doña Concha and of Brandon, and, having made Sostenes, the porter, promise to call him at three o'clock, he went to bed. He blew out his candle, tucked in his mosquitocurtains, lay down, and, with a long sigh, closed his eyes. In a minute he was unconscious. In another minute, as it seemed to him, he was awake, no longer sleepy, his mind clear, his case lying before him as in a map. It was a cruel stroke of Fate that his love should be an alien. But he was no coward. He would live through this, and no one should suffer but himself. She would remain a lovely dream. He had never spoken to her or touched her hand, but her memory would be romance enough to last his life. She was not for him, but no other woman should take her place. Somehow he found this thought consoling. He repeated to himself, 'No other woman, no other, no'—

'Ya se dieron las tres, señor' ('Just struck three o'clock, sir').

Sostenes had opened the door, and was speaking to him. He started up, groped for the matches, and lit his candle. The air felt cold. He dressed quickly, and went out into the corredor, one side of which was open to the garden. It was quite dark. Only in a distant corner a taper glimmered before a picture of the Virgin just within the open door of Doña Concha's own apartment. Sostenes shouldered the value and blew out the candle, and Sandford followed the porter out to the grassy street. Rain had fallen, and no star was visible.

Doña Concha's household did not rise to minister to parting guests who left before daylight. Sostenes guided Sandford to an early coffee-shop in the market-place. Steaming pots, some of coffee and some of boiling milk, were on the counter, with heaps of fresh rolls, and, by the light of a flaring chimneyless petroleum-lamp, a brown, barefooted waiter, wearing a big sombrero and wrapped to the nose in a gaudy blanket, served other brown men in blankets and big sombreros, who sat on wooden stools at little tables placed here and there on the rough stone floor. The scene in its Rembrandtesque obscurity resembled the 'Robbers' Cave' of the melodrama, filled with 'dissembling villains.'

The hot coffee was excellent, and, as Sandford finished his, the chimes in the clock-tower on the plaza struck the three-quarters. Again Sostenes shouldered the valise and set out. The Indian, like the wild creatures, either sees in the dark or his retina is sensitive to rays outside that part of the spectrum which alone is visible to white men. Sostenes marched to the river-side as confidently as if it had been high noon, and Sandford blindly followed the light sound of his footsters.

A dim lantern hung under the awning of the little steamer, deepening, if that were possible, the shadow below. Sandford groped his way on board, and took a seat on the locker-bench in the stern. There was no one else there. Sostenes received his pesseta, wished the senor a fortunate journey, and departed. There was no sound but the 'crackling' of the water in the boiler and the hiss of the steam in the escape-valve.

After a minute or two Sandford heard some one moving.

- 'Buenos dias' ('Good-morning'), he cried.
- 'Buenos dias, señor,' replied a voice from the darkness forward of the engine.

When do we start ?'

We are waiting for the capitan, señor. I will

whistle for him.'

The steam-whistle startled the stillness with a piercing and prolonged shriek, and after some seconds a faint, clear echo came back from the opposite shore a mile away, but no other effect was discernible. Sandford heard the scratching of a match and saw the glow of a cigarette. The clock on the plaza chimed all the quarters and then struck four, and all was quiet again but for the increasing hiss of the steam at the escapevalve.

After a few minutes, 'Amigo,' said Sandford, 'your captain seems a sound sleeper. You had better call him again.

'I believe it.'

And again the whistle blew, this time a succession of screams that might have awakened not only the captain but the whole population of Garapatas. And again the far-off echoes came back across the river. As they died away voices were heard approaching, and the soft rustle of footsteps on the grass. They reached the bank. Sandford could Then some one with naked feet see nothing. stepped into the dim 'well' of the little steamer where he sat, and with a 'Con permiso, señor,' set down some packages.

'Is this your best light, captain?' said a masculine voice. Another murmured some apology, and the lantern was taken down and held so that it feebly

shone on the gunwale.

'Por aqui; cuidado' ('This way; take care'), said the second voice again, and Sandford saw the point of a little slipper and the edge of a dark skirt cross the dim circle of illumination, and felt the slight change in the boat's equilibrium as a light figure stepped on board. It was followed by a heavier one. He moved to make room, and the voice he had first heard thanked him and bade him good-morning. He could not

see any one, but he answered politely in the darkness.

The new passengers seemed to seat themselves.

' Vamonos !' cried the captain.

The whistle shrieked again. Somebody stepped ashore and loosed a mooring-rope, and a naked brown foot was extended from the vessel's side to push her off. The engine started with a grunt, the screw began to labour and throb below Sandford's seat, and the Vigilancia swung out on the river. The engineer had taken away the lantern, and the passengers could see nothing.

Sandford felt the situation strange and even exciting. The little boat rolled ominously as she drove against the swirling current; the machinery panted and beat as if it were fighting desperately with strangling enemies in the inky darkness; the invisible river slapped the side heavily at unexpected moments, and swished and gurgled under the counter as if it were alive. Sandford felt helpless in the hands of seemingly happy-go-lucky navigators, of whose skill or prudence he knew nothing. With distended eyes he stared in vain into the blackness which covered equally the rushing river and the mysterious passengers.

Suddenly some unnamed sense came to the aid of his useless sight. The face of the girl who had influenced him so strangely rose before his mind, and in a moment he knew, somehow, that she was by his side. He could not see the faintest outline of her form, but he was certain she was there.

An hour later dawn began to break, and everything looked cold and gray. The water became visible first, then the dark lines of the riverbanks. At last the boat and its passengers slowly materialised out of the shadows. Opposite sat a man with upright figure and a bearded face, and beside Sandford was a woman wrapped in a dark shawl. As he glanced at her she turned her head and met his eyes.

(To be continued.)

TOWNS. DEVONIAN THREE

II. - DARTMOUTH.

HAT beautiful Dartmouth,' wrote Queen Victoria when, over sixty years ago, she, a fair and happy young matron with a devoted husband and lovely children, sailed for shelter in her royal

yacht across the bar and up the estuary of the Dart on a wild and stormy day in August 1840 while on her way to Plymouth. 'Notwithstanding the rain,' she wrote, 'the place is lovely.' And by whatever route you approach the town unto this day, the royal verdict holds good, and will do so unto the end of time.

Follow the progress of the royal yacht and enter the harbour from the sea, float down the river

from Totnes, following every curve and bend of the softly flowing waters that wind amongst the enfolding hills, take the steep and hilly road from Brixham, or even dash along the shores of the tidal river in the thundering train that halts at Kingswear, opposite to the town, and it is just the same; you can only repeat the royal saying and declare the place to be lovely, with a beauty peculiarly its own. You cannot compare it with anything else. These Devonian hills are mere molehills to the 'stern and wild' mountains which clasp to their bosoms our ocean inlets away up north; but the tender beauty, the infinite grace and softness, of their flowing lines, the richness of their colouring, the lavish luxuriousness of their vegetation, impart to them a beauty that has a distinct charm of its own, not to be measured by other standards.

This strange old town lies in a sleepy hollow. Kingswear, opposite to it, where the terminus of the Great Western Railway forms its one link with the outer world, is said to be the older town, for the ancient rhyme runs: 'Kingswear was a market town when Dartmouth was a fuzzy down;' but that is a very old story indeed, for the importance of the little burgh clinging to its precipitous hillsides has long since passed away, absorbed in the greatness of its sister on the southern side of the harbour. But there is an old church here, about the only one in England dedicated to St Thomas à Becket, and a little way down the steep shore there is a ruin, all that remains of an old castle built by the men of Dartmouth in fulfilment of an agreement with Edward IV., who undertook to pay the burgesses of Dartmouth-a very flourishing and important place in those days—a fairly large sum of money annually, 'for ever,' on condition that they 'did buyld and mayntayne there a strong and mightye new toure,' with a boom and chain that could be attached to a corresponding 'buyldynge' on the opposite side, to block the entrance to the river against all comers. The ruin stands at the mouth of a deep and narrow gorge that runs inland, built upon a mass of rock on which the remains of the old guard-room and the groove through which the chain ran can still be distinctly traced. Lower down the winding shore another old castle, dating from the reign of King John, overlooks the bright waters; but its appearance is not improved by the modern residence attached to the decayed old walls.

We are gliding across the river in the swift steamer that plies from the railway terminus to the larger town, and from that ferry-boat Dartmouth has a decidly foreign aspect. Like Totnes, the houses are richly coloured, rising one above the other in serried, picturesque rows, a tall churchtower in the background forming the apex of the picture. Hills enclose the bright expanse of waters. Long ago a spy in the service of Spain reported that 'the town is not walled. The mountains are its walls.' It was, and is, a very apt description, for Dartmouth lies in a secure hollow of those fair hills, beside the beautiful harbour with its ceaseless ebb and flow. The streets go straggling up the hills, and, look where you will, the sea closes every vista, mistress of the scene. Up the river you see the great hull of the old Britannia, for so long the nursing-home of England's sailor lads; now her place is filled by the magnificent College for Naval Cadets, which crowns one of the long slopes above the town. Here there are in the making the successors of those great captains and admirals which Dartmouth has given to the world for centuries. A beautiful building, worthy of its most noble aim!

It would require volumes to relate the history of this noble old town. Younger than Totnes as a municipality by more than a century, its origin, like that of its elder sister, is lost in the mists of ages. It was a town in the old Roman days, perhaps nothing more than a fishing-village; but at the time of the Conquest it was a port of considerable importance. In 1099 William Rufus embarked here on his way to Normandy, and a century later it was the rendezvous of an important portion of the fleet which accompanied Richard I. to the Holy Land. In 1341 Edward III. granted a charter of municipality to the corporation on condition of their providing the king with 'two goode shippes of an hundred and twentie tons' when he should so require. But the men of Dartmouth, being right loyal and patriotic, far outdid their bargain, for in 1346 they sent thirty-one ships and seven hundred and seventy-seven men to help the great Sailor King at the siege of Calais. They were ever ready to stand by Crown and country, these brave men of Dartmouth. Once when a French fleet invaded the harbour-it was in the feeble days of Henry II. -the very women and children turned out to do battle with the foe; and the brave lassies, by 'hurling of flints and pebbles and such like artillery, did greatly advance their men-folks' victory.' Brave dames!

It is rather a blow to read that in the river, a little above the town, stands a black rock that rises in midstream, which was an instrument of punishment in ancient days, for there the shipmen and any one else troubled by a scolding or disobedient wife conveyed the angry lady at fall of tide, leaving her until her anger cooled and her 'high stomach' found its level as the incoming waters crept near and nearer. It was a very effectual cure for warlike spirits when there were no invading Frenchmen or Spaniards to oppose with 'flints and pebbles,' and husbands suffered instead.

How many great seamen has this town contributed to swell the ranks of England's heroes it would take too great time to tell. Only a few can be named out of a mighty host, for the Dartmouth men are born sons of the seas; there is the love of the mighty mother in their very blood. It is more than probable that the town owes its beginnings to a horde of sea-rovers whose long ships swept the Channel long before history began to be written. Although these wild men have left no record behind them, they have bequeathed their dash and daring to their descendants, and, since England has been a nation, the Dartmouth men have stood out as typical sailors. Not without reason has the father of English poetry drawn one of his immortal characters from this seafaring town. Side by side with his Franklin and his gentle Prioress rides a Dartmouth Captain, who

Rode upon a rouncy as he couthe, In a gown of faldyng to the kne. The poet does not say in so many words that this 'Good Felawe' was corsair and pirate, but he allows us to infer that his conscience was just a little elastic with regard to what Fortune put in his way upon the high seas. We have changed all that. In those days there were no international laws, and even if such laws did exist, there was no possible means of enforcing them; and, moreover, ideas have changed until the Dartmouth captain's point of view has for ever vanished.

It was in the reign of Richard II, that the town won the privilege of using the Royal Lions as the supporters of its coat of arms. In that reign, threatened with a French invasion, the brave town determined to take the initiative. Joining with Portsmouth, the inhabitants 'furnished forth and manned a few ships at their proper cost.' Entering the Seine, they dashed into the very heart of the French fleet, destroyed their vessels, and returned home laden with plunder. John Hawley, a merchant-prince of the time, who possessed a large fleet of his own, commanded this daring expedition, and on his triumphant return was presented to the king, who bade him name his reward for so gallant a service. But the great-hearted seaman asked nothing for himself, only a regal honour for his town; and so it carries the Royal Lions on its escutcheon to this day. Ships of Dartmouth helped to fling back the Armada from our shores; but, best of all, it sent out those strong, brave, simplehearted sailors who, in mere cockle-shells of ships, sought and found so much for the glory of their native land. The gallant brothers Humphrey and Adrian Gilbert here saw the light, and imbibed with their mother's milk the spirit of adventure which sent them afar to found new empires and establish the greatness of that realm upon which the sun never sets. Walter Raleigh was born on the banks of the river Dart; and here the discoverer of the Arctic Circle, the pioneer of so many seekers after one of Nature's secrets, and possibly the most successful and loval-hearted amongst a band of heroes. John Davis, the discoverer of Davis Strait, first saw the light of day. Go and read about him in Hakluyt's fascinating story of the voyagers who laid the foundations of our Empire, and think of the rock from whence we have been hewn and the pit from whence we have been digged.

Ah, but the town is calling to us. We must think of its departed sons no more. Here is the steep ascent from the ferry-slip to the street—a slippery bit of walking, for the tide has only just receded, and there are sundry ribbons of seawed lingering on the stones. But here is the town, and what a quaint, unusual, ancient town it is! There are old houses with fantastically carved fronts, bays that jut out three feet beyond the lower story, the leaded sashes divided by carved uprights, with quaint monsters supporting the overhanging windows. Some of them have two tiers of these old-fashioned projecting windows; all richly carved, and a few are dated. There is a Butter Walk here as at Totnes; but it only stands on one

side of the street-the corresponding side-walk having been 'improved away.' Like the Totnes arcade, it overhangs a bit of the road, and above the colonnade rises the carved front and leaded windows of what was once a noble mansion, now divided into three houses and shops, all dealing in smallwares. The centre house bears date 1634, but may be older, and the initials M. H. are to be seen on the carved oak frieze of the front There are notable ceilings in stucco-work all through the house, although the best of them is not open to the public. There is one, however, in the centre house, which can be inspected, and the owner of it, a most worthy old seafaring man, is only too glad to exhibit the lovely piece of ancient work. He points with pride to a wonderful overmantel of carved oak which hangs as it did from the time the house was first inhabited, although the wide chimneypiece it once adorned has vanished, and a rather mean little modern grate stands in its stead. It represents the Day of Pentecost, and is really a wonderful bit of workmanship. On either side of the central panel are figures of Moses, the lawgiver, and King David, the sweet singer of Israel-the quaintest and most archaic forms imaginable, and yet by no means ludicrous, because the artist has worked at his task with a simple, child-like faith that is quite beautiful to see. The old mansion was honoured by two visits from Stuart kings Here Charles I. held his Court when Prince Maurice captured the town from the army of the Parliament, the Royal Arms being placed on the house by its proud owner in commemoration of the event; and here his graceless son came in the old age of the century to hold a merry Court, which so pleased the king that he made one of his numerous sons Earl of Dartmouth-a dubious honour which did not last long, as the boy died a few years afterwards

The merchants of the town must have been men of great taste as well as wealth, because the houses they have left behind them are richly carved and decorated inside and out. In a back-street, doubtless once a noble thoroughfare, there is a house-front which is a perfect example of its peculiar style of domestic architecture. How is it that we have lost the secret of those old builders? Those quaint houses have carvings that, exposed to a strong sea. air as they have been for centuries, are still as well defined and as clear cut in their detail as they were when hands, long since dust, lavished their skill upon them. Attempts at restoration of some old houses have been made, and with fairly good success. Like the townsfolk of Bruges, the municipality rather encourages such imitations, and it is to be hoped that the old town, like that other old Belgian city, will preserve its antique character as time crumbles away the venerable relics of past ages.

Up a steep hill, its tower forming a striking feature in the vista, stands the ancient parish church of St Saviour. It is in the very heart of the town, with very old houses closely encircling its ancient walls. Those brave men of Dartmouth in the

fourteenth century, when they built and adorned their dwellings, did not forget to lav out their wealth upon the House of God in their midst. For this old church, although not approaching the singular beauty of the Totnes edifice, is a magnificent example of Decorated period, although traces of earlier styles remain. There is a most quaint old doorway covered with beaten ironwork, bearing the arms of the town wrought into a strange device which bears date 1634; but the tower and the body of the church are of a very much older period. There is a list of incumbents hanging in a sidechapel which begins in 1272, and possibly this building, ancient as it is, was erected upon still older foundations. There is a noble old Rood-screen of carved wood, most beautiful in its details, and a stone pulpit to correspond, the gift of Charles II., the decorations of which are an exact copy of the very much older woodwork of the screen. Both are beautifully gilt and coloured, but the beauty of the church is sadly marred by the deep, overhanging galleries which, even when the church was restored in 1887-88, were not cleared away. The lovely form of the arches is quite lost in these unsightly additions. It is impossible to discover the real meaning of the architects who fashioned the building in the thirteenth century and adorned it at later dates. The beautiful screen is smothered with galleries as they push forward upon it, and the vista, looking up the church, quite lost in a confusion of shadows never dreamt of by the men who built and adorned this stately house of prayer. One turns away with a feeling of disappointment. In one of the side-galleries, hung upon the wall of the staircase, is a huge picture by a local artist who followed hard on the footsteps of George III.'s favourite painter, Benjamin West. It is a life-size representation of 'The Raising of the Widow's Son,' and is chiefly remarkable for the extreme beauty of the frame, which is of carved oak, done in a design of vine-leaves and fruit—a real work of genius if you like.

But back into the streets once more, and away to the harbour-mouth there is the old church St Petrox, which is only open for public worship in summer; and above this ancient chapel stands Dartmouth Castle, built at the same time as the corresponding tower at Kingswear, and under the same agreement with King Edward III. Here the great boom which was to exclude all unwelcome strangers swung across the harbour-mouth to the opposite point, and here are a few guns pointing seaward; but one may smile now at the feeble defences which kept our foes at bay in departed days. To these remains of an old order vanished for ever is allotted

the duty of saluting any representative of the mighty upon earth who may happen to pass by upon the great highway of the world. St Petrox contains a fine brass, spared by the rude soldiers of the Commonwealth, in memory of one of the leading merchants of the town who died in 1609—so long ago, and still remembered. The view looking up the river from the church is one of exceeding beauty. The hills, being wooded to the water's edge, are mirrored back in doubled beauty. White-winged boats flit to and fro; sometimes a stately ship comes sailing by, or a great warship forges her majestic way up to the harbourage, which, three hundred years ago, was said to be 'of the depth of five yards and more at lowest water.'

Dartmouth is a restful place. There is something in the atmosphere of South Devon which tends to respose. You drift on the shores of Lotus-land. No one is in a hurry. Life runs upon well-oiled wheels. True, there are great industries going on. Boats are being built somewhere close at hand, but you do not see any sign of active life. In the streets handsome young Devonians, with somewhat dreamy eyes in their comely heads, lounge gracefully about their daily avocations as if there were not the least hurry in the days. Time enough to do all that life demands of us. The boats slip lazily through the deep blue waters. In the streets good folks stand and indulge in a quiet gossip. It is all easy-going, all permeated with a certain sense of taking life in its simplest mood; and yet we know well what tempests have overswept this quiet harbour, and what wild work has been done amongst these encircling hills. Fortunes have been made and lost here. Men have lived, and toiled, and suffered. There was a bad business in the days of Edward VI., when the great reactionary movement took place against Somerset's high-handed injustice; and here the armies of Prince Maurice and those of the Commonwealth made fierce play, doing deathly work under the hills-but all that is of the past. Now the vivid life of the place goes on in the great new college on the slope amongst the woods, and in the town men take the burden of the days peacefully; while all round the noble old town and the beautiful harbour the hills are springing green, and little touches of spring awaken daily, birds sing in the orchards, and lambs frisk upon the hills. It is England in her most placid mood; England watching by untroubled waters; England, the home of settled peace, although life calls us away to more strenuous scenes and less peaceful, dreamy days. Farewell, fair town by the lovely river-mouth! Your fighting days are over, and your rest is

CONVENIENCE. A MARRIAGE OF

CHAPTER VIIL

T was the day before Beatrix van Zyll's wedding to Hartley Gordon, Earl of Tallantyre. Her father's unbounded joy over the whole proceeding jarred upon her inexpressibly; at times she felt that she could not do the thing

which she had covenanted to do on the morrow. Then the memory of Hartley's unvarying kindness came back to her, his thoughtful consideration for her comfort, his chivalrous care for her. She could not be the means of bringing disaster upon him. All she could do was to marry him. At any rate, she knew, he would be good to her. She sat again in the over-elaborate drawing-room, that apartment of velvet and gilding, waiting for dinner to be announced—the last dinner she would eat in that

Suddenly the butler, velvet-footed, suave as ever, appeared. 'Lord Tallantyre wishes to see you, miss, if you can spare him a moment, he said, Tallantyre himself at his heels.

'Forgive me,' said the young man, coming forward. 'Your servant made a mistake; it was really your father I wished to see upon a little matter of business connected with to-morrow. Do you think he will see me?'

'Yes, I am sure he will,' returned the girl listlessly. 'He is in his business-room with his secretary, I believe. Come with me. I will show you the way.'

She got up from her chair as she spoke. Tallantyre noticed how white she looked, how her energy seemed to have vanished during these days of waiting, since her return from Tallantyre.

'By the way,' he said, pulling the pink sheet of a Globe from his pocket, 'do you remember Crone? There has been a big fight out at the front. Crone's name is mentioned. Saved a gun or something, and got a bit wounded in the process.'

Beatrix suddenly felt the great room swing round; she dropped into a chair at hand, the sound as of many waters drumming in her ears. But her affianced husband had seen her face; he knew of a sudden why she was so white and tired, why her interest in life had waned. He knew by a sudden flash of intuition that her heart was not his, that it had gone out to the veldt with Rothery Crone. He slopped his handkerchief with water from a vase and dabbed her gray face with it, greatly relieved as she opened her eyes and looked up at him with a wry smile.

'All right, Hartley,' she said. 'The room was hot, that was all. Did you say Mr Crone was badly hurt?'

'No, no,' he cried; 'not serious at all, I believe. I expect he will get a commission, though. They'll have to give it him. But, Beatrix'-

She cut him short.

'I forgot,' she said, rising unsteadily to her feet. 'You wanted to see father. Come along. There will be time before dinner.'

Hartley, confused and stunned with sudden and violent emotion, followed her. He could not clear his wits sufficiently to decide on what his course of action should be, and he was still in a condition of mental fog when they reached the great library, with an adjoining strong-room where Israel van Zyll kept most of his important papers.

The revolving-chair in front of the substantial writing-table, with its litter of papers, was empty, as was also the rest of the room. Beyond a glass door opening out of another side of the room came the busy scraping of a pen and the cough of a quickly writing secretary.

Beatrix opened the glass door, and the secretary

looked up interrogatively. 'Where is Mr Van Zyll?' she asked him.

The young man looked puzzled.

'Isn't he there?' he asked, getting up hastily, and looking beyond the other two into the library. 'He was going into the strong-room when last I saw him, to look over some papers he said he would require to-morrow. Why, Miss Van Zyll, he has left the key in the lock!'

They all three went hurriedly to where, in a kind of recess, a great steel door, fastened with a patent lock, formed the only entrance to the fireproof, burglar-proof, water-proof strong-room where the records of the doings of Israel van Zyll were kept. A sudden dew started to the forehead of the secretary, and he laid a shaking hand on Tallantyre's

'The door must have slammed,' he whispered, trying to control his trembling voice so that Beatrix should not hear. 'He was messing about with those papers a good hour ago, and the air in there could not last him more than half-anhour at most. I was too busy to notice.' His voice trailed away into sick silence.

Beatrix put her hand on the key. 'I know how to unlock the door,' she said quietly and steadily. 'It relocks automatically with the shutting of the door.'

She turned the key, then took hold of the handle, turned it, and swung open the heavy door, which moved noiselessly back on its well-oiled hinges, disclosing a deep recess, behind which were cupboards and deed-boxes. A flutter of papers near a dark heap on the floor showed that one of these was open.

'Get a lamp,' whispered Beatrix quickly.

Both men made a rush to the secretary's tiny room, where a lamp burned. They had forgotten the electric hand-lamp in the library.

Beatrix bent hastily over the dark heap by the papers, then hurriedly seized the latter, pushing them out of sight in the bosom of her dress. Instinct told her what they were. In dull wonder she watched the two men return, each with a lamp; she watched them bend over the collapsed heap of blue-faced clay that two hours ago had been Israel van Zyll.

'Will you fetch a doctor?' she said to Tallantyre, though all three knew that the whole combined Colleges of Physicians and Surgeons could not bring back the breath which had so lately left the financier's lungs.

Presently, in her own room, Beatrix hastily read and tore up deed after deed, burning them carefully after she had done so.

'That sets us both free,' she muttered as the last fragment fluttered into gray ash. 'They are mine now, and it was only just'——

Then she fainted quietly away on the hearthrug, where her maid found her a few minutes later.

CHAPTER IX.

HE day after the funeral of the financier, Tallantyre stood again in the gorgeous drawing-room, waiting nervously for the

girl to whom his troth was plighted, who but for the tragedy of the strong-room would ere this have been his wife.

Presently two heavy velvet curtains parted silently and she came to greet him, a frail, delicate creature, in her rich mourning, her face white and tired, the big eyes bigger even than usual.

He took the little white hands in his and led her to one of the uncomfortable, brocade-cushioned

'Beatrix,' he said slowly, looking down the while into the steady, deep eyes so trustingly lifted up to his gray ones, 'we are friends, are we not—real, true friends?'

'Yes,' she answered, wondering greatly. 'What is it, Hartley?'

'It is this,' he went on, still in the deliberate manner of a man who has made up his mind to do a disagreeable thing. 'Beatrix, I have treated you vilely. I undertook to marry you at first to save Tallantyre—your father got possession of all the mortgages. Then gradually I came to care for you for yourself. I loved you for your gentle self. We should have been good friends, I think, had we married. But now I know that you do not love me, though I know you care for me as a friend, dear. There is some one else, is there not?'

A hot flood of colour rushed into the pale cheeks. She bowed her head in mute assent.

'Now, what I want you to do is this,' continued the young man. 'I want you to set me free that I may go out to South Africa and fetch Crone back. I don't think he will come for writing; but he will if I explain.'

A mischievous gleam came into the girl's eyes.

'And what about Tallantyre?' she asked. 'I am
my father's sole heiress, you know.'

'Tallantyre must chance it,' he returned steadily.
'Even Tallantyre shall stand no longer between me and the thing that is right and just.'

'Well done,' said the girl. 'I am proud of my friend. Now, Hartley, those mortgages are burnt. They were in the deed-box when—when my father was found'—she shuddered—'and I took them when you went for the lamp, and burned them, that there might be no more evil wrought through them. Now, go as soon as you can, and find Rothery Crone for me.' She coloured hotly again, but her head was up now, and her eyes were shining.

Hartley shook her hand gratefully.

'I will go by the *Union Custle* on Saturday,' he said. 'But what will you do with yourself all the lonely weeks till we get back?'

'Cicely Grant will be my companion, I hope,' returned Beatrix, smiling at a sudden deepening of the colour in the Earl's tanned face. 'She'll want a new situation when Rothery gets back, you know,' she added inconsequently.

'Do you think,' said Tallantyre as he stood with one strong hand on the door-handle, 'that she would take one—for life—with me if I asked her nicely?'

'If I were you,' said Beatrix as he opened the door, 'I should come here to dinner to-morrow night and see. She comes down to me by a train reaching Euston at 7.11 P.M. Will you meet her for me and bring her here?'

'I will,' said Tallantyre; 'and God bless you, Beatrix!'

Then he went out.

CHAPTER X.

SMALL crowd gathered on the Ocean Quay of Southampton docks some three months after the day that Tallantyre asked Beatrix to release him from his promise of mar-

riage. They were waiting for the inward bound Union Castle Liner which was returning from South Africa with a large consignment of troops from the front.

Amongst those who eagerly awaited the great ship's arrival—she was already signalled from Hurst Castle—were three ladies: one elderly, white-haired, gracious, and stately; and two younger ones—in a word, Lady Tallantyre, Cicely, and Beatrix van Zyll.

'Yonder's the ship, lady,' said one of the kindly dock-police on duty. 'She is just off Netley now.'

Nearer she crept—the great, gray-hulled, redfunnelled monster of the deep—rigging, taffrails, davits swarming with hoarsely cheering figures in khaki. As she crept silently alongside the quay, with the lines of sheds where trains waited, the crowd pressed forward to scan the sea of faces high above them, waiting impatiently for the gangways to be run out.

'Look! there they are,' cried Cicely. 'There! amongst that group of officers. Oh, good gracious,

Rothery has only one arm !'

It was true. As Rothery wrenched his widebrimmed yeomanry hat off his head to wave in response to their shouts of welcome, all saw that his right sleeve was pinned—empty—to his breast.

Beatrix's face whitened for a moment; then the joy of meeting swept away all else. They were

together; nothing else mattered.

As the train crawled through the endless tracts

and wagon-ways of the docks, Cicely's hand crept into Tallantyre's.

'Isn't it jolly?' she said. 'Hartley, Beatrix, Rothery, let us all be married on the same day! I don't know about going to the same place for our honeymoons'——

'Of course,' chorused the others.

'We started our friendship all wrong,' chimed in Hartley, 'all askew, owing to my false move in the way of a marriage of convenience. Now we are going to put it on a real sound footing, with two marriages for love.'

'Amen!' said Lady Tallantyre; 'for, after all, it is love that makes the world go round, even if

money greases the wheels.'

THE END.

AGITATED INDIA.

By George L. Jennings.

is a coincidence that the fiftieth anniversary of the Indian Mutiny saw a state of startling unrest in the Punjab and Eastern Bengal, but it is nothing more. The history of the

Mutiny is an open book to all, but the cause of this threatening flare in the great Eastern Empire is a matter which requires for its elucidation close investigation on the scene of the occurrence.

The average Englishman is careless and beautifully ignorant concerning India—pulsating, perspiring India. He knows the country as a geographical asset, but he realises nothing of the inward struggles of the three hundred millionsthey are as abstruse to him as the L.C.C. elections are to a Calcutta parawalla, who is the red-turbaned, flat-footed, somnolent constable of the capital.

The English newspapers tell shortly of faction fights between Moslems and Hindus in East Bengal, of dacoities, of the desecration of goddesses, of outrage on Hindu women, and mention Swaraj and Swadeshi. There is a hint in cables of sedition, the conviction of the editor of a paper called the Punjabee for publishing seditious articles, the mad rush of a horde of firebands through garrisoned Rawal Pindi, and the culmination of the unrest in the deportation to Burma of a pleader (the Indian equivalent of solicitor) who had publicly advocated agitation and fearlessly preached sedition. But the origin of the disturbances and their exact meaning are left very much of a riddle.

Lord Curzon saw that it would be in the interests of adminstration if the great province of Bengal were reduced by the clipping of the eastern divisions, which were added to Assam, and the new province of Eastern Bengal and Assam was thus constituted. The Bengalis at once raised a great screech of dismay—Government was favouring the Mohammedans, was filching the chances of the babus

of obtaining Government billets, was severing the associations of a people, was destroying a condition of affairs which had answered well so far as the Hindus were concerned. But Curzon had ever the greater good before him, and where effective administration was in question, the foibles of the flabby, effeminate, crafty, and self-seeking section of the inhabitants of Bengal sank into nothingness in the estimation of that Viceroy whose motto was 'Strong personal government.'

On 16th October 1905 the partition became a fact. Curzon is gone, but the agitation started by his policy has never ceased. The Indian Congress that is not representative of the mass of the population, but only of a minority, has passed resolutions pledging the members to endeavour to undo the partition, and advocating ceaseless agitation. The spirit of antagonism to government of one section of Congress produced a split and gave birth to the Moderates and Extremists. The Extremists demand self-government; the Moderates ask for a share in the rule of the land. The Extremists carry on a vigorous campaign to suppress British goods, and incite young bloods to form themselves into volunteers ready to sacrifice themselves in the cause of the country. The section of the Hindu and vernacular press that has been won over by the Extremists has energetically preached sedition. Here is a sample translated from a paper called The Jugantar:

'The English are not tigers but demons. If a thousand tigers were let loose in Jamalpore, such a demoniacal affair would not have occurred. Come, ye English! declare war against the Bande Mataram mantra with your guns and cannons. Then we shall call you British tiger! Come, let us die fighting with you in open battle and go to the tetrual heaven. For once put your puppet Mussulmans behind and advance. You will see that thousands of hearts will become mad to die, uttering

Bande Mataram. It is useless telling you more. Brother Hindu! What more do you want? Will you yet trust the English? Will you still send your boys to school with first and second readers in hand, instead of preparing them for the future Kurukhetra (war)? Wealthy Indians! Will you still hoard your money for the English to loot in future? Men are being prepared in the country, but where is money? Who are the Mussulmans? Teach the English a good lesson somewhere to-day. To-morrow you will see that the Mussulman goondas are running with you, shouting "Alla-ho-Akbar." Not the Mohammedans but the English are responsible for the humiliation, oppression, &c. of the Hindus. We shall have to wreak vengeance for these not on Mussulmans but on the English. Ye mother's children! be equipped. Go to every village and initiate the Indians for death.'

Government has regarded this press defiance with a coolness that may appear folly to the man in the street, but it is the only way to avoid creating martyrs. How scant and limited education is may be illustrated by the circumstance that the masses of the people swallow as truth the lies of the native press, and believe that the British are as impotent as they are said to be by the ink-splashers of the

gutter press.

In East Bengal the babus go about stating that Surendra Nath Banerjee, the uncrowned 'king' of Bengal, the dismissed government official who has been in jail, is to be Raja, and these men, with something of the madness of Solomon Eagles, proclaim the nearness of a republic in Bengal. European officials are insulted in the mofussil districts; men spit as they pass, and sling lewd remarks after them. Ladies, even in Calcutta, are insulted. Up-country, near Mymensingh, a European traveller for a large Calcutta firm, while touring in a motor-car, was stoned, and he had to abandon his 'round' as his life was imperilled by these attacks.

The leaders of the campaign of agitation and boycott of British goods have called on every Bengali father to place one son from birth at the service of his country as a volunteer. The 'National Volunteers' may be seen in the districts of Mymensingh, Dacca, and Barisal, where bad blood

between Mohammedans and Hindus has been marked by open ruptures, practising lathe drill and sword exercise, and not a few have cheap revolvers and pistols.

The loyalty of the Mohammedans has undoubtedly been the steadying factor in the days of riot and rumoured rising, and yet it is the Mohammedans who chiefly are affected by the boycott, as it is they who deal in the detested belati (English) goods. In northern India the Sikhs have remained cool and displayed no sign of disaffection, and in Eastern Bengal the Mohammedans have followed the advice of such leaders as the Nawab of Dacca, who is a prominent member of the Viceroy's Council, and refrained from avenging their undoubted wrongs on the oppressive and maddening Hindus.

The deportation of Lala Lajput Rai, and the ordinance suppressing public meetings likely to create breaches of the peace, had a magical effect on the Hindus—agitators ran to their burrows, and editors of seditionary rags went to sleep wolves and

awoke lambs.

The voice that commanded deportation was the voice of Morley, but the hand was the hand of Sir Denzil Ibbetson, and the strong man who suddenly arose to put the ordinance into operation was Lord Minto, who by his sudden display of strength astonished India. But the man who foresaw the trouble in Eastern Bengal, and who wished to check it eighteen months ago, was Sir Bamfylde Fuller. Government recklessly kicked away one of its strongest pillars when his resignation was accepted. East Bengal requires a strong Lieutenant-Governor, and meanwhile this explosive province, more especially in the district around Shillong, remains seething with discontent.

But Government has learnt a lesson. It has experienced a rough and rude shock, which has aroused not only official India but the world to the fact that, while Kitchener of Khartoum has assured us that India is safe from invasion from outside, it contains a cyst of revolt in its heart which some day will burst in a torrent of bloody horror unless removed by strong and fearless rule, marked at the same time by a wide awake justice and the maintenance of a careful equity between the dominant races.

DIPLOMATIST AND MAN OF LETTERS.

HE late Canon Ainger has related how, in one of his earliest interviews with Alexander Macmillan, the great publisher repeated from memory the stanzas by Tennyson addressed to Bulwer Lytton, which had appeared

in Punch over the signature 'Alcibiades.' The poem was provoked by the fact of the novelist having attacked the poet in his New Timon, on hearing that he had been placed on the pension-list. The

novelist was distinctly ungenerous towards 'Schoolmiss Alfred.' Tennyson in his reply hit hard, and referred to Lytton as the 'padded man that wears the stays,' and asked:

What profits now to understand The merits of a spotless shirt, A dapper boot, a little hand, If half the little soul is dirt?

The verses, with other dropped pieces, are included in some of the American editions of Tennyson, but in none of the authorised editions on this side. Bulwer Lytton obliterated the offending lines from later editions of his satire, while Tennyson regretted his reply, and afterwards dedicated his Harold to the son of the man with whom he had this literary quarrel. In doing so he acknowledged some debt to Bulwer's Harold: 'Your father dedicated his Harold to my father's brother; allow me to dedicate my Harold to yourself.' This son, a future Viceroy of India, was responsible for his father's biography. It may be matter of regret that The Life, Letters, and Literary Remains of Edward Bulwer, Lord Lytton, only cover the period from 1803 to 1832, and break off before the family catastrophe. This was the legal separation of Lord Lytton from his wife, Rosina Doyle Wheeler, in 1836, owing to incompatibility of temper. In the Life of Rosina, Lady Lytton, which was suppressed shortly after publication, there is a bitter attack made on her husband, who had allowed her four hundred pounds a year after the separation. She was an Irish lady of remarkable beauty, clever, accomplished, passionate, and apparently with little of true maternal instinct. The faults were not all upon one side, for the husband was sensitive and irritable at the best, in his early married life continually writing or meditating in preparation for it, and was often 'like a man flayed and sore all over.' Sir Leslie Stephen counts him among the eminent authors who have not made, and have not deserved, success in married life. Lady Lytton retaliated in various petty ways: by letters, threatened legal proceedings, and by putting in an appearance at political gatherings where Lord Lytton might be speaking. She satirised him and all his set in a novel, published in 1839, which sold an edition in one week. Lady Lytton died

How the only son, Robert, first Earl of Lytton, regarded the matter may be seen from the following extract from his will: 'Whereas there now exists in the hands of persons unrestrained by any sense of honour or decency certain letters which I believe to be garbled, and certain written statements which I know to be wicked and cruel falsehoods relative to the domestic life of my father and mother; and whereas also there is no misstatement however impudent, and no imputation however baseless, which biographers are incapable of adopting, in their pursuit of sensational novelties about the private lives of eminent persons; therefore, it is my wish and request that immediately after my death all letters and papers bequeathed to me by my father should be collected by my wife, and placed by her under lock and seal in a box or boxes, unless this has previously been done by me.' The box or boxes are to be kept in the muniment-room at Knebworth, and transmitted to the testator's eldest son, or whosoever may succeed him as Earl of Lytton. 'And I do furthermore earnestly request my said eldest son, or whoever else may succeed as Earl of Lytton, to bequeath the said papers on the same conditions and with the

same request to his or her successor, in order that the heirs and representatives of the name rendered illustrious by my dear and honoured father may at no future time be without the means of refuting, if necessary, the calumnies originated by Rosina Lady Lytton. For which reason, and with which object, I do hereby exhort my said wife and my executors not to destroy, or permit to be destroyed, the above-mentioned letters and papers, which contain the complete refutation of the said calumnies. We need hardly wonder, as his daughter tells us, that the Earl of Lytton's heart failed him and his pen flagged at less than mid-career of his father's life, when he read the old letters and recalled the unhappy period through which his sister and himself had passed.

Lord Lytton, as is well known, was brilliantly successful as a novelist. No author, it has been said, displayed more industry, energy, or versatility, with less disposition to lapse into slovenliness. Some sixty separate volumes stand to his credit. In 1853 Messrs Routledge engaged to pay him twenty thousand pounds for the ten years' copyright of a cheap edition of his novels; at the end of that time five thousand pounds were paid for another period, while a contract was made again for a third period. His novels are still widely read in the many editions made possible by lapse of copyright.

We have no intention of raking up the embers of now-forgotten public or private quarrels. But these things affected the early life especially of son and daughter, and are recalled by the publication of Personal and Literary Letters of Robert, First Earl of Lytton (two vols., Longmans), edited by his daughter, Lady Betty Balfour, wife of the Right Hon. Gerald Balfour, brother of the ex-Prime Minister. When Viceroy of India, Lytton's diplomatic papers were the admiration of the India Office. It was said at an earlier period that in his despatches he was an artist, and that all the others were journeymen. The letters in these volumes are written with grace and literary charm. The work is one to be thankful for, while the editing and execution generally are all that can be desired. As diplomatist, poet, and thinker he possessed a singularly engaging and cultivated personality, endued with a profound insight into books, cities, and men, and was richly dowered with a genius for friendship. The highest divine fire may have been absent from his poetry; the divine fire of love was at least not absent from his life. His letters read like finished essays, and reflect the wonderful variety and interest of a life which moved from one important post to another in the diplomatic service.

The clouds were already gathering in the demestic sky when Robert Lytton was born in Hertford Street, London, November 8, 1831. Rosina Wheeler seems to have had little family affection towards the son and daughter born to her, while the nervous irritability of her husband vented itself at every unwelcome circumstance in complaints, taunts, and fits of anger. The home at Acton, near Ealing, was

broken up. After the separation the boy and girl found a second mother and careful guardian in Miss Greene, a friend of their mother, an Irish lady. She tended Emily until her death at the age of twenty, and the youth until the end of his schooldays. At Twickenham, Brighton, and Harrow (where he was for three years), Robert Lytton seems to have gained little schooling; at Bonn, under an English tutor, he applied his mind specially to the study of modern languages. He cared little for outdoor sports, had an insatiable appetite for reading, and wrote verse at twelve. Until the eighteenth year of his age he signed himself Edward Bulwer Lytton; but on representation from his father that it was awkward that he should have a signature similar to his own, he began to use his second name, Robert, and stuck to it through life. This to him, he confided to a friend, was a vile name: 'The only people I recollect of the name of Robert are Robert Peel (traitor), Robert Walpole (horrid old fox), Robert the Devil-I dare say the greatest gentleman of the three.'

In 1850 an offer from his uncle, Sir Henry Bulwer (afterwards Lord Dalling), to join him at Washington as unpaid attaché, was a start in the diplomatic service. When his uncle moved to Florence, amongst the good things which came to Lytton in Italy was the friendship of Robert and Elizabeth Barrett Browning. The latter wrote to a friend: 'I like him, we both do, from the bottom of our hearts.' Lytton said of Mrs Browning, when she was carried from Casa Guidi to be laid in the beautiful Protestant cemetery in Florence: 'A lovelier life never went back to God.' As one of her critics has expressed it, her noblest poem was what she made of Robert Browning's life. Lytton thought that Robert Browning in his Mon and Women had established his loftiest title to immortality, and that all his best and greatest work, some of which he considered very great indeed, was written during his married life in Italy, work which 'our sagacious literary press never deigned to notice except with an occasional sneer.' Lytton's youthful ardour for Browning had somewhat cooled by the time The Ring and the Book appeared, and this he could not read. Mrs Browning was a shrewd and faithful critic of his own poetry, which he was now writing and publishing. She urged him to more individuality, and to a more abounding life of his own, so that in reading his work one would not be reminded so much of this or that poet. She added: 'When you are so certainly and thoroughly a poet yourself, you don't imitate them. Why should you not be original?' His father gave him then and afterwards the best of advice also regarding his work and regarding the strong literary leanings which prompted him to throw up official life altogether, and left him rather impecunious. Robert Lytton when in Florence was not tall, but about five feet ten inches in height, slight and fraillooking in appearance, with intensely blue eyes, no beard, and hair dark and curly. In general society he was shy and silent. By 1858 he became entitled to his first official salary of two hundred and fifty pounds a year. About this time he passed five months of strain and unhappiness in the society of his mother, with whom he went to the Continent in order to prevent the public scandal of a trial in connection with the measures that were threatened in order to put her under restraint. She tried in vain to shake his loyalty to his father. The son left his mother at Luchon, and only saw her once again in Paris; and, being out of funds, worked his way back as a travelling artist.

The landmarks in what was on the whole a happy and successful career were the writing and publication of his various volumes of poetry, the editing and publication of his father's speeches and memoir up to 1832, and the moving from place to place for official duty. He was in succession at Paris, the Hagne, at Vienna (where he was appointed second secretary), at Copenhagen (where he was first secretary of Legation), and at Athens. Then followed his happy marriage to Miss Edith Villiers, niece of the fourth Earl of Clarendon, whose presence was to him as a 'bath of sunshine.' This was followed by periods of service at Lisbon, Madrid, and again at Vienna. He acted as secretary to the Embassy at Paris, and went to Lisbon as Minister. The great opportunity of his life came in 1875, when Mr Disraeli offered him the Governor-Generalship of India, a position which he accepted after some hesitation as to his fitness for the great task. While he was Viceroy, Queen Victoria was proclaimed Empress of India, and a famine commission made rules and regulations for times of dearth. Measures of a more liberal nature were taken in regard to the employment of natives in the Civil Service. There was the abolition of inland customs, repeal of duties on cotton goods, while railways and irrigation works were encouraged. There were difficulties with Afghanistan, a campaign in which Shere Ali was overthrown and Yakoub, his son, placed on the throne; and the Treaty of Gandamak (1879) gave India a 'scientific frontier' and a British residency at Kabul. This was followed by the massacre of the British envoy and his suite, and the march to Kabul of General Roberts, and a change of ruler. The expenses of the Afghan war (which by a financial blunder were underestimated) and the frontier railway afforded ground for political attack, and Lytton's lack of discretion in small matters of convention gave rise to unfavourable verdicts on his policy, which in the light of later events seem to have received some justification. On his return Lytton made a notable speech in the House of Lords on India, about which Disraeli said, 'You have made a great effect without one injudicious word.' After hearing Lytton address a large gathering in Manchester on India an old gentleman said, 'That image of yours about the Shunamite was the finest burst of pure eloquence that has been heard on any public platform since the days of Grattan.' Here is the passage:

'It is British rule alone that now keeps the peace from end to end of India. It is British rule alone that allows and enables every native of India to follow his own calling, profess his own creed, and eat the fruits of his own industry undisturbed by his neighbours. The renovating presence of the British power is now spread out over India like the living body of the Hebrew prophet over the dead child of the Shunamite. And everywhere beneath its animating touch the inertness of death is gathering life and warmth and motion. But do not forget that when the prophet performed his healing work he did not argue about his right to do it, or his right to be obeyed by those benefiting. He closed the door behind him, and suffered no intrusion on his own beneficial authority.'

In writing to Mr John Morley, with whom he parted company, he expressed the thought that the outlook for the Empire was grave mainly 'because the government and the very maintenance of India depend ultimately on the will of a people from whose political life the sentiment and instinct of Empire seems to be dying out.' From no other point of view did he regard the government of India with apprehension. He was created Earl of Lytton in 1880, and in 1887 was elected Lord Rector of Glasgow University, a position to which his father had also been elected.

When Prince of Wales, our King, in a moment of frankness, told him of the Queen's opinion that her three best diplomatists were Odo Russell, Lyons, and himself. He was most graciously received by the late Queen at Windsor on his return from India, and led seven very happy years in the society of his wife and family at Knebworth and elsewhere.

He held the post of ambassador to France, when death suddenly overtook him in Paris in 1891, in his sixtieth year. Altogether he had been twentyseven years in the diplomatic service, and this is part of the inscription which his friend Elwin wrote for his monument in St Paul's, London: 'He was a diplomatist rich in the qualities, official and social, by which amity with foreign nations is maintained; a viceroy independent in his views, resolute in action, looking forward to the future; a poet of many styles, each the expression of his habitual thoughts; a man of superior faculties, highly cultivated by literature, ardent in his affections, tender and gracious in all the circumstances of life, lavish in his commendation of others, and humble in his estimate of himself.'

As ambassador in Paris the Earl of Lytton was quite in his element and extremely popular. He remarked, 'I devoted my life to India, and everybody abused me; I come here, do nothing, and am praised to the skies.' Part of the secret was that he was always glad to afford pleasure, and showed perfect courtesy to every one, with a mastery of French language, literature, and art. Nothing seemed to come amiss to him: a sitting at the Academy, a sensational murder trial, a private view of pictures, or an interview with the Minister of Foreign Affairs.

One who knew him said few touched life at so many points, enjoyed such a variety of interesting experiences, or so perfectly fascinated their intimates. He all along had an intense desire to distinguish himself in literature, and did his best by amending and polishing his poems, of which Fables in Song and King Poppy are most representative. These are characterised by brilliancy of idea, phrase, and description.

The best tribute to him has come from the present Earl, Victor Alexander George Robert Lytton, born at Simla in 1876. In a speech to the Parents' National Educational Union, delivered since the Letters were published, he said: 'At an early age I lost my father, and was thus deprived of an intellectual stimulus and companionship which would have been a priceless possession in the days of awakening manhood; but even he lived long enough to teach me a lesson which I shall never forget-namely, that the best education which a father can give to his children is to be found in the pattern of his own life. Though I was only fifteen when he died, I had already received impressions which will remain with me always. He had taught me, perhaps unconsciously to himself, to regard his approval as my highest aim in life. He had given me an ideal which death could not take away. If in the years to come it may ever be vouchsafed to me to do any service or to achieve any success, it will be due solely to the fact that I have known what I would that every child could know to the same degree-the value of a father's example and a mother's love.'

COMPENSATION.

Now, this is a song that has never before Been sung by the lips of a mortal alive, Of that dear, dreamy hour which is something past four, But not nearly five.

Oh, fleeting the joys of this workaday sphere, Where trouble and turmoil go wandering free; But an interval comes in our daily career For afternoon tea.

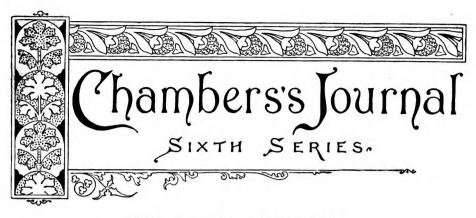

How restful and soothing the firelight's soft glow, The curtains how cosily crimson in hue! A chair with a cushion—there, let yourself go, And-one lump or two?

I want not the suffrage at moments like this, My country need fear no disturbance from me; Let man do the voting; he knows not the bliss Of afternoon tea.

With toes on the fen ar, life's worries remote, We'll chat on the topics attracting us most; No doubt, dearest Jake, there's some joy in a vote; But take some more toast.

And, spite of the drawbacks that Fate has in store, I'm glad I'm a woman, and glad I'm alive At the mystical hour that is rather past four, But not nearly five.

R. E. OHLSON.

THE HEART OF THINGS.

By HENRY LEACH.

London, August 20, 1907.

DNDON is passing through its dead season now, and only those who are called upon to live the greater part of the year in the Metropolis, and then find themselves, from one cause or another, compelled to endure it

during the holiday month of August also, can quite understand what a lonely misery it can be then. Friends have all gone, some of them to the seaside, others to the Alps of Switzerland, more to the golflinks or the moors or the rivers of Scotland; but .'ll, all are gone somewhere, for there is no determination like that of the Londoner to see as little as he can of London in this holiday month. So the streets are all 'up,' some of the clubs are closed, and are, in a way of speaking, living with other clubs, and those that are not closed have some of their rooms dismantled and are on reduced staff; the theatres are for the most part shut also; in fact, there is a feeling as of desertion everywhere, and the town seems to mock the man who lingers, and to groan at him, 'Oh, go away! go away!' Yet this is the time for the strangers, and they come up in abundance from the country and the Continent, while the Americans are in force again, having finished their travels, and being in the way of preparation for their voyage home. So it comes to pass in these dull days that the sights of London have as busy a time as they ever do, and you may often encounter a keeper or an attendant in August who will complain much of the manner in which he is overworked. And this reminds one that now and then a happy whim seizes some old Londoner that he too will make a holiday in London; and, perhaps for the first time in his life, he will go to see the great sights, to gaze upon the ancient places in the City and at Westminster, and to study their story and their meaning with a guide-book; that he will explore the halls that contain the rich art and other treasures of the nation; that he will wander through the great parks and see what beauties they contain; that he will plunge into the No. 509. -Vol. X.

depths of the East End and solve some of the mysteries that have baffled him; that he will go through to the docks and see the shipping; that in turn he will examine some of the new wonders of comfort and convenience such as have been promoted by the County Council; and that, when tired of all this sight-seeing, he will seek a little rest and relaxation in a trip by steamer down the river, and through the busy pool and under all the bridges, to Greenwich. I have known men who have lived in London for fifty years, and have then made a holiday like this, and they have pronounced the judgment that it was the richest holiday of their lives. For it is the simple truth that there is nobody so ignorant of London as the Londoner, and the old Londoner. It is true that he loves it and appreciates it, and he has a sense of its greatness and its complexity as no other man has. In the bulk, indeed, he knows it; but it is as if his mind, widened beyond that of many provincials, will not allow itself to be troubled with detail, and so, too much, detail is neglected. And then, again, he has so much to do that he puts off to some other day the seeing of some of those glories of the capital which he may sometimes reproach himself for not having seen so far. It must be the fact that there are hundreds of French, hundreds of Germans, and many thousands of country Britishers who have seen far more of the good sights of London than the average-yes, the average-Londoner. strangers who come to town see everything. have met some of them in the evening when in that one day they have explored the Tower of London, the Guildhall, St Paul's Cathedral, Westminster Abbey, and the National Art Gallery, and they have lunched in a historic tavern and learned of the famous men who fed there when George the Third was king. Now, what a very few in proportion of the whole population of London have done these things in the whole of their lives! I dare say that not one Londoner in fifty has been inside the Tower for five minutes, and the same may be said of the Abbey and the Art Gallery. AUGUST 31, 1907. [All Rights Reserved.]

They all mean to do so some day, but not now; they have too much to do. And, alas! they have always too much to do. So their ignorance of London is as vast as London itself; and I know a man who has written fine and realistic stories of the life of London, stories that thrill and are perfect in their description of London life; a man who has travelled much, and can tell you all about the fine pictures and the curious carvings in the Cathedral at Antwerp, and all that he saw in the Cathedral at Cologne, and of the Roman ruins at Mayence, who yet has not been in the Tower of London, and has not spent five minutes in Westminster Abbey! So it is that our wonders are not without honour save among some of our own citizens, and so also that for those who like the intellectual holiday there is no place like London and no time for it as in August and September.

* * *

Some people might think that when London is thus to an extent 'shut up,' as they say—when the full life of the place is a little stilled, when the light no longer burns on the Clock Tower at Westminster as a sign that a Government is wrestling with its Bills, when the Law Courts are closed, and you see foreigners with Baedekers in their hands gazing in front of Somerset House or straining their sight towards the summit of the Nelson Column-some people might think that despite these foreigners, the Americans, and all the country visitors, this must be rather a bad time for London hotels; and the hotels of London have of late years been increasing so much in number and in size, and there have been such complaints of bad times, that this would be a very reasonable doubt. Now, when all has been said about antiquities and treasures, few things in London interest the average non-Londoner so much as the hotels; and it may stir their curiosity to hear that despite all the bad weather that was endured in advance, these big caravansaries have had quite a good season, and that, as a matter of fact, the dead season is anything but a dead one for them. The truth is that the biggest of them depend far more on foreigners in these days than on Britishers, and that if London were not in a very full sense a cosmopolitan city a large number of them would be obliged to close. It is actually the case that, leaving out of consideration for the moment the large number of Continental visitors, there are three or four big establishments that yearly take in more Americans than they do British. It is established that out of every hundred people who visit a particular one of them in the West End no fewer than thirty-nine are American and only thirty-four are British. Of the others, it is interesting to know that on an average a little more than nine are German, while eight are French. There is no other country that supplies an average of two, the Belgians coming fifth on the list with an average of about one and a half. The Germans are becoming far more frequent visitors to London in these days

than they used to be, and it is a circumstance that is worth bearing in mind in view of the somewhat cool relations that have obtained between the two countries of late years, and the probability of a closer rapprochement happening as a consequence of the forthcoming visit of the Kaiser. Only two years ago, as a close analysis of hotel statistics has shown, there were ten Frenchmen to every five Germans in every hundred guests, and now we have seen that the wanderers from the Fatherland have become the more numerous. If it were not for the Americans in their hundreds and their thousands the hotels would, as one might say, be almost comatose in the holiday season, for it is found that of the full number of British people who patronise them in the course of the year only 31 per cent. are there in the month of August; while in October, when they have all come back from the seaside and the moors, there are nearly 16 per cent. On the other hand, of each hundred Americans who stay in London hotels in the course of a year nearly twenty do so in August, and in October only three. You see how the disposition of international habits and tastes has worked out most beneficially and most wonderfully to the advantage of these hotels. One hears it said often enough that London has much to learn from other great cities in this matter; but it is a point as to whether we are not too pessimistic about our own things. Foreigners are generally delighted with the accommodation that we give them, and they say that nowhere are their own home tastes so well catered for when insisted upon, and that, on the other hand, nowhere do they find it so easy and so pleasant to conform to the tastes of the country. It is a curious fact that there is nothing that our chefs can serve him with that the foreigner likes better than our English mutton. He admits the merit of the roast-beef of Old England; but it is for our mutton that he has the greatest relish, and the Americans, whom some people imagine to go searching for a restaurant where they may get Boston baked beans, or some peculiar dish of that kind, on their arrival in London call instead for an English mutton chop, and so they do on five or six days of the week. Hotel and restaurant keepers will say boldly that his love of that is one of the foremost characteristics of the American when in London.

Still harping on our holidays, one wonders whether it is realised that of all the periods of the year this is the most unprofitable to one of the greatest of our national institutions of convenience, the G.P.O.—that in the nature of things it must be so. London, of course, is the great source of the strength of the Post-Office, as may well be realised when it is said that over two million letters are delivered in the Metropolis every day, the total number delivered during the whole of last year being over seven hundred and fifty millions. Besides these letters, there were one hundred and eighty-three million post-cards, and one hundred and sixty-nine million

halfpenny packets; and the total number of postalpackets of one kind and another delivered in town in this one year was one thousand one hundred and sixty million—unthinkable figures; they are quoted merely to show what scope there is for shrinkage when as much of commercial London as can manage it is basking in the sunshine far away, and inhaling the ozone of the sea instead of the fumes of petrol in the City streets, which never stink so much as they do now. Correspondence slackens, and telegrams of excuse increase. And there is another way in which the Post-Office suffers, for it not only has a little less work to do, that is paid for, but it has to do much more than usual for nothingthat is to say, its kindness in readdressing letters to people who have shut up their homes, and sending them on free of charge according to instructions given, is at this season availed of to the maximum extent. But, again, the general disposition of things in this complex world affords a little crumb of compensation even to the Postmaster-General in the shape of the picture post-card craze, which in August is at its height. One could almost paper the walls of St Martin's-le-Grand with the views of scenes in the four corners of the world that come from them into London every week. It was prophesied when this craze first began that it would speedily die the death that is generally ordained for all such fancies of a people who in the twentieth century have a feverish desire for novelties; but the picture post-card has in some measure redeemed the character of the general public for constancy in its fads. Many years after its establishment, the picture post-card is as popular to-day as it has ever been.

* * *

The silly season discussions were given an excellent start this time with the pregnant question as to whether British athleticism is or is not in a very decadent state, the pessimists being able to give very fine point to their arguments as the result of certain successes which have been won by colonial and foreign players of various games in competition with British opponents, the said games being for the most part of British origin. Those pessimists who profess most anxiety, and who have so many morals to mark, are generally the people who understand less than others about such matters, and who do not see below the surface. For example, no golfer need be told of the absurdity of the idea so emphatically set forth by the pessimists that France is asserting supremacy over Britain at the royal and ancient game just because one French golfer has trained himself so well in Scotland that he has at last been able to win the open championship of the game. In the matter of other sports and games it has to be remembered that for many years past the athletic habit has been spreading all over the world, so that it is no longer exclusively British, as it almost used to be in the days when the battle of Waterloo was won on the playing-fields of Eton. Particularly has the love of field-pastimes developed strongly

in America, in the colonies, and in France; and it would be almost a strange thing if our young men were to continue to hold supremacy over the whole world. They can have no monopoly of bone and muscle and nerve; and, generally speaking, they are severely handicapped both by climate and by the circumstance that in Britain the tendencies of the time demand more strenuous lives than they do in most other parts. The youth of England and Scotland is not so well placed for the cultivation of physique as is that of the colonies. At the same time, there is probably some justification for the suggestion that our young men do themselves great harm in these days by excessive indulgence in the 'deadly cigarette,' and few even of those who rail constantly against this habit have any proper idea of the damage that it does to nerve and physical stamina, for this reason, that those who suffer are slow to confess the fact, and their general helplessness to overcome their weakness, so that they appear to make light of it when the question is raised. Those who speak from the outside do not know the exact way in which the cigarette hits the man who smokes twenty or thirty of them in a day. To consume such a number-and this is quite commonly done-in the ordinary way of smoking would be harmful enough, no doubt; but no man ever smokes so many unless he has fallen a victim to the really deadly habit of inhaling all the smoke. Those who have not so fallen can have no knowledge of the fast grip that the practice secures upon the man. Men have spent half a lifetime in trying to get rid of it, and failed; and I have heard a most famous doctor express the conviction that it was far easier for a drunkard to become an abstainer than for a cigarette-smoker to give up inhaling. In a dry or a bracing climate this habit does not seem to work so much injury upon the man; but Britain is poorly suited to it. Its immediate effect is a remarkable lowering of the vitality and a pronounced unsteadying of the nerve; and it is quite certain that it is the very worst thing possible for the athlete and the player of games, despite the fact that many have risen to greatness while handicapped by it. Upon occasion little crusades against it have been initiated, but they fail because the people who undertake them do not understand their subject properly, and because the sufferers -and they are sufferers in the fullest sense of the term-do not confess. It is only within the last fifteen years that the habit has become at all general in this country, and it is as certain as anything can be that it is having a bad effect on the national physique.

The literary world is looking forward with some keenness to the autumn publishing season, which by all accounts is expected to be brisker than for some time past, and that in spite of the fact that few books of outstanding interest are expected. Apart from fiction, perhaps the chief work to be

published between now and Christmas will be the letters of Queen Victoria, which will appear in two bulky volumes. These letters will almost assuredly shed a considerable light on many of the events of the higher and lower politics during the reign of the late monarch. We shall probably know something more of the circumstances that made Governments and brought about wars, and of others that unmade Governments and averted wars; and we may be led also in reflection to an even fuller appreciation than we at present entertain of the manifold advantages of the perfect tact and diplomacy and of the active and excellent statesmanship of the present ruler. In the matter of fiction, the literary and publishing world has been passing through a very unsettled period. The problem of the cheap reprints has become a very serious one to authors and publishers alike, and there can be little doubt that the tendency at the present time is to make it less and less worth while to produce first-class work, something with an artist's soul in it. However, in literary circles it is counted for a good thing, at any rate, that the half-hearted attempt that was made some time

since to lower the standard price of volumes of new fiction from six shillings to three-and-sixpence has failed. One of the questions of the moment is as to what shall be done with our women novelists, for their excursions into dangerous paths are becoming more frequent and more daring, a new book by one of them, published recently, being of such a kind that the libraries and even some booksellers, so it was said, did not like to display it openly, but only supplied it when asked for by their customers. The result, of course, was that as soon as this became known it was asked for very extensively-chiefly by lady readers. A publisher told me recently that of all the 'dangerous' books that were submitted to him, four-fifths came from lady writers, and that he felt between the devil and the deep sea in regard to them, for there was certainly little literary merit but lots of money in them; yet that, on the other hand, he would be discrediting his house in some measure by issuing such work. There is a feeling abroad that we are within hail of the time when there will be a literary censor, and a strenuous life he will have to lead.

THE ROMANCE OF A FLOATING DOCK.

CHAPTER VI.

HE little Vigilancia was loaded with the commodities required by the inhabitants of the interior. Bags of coarse salt and boxes of Germanmade hardware filled her shallow holds. The captain, steering by a

wheel placed in the bows (there being no possibility of a view ahead from the stern), was walled in by bundles of dried cod-fish piled up to the awning; the engineer, who was also the stoker, was hidden in stacks of firewood; while the two deck-hands had to creep about their duties through narrow alleyways left for them among the cargo, or, like the guard on the German train, pass forward and aft clinging like flies to the gunwale outside. The scanty passenger accommodation was invaded by boxes of yellow soap and wicker-covered carboys of native rum. These last were open because the heat and the motion would have exploded them if stoppered, while a percentage of pilfering en route was a certainty anyway, and calculated in the cost of freight. Both articles proclaimed their identity to every nose. They also left so little room that the three travellers were forced into propinquity if not into intimacy, and, whether in sympathy or not, had no choice but to be in touch.

Don Santiago Velasquez and his daughter Carmen were Sandford's fellow-passengers. A coincidence impossible for the young man to have foreseen had made his flight from temptation a failure. Many a man, finding fortune so bent to checkmate him, would have given up the game, especially when

the battle between prudence and a treacherous inclination was all within, and, besides his own soul, there would be no spectator of his defeat. Why should he not indulge himself in some present joy, and dismiss till another day consideration of the end?

But Sandford had not been accustomed to indulge himself, and holding to an honest resolve was part of his religion. He respected himself too much to yield to a current, however strong, that should carry him against his better judgment. Once he had reasoned a thing out and determined on his course, he would hardly swerve. Anybody can secretly make a good resolution; Sandford could keep one—at least so far as he had hitherto been tried. He wanted to keep his. But when he resolved, it was in ignorance of how far he was to be tried. When Benedick swore he would die a bachelor, he did not know that he would live to be married.

Sandford, conscious of his weakness, and surprised and enraged at it, absorbed in fighting with himself, and struggling to conceal his agitation, showed in his looks no invitation to friendly advance from his companions.

Don Santiago, for his part, was surprised to find the Englishman on the steamer, and could not imagine the object of his journey. But he was too well bred to show or even indulge any curiosity. Seeing Sandford's pale face, averted eyes, and hardset mouth, he easily mistook their cause. He recognised, as he thought, the manners of the

travelling Englishman. 'We have not been introduced,' he said to himself, 'and therefore, if we sat for a month with our knees touching, we must ignore each other's existence.' He grinned behind his big moustache. 'Well, my dear sir, I shall not invade your exclusiveness. I fancy you will have cause to unbend sooner than I shall; and if not, the loss is your own.'

As for his daughter, she understood nothing, nor did she try to guess. She could not have imagined that she should find the stranger in the little steamer with her father and herself. But a girl generally does not expect to foresee, still less to control, events, but only to accept them. She had seen Sandford three times, and each time only for a moment. She had once heard his voice. She had never heard his name. But since that brief magnetic first glance on the plaza at Puerto Nacional he had been so much in her thoughts that, somehow, to find herself near him did not in the least surprise her. It was not till she had had time to think about it that it did not seem the most natural thing in the world.

She sat in silence, her eyes downcast. The throbbing of the little engine, the gurgle of the water so close to her, the gentle, slipping lift and fall of the boat, all lulled her into a kind of trance, in which she felt as if she were being carried along by some overmastering power. She did not know whether or not she was afraid. The impossible had happened, the unplanned, the unforeseen. All her schemes of life had become as cobwebs. Still, she was less scared than allured. She was drifting without her will, yet not reluctantly, towards the unknown, but somehow towards the desired. Slowly she awoke from her half-dream, outwardly rather grave and shrinking, inwardly excited, and yet strangely content.

So the three remained silent until to the goodnatured Don Santiago the situation seemed absurd. 'Oh Englishman,' he said inwardly, 'I know that, in your small country, two of you, equally well bred, well educated, and well dressed, will travel together in one of your boxes of railway compartments from seashore to seashore and never exchange a word, in fear of the "awkwardness" should you turn out to belong to different sets. But in a republic we are not so timid before these social dangers.'

Don Santiago was a happy, and therefore a genial, person, and he decided to make an effort at friendly conversation with the young man, who looked like a gentleman, and did not seem disposed to be either subservient or forward. There being no acquaintance to introduce them, he called in the aid of the common friend of man, the universal master of ceremonies, tobacco, and taking out his cigar-case, 'Señor,' he said, 'will you try one of my puros?'

Sandford understood that refusal to smoke with a stranger in South America is as insulting as refusal to drink with a stranger in California. He would not be rude, even to the prospective fatherin-law of Don Diego Lopez, and accordingly he accepted the cigar with a bow and a murmur of thanks. Before lighting it he turned mechanically to the lady and asked her permission. She granted it smilingly, and he remembered with a pang the superfluity of the request in the case of a Moyocuilean girl, who no doubt herself smoked. He expected to see her produce and light a cigarette at least, but she did not.

While these mutual courtesies were proceeding, the Vigilancia, leaving the broad Mariposas, turned into the swifter Carrizal. As she did so the tropical sun seemed to spring above the horizon, and his level beams suddenly shone full on the faces of Sandford and the girl. Don Santiago rose and let down part of the canvas curtain, and Sandford thanked him again.

If Sandford had had more experience he would have guessed that his vis-à-vis was somewhat superior to the ordinary Moyocuilean. He must have felt curious about the other man's business upriver, and yet he was not inquisitive. In a highly civilised country it is considered impertinent to inquire into a stranger's private affairs. But among primitive people good manners authorise and even demand the putting of questions that show a friendly interest. When King Pharaoh began his conversation with the patriarch Jacob by asking his age, he was only following the prescriptions of conventional and perennial politeness. Oldfashioned German good breeding required exactly similar inquiries in Kraewinkel. And in Moyocuil, still in its national childhood, new-comers are treated as they were treated by our fathers, and are still treated by our children, and interrogated with perfect frankness. Don Santiago ought promptly to have asked the stranger's name, age, occupation, and errand. And if Sandford had himself been a Moyocuilean he would have replied as promptly, telling with feigned candour such truths and falsehoods as suited his purpose, which the other would have discounted at the usual rate. Don Santiago, however, seemed as well-mannered as Sandford himself, while Sandford thought him probably such another as Don Diego. This prevented him from having any desire for conversation, still more from making any inquiry which might betray the object of his journey. He had to find out where the timber he wanted was to be got, and he had to find out by asking. But he was resolved to postpone his inquiries until he should be separated from his fellow-passengers from Garapatas. And this resolve was reinforced by the other motive of his flight. Accordingly, with true British stolidity, he held his tongue and looked at his boots. Don Santiago, not being an Englishman and having no reason for silence, made a further effort at conversation. He believed the stranger would need help and information. He knew he could probably supply both, and he was good-naturedly ready to do it. But he would ask no questions of this reserved young gentleman, not even the natural

one, 'Have you made this journey before?' He began with the most unobtrusive remark he could think of. Moving a box of soap aside a little and pushing out his feet, he said, 'They don't give us very much room, do they? But it is better than the canoe.'

'I suppose so,' said Sandford; and then, finding it impossible to be altogether churlish even to Don Diego's future father-in-law, he added, 'It is my

first journey on the river.'

'Indeed?' said Don Santiago. 'Then you don't know the discomfort we used to have. This is cramped as regards space, but it is luxury as regards time. We used to travel like that.' He pointed across the river. A long, narrow boat was being slowly pushed up the stream close in by the bank. Four barefooted fellows, two on each side, each with his shoulder to the end of a pole, propelled her. They leaned far forward on the pole, pushing with their feet, till they reached the end of their gangway, when they trotted forward, trailing their poles in

the water, to start pushing again from the bow. Their progress, as seen from the steamer, was little more than perceptible.

'Instead of doing the journey in one day, as we do now,' said Don Santiago, 'we took a fortnight

or three weeks if the rains had begun.'
'That must have been tiresome.'

Something made Sandford glance at the girl. Her bright eyes were fixed on her father's face, and a happy smile was on her lips. For a moment she seemed about to speak, but she did not, and her father continued, 'Well, it depends. If your only object is to get to the end of the journey, then the steamer is better, just as on land a night journey in an express sleeping-car takes you to your destination more quickly than if you travelled by road in a wagon. The canoe is the river wagon, and there are lazy people'—he looked at his daughter with a twinkle in his eye—'who prefer it to this.'

The girl nodded and smiled.

(To be continued.)

AN OBSERVER IN THE NEAR EAST.

acute and clever journalist and novelist has set down his impressions of a recent visit to Eastern Europe in An Observer in the Near East (Eveleigh Nash), which proves a very interesting record of a long

journey of close and confidential inquiry. anonymity of the author is only faintly concealed, as his portrait appears in at least two of the illustrations. The book is well illustrated from photographs by the author and Princess Xenia of Montenegro, and a useful map of the author's route is appended. What we read of the wild tribes of North Albania is fresh and interesting, while the remarks on the condition of Montenegro, Bosnia, Servia, and Bulgaria are no less fresh and valuable. It is possible the writer is only too suspicious of Austria and Germany, which are described as slowly but surely marching to the East. through the Balkan Peninsula the weak are being crushed by the strong. 'The Austrian eagle has overshadowed and grasped Bosnia; she has her talons in Servia, and is casting covetous glances upon gallant little Montenegro. . . . The poor, defenceless Macedonians are being daily outraged, murdered, or burned; she [Germany] secretly aids Greece and abets the Greek bands in their nefarious work of outrage, murder, and extermination. The Kaiser could cause this to cease, but his policy is to create disorder in that terror-stricken country, so that Bulgaria and Turkey must be compelled ere long to fly at each other's throats.' Then we are told how the Turk hates the Bulgar, the Serb hates the Austrian, the Roumanian hates the Greek, the Albanian the Montenegrin, and the Bosnian the Turk. Our observer gives passing glimpses of

famous personages, the phantasmagoria of colour, and the signs of progress and possibilities of war. Austria is Servia's sworn enemy; Turkey is the enemy of Bulgaria; but as long as the Sultan lives there may be no declaration of war against Bulgaria. Before the Sultan passes Bulgaria herself

may declare war. The writer entered the East by Montenegro, 'one huge natural fortress,' and there and in Albania 'arms make the man.' In Cetinje every one is armed. The Montenegrins are sturdy mountaineers, handsome, of fine physique, dressed in blue baggy trousers, white woollen gaiters, raw-hide shoes, and scarlet jackets braided with gold. They are born fighters, counting work undignified. My lords allow the women to do that which in other countries is relegated to men. Petroleum tins are much in evidence in Cetinje for carrying water and milk, and as pails and flower-pots. Prince Nicholas in the course of a chat with our observer acknowledged that it was Mr Gladstone who gave them the strip of seaboard on the Adriatic, with Dulcigno. The Prince strongly advised our traveller against visiting Northern Albania. The 'accursed mountains' were held by brigands, who shot the traveller at sight without ransom. The Northern Albanian is still in the lowest depth of barbarism, ruled by chieftains according to unwritten laws, acknowledging no law, and paying no taxes. And, in fact, the visitor was not in Skodra half-an-hour when he was fired at. Machinery of all kinds is forbidden, as well as telephones and electric light, and no newspapers or books are allowed to enter Albania. The men have manly faces with clean-cut features, a swaggering gait, and shave their heads. They wear tight-fitting, black-and-white striped trousers, black woollen boleros, their belts filled with cartridges, and a rifle over the shoulder. 'Observer' chatted and drank coffee in bazaars with men who had a price set on their heads, men who would kneel and pray in church and ask guidance there as to murdering their enemy. The bloodfeud is part of the creed of Mohammedans and Christians. There is no drainage, the post-office is a wooden shed, and antiques are to be bought in Skodra at reasonable prices.

In spite of advice to the contrary, Observer secured permission to visit Northern Albania with a trustworthy guide. The Albanian he found to be thin and wiry, wearing rawhide slippers, and dressed in the 'protective' colour of the rocks; moving with a stealthy, cat-like tread, and looking as if he had stepped from a medieval Florentine fresco, with half-shaven head, and hair long at the back and cut square across the shoulders. Here he saw the genuine brigand, a fierce, bloodthirsty fellow, dressed in skin-tight, white woollen trousers. From chief Vatt Marsahi, a big, muscular fellow, he received great kindness and hospitality.

Our observer found the Montenegrin road through Dalmatia to Herzegovina the most superb in Europe. Ragusa he calls a dull little town full of faded glory, and Sarayevo, the Bosnian capital, very Eastern, and full of attraction to strangers, with its mosques and every house in its own little garden. Here most of the Oriental goods offered for sale are 'fakes;' but the chiselled metal-work is good. Bosnia, we are told, is to-day 'helpless beneath the talons of the Austrian eagle,' which is slowly exterminating the people. This scarcely agrees with some other testimonies we could name, or the flourishing tables of exports and imports. The police and gendarmes are said to shoot the witnesses of their crimes, while the administration is a shameful travesty of civilised rule. Education is at a standstill; there is a censorship of the press, and every book or newspaper goes through the censor's office. In Sarayevo one-half the population is paid to spy upon the other half, and the spy system is said to be more complete and elaborate than in Russia or France. The movements of the observer were carefully watched, and his guide was a spy. This seems deplorable, as Bosnia and Herzegovina are both rich countries, the soil productive, the inhabitants intelligent, apt in agriculture, industry, and commerce.

Belgrade (capital of Servia, at the junction of the Save and Danube, the Gateway of the East) looked like a dull Russian town. The social life is bright and entertaining, however; the streets in the mornings are filled with well-dressed ladies and gallant officers in smart uniforms. Bridge is played universally; both sexes smoke cigarettes; there is extravagance in dress and much else, with bad cookery. The Servians are highly intelligent and thoughtful, and a recruit there learns in six months what a French recruit takes eighteen months to learn. Politics are the breath of the people's nostrils;

there were one hundred and thirteen known secret agents of Austria here. Pauperism is unknown; the peasants, amongst whom the land is mostly divided, seemed prosperous, and more industrious than the Bulgars or Roumanians.

King Peter of Servia wears his sixty-two years well, is active physically and mentally, popular with the people, and in his family life has shown a good example. In bearing he somewhat resembles Lord Roberts. He is interested in sanitation, agriculture, morality, religion, and the general wellbeing of the people, which he is confident cannot be attained without a strong religious belief. His policy is one of peace, and education has reached a high level. He is anxious to develop the rich mineral resources of the country. The output from the Bor copper-mine is enormous, and by experts it is considered one of the richest in Europe. Besides copper, iron, coal, antimony, and even gold might be exploited by an influx of British capital. Marmalade and alivovitza spirit made of prunes are amongst the exports. Immense forests are still hardly drawn upon.

Sofia, in Bulgaria, at its present rate of progress, may soon be the Brussels of the East. There is an excellent club with cosy and artistic rooms and good food, as also a tennis and hockey club. There is an orphanage for Macedonian boys, established by Mr Pierce O. Mahony, an Irish philanthropist. It is for the education of orphans whose parents were killed in the raids. Observer gives the story of one boy, and got his photograph, which was too ghastly to reproduce. He lived in the district of Ochrida, and was one day tending his sheep, when some Turkish soldiers asked if he had seen a Bulgarian band pass along. The lad replied that he had seen nobody. The soldiers doubted him, as they knew the Bulgarians were in the neighbourhood; they asked him again, and the boy repeated his denial. One of the Turkish soldiers thereupon smashed in the little fellow's skull with the buttend of his rifle; another took a knife and cut his throat from ear to ear. They then dug a rough hole in the ground and buried him. The lad was found by a passing shepherd, whose dog began scratching the earth above him. He was exhumed, and found to be still living, and admitted to the hospital. Another lad had seen his father and mother tortured and then burnt before his eyes! Neither Bulgaria, Servia, nor Roumania, we are told, can solve the Macedonian question without joint action of the Powers. Never in modern history was Macedonia so bad. A thousand Christian Bulgars were killed in raids last year, and as many more have perished this year.

The products of Bulgaria include tobacco, soap, table-covers, carpets, and otto of roses (there is a valuable chapter on its production). In the Shipka district the whole country is covered with blossom, including the red rose (Rosa damascena) and various species of white rose, of which Rosa moscata is the most used. There are extensive plantations cover-

ing fifteen thousand five hundred acres, and one hundred and seventy-three villages are engaged in the industry. It takes one hundred and sixty to two hundred and fifty pounds of rose-flowers to make one ounce of otto, with about three hundred roses to the pound. There are thirteen thousand native stills, and the average yield is one hundred and twenty thousand ounces a year. Messrs Shipkoff of Kazanlik export about two-thirds of the whole rose-produce. This firm and others make advances to the peasantry upon their growing crops, and the peasant pays these advances in distilled otto. Adulteration is practised by some with geranium oil, made in India and sold at Constantinople. The rose-harvest begins at the end of May, and lasts from eighteen to thirty days. With the memory of Merryweather's rosery at Southwell, Notts, in our mind's eye, we believe our author when he says that nothing can present a more captivating scene than a rose-garden in bloom, with gaily attired peasant girls gathering its roses, and its nightingales trying in most melodious songs to outsing the maidens. The process of distillation is described. The otto rises with the steam, and is condensed in a small pipe; the yellow and the white oily globules of the otto are skimmed off and put into bottles to be tested and prepared for the market. The Bulgarian Commercial and Industrial Museum shows how Bulgaria is growing commercially. Concessions have been made in recent years for mining coal, copper, manganese, and zinc. The country is rich in mineral springs. Bulgaria, with Servia, seems destined to become a power in the Balkans.

Roumania has progressed so rapidly during the forty years of its freedom that in Bucharest, save for Roumanian names, our observer might have thought himself in Paris or Brussels. It is a gay city, with smart cafés and confectioneries, expensive hotels, and shops that charge double Paris prices. The façades of private houses seemed marvels of florid bad taste. Gambling is rife, cabs are in great demand, and every one lives above his income. Jews constitute about one-twentieth of the

population of the country. There are rich saltmines in Roumania, and iron and copper ore remains to be exploited. The supplies of petroleum are very rich; the American Standard Oil Company has established itself in Roumania.

The Queen of Roumania gave our observer an audience, and he describes her as having a tall, fine figure, with sweet silver voice, kindly manner, queenly bearing, dressed in a gown of pale dovegray, with no jewellery save a single gold bracelet and one or two fine rings. 'As she sat before me, the handsome, thoughtful countenance, the white hair brushed straight back, and the soft and very becoming head-dress, Her Majesty was surely the most picturesque, the most interesting, and perhaps the most accomplished and intelligent of queens of Europe.' She is interested in the poor and the blind, and has a scheme for the establishment of a model town to which the blind of every nation may come and work and support themselves.

Our observer travelled in a train de luxe from Bucharest to Constantinople, but has little to praise in the comforts or food. He is eloquent regarding the squalor in Galata; Pera sickened him, with its unswept streets an inch deep in slimy mud and gray wolf-like dogs about; Constantinople, with the most picturesque and beautiful position in the world, seemed the most filthy and uncomfortable of cities. In an interview with Noury Pasha, he was told that Turkey did not aid and abet the Greek bands in massacring the Christians. It was the interest of Turkey to keep order in Macedonia Tewfik Pasha, Minister of Foreign Affairs, he found to be a quiet-spoken, gray-bearded gentleman, with kindly eyes and a fatherly manner. He had interviews with the Sultan and others, and found that Turkey is not in any way afraid of Bulgaria. 'It takes a good deal to arouse us Turks,' said Noury Pasha; 'but when we are aroused we fight, and fight to the death.' But what of Germany, which we are assured intends to wipe Turkey off the face of the earth?

THE GREAT COLORADO DIAMOND-SWINDLE.

HE discovery of the Comstock silverlode of Nevada in 1859 was an event in the annals of mining of scarcely less importance than the gold-find of John Marshall in California ten years previously. It

seems strange that even among mining men and members of the London Stock Exchange there is so little known about the old Comstock, by far the richest deposit of the 'white metal' ever exploited in any part of the world. This ignorance may possibly be accounted for by the fact that Comstock mines were not listed over here; they

never became 'fashionable' among our speculators, but were for many years the favourite gamble among Californians and New Yorkers. It within a few years, however, many new silver-camps were opened up in Austin, White Pine, Eureka, and Pioche, all in Nevada; then came the rich discoveries in Idaho and Arizona. Vast sums of English capital were invested in these districts, and the mines placed on the London Exchange. Some of these ventures, such as the Richmond in Eureka and the Eberhardt in White Pine, paid large dividends; but the Emma in Utah turned out a sad failure, bringing disgrace on the late

'Baron' Grant, the principal promotor, and for years throwing a wet blanket over silver-mining in the States.

In the days of old, the days of gold, The days of forty-nine,

when the great West was 'wild and woolly,' the red-shirted miner, with revolver and bowie-knife on hip, was an inveterate gambler, and would frequently stake his interest in a rich 'placer' claim on a hand at poker or on the turn of a card at faro. By a natural process of evolution, in a few years he had become a law-abiding citizen in frock-coat and top-hat, but with the same old craving for excitement; so, when the San Francisco Stock Exchange was opened in 1862, he was not slow to discover that he could have all the fun he wanted gambling in silver shares, and might make a fortune or 'go broke' in a week without any trouble.

Among the most successful speculators in San Francisco was a man named Ashbury Harpending. He was very wealthy, and a bold and original operator. In 1863, during the Civil War, he had equipped the Chapman schooner as a privateer; she had a couple of powerful guns on board and a picked crew. His plan was to hold up the Panama steamer from San Francisco to the isthmus, capture her with all the treasure aboard, and then play Alabama with American commerce on the Pacific. The passengers and crew of the steamer were to have been put on board the Chapman. Unfortunately for him and his associates, the plot was given away the day before she sailed; a Federal gunboat came alongside the schooner, and sent an officer with a boat's crew on board. Mr Harpending and all hands were arrested and tried before a civil tribunal for attempted piracy. They were all sentenced to long terms of imprisonment, although they claimed to have received a 'letter of marque' from Jeff Davis, President of the Confederate States. A young Englishman named Rubery, the son of a wealthy merchant in Birmingham, had advanced the money for the purchase of the schooner. After a short imprisonment he was pardoned by President Lincoln, at the request of John Bright. Harpending and the others were released at the end of the war.

Mining business had been very quiet on the Pacific coast for a few years; and Mr Harpending, who had returned to San Francisco, confined his operations chiefly to an occasional deal in city property, keeping a close watch, however, on the mining market, and waiting his chance to make a great coup. In 1871-72 several important developments were made at a great depth on the Comstock and some of the mines in outlying districts, and all classes of the community were suddenly seized with a mania for speculation scarcely second to that of the Parisians at the time of the famous Mississippi Scheme of John Law. Brokers' offices were crowded from early morn with clients giving orders to purchase, and an army of extra clerks had to be

engaged. A second Stock Exchange was opened, and all the members were making enormous commissions; each board held two daily sessions in order to supply their clients with silver shares.

Good Mr Harpending, who was nothing if not philanthropic, thought it was a pity that so many of his friends and fellow-citizens should throw away their money on wild-cat mines, and it was painful to reflect that none of those bright twenty-dollar gold pieces with which the brokers' strong-boxes were overflowing were coming his way at all. He felt that it was a duty he owed to himself to make an effort by which the Pactolian stream might be diverted towards the Harpending bank-account. Gold-mines were played out, silver-mines overdone; there was no demand for a big copper-mine. Why not start a great diamond-field? It was, indeed, a happy thought. All rich Americans, especially the ladies, were very fond of these beautiful gems, for which there was a steadily increasing demand, as the output from the old mines of Brazil and India had been declining for years, and Kimberley had not been discovered. But how were the diamonds to be got? That was the question. Had it been the fixing up of a gold or silver mine for an Eastern or English mining expert, there would have been no difficulty in procuring a ton of specimens for the purpose; but rough diamonds cost money, and as he did not care about risking too much in the venture, he resolved to take in a couple of partners.

After deep deliberation Harpending selected two men on whose discretion he could rely-men who were not troubled with any nice scruples of conscience when it came to a question of making money. Knowing that men are apt to be more generously disposed after being well fed, he invited them to dinner; and then, over the walnuts and the wine, he laid before them a scheme by which they might rake in all the spare cash in the country. He told them that the daily transactions on the Stock Exchanges amounted to an enormous sum: and if only a good diamond-field were to be laid before the public, say, in a million shares, he felt confident they could be placed at a fair figure within a few months, and if only a small capital was subscribed, he would guarantee a find that would throw Golconda into the shade. His arguments were convincing, and the sum of twenty-five thousand dollars was put up, and no questions asked.

Mr Harpending's scheme was very simple, and had it not been for the merest accident the promoters would undoubtedly have succeeded in swindling the public out of millions of dollars; but it is always the unforeseen that happens.

Two old prospectors, Messrs Arnold and Slack, with whom Harpending was well acquainted, had just returned to San Francisco after a long trip through Colorado. They had shown him some very fine specimens of gold and silver ore from the mountain ranges of that state, and also some beautiful quartz crystals which sparkled like diamonds. As a matter of fact, these formed the

nucleus of the Colorado diamond-field. Harpending thought if crystallised quartz was in such abundance, why not crystallised carbon-diamonds? It took but a short time to arrange matters with the two old 'honest' miners, and the plan of campaign was laid out to the minutest detail. Arnold and Slack were furnished with fifteen thousand dollars, and despatched to London with instructions to purchase small rough stones to that amount from a firm in Hatton Garden. On arriving in the great Metropolis they went to work at once, and succeeded in securing a large parcel of small stones. They were easily pleased, and would take anything from a half-carat up-anything in the shape of a diamond, in fact, and they did not require any fine

In 1871 but little exploration had been done in Colorado, and it was left to their discretion to select a likely section of country to salt with the stones. Having completed their purchases, they did not waste any time taking in the sights of London, but returned at once to New York, and thence by rail to Denver, the capital of Colorado, where they secured horses and sufficient supplies for a few weeks in the mountains. The locality selected by them was a black, barren plateau, elevated some five hundred feet above the level of the valley, and having an area of some thirty square miles; the forbidding sage-brush being the only shrub that would thrive in the sandy waste. They did not spend much time in this desolate region; probably they were the first white men who had ever entered it. They set to work blocking out areas of a few yards square, and about the centre of each would plant a rough diamond about a foot deep; and so they proceeded until they had nearly exhausted their supply-in fact, they only reserved about twenty of the largest to take to San Francisco as samples of their 'discovery.'

They were glad to hurry away from the wilderness, and their first care on arriving was to report to the promoters of the scheme, who had gathered together in Harpending's office, and to these worthies they showed their samples and a rough map of the field. These two men had played their part well, and could now retire behind the scenes to await further developments. The next step was to get the report of a mining engineer, who must be well known in the state, and then the prospectus might be drawn up, the company incorporated, and shares offered to the public for subscription. Mr Henry Janin was the engineer selected; and, accompanied by Harpending and Slack (who acted as guide), he left the city quietly for Colorado.

Having arrived at the salted plateau in Summit County, Slack, who carried pick, pan, and shovel, went round to each marked spot, and took up a few shovelfuls of sand, which Janin carefully panned out at a little alkaline water-hole, finding, of course, a diamond or two in the pan at every

prospect he tried; and thus for a couple of days the three men remained on the plateau, and Janin had tried about a hundred spots with his prospecting-pan.

Shortly after their return to the city Janin furnished his report to the promoters, and the estimated yield per cubic yard, figured out in dollars, was something colossal; I do not recollect the exact figures, but Golconda was not in it with

the great Colorado field. A good title was secured from the United States Government to several square miles of the plateau, and then all that was lacking was a board of directors whose names would be a safe guarantee to the public that the company was genuine and had actually acquired the wonderful property described in the prospectus and engineer's report. After several lengthy interviews with some of the leading financial magnates of the city, Harpending and his associates succeeded in inducing Mr Milton S. Latham, manager of the London and San Francisco Bank, to become president of the concern, and Wm. C. Ralston of the Bank of California lent his name as a director. The two names were probably the best that could have been chosen, as these gentlemen were men of the highest standing, socially and financially, and extremely popular with all classes of the community. Mr Latham had been one of the best Governors ever elected in California, and Mr Ralston was the founder of many of the most successful industrial, manufacturing, and mining enterprises on the Pacific coast, and they were both managers of great banking institutions. The most lamentable fact connected with the scheme was that when it became known to the directors in London who employed Mr Latham that he had become identified with the diamond-swindle, a meeting was called and his successor appointed. He was dismissed from his post with as little ceremony as would have been shown to a dishonest footman. He died in very poor circumstances in New York a few years later, and Mr Ralston was drowned whilst bathing in 1874.

The end of the great diamond-scheme was not far off, as in an unlucky moment Harpending had approached General D. D. Colton, one of the directors of the Central Pacific Railroad, and tried to induce him to purchase a big block of shares before they were placed on the market. The General, a shrewd man of business, read the prospectus and report carefully, and promised to give a decided answer in a few days. He had learned from Harpending the exact location of the diamond-field; and, amazed at the potential wealth to be acquired as set forth in the report, he determined to make a thorough personal examination of the Colorado plateau. Just at this time Mr Clarence King happened to be in San Francisco. Mr King, who was probably the most eminent geologist in the United States, and the leading authority on mines, had just come down from Eureka (Nevada), where he had been giving his testimony in the great lawsuit between the Richmond and Eureka mining companies. He gladly accepted Colton's offer to visit the diamond-field, and very quietly the two gentlemen started off in the director's private car to Red Desert station, the nearest point on the railroad to the plateau of Arnold and Slack. Horses, which had been telegraphed for were awaiting them on the platform, and after a couple of hours in the saddle they arrived on the ground. Having made a brief geological examination, Mr King pronounced the formation to be non-diamondiferous, and he then went to work carefully with his prospecting-pick at points where he saw the surface had been disturbed. After a little surfacescratching he came on one of the holes into which Arnold and Slack had dropped a couple of diamonds, and right there the gigantic bubble was burst. Truly an inglorious ending; and the curtain might be rung down, for the comedy was played out.

The two gentlemen spent another day on the plateau before breaking up camp. They went carefully over the ground, and found several little salted holes, each containing a diamond or two, and then they started for the railroad, arriving in San Francisco as quietly as they had left. Colton's absence from his office had excited no suspicions in Harpending's mind, for he was a very busy man, as the General's time was fully taken up superintending construction along the line as far as Ogden in Utah.

It was as though a thunderbolt had fallen in the diamond-camp the day Colton came down town. He walked straight into Mr Latham's private office in the bank, and said, 'Look here, Latham; I'm sorry to think that you have lent your name to that swindling diamond-scheme of Harpending's. I don't accuse you of any complicity with him or his gang, or suppose for one moment that you had

any idea that the whole thing was bogus. Take my advice, and publish your resignation of the presidency in all the daily papers, and warn people to have nothing to do with diamond shares. I have requested Clarence King to call on you and tell you the whole story of the supposed diamond-field. By prompt action on your part you may save yourself from having serious trouble with the London directors of the bank.'

In justice to the memory of the late Mr Latham it is only right to add that he did exactly as suggested by General Colton; but it did not save him from dismissal, as he was sharply criticised by the local press. The report of Clarence King, which was published a few days later, produced consternation in San Francisco, and Harpending deemed it advisable to take a trip to Arizona until the storm blew over. He only saved himself from a criminal prosecution by refunding the money to those purchasers who had been permitted as a great favour to secure shares at bedrock prices.

It was probably as well for mining speculators in England that the Colorado swindle was exposed so promptly. In the early seventies a vast amount of English capital was invested in mining enterprises on the Pacific coast, and some sensational articles had appeared in London papers regarding the Colorado diamond-field. When Harpending and his associates had realised a sufficiently large sum of money by the sale of shares in the original company, their plan was to set apart about a hundred thousand dollars for the purchase of another lot of rough stones in London. Fresh areas of desert would have been salted, and a second flotation made on this market.

The great diamond-swindle was soon forgotten in California, as in a couple of years Messrs Mackay and Fair opened up the great Bonanza mines in Virginia City (Nevada), and gave the speculators a fair chance for their money.

THE MONTH: SCIENCE AND ARTS.

A PLANT WHICH STORES WATER.

OME curious plants are under observation at the Carnegie Institute. They are members of the cucumber family, and are known as *Ibervillea sonore*. The natural habitat of these plants is the desert, where a rainy

season coming but once a year furnishes the only moisture with which the growth can be produced. To meet this condition the *I. sonora* produces an organ for the storing of water at the base of the stem. It is covered with a kind of mackin-toah envelope, through which the water cannot escape by evaporation or otherwise, and all through the dry season this curious organ lies on the hot sand unchanged. As soon as the rainy season com-

mences, roots and shoots are produced rapidly, fruit and seed brought to maturity, and then the thin stalks wither and the replenished water-container rests for another year. A number of these storage-organs were collected in 1901 and placed on the shelves at the Carnegie Institute. Every year about the time of the occurrence of the rainy season in their native deserts these curious plants throw out little shoots, which die back again for lack of encouragement. The plants have been doing this for five years, and apparently there is still water enough left to carry them on for several seasons more.

AN INGENIOUS TEAPOT.

Many and grave are the warnings as to the dire consequences of drinking tea which has 'stood.' Tea is thoroughly brewed, they say, in from three to six minutes, according to its kind, and after that it begins to exude a vile poison called tannin. So often have women been told of this danger-not that they are the worst offenders, but they are popularly supposed to be-that one can only marvel at the bravery with which they unfalteringly demand a second cup, although that second cup should, by all accounts, contain more poison than tea. It is true that men and women go on living in spite of this daily danger; but when the modicum of truth has been sifted from the mass of exaggeration, we may take it that they would live a little better if they confined themselves to first helpings. However, that is too much to expect from human nature, and a teapot which provides that the second cup shall be as good as the first should therefore be a boon. The S.Y.P. patent teapot seems to meet the case well. It is like an ordinary teapot with an extra compartment at the top, above the handle, in which the tea-leaves are placed. This compartment communicates with the teapot proper by means of a perforated partition. Certain projections on the sides of the teapot enable it to be laid on its back, where it will stand firmly as long as required to do so. Tea-leaves placed in the upper story and boiling water in the lower will come into the necessary intimate contact immediately if the teapot be stood on its hind legs as it were. After the lapse of the necessary number of minutes to 'draw' the tea properly, the pot is placed erect, the properly made tea draws away from the tea-leaves, and the evil designs of the malignant tannin are nipped in the bud.

MAGIC POLISHING-CLOTHS.

Polishing-cloths which are said to possess magic properties are being sold on the other side of the Atlantic with a success which is gratifying to both vendor and buyer. Popular Mechanics gives a recipe for making these cloths which some may care to try. It is as follows: Take one gallon gasolene, two pounds whiting, and half an ounce oleic acid; mix and shake up well. Pieces of woollen cloth soaked in this mixture, wrung out, and hung up to dry are said to put a fine gloss on any polished surface, silver-ware, &c.; and although the cloths may become soiled and dirty with constant use, they will never dirty the hands of the user or lose their polishing power. A word of warning may be added as to the danger of using gasolene anywhere near a naked light or fireplace. It is obvious, therefore, that the cloths should be dried in the open air; once dried of course, there will be no further danger.

A NEW DUST-PAN.

It is a well-known fact that charity very seldom finds its origin in the place where the proverb says it should begin, and it is said that the inventive genius searching for a field worthy of his operations is likewise seldom content to begin at home.

Perhaps this is the reason why many household appliances are still in a very primitive condition. Among other incongruities, that of using a shorthandled dust-pan with a long-handled broom has escaped its fair share of attention for a long time. A very simple contrivance is described in the Scientific American to remedy this anomaly. This novel dust-pan has a simple attachment by which it can be fastened to the foot of the user. Thus, when the housemaid is sweeping out a room with both hands she can with one foot hold the dust-pan to the brush and collect the proceeds without stooping. Again, the ordinary dust-pan consists principally of a tin scoop so designed as to spill all the dust as soon as it has been collected; the American contrivance, however, is so shaped that all the dust is collected in a pocket behind the scoop, and there it remains until its ultimate goal, the dust-bin, is safely reached. In passing, it may be noticed that the housemaid whose two hands are engaged with the broom, and whose one foot is tethered to a dust-pan, may raise mental visions the realisation of which the prudent householder may not care to risk in face of the provisions of the new Workman's Compensation Act.

A NEW RAILWAY COUPLING.

Despite hundreds of more or less ingenious inventions, the old crude method of coupling carriage to carriage on our railways still obtains, principally because the adoption of any new system would entail such a vast amount of alteration that the railway companies naturally shrink from the prospect. Particulars are to hand of a coupling invented by Dr Arthur J. Gray which is said to be applicable to the present fittings with a little alteration. The device is simple, and the models which have been seen by various people familiar with railway matters are stated to have been highly spoken of. The coupling can be worked from the engine by the driver himself, or when coaches or trucks have to be coupled or uncoupled the operation is easily and simply performed from the side of the vehicles without the necessity of sending a man between the trucks, as is the present dangerous practice. It is to be hoped that Dr Gray's invention may prove all that is claimed for it, and, moreover, may be capable of inducing the powers that be to adopt it.

TINOL

Those amateurs who wield the soldering-iron with more or less success know that the process is beset with little difficulties which often combine in unskilled hands to form an almost insuperable obstacle. One of the greatest troubles is thoroughly to cleanse the parts to be soldered. If all be true that is claimed for the new soldering paste Tinol, its advent will be hailed with joy by a great number of people other than the professional tinker. The paste is a mixture of varying consistency, according to the purpose for which it is required.

Some kinds are so thin that they can be applied with a brush. It contains within itself the metal for the making of the joint, the flux, and the cleansing medium. To make a joint, all that is necessary is to apply a little of the paste to the uncleaned surface, and then heat the work until the solder flows. For very small articles the heat of a candleflame is said to be sufficient. The paste is prepared from finely powdered tin and lead, obtained by projecting a jet of compressed air or steam against a stream of the molten metal. This fine powder is mixed with a reducing substance, such as chloride of zinc, and made up into a paste with glycerine or vaseline thickened with a preparation of cellulose, which burns without ash. These ingredients are so chosen in order that when the paste is heated the metal may melt first and be protected from oxidation by its still unchanged surrounding matter. Then the other ingredients decompose in turn, the flux allowing the metal to run together, while the cleansing material prepares the way for it into the interstices of the joint. The result is said to be a perfectly clean union, with no acid or other impurity remaining to give subsequent trouble.

TWO MORE USES FOR PAPER.

To those who deplore the approaching time when the last particle of iron ore has been extracted from the earth the reply has been made that long before that day every article which man requires will have been made of paper in some form or other, and there will be no further use for steel and iron. However this may be, new uses for paper are constantly being found, and truly its capabilities appear to be almost unlimited. Gear-wheels are now being successfully made of paper compressed in a thousand-ton hydraulic press. Gear-wheels are coming more and more into favour in place of belts and other transmission appliances because of their high efficiency and the small space which they occupy. But the great trouble with metal gear-wheels is that they are very noisy at all high speeds. This has been overcome to a great extent by using pinion wheels of raw-hide meshing with the metal wheels, and now paper is said to be taking the place of the raw hide. It wears very much better, and outlasts the leather many times, while it is quite as silent. The new pinions should commend themselves to all users of machinery to which they are applicable, and among these, of course, motor-cars must be included. The other use for paper—and this hails also from America—is in the making of bottles for the conveyance of milk from the dairy to the consumer. To put new milk into old bottles, they say, is a practice which is fraught with much danger, for bottles are difficult things to cleanse thoroughly. The paper bottles are very inexpensively produced, and consequently when they are used there is no temptation to refill them. In the process of manufacture the bottles are steeped in melted paraffin, and afterwards baked so that the paper sucks up the paraffin to saturation, and the

surplus runs back into vats. The wax absolutely protects the paper from the action of the liquid, and the milk, on the other hand, has no action whatever upon the paraffin.

PAPER CLOTHING.

Here is still another use for paper, which, according to Mr Carl Hurst, United States Consul at Plauen, appears to have a vastly important future before it. This is in the manufacture from wood-fibre of a kind of paper yarn or thread suitable for use in the looms in the same way that cotton and linen yarns are used. The thread is not brittle and has not a hard surface, it has great tensile strength, and is capable of being woven into all manner of cloth, from pockethandkerchiefs to floor carpets. Xylolin, as it is called, neither shrinks nor stretches in any appreciable degree, and moisture has no particular effect upon it. It is susceptible to dyes to a considerably greater extent than cotton, and very much more than linen, while its price is only one-third that of the former and one-tenth that of the latter material.

A NEW LIGHTHOUSE.

The new lighthouse for Cape Race embodies the latest developments in this branch of optics and engineering; hence a few particulars taken from a full description of this work recently published in The Engineer will be of interest. The lantern is over seventeen feet in diameter, and chiefly consists of a glazed steel framework surmounted by a copper dome. This structure, which is thirty-seven feet in height to the top of the weather-vane, rests upon a circular tower built of concrete, strengthened by a steel framework. Inside the lantern is the burner, surrounded by the prismatic lenses whose function is to collect the rays of light and project them in a horizontal direction. This apparatus, which weighs seven tons, is revolved by clockwork once in every thirty seconds; and, to eliminate friction as far as possible, the lenses and framework carrying them are floated in a bath of mercury. But in spite of this device a clock-weight weighing eight hundredweight, and falling fourteen and a half feet per hour, is required to revolve the light. The burner is similar in principle to the ordinary incandescent gas-burner, excepting that it is fed with petroleum vapour and air under pressure, a 300 per cent. increase in the amount of light being thus obtained over the old wick-burners. The light given out equals about two thousand four hundred candles, the consumption of oil only amounting to two and a quarter pints per hour. The lantern is one hundred and sixty-five feet above the sea-level, and the light is visible over a distance of nearly twenty nautical miles.

ELECTRIC LIGHTING BY WIND-POWER.

The old-fashioned four-armed windmill for the purpose of grinding corn has now become almost

extinct in this country, but the circular type of wind-engine is obtaining an extended use for the operation of small machines about a farm and for the provision of private water-supplies. A new use has also been found for this prime mover in the form of providing power for private electric-lighting installations, and at least one successful example of this application of wind-power is in operation. The earliest attempt to use a windmill for this purpose was made by Mr George Cadbury some twelve years ago; and although this plant was very badly proportioned, owing to the lack of previous experience, the lighting was on one occasion kept up for six weeks without a break. Excellent results have been obtained in a later installation by means of the knowledge gained from Mr Cadbury's experiments, and a plant erected three years later for lighting a large mansion in Yorkshire has given the utmost satisfaction to the owner. In this instance a circular wind-engine thirty feet in diameter drives a suitable dynamo, the electric current generated being stored in a battery of accumulators until required. The plant is looked after by a gardener, who devotes about four hours a week to this duty, the windmill being left running for many hours at a time without any attention whatever. Another successful installation for driving electric current from wind-power has been laid down at Askow, in Denmark, where a four-armed windmill of large power is used for the public supply of electricity to four hundred and fifty incandescent lamps, besides several motors and arc lamps. An oil-engine is the only alternative power in country districts; and although no very great saving in cost follows the use of a windmill, the latter is much the more robust prime-mover of the two, as it runs very slowly and the chance of a breakdown is very remote, whereas an oil-engine works at a high speed and is fitted with very delicate mechanism.

ELECTRIC HAULAGE FOR CANALS.

The improvement of our canals and waterways has lately been occupying the attention of a Royal Commission, by whom a great deal of interesting evidence has been taken. It would appear that both in Belgium and Germany electric traction has been adopted for the haulage of canal-boats, and estimates have been obtained with a view to a trial of this system upon a length of the waterway between Leeds and Liverpool. The banks of a canal are damaged by any form of self-propelled traffic; hence traction has been resorted to. A trolley wire similar to those used on electric tramways is carried upon poles along the tow-path, and a locomotive is caused to run along the latter by means of the electric current obtained from the wire. No rails were provided for the locomotive to run upon in the earlier experiments; but practice has shown that although the capital cost is thus kept low, the upkeep of the tow-path more than outweighs this advantage, and rails have been pro-

vided in later examples of this system. As it is impossible for the locomotives to pass each other, they are exchanged when two boats meet, and each motor returns in the direction from whence it came, whilst the boats continue their respective journeys. In one instance haulage arrangements are provided on each side of the canal to avoid this exchange of locomotives, and to enable a larger traffic to be handled.

WIDENING OF THE NORTH SEA AND BALTIC CANAL

According to Engineering, the German Government contemplates the widening and improvement of the North Sea and Baltic Canal, which, if the projected scheme is carried out, will be a work of great magnitude. In round figures, the depth is to be increased from twenty-nine to thirty-six feet, and the bottom will measure one hundred and forty-four feet across instead of half this width, as at present. In two places new cuttings are to be made in order to do away with existing curves, which are objectionable. Passing-places will be provided every six miles, and four of these enlargements are to be still further widened to allow vessels to turn round. The new locks will be eleven hundred feet long by one hundred and fifty feet in width, the depth of water being fortysix feet at the ordinary canal-level. The alterations are for the purpose of allowing war-vessels of the Dreadnought type to pass through the canal.

THE HIGHEST DAM IN THE WORLD.

We are accustomed to look for engineering works of a large magnitude in the United States, and the new Croton dam recently completed fully upholds the American reputation in this respect. This dam is part of the scheme for supplying water to New York, and it is the highest structure of its kind in the world, measuring two hundred and ninety-seven feet from the bottom of the foundations to the crest. The length of this enormous wall is nearly twelve hundred feet, the thickness being over two hundred feet at the base and eighteen feet across the top. Fifteen years have been occupied in carrying out the work, which has cost one and a half million pounds. The reservoir has a storage capacity of thirty-two billion gallons, and a considerable portion of it exceeds one hundred feet in depth. A huge aqueduct capable of passing three hundred million gallons a day conveys the water to the city, some thirty-seven miles distant, this work having been completed in 1890 at a cost of five million pounds, in connection with the old Croton waterworks. The raising of the water-level involved the destruction of three villages and many buildings, in addition to the removal of several cemeteries.

AN UP-TO-DATE SUNDIAL

The old-fashioned sundial as a means of telling the time has long since ceased to possess any value, and it is somewhat startling in these days to witness its appearance in an improved form. The helicchronometer, as it is called, has been invented by Mr G. J. Gibbs, and was exhibited at the Royal Society's soirée. This instrument will give exact Greenwich time within a few seconds whenever the sun can be made use of, and without involving any tiresome calculations, the only operation being the adjustment of two circles. It is not proposed to replace clocks and watches by this device, but it performs a useful purpose in correcting and regulating them, besides possessing a special interest for many scientifically disposed persons.

COALITE.

When coal is burnt in the ordinary domestic firegrate a considerable amount of smoke is produced owing to incomplete combustion. This smoke, instead of being wasted, might be made to yield gas suitable for lighting or power, tar with the various oils which may be obtained from it, and sulphate of ammonia. The makers of coalite claim to effect these results by abstracting the smoke from the coal before it is supplied for domestic purposes, the residue being a fuel which is easily lit, gives out no smoke, and burns with a certain amount of cheerful flame. These claims have been established by practical experiments, and large factories are being laid down to cope with the demand which is certain to arise for this new fuel when its advantages become known. Further tests of coalite with steam boilers have proved satisfactory as far as they have gone, and it seems possible that the production of smoke in large towns may eventually be prevented by the use of this fuel.

MASSAGE FOR DEAFNESS.

Since the appearance of the paragraph in 'The Month' of February last on 'Massage for Deafness,' letters of inquiry have reached the publishers from all parts of the world asking for the name and address of the maker of the akou-vibra instrument for deafness therein described. Further inquirers are directed to communicate with Mr Philip V. Summer, 3 Coates Place, Edinburgh, and 420 Sauchiehall Street, Glasgow.

APPRENTICESHIP IN THE MERCANTILE MARINE.

By Lieutenant D. M'G. NEWTON, R.N.R.

FTER many years of dissatisfaction and fruitless grumbling, it appears that the public are at length commencing to glean some idea of the hard lot of the officers of our mercantile marine. More than one first-

class newspaper has voiced the ills from which this body of men suffer. For the threatened shortage of officers, which is so deplored by shipowners, these papers have not hesitated to point out that the employers have evidently only themselves to thank. Naturally, the poor remuneration and inconsiderate treatment which mercantile marine officers have had, as a body, to endure have been the chief cause of the lessening numbers of young men embracing the sea-career; and it is from this aspect that most of the articles which have appeared in the press have been written.

There is, however, another cause which, if it has not kept boys from going to sea, has at least induced many of them to leave it before the end of their term of apprenticeship, and has thus aided to reduce the supply of officers. This cause is the way in which apprentices are treated in most sailingships. The hardship of the life would not deter many English boys from embracing a sea-career, and those whom it might deter are not the kind we need to officer our ships; but the humiliations and disgusting treatment they receive have prevented hundreds of high-spirited boys-boys who are fitted in every way to uphold the honour of the flagfrom continuing the profession which they had chosen. The conditions of an apprentice's life are but little known outside shipping circles, and I

venture to think that a brief resume of my own experiences while serving my time may enlighten the public as to yet another cause, besides the everpressing one of financial remuneration, that contributes to make our boys shun the sea-career.

After leaving school I elected to go to sea, and, although my parents tried to dissuade me, was allowed to do so. I was accordingly apprenticed to a highly respected Liverpool firm, and in due course was appointed to a full-rigged ship of some fourteen hundred tons. I embarked upon my career full of hope, expecting to find decent quarters, fair living, and to receive some instruction in the duties fitting me for the position of an officer. In something under an hour my illusions were shattered. My first duty was to clean out a pig-sty, my second an undertaking the doing of which would have been refused by any self-respecting domestic. When, after the day's work, we went below, I found that the apprentices' room—there were four of us—was some twelve feet by nine, of which space one-third was taken up by our bunks. This den was literally one mass of crawling cockroaches, and was unspeakably filthy. The meal with which we were to make ourselves ready for the labours of the next day consisted of tea without milk or sugar—the former being unheard of, and the week's allowance (fourteen ounces per head) of the latter having been all consumed before my arrival-and bread without butter, the latter commodity, of which the allowance was the same, having gone the way of the sugar. My illusions respecting the instruction that I was to receive were speedily shattered by the other apprentices. who were all old hands.

After a few days in port, each of which was a counterpart of the first, we sailed for Australia. I soon discovered that the gloomy accounts I had received from my room-mates were in nowise exaggerated. I immediately stamped myself as a 'stuck-up young cub' because I refused to help the steward in waiting on the cabin-table. We were the 'boys' of the ship, and were, in consequence, supposed to do all the dirty work, the least repulsive of which consisted in scrubbing out the officers rooms, &c. We were the messengerboys, and in every respect were worse off than the forecastle hands. Seamanship we picked up from the men as best we could; navigation we were not supposed to trouble our heads about. Our food was filthily prepared, and was served out only in the quantities that the Board of Trade has laid down as a minimum. The biscuits, which were the staple article of diet, speedily became a crawling mass of maggots, owing to lack of care in keeping the tanks in which they were stowed properly closed.

To quote one anecdote about our food. Christmas was approaching, and we wondered what preparations were to be made for our dinner. We had a number of fowls-for cabin consumption-on board, and we had hoped that one of them might be given to us for our Christmas dinner. One wretched bird had been sick; and, though the captain had tended it and dosed it as carefully as though it had been his own son, it sickened day by day, and on Christmas Eve was reduced to skin and bone and could hardly stand. We, in the meantime, hearing of no Christmas treat, approached the captain. He looked very scowlingly at us as we made our request; then his face cleared, and he called, 'Stooard, kill that there sick 'en and give it to them b'ys.' This, with a claggy mass, in which currants played hide-andseek, was our Christmas dinner.

The last year of my time was performed in a bark. We sailed from Liverpool to New Zealand with a crew of seventeen, all told. Off the Cape of Good Hope, when running the easting down, we had one night to shorten sail. By midnight it was blowing so hard that it was determined to keep all hands on deck to furl the foresail. While hauling it up the buntlines and leechlines carried away, and we could not, on account of the water we were shipping, open the forward hatches to get ropes to make spilling-lines of. Consequently all hands manned the yard to try and furl the sail. It took from midnight until 6 A.M., in the most bitter cold, to perform this operation, each time the sail was half-gathered up a fresh gust taking it out of our hands. However, during a lull, the sail was finally stowed, and all hands came down. senior apprentice went aft to the poop and asked if we could have hot coffee served out to us. This moderate request was, with considerable vituperation, refused by the captain. Grog was, in this

From New Zealand the ship proceeded to New-castle, N.S.W., and from thence to Guayaquil, the chief port of the republic of Ecuador. We arrived there at the commencement of the sickly season. The heat was intense, and even the natives would not work during the midday and hottest hours. But no such luxury for the crew could be tolerated. We, including the apprentices, worked at the cargo from 6 A.M. to 6 P.M., with the usual rests of one hour for breakfast and dinner. Of the seventen that formed the crew, eight died of yellow-fever and malaria. In a Norwegian ship lying close to us, where the men stopped work from 11 A.M. to 3 P.M., and were better fed, only one death occurred in a crew of nineteen.

occurred in a crew of nineteen.

I have given a few instances, out of the many that I have seen, of the treatment meted out to apprentices. While I was undoubtedly in hard ships, I believe that the majority are not a great deal better. There are, of course, a few firms where apprenticeship is not considered merely as a cheap method of manning ships, firms where the owners are upright, honourable gentlemen who see to it that their apprentices are properly fed, taught, and treated; but such firms are in a sad minority.

The moral to be drawn is obvious. Parents, do minority. not send your boys to sea while the present conditions exist. Should any one doubt these statements, let them consult the representative of the Mersey Mission to Seamen in San Francisco. This gentleman and his predecessors, where they were needed perhaps more than in any place in the world, have seen and know the conditions of an apprentice's life. They know how many apprentices used to desert from their ships and so ruin their careers. That the number of such desertions is less now is not due to better treatment, but to the efforts of these gentlemen, the pioneer of whom was the Rev. J. Fell, w counteract such treatment by sympathy, counsel, and healthy evening recreations. Their work has not been fruitless, for wherever the British flag flies and English keels plough the water one hears 'God bless the Padre in San Francisco!'

THE AUSTRALIAN BUSH.

No life, no stir, no sound save the sad rush Of the west wind within the trees. Now night Has spread her dusky pinions, and the light Steals from the forest glades, the purple flush Dies on the hills, and a deep roseate blush Fades from the far-flung clouds; all wan and white The slim moon sets; a myriad stars are bright Above this wilderness of virgin bush. Here day is dumb, and night with deep-drawn breath Sighs wearily, as one whose thoughts are cast Rver behind her to a distant past Of tender memories. The burning day Cares not for song nor music; on his way He moves from flaming dawn to fiery death.

SOME SORT OFHERO.

A SOUTH AMERICAN STORY.

By FRANK H. SHAW, F.R.A.S.

IN THREE CHAPTERS. -CHAPTER I.

TE. 35 8-

52. 100

đ ...

in:

10 10

3

8

N the night of the 17th of May 1905, the wife of the British Ambassador to the Estrellian Government gave a dance at her house in Calle 19 de Avrile. It was not a particularly elaborate dance, being entirely un-

official; but there were some notables there, and in spite of the fact that the thermometer stood at ninety-five in the streets outside, the dancing was carried on vigorously. There were half-a-dozen officers from a newly arrived British man-o'-war there, and these ingenuous youths threw themselves into the business of pleasure-making with that peculiar energy which is characteristic of the naval officer ashore.

But the outlook was frankly boring to Edward Seymour, the youngest attaché at the Embassy. He sat in a retired corner by an open window, and gazed with unseeing eyes upon the brilliant scene, the flashing uniforms and the swirling crowd of pretty Spanish faces, for he had been coerced into attending that night by the persuasions of the Minister's wife, who had held out veiled threats. In reality, Seymour was a mile and a half away from the Embassy; he was roaming at will through the narrow streets of what has been termed 'the wickedest city in the world, listening unsuspectedly to muttered conversations, watching the faces of men-peons of the docks, muleteers, discharged soldiers-for this was his hobby. He called himself a character-student; but as yet he had made none of his impressions known. He was a man of few words. If he had cared to speak out, it is probable that people would have listened to him entrancedly for half-an-hour, and then shrugged their shoulders and called him an alarmist. Therefore he never did speak out; instead, he watched and waited.

If he had, indeed, spoken he would probably have said that the city was a seething hotbed of anarchy, that revolution was stirring behind the sullen masks of the people in the streets, that harsh words

had been spoken about the President-men saying that he was a fool, a would-be purger of evil, a man who dwelt in the clouds, and who desired all others to share his radiant atmosphere. Therefore, such a man must be removed from office and from life at the earliest opportunity.

'I'll sit out another half-hour,' muttered Seymour to himself, 'and then I'll make my apologies and clear out. I'd give a month's pay to be out of this evening-dress and into my old sombrero and capa. But I suppose duty must be obeyed at times. Anyhow, I hope the poor old President will keep indoors to-night and the next few nights, since that infernal villain Casseras is in the city. With him about and at large, there's no telling when matters may reach a crisis. Although I've never seen the President to speak to, I like the man, and I'd not care to have him wiped out by a knife-thrust between the shoulders. I'll drop him a note and warn him; though I suppose he'll know all about it, and it really isn't my business at all. If it were found that a simple attaché of the British Embassy. were interesting himself in the internal affairs of this rotten city there'd be no end of a row.'

So he ruminated, being bored. He showed his boredom; so much so, indeed, that Lady Clavering smiled behind her fan on one or two occasions, and looked rather anxiously towards the door. In her heart of hearts the white-haired lady loved this cool, nonchalant young man, who reminded her of a certain young soldier who had been buried on the veldt a few years before. Apart from the dead Ronald, Lady Clavering had no children. She, being a judge of men, had long ago decided that Edward Seymour possessed many qualities that did not appear on the surface; and, being essentially a woman, she felt that something would some day give him a chance to show just what constituents went to his make-up.

And then, all suddenly, as these things do happen, **SEPTEMBER 7, 1907.**

No. 510. - Vol. X.

[All Rights Reserved.]

Seymour was arrested in his train of thought, and confronted with a vision from another world. It wasn't that a crown of the most glorious golden hair in existence was piled in careless masses on her head; it wasn't that the regular features of the highest type of Spanish beauty were combined with the creamy complexion of a British girl; it was more than that. There was something in the eyes, some indefinable charm that told of a spirit at war with itself; something in the proud carriage of the neck that told him he was face to face with the most noble woman in the world. He fell in love.

He rose from his seat hurriedly and made his way negligently through the crowds of dancers, on the command of Lady Clavering's beckoning finger. There was a certain pride, mingled with impish glee, in the old lady's eyes as she laid her hand on the white arm of the girl at her side, and spoke. 'I should like to introduce Mr Seymour, our latest acquisition at the Embassy,' she said. 'You have not seen him before, of course; he came after you went to Scotland.-Mr Seymour, Señorita Inez de Fuella, the daughter of the President.'

There was something dream-like about it all, thought Seymour, as he bowed gravely and watched the little flicker of amusement come into those glorious eyes. Five minutes before he had been distinctly out of love with himself; now he was doubly so, but incalculably in love with somebody else. And yet he was compelled to talk inane trivialities to his soul's queen, for how could she dream that he was struck to the heart by the first shot from Cupid's bow?

'Er-beastly hot in here,' he found himself saying; 'can't we find some place where it's cooler?'

But, said Inez with a merry laugh that rippled like golden music-'but you are already bored, Señor Seymour? Ah, you Englishmen! Always bored, always dreamy, always seeking for ease. I have come here to dance only, and I will dance until I grow too tired to stand.

'What beastly energy!' said the attaché sleepily. 'How can you keep it up here? But still-if you

insist-may I have the pleasure?'

The girl looked at him for a moment and took in all the particulars of his faultless evening-dress, his thin, clever face, his air of total abstraction, and the listless hang of his hands. Then she shrugged her white shoulders.

'After all,' she said to herself, 'he is like all the rest -a man of no ambition, of no achievements. And Lady Clavering spoke of him with such pride.' Aloud she said, 'If it is not too much trouble, Señor Seymour, I should like a dance.' He laughed at the thrust, and took her round the waist. Then Paradise opened its doors for him; and for many a long minute he dwelt on the threshold of another life, where love took up the harp of glory, and smote strange, head-turning, bewitching music from the strings. It mattered little that this was the prosaic twentieth century in a warful South American Republic, seething

with crime and petty strife; he was translated into a realm of eternal peace, far above a floor of golden clouds, where such music as can never be heard on earth was pulsating through the radiant ether.

Then the band stopped with a blare and a crash of chords, and he fell back to earth at one swoop.

Other men came or were brought to Inez after this epoch-making waltz, men who were scanned with eyes of hatred by Edward Seymour; for what hatred can equal that which is born in a man at the sight of other men claiming favours from the woman he loves? Swarthy soldiers took her through the mazes of sundry dances, cheerful sailors jogged gaily to and fro with her in their arms, and Seymour sat apart in his corner longing blackly for the heavily carved roof to fall in and crush sundry interlopers. Then a new hope was born in his breast: perhaps, after a time, he would have the chance of another glimpse of Paradise. He caught his breath at the thought. It would be quite respectable of him were he to solicit for another dance, and he did it. This, be it noted, was the man who had looked upon dancing as a waste of valuable hours!

'I am tired,' said Inez when he came to her with his request. 'I am also too hot for more dancing.'

'The patio is cool and refreshing,' suggested Seymour with something tearing at his heart-strings. He had seen from the first that Inez was not a girl to care about violating the proprieties if need were. He had noted, with that keen notice which some men give to small details, that she had come to the ball unattended by any duenna.

The patio was both cool and refreshing. It was also enshrouded in a rich, velvety gloom, and subdued chuckles and titters came to the ears of these two from an out-of-the-way corner, where a gleam of gold lace told of the presence of a naval officer. There were other chuckles also, in a soprano key.

Inez seated herself on the brink of the fountain, and listened to the sweet plash of the falling water. The leaves of the surrounding palms rustled weirdly in a faint breeze that was whispering overhead, and the stars of the South blazed fiercely in the purple vault of the night. Occasionally sounds of the street would come through the open gate of the patio-courtyard, as we should term it. There was the clang of a cable-car, the tinkle of an amorous Estrellian's mandoline, the scuffle of hurrying mules hoofs on the cobble-stones outside.

'You will catch a chill,' said Seymour after a long silence. 'The night air of Caleta Malo'-this is the name of the capital of Estrellia—'is very treacherous; and he wrapped a shawl about her white shoulders, trembling at the sweet intimacy of the act.

'You forget, señor,' said Inez a little pettishly, I am but newly returned from Scotland. I am accustomed to the night air. It is most refreshing

'All the more reason why you should take care of yourself,' returned her companion. 'But you say you were in Scotland. I know some people there. Where were you?'

'In Perthshire. My mother was born there. She was Scotch; that is why I am fair, I suppose, I have been through those glorious Trossachs, and have rowed on Loch Katrine. I have meditated on Ellen's Isle, and have seen the incidents of Scott's novels grow into rich reality as I watched the sunlight fall salant on the purple heather. Oh, those days of the past!'

'Present-day isn't such a bad time,' said Seymour,

who thought so.

'Pah!' No word can adequately express the scorn that made the girl's rich young voice tremble. She was a bare eighteen in years, but Southern women ripen quickly, and Inez was already a woman. 'Pah! This modern day! This effete present! Señor Seymour, listen to me. There are no men now to do things. They are all idlers, men who are bored. They let the days pass without a thought of the glories that have been. I have not yet met a man who stood head and shoulders over his compeers. Oh! there was something glorious and thrilling in the older days, when steel rang on steel, when men grappled with mighty issues, and fought like the heroes they were for the fair name of their ladies.'

'Yes,' said Seymour lazily, 'Scott used to take me like that too. But I got over it. It was rather a bore after all; it spoiled one's digestion. After an evening with Scott, too, I used to have dreams.

No, they were nightmares.'

'Ah! yes, that is too much trouble always.' She spread her hands out in a little gesture that showed her Spanish strain. It was as if she had washed her hands of the entire present generation, and was casting the soiled water away. Seymour was conscious mainly of an intense desire to seize those white hands, with their flashing rings, and crush them to his lips. He was compelled to hold on to the arms of his chair to avert the catastrophe.

'Have you ever read the lives of the men who found this country?' asked the girl after a long pause. 'I have read about them all. They were the men I could have loved. Ah!'

Even in the dimness of the night Seymour could

see the flash of her eyes.

'They took their fortunes in their hands, and with their swords cut their way to fame and high honour,' went on Inez passionately. 'They ventured into lands where all manner of devils and wild men lived; and caring for nothing but their fame and the honour of their ladies, they hewed them paths to the highest renown. Those were the men! Now, what is it? Men resent the very thought of action. If a crisis arrives they shrug their shoulders and say, "It is too much trouble." Señor, are you different from the rest? Have you ever done anything that you are proud of? No, I don't mean exactly that. Have you ever done anything that would cause the world to ring with your fame? Yet, why should I ask? I know what the answer will be.

'To tell the honest truth,' said Seymour, 'I find

doing things an intolerable bore. It is so much better to have a man to do it for you. Those dear old fellows you talk about, señorita, were fine chaps -yes, very fine indeed; but they were rather too strenuous for modern days. If a man were suddenly to start invading a country, and were to take, say, the President, and hang him up before a slow fire while he roasted appetisingly, as some of these old cavaliers of Spain did - well, there'd be a terrible to-do. It would get into the papers, and there'd never be an end of it. No, no, autre temps, autres mæurs. We men nowadays must content ourselves with sitting still. There isn't so much scope as there used to be, and we shouldn't want it if there were. As I said, this excitement of action is an awful nuisance.'

Once more that indescribable exclamation from the girl. The moon exept up over the wall of the patio, and shome down with a warmth that a Northern moon can never show. The sters seemed to blaze still more fiercely, and Seymour's heart had lost its steady beat. They were now alone. They had heard the clank of a sword and the froufrou of a skirt, and their unseen companions had vanished into the ballroom.

'But, tell me, Seeor Seymour, have you never done anything great? Have you nothing to look back on that brings the blood surging to your heart

with the memory of noble deeds?

'Well,' drawled Seymour, with the nonchalant air of a man towards a curious child, 'I once got sixteen not out in an Eton-Harrow match. I think that's about my only claim to fame.' He came of a stock and was the subject of a training that held the lauding of one's own deeds as a more heinous crime than murder. Otherwise, had he been so disposed, he might have told her tales of a wild, mad ride through the night with death pelting at his heels, with dark forms lurking in his path and rising to snatch at his horse's bridle, of red flashes piercing the darkness, of the sharp sting of a hostile bullet. But that was when he was in Russia on a holiday, and had no place in his conversation now.

'Ah! let us go in. I might have known that my dreams were but dreams. Ciel! but how I could love a man who had done some of these great deeds! I would fall on my knees and worship a hero, if there were one to be found. I only know of one man who is really brave. You saw him—Captain Gonzales—he who went down into Patagonia and pacified the rebellious natives there? He is writing a book about his adventures, and we shall then know how truly great he is.'

'Yes, if that man with the Wilhelm the Second moustache and the eyeglass is the man you mean, you'll hear how great a man he thinks he is, no doubt. But I have done something which merits your approval, Senorita Inez, though I should not have mentioned it, perhaps, if you had not dragged it out of me. I love you with all the heart that's

in me.

And on the heels of this astounding declaration, and because of the youth and the love that were in him, he took the astonished girl in his arms and crushed her to him.

She struck at him with her little hand, and a sudden wave of shame obliterated the glowing exultation that had come to him at the pressure of her slim young body.

'Let me go!' she panted; 'let me go! How

dare you? To think that I would allow a mere dilettante, a trifler, to love me!'

Seymour forgot all about his longings for his sombrero and capa that night, as he sat in his room meditating over the events of the evening. He was conscious of a pang of shame; but the fire of that stolen kiss burned his lips to distraction. He did not sleep at all that night.

(To be continued.)

CENTURY. OF HALF A MEMORIES

By R. C. LEHMANN, M.P.

PART VL

HAVE already said in a previous part of these 'Memories' (Chambers's Journal, 1903) that my father and mother had, at an early period of their married life, become acquainted with Charles Dickens through Mr and Mrs W. H.

Wills, Mrs Wills being my mother's aunt, and W. H. Wills being Charles Dickens's right-hand man in Household Words and All the Year Round. Dickens family and ours became great friends. father and mother were Dickens's guests at Gad's Hill on more than one occasion; my father was present at the marriage of his second daughter to Charles A. Collins (the brother of Wilkie), and both he and my mother were amongst those who had the melancholy privilege of being summoned to Gad's Hill to pay a last tribute of friendship and regard to his lifeless body.

The letters I possess from Dickens to my parents extend from 1860 to the 14th April 1870, the year of his death. Four of these have been already printed in the collection of Dickens's letters published by Miss Dickens and Miss Hogarth. Two I have printed in a former article. I have Miss Hogarth's permission to publish a selection from those that remain. I will preface them by a letter from my father to my mother, who was recruiting her health and that of her small family at Vernon Cottage, Shanklin, during July of 1860. The letter describes the festivities that took place at Gad's Hill on the occasion of the marriage of Dickens's younger daughter, Katie, to Charles Collins. In a letter of May 3, 1860, to M. de Cerjat (Letters, vol. ii. p. 113), Dickens says: 'My second daughter is going to be married in the course of the summer to Charles Collins, the brother of Wilkie Collins, the novelist. The father was one of the most famous painters of English green lanes and coast pieces. He was bred an artist, too, and does "The Eye-Witness" in All the Year Round. He is a gentleman, accomplished and amiable.'

My father writes from London on July 18: 'On Monday evening I went to the French play after a lonely dinner at the club. The piece, Pattes de Mouches, is excellently played and very French, a mere airy nothing. I enjoyed it as much as one

can enjoy anything alone. When I got home the butler was in bed, and there was nobody whom I could order to call me at 7 A.M. I regret to inform you that your great and infallible husband overslept himself, and awoke cheerfully at a quarter to nine. Hurrah! To be at London Bridge at 9.40 was impossible. Still, I rushed into my clothes, into a cup of coffee, and into a hansom, and arrived at the station at 10.15, just in time, not for the special, but for another train about to leave for those parts. When I arrived at Higham Station at 11.45 the stationmaster said the wedding would be nearly over, and I had better go at once to the house. So I did, and was overtaken on the road by the whole party coming in ever so many carriages from church. First Charlie and Katie, and didn't I give them a cheer! Then Wilkie, Holman Hunt, Tuck,* and Miss Crawford, who insisted on picking me up When the others joined us at the house the astonishment at my presence was general, as I had been given up, but Mamie rushed towards me and greeted me most affectionately—so I had lost the ceremony, but came in for all the essentials. Katie looked sweet in her bridal dress. There was a little exhibition of presents, the description of which I will leave to Tuck; and, in order to despatch the bride and bridegroom from the scene, I will say at once that they just sat down at the breakfast, to reappear again in travelling dress: Katie crying bitterly on her father's breast, Mamie dissolved in tears, Charlie as white as snow. No end of God bless yous; King John Forster adding in his most stentorian voice, "Take care of her, Charlie. You have got a most precious treasure." Shaking of hands, a vision of a postillion in red, a shower of old shoes, and execut Mr and Mrs Charles Collins.

'The party consisted of Mr and Mrs Forster, Tuck, Chorley [the musical critic of the Athenaum] Miss Crawford, Holman Hunt, Mr and Mrs Malleson, and Mr and Mrs Hulkes (neighbours), Uncle and Auntie [Mr and Mrs W. H. Wills], old Mrs Collins, and Mr Townshend. The house is a perfect gem-not a

^{*} Miss Chambers, my mother's sister, who was one of the bride's maids. She afterwards married my father's brother, Rudolf Lehmann, the artist.

Vernon Cottage for poetry, but a downright pretty, honest, English country house, red brick, and no end of smooth lawn. No great view, but everything that's pleasant and kind to the eye. The breakfast was a gorgeous affair. Everything on the table in the way of decoration was white, flowers and all. After breakfast (without a single speech, and only one toast) we had games on the lawn, and Aunt Sally was the great attraction. About three o'clock we all drove to Rochester, and had a good time in that delicious old ruin, Rochester Castle. . . . Thence to Chatham, where we listened to a military band performing in a park. The programmes handed round being signed, "W. Collins, Bandmaster," exposed Wilkie to innumerable bad jokes. About 6.30 we were back at Gad's Hill, had time for a game of croquet, saw the children of the neighbouring people get tea and cake, and went in to dinner at seven. I sat next old Forster, a most unmanageable, wild man, whom, however, I tamed successfully, at least for the evening. Dinner over at nine; a cigar in the garden; Tuck sings, to everybody's enthusiastic delight; a country dance; and we all fly at eleven to our special waiting our return at Higham.'

I now begin the Dickens letters:

'Office of "ALL THE YEAR ROUND,"

Tuesday, Sixth November 1860.

'MY DEAR MRS LEHMANN,—I have been in Cornwall and have missed your note. Came back only last night.

'It unfortunately happens that I am engaged to-morrow. Don't give me up because of my misfortunes. Have faith in me. Try me again, and your Petitioner will ever pray!

'I hear rumours that Mary is at the present moment advancing towards the Metropolis on crutches!—Ever faithfully yours,

'CHARLES DICKENS,'

Mary Dickens had had a riding accident, which is thus described in a letter from Dickens to Wilkie Collins (Letters of Charles Dickens, vol. ii. p. 129): 'I also found a letter from Georgina describing that Mary's horse went down suddenly on a stone, and how Mary was thrown, and had her riding-habit torn to pieces, and has a deep cut just above the knee—fortunately, not in the knee itself—which is doing exceedingly well, but which will probably incapacitate her from walking for days and days to come.'

When my father was proposing to go to America in 1862 on business he had the following letter from Dickens:

'GAD'S HILL PLACE, HIGHAM, BY ROCHESTER, KENT, Tuesday, Twenty Second July 1862.

'MY DEAR LEHMANN,—I write in the greatest haste, being pressed by all manner of business and botheration.

'Here is a note to Fields, who is a capital fellow and of strong English sympathy. So many years have passed since I was at Boston, and so many of the people whom I knew there have gone to that Far Far West which is behind the sun and moon, that I cannot hurriedly recall any other likely names.

'Heaven speed you in that distracted land of troublesome vagabonds!—Faithfully always,

'C. D.'

There follows a series of letters written in 1863, and relating to a family matter about which Dickens had consulted my father. He writes to him about it from Paris, where he had gone to give readings at the Embassy, and adds (3rd February 1863): 'If I had carried out my original intention and had Readings of my own in Paris, I don't know where they would have stopped. The Parisian audiences run away with them in a most astonishing and most rapturous manner.'

In 1865 my father and mother were to have been Dickens's guests at Gad's Hill. I find the prospect of this visit referred to in the following letter:

'16 SOMERS PLACE, Twenty Seventh April 1865.

'MY DEAR LEHMANN,—If I had not settled to go out of town between my two Nos. your kind note would have made sure of me at once. But I had, and settled it these ten days. It is really necessary to the pains I am taking with my book—always was indispensable to my working at my best—and has not become the less so as my botherations have grown taller. I can throw anything off by going off myself. Not otherwise.

'To-day I am going out to dinner for the first time. But whether I can keep a boot on, and get it on again for the Academy Dinner on Saturday, remains to be seen. If I can't, I shall go off on Saturday for a week. If I can, I shall go off on Sunday.

'Mary is going to propound to Mrs Lehmann a certain distinct time early in June for a visit to Gad's Hill, where I shall be heartily glad to see you and walk with you.—Faithfully yours always,

'C. D.'

It seems, however, that this visit did not take place, for on the 13th July of the same year Dickens writes to my father:

'My DEAR LEHMANN,—I was vexed that you were put off from coming here by the inscrutability of Mary's arrangements. But we will try the Fates again when you come back from Heligoland, and I hope they may be propitious. I have no present idea of being away from here for longer than a day or two together, until the Autumn is out.

'So I still hope to see you, and you must undertake to report your return. Meantime all good go with [you] and return likewise.—Faithfully yours always, C. D.'

Dickens's fondness for dogs is well known. Forster (*Life*, vol iii. pp. 191-193) gives an account of his favourites, Turk, a mastiff, 'a noble animal, full of affection and intelligence, whose death by

a railway accident, shortly after the Staplchurst catastrophe, caused him great grief. Turk's sole companion up to that date (1865) was Linda, puppy of a great St Bernard brought over by Mr Albert Smith, and grown into a superbly beautiful creature.' After Turk came Sultan, whom Forster describes as an Irish dog, given by Mr Percy Fitzgerald, a cross between a St Bernard and a bloodhound. It is not easy to understand how, with such an ancestry, he came to be Irish at all. Dickens, however, according to Forster, always protested that Sultan was a Fenian, for that no dog, not a secretly sworn member of that body, would ever have made such a point, muzzled as he was, of rushing at and bearing down with fury anything in scarlet with the remotest resemblance to a British uniform. In a letter to Mr Fitzgerald (Letters, vol. ii. p. 264) Dickens thus refers to him: 'Your mention of the late Sultan touches me nearly. He was the finest dog I ever saw, and between him and me there was a perfect understanding. But, to adopt the popular phrase, it was so very confidential that "it went no further." He would fly at anybody else with the greatest enthusiasm for destruction. I saw him, muzzled, pound into the heart of a regiment of the line, and I have frequently seen him, muzzled, hold a great dog down with his chest and feet. He has broken loose (muzzled) and come home covered with blood, again and again. And yet he never disobeyed me, unless he had Sultan's untamable first laid hold of a dog.' ferocity brought him to a tragic end. seized a little girl, sister to one of the servants, he was sentenced by Dickens to be shot on the following morning at seven o'clock. 'He went out very cheerfully, says Dickens in a letter to M. de Cerjat, 'with the half-dozen men told off for the purpose, evidently thinking that they were going to the death of somebody unknown. But observing in the procession an empty wheelbarrow and a double-barrelled gun, he became meditative, and fixed the bearer of the gun with his eyes. A stone deftly thrown across him by the village blackguard (chief mourner) caused him to look round for an instant, and he then fell dead, shot through the heart.'

The unfortunate Sultan was succeeded by Don, a Newfoundland, brought over to this country in early doghood by my father, and by him presented to Dickens. He and the St Bernard, Linda, another great favourite, became the parents of Bumble and another who survived their master. Here, in a letter to my father, is Dickens's recipe for a big dog's dinner:

'Office of "All the Year Round," Tuesday, Seventh November 1865.

'My DEAR LEHMANN,—The recipe for one dog's allowance is this: 2 pints oatmeal, 1 pint barley meal, 1 pound mangel wurzel, boiled together, and then mixed with pot-liquor, which is poured over it. If there be no pot-liquor in the house, a sheep's head will make it very well. Any bones that

happen to be about may be put into the mixture for the exercise of the dog's teeth. Its effect upon the body and spirits of the creature is quite surprising. I have my dogs fed once a day, always at the same hour.

'I am very sorry to say I cannot take my pleasure to-morrow, having to "make up" the Xmas No. with the printer. Always a tough job.—Ever yours,

The last letter I possess is written to my mother, and relates to a German translation of Edwin Drood, which was being written by an uncle of mine:

'Office of "All the Year Rouse," Thursday, Fourteenth April 1870.

'MY DEAR MRS LEHMANN,—I think the enclosed must have crossed a letter to Dr Lehmann from my publishers, whom I instructed to send—and who, I know, sent—the let No. to Hamburg for translation. All other Nos. will duly follow, and there will be twelve in all.

'If you pay to my account at Coutte's, at any time, £50, you will have done your duty in that station of life in which, &c. (see Church Catechim)

—Faithfully yours always, CHARLES DICKENE'

In Mr C. L. Graves's Life of Sir George Grove there is a letter from Grove (p. 97) referring to a dinner at our house in Westbourne Terrace some time in June 1863. 'On Thursday,' he says, 'we went to a great dinner-party there, followed by a musical "at home." At dinner were Dickens and his sisterin-law, R. Browning, R. Chambers, Miss Gabriel, and ourselves. It was very pleasant. Dickens was very amusing, but not the least forced, and Browning was also interesting. Dickens was full of a ship of Mormon emigrants which he had been seeing: 1200 of the cleanest, best conducted, most excellent people he ever saw.' I wish I myself could recall Dickens at dinner under the influence of cheerful company and pleasant entertainment. All I can remember, however, is our family tradition which has handed him down as the prince of companions, always brilliant, humorous, and delightful. I like to remember that my own father in such feasts of a later date as I can call to mind was haud impar congressus Achilli, even when Achilles was for the moment represented by Robert Browning or James Payn or J. E. Millais or Arthur Sullivan; for he was a man of commanding mind, well read, a fine musician, and of keen artistic sympathy. Above all he had, before illness came upon him and depressed his later years, a special gift of humour which rendered his society attractive to his friends. I may perhaps be pardoned on the score of filial piety if I give one example of that quality which was supplied to me, while the previous parts of these 'Memories' were appearing in these columns, by Mr Thomas Widdows, of Westcombe Park, S.E. Mr Widdows (whose permission I have to make use of his letter) wrote to me as follows:

'I have wondered what relation you were to a Mr Lehmann whom I met a great many years ago,

when an incident occurred which amused me extremely at the time, and which I have never forgotten.

'It must be thirty years ago or more [as a matter of fact it must have been in 1868 or 1869] when I was staying at Enfield from Saturday to Monday with an uncle of mine, an architect, Mr F. G. Widdows. He proposed on the Sunday morning that we should drive over and look at a house where he was carrying out extensive alterations for a Mr Lehmann, and we accordingly did so. The house was between Highgate and Hampstead [strictly speaking, it was a mile or so beyond Highgate, on the way to Muswell Hill]. I do not know whether my uncle wished to see Mr Lehmann on business, or whether, as he always took a great pride and interest in his work, he only wished to have the pleasure of looking at it, as the peasants in, I think, one of George Eliot's novels used on Sunday mornings to go and look admiringly at the ricks which they had thatched during the week.

'Mr Lehmann, however, very kindly showed me the house, and regretted that he could not take me into one particular room, as Wilkie Collins was at work there. We eventually got to the top floor, where we were joined by the builder, a Mr Colls. I suppose the staircases up to the last flight but one were of stone, but from the top of this last flight there was an arrangement for dropping a folded iron ladder which, opening by its own weight, would in case of fire give access to the

floor below. Mr Colls, in a quiet, mechanical way, just to show the perfection and simplicity of the arrangement, opened the trap-door, and had taken hold of the ladder, when Mr Lehmann from a little distance off said in a commanding and serious tone, "Stop! It is above all things necessary that I should understand the working of the arrangement." He then placed himself carefully where he could have a perfect view of the procedure, and, Mr Colls having the ladder ready in his hand, Mr Lehmann gave the word "Now!" Mr Colls thereupon let go, but the machinery did not work. The ladder was to fall easily when he let go, but it did not move; nor did a slight shake or two even effect the desired result. Mr Lehmann looked on solemn and expectant, and after a little time said, "Remember, the flames are roaring and raging around us." Thus urged, Mr Colls shook and shook again, all without result, till at last, when it was evident that it would not work at all, Mr Lehmann cried out, still looking on, "Great Heaven, this is death!" Mr Colls remained perfectly serious, and the whole incident, though I have imperfectly described it, was irresistibly funny.'

Many such scenes I feel that I myself ought to be able to remember. Gleams of them come to my memory, but when I try to grasp them they are gone. It gives me all the greater pleasure, therefore, to be able to set down Mr Widdows's story, which I recognise as highly characteristic of the man to whom it relates.

THE ROMANCE OF A FLOATING DOCK.

By ANDREW MARSHALL, Author of Comedy East and Tragedy West, &c.

CHAPTER VII.

HE sun rose higher, and about eight o'clock the *Vigilancia* swung round into a smaller stream, and, after half a mile of steaming and a prolonged shriek of her whistle, was run along-

side a rude jetty, where many stacks of firewood awaited her. Sandford saw the captain scramble up a steep path and disappear, and after a moment Don Santiago and his daughter also rose. Don Santiago gave her his hand, and they stepped ashore and followed the captain, glancing back as if they expected Sandford to follow, but he turned his eyes away. Soon finding, however, that he was alone on the steamer, he rose and looked about. No one was to be seen. He went ashore and climbed the path to the top of the bank, and found himself in view of some half-dozen palm-thatched huts. Two or three naked children of the same colour as the baked soil stared at him, and a dog barked viciously. Farther off stood a more substantial building roofed with large red tiles, its whitewashed walls discoloured by the damp of past years' rains for a yard above the ground. The door-posts had

been painted blue, but both blue paint and plaster had been rubbed off at the sides by many passers out and in till the brickwork showed naked in patches. Over the door was a weather-worn signboard on which Sandford made out with difficulty the words Tienda de la Santa Fé. He suddenly found that he was hungry, and entered. The landlord, a half-breed in white shirt and trousers, came forward and bade him good-day, motioning him towards the roofed portion of a half-covered courtyard. At a rough table with a white cloth were seated Don Santiago and the captain of the steamer. There was plenty of room. They saluted him politely, and he took a seat. A barefooted Indian girl brought him a bowl of chocolate, and Don Santiago pushed a plate of bread within his reach. He had scarcely begun to eat when a brown woman in a voluminous printed muslin dress and a white sleeveless chemisette entered, ushering in the young lady, placed a seat for her beside her father, and began to wait on her with eager assiduity.

The captain, having breakfasted, rolled and lit a cigarette, and, with the usual request for permis-

sion, rose and went away. Sandford, also muttering a formal 'Con permiso,' followed him, and watched while, with the help of a couple of Indians of the place, the men landed a few packages of the cargo and embarked as much firewood as there was room for. Then the captain sounded his whistle again. Sandford took his seat. Don Santiago came down in leisurely conversation with the proprietor of the tienda, who stood hat in hand as they stepped on board. The mooring-rope was cast off.

'Adios, señores, y buen' viaje!' cried the landlord, waving his hat.

'Adios, Pedro,' said Don Santiago, and 'Adios, Pedro,' said the girl, in what Sandford thought the sweetest voice he had ever heard.

The little steamer swung out from the landingplace, and, making a half circle, flew with the helping current. It seemed but a few moments when she turned once more into the Carrizal, and was again, with throbbing and pounding engine, forcing

her way up its stream.

The sun was high and hot when they set out again, but before long heavy clouds began to come up from the north, and the sky grew dark. Thunder growled, in the distance at first, but drew nearer and nearer till the lightning-flashes were instantly followed by reverberating peals. Then the rain came down in sheets, tumbling like a stream on the wooden awning, and hissing in the funnel, while blaze and crash became incessant and almost simultaneous. The storm raged for an hour and a half, and then ceased as suddenly as it had begun. The clouds in heavy masses floated towards the southern horizon. The sun blazed again overhead. The swollen river rushed along with a strengthening current, and the little steamer, to make better headway, sought the slacker water under the bank. Hour after hour passed as they battled with the rising stream. The country was flat and the riverbanks high, and there was no view beyond them. Now and then their intrusion raised a dove-coloured crane or a pink flamingo that slowly flapped away. Here and there on a muddy slope a crocodile lay basking, to dash into the water with lizard-like rapidity when one of the crew fired an ineffectual revolver-shot at it. Sometimes they saw an iguana asleep on a rotten branch of driftwood, or watched the orange and black orioles flashing round their hanging-nests. The girl read a book. What it was Sandford did not look to see. Her father

The sun had begun to decline from the zenith when the river narrowed.

'We are passing the big island,' said Don Santiago. 'We are taking the east channel to-day.'

'Is this not the usual route?' asked Sandford.

'It is a question of snags,' he replied. 'Sometimes one channel is better, sometimes the other. As we ascend the water gets shallower of course, and so obstructions get more frequent. Big trees brought down by the floods ground here and there, and then all sorts of debris accumulates behind them.

Indeed, this great island was originally formed in just that way.

They passed many such snags, with the brown water foaming over them. The largest of them all was a giant ceiba, which had grounded opposite a bend of the river. Several of its great limbs, partly broken and entangled, stood out above the water, which rushed foaming and roaring through them. Sandford stood up to look at it, and saw the captain at the steering-wheel forward. The captain shook his head and gave the tree a wide berth.

A short way above this bend the ground was higher on the left, and there was an opening in the jungle, where the perpendicular bank gave back and became a muddy slope, over which could be seen the palm-thatched roofs of a village. The whistle shrieked, and the inhabitants came out to look at their unusual visitor. There was no kind of jetty here. A few boys and bare-legged brown men came down the slippery declivity to the mud-bank on the water's edge. A rope was thrown from the steamer, and some of them with clumsy eagerness made haste to tie it to a stake driven into the mud. Then they waded into the water and got the end of a thin plank, which, with splashing and shouting, every one engaged and nearly every spectator bawling directions at once, was established as a gangway between the steamer and the land. The captain immediately went ashore by it, its centre sagging down to the water's surface with his weight. He was followed by the engineer, and they both scrambled up the bank and disappeared.

Don Santiago rose and took out his watch.

'We shall remain here probably for an hour or so,' he said, 'but I don't advise you to go ashore There is nothing to see, and the mud is deep and slippery. I have some business with the alcald, and I see he is waiting for me; and, begging to be excused for a few minutes, he crossed the plank in a gingerly manner and joined a stout man who had been politely waving a broad-brimmed hat from the bank.

As Sandford turned his head from watching Don Santiago's acrobatic passage across the unsteady gangway plank, his eye was caught by a figure on the other side of the river. It was an Indian in a canoe. The man was standing upright in his narrow craft, and, with a slender pole, pushing it up-stream in the shallow water by the bank. Then, choosing a moment, with accurate judgment of the distance and the power of the current, he turned its head slightly out into the stream, so that the current caught it. His calculation was so nice that it was swept downwards and across exactly to the steamer's side, the man holding up his pole, which was useless in the deeper water, and balancing him self easily in his cranky little vessel. As he came in he caught one of the stanchions of the awning and laid his canoe neatly alongside.

'Con permiso,' he said, as he made fast the painter of twisted bark. Then he took up a large fish in his hand and lightly stepped on board.

'Will you buy, señor?' he said with a persuasive smile, holding up the fish and pointing to another that lay in the bottom of his canoe. Sandford referred him to the captain, and, again begging permission, the Indian lightly crossed the plank and went ashore to seek that officer. Sandford was left alone with the girl, for the two hands forward were invisible behind the stacked firewood. He wondered whether he had better go ashore too. But, even while he debated with himself, Don Santiago and his companion and the place where they stood seemed to move slowly away. The steamer was swinging in the rising current. The plank slid from the gunwale and fell with a splash into the water. Sandford looked quickly at the mooring-rope. It had slipped and was dragging loose. Some one ran forward to catch it, but floundered in the deep mud and failed. The steamer's head swung round, and the full strength of the current caught her.

Sandford kept his head. He called to one of the

men to take the wheel, and himself sprang to the engine. But the engineer had opened the escape before going ashore, and had let his wood fire die down. Sandford turned on steam, but there was barely enough to move the screw. A glance at the indicator showed him that for the moment they were helpless.

'Get out the anchor,' he cried, jumping forward. 'Where is it?'

The two men looked stupidly round, for the anchor was seldom used. It might be under the firewood, or under the salt-bags, or perhaps in the hold. Who knew?

But the boat was by this time lying like a straw across the heaped-up flying water in the centre of the swollen river. The shore moved faster away. A dozen confused shouts from the people on the bank were answered incoherently by helpless cries from the two men on board. In a few seconds they were out of hearing.

(To be continued.)

THE INSURANCE PROBLEM.

By R. A. GATTY.

HE extension of the Workmen's Compensation Act to domestic service has sent a flutter of anxiety into every home in the land where servants are kept. Every day the post brings prospectuses of competing

insurance companies offering to take all risks at low premiums, and the mystified householder, to whom the Act is new, has to decide not only which office is safe and reliable, but to what extent he has to cover the risk of accidents to those he employs. For instance, during a spring cleaning he may call in a little extra assistance, and order a man to bring a ladder and clean the outside of his windows. Is he liable to pay compensation if the man slips on the ladder and breaks his leg or kills himself? It would appear that such is the case; and, if this is so, the only course left to him is to insure the window-cleaner before he commences his work, an expensive process for one day's labour.

Then, again, in cases where, more for charity than anything else, an old man is employed for such odd jobs as weeding the garden-beds or sweeping up dead leaves in the walks and carriage-drive, insurance may be necessary, for even in such safe employments old age is liable to accidents, and a slip and fall on the gravel may break a limb, and the responsibility will rest on the kind-hearted employer who gives the extra work from motives of charity. It is true the risks of accident are very remote in well-ordered households; but few, one would think, will be so unwise as to neglect to cover them. In fact, we are promised that very shortly insurance will be made compulsory, as it

is in Germany; and the present Act is only the commencement of a system which will deal not only with accidents, but sickness, total incapacity, and old-age pensions.

It is curious to observe the opinions of workmen themselves on the Compensation Act. It is not universally popular, as might be supposed, for it has already thrown out of employment many who, though they have passed middle life, are by no means incapacitated from pursuing their trade. In a word, employers no longer care to take on elderly men; and as the labour-market is, if anything, congested, there is no lack of young hands. I have come across many instances of this, where men little over fifty have found themselves turned adrift. The men of forty also feel their time is coming, and another ten years or so may find them in a similar position. It goes without saying that small employers of labour limit the number of their workmen as far as they can, and so the Act reacts adversely on the labour-market.

The Germans seem to have solved the insurance and old-age pension problems in a satisfactory manner, and the new Royal Commission is going to study their tactics. The German plan appears rather complicated through the number of different authorities brought into play, as existing friendly societies and others are supplemented by the State compulsory insurance. The entire system as controlled by the Government falls into three distinct categories—namely, insurance against sickness, insurance against accident, and old-age and incapacity pensions.

With regard to sickness, when a workman falls ill he gets from the outset free medical attendance,

and from the third day a sick-allowance of at least 50 per cent. of his average earnings. These privileges formerly ceased at the end of thirteen weeks; but now the period has been doubled. If at the end of that time he has not recovered, the chances are that he will be a suitable case for the incapacity insurance. Women in childbed are supported for a period of six weeks. The costs of the insurance are met partly by the workmen themselves and partly by their employers, who deduct their workmen's contributions from the weekly wages, and add thereto an allowance of 50 per cent. The actual insurance is effected through a number of different agencies. When the law came into operation it found many private associations of the friendly society type already in the field, and wherever possible advantage was taken of these institutions. A noteworthy development has been that these insurance companies have found it to their advantage to erect hospitals and convalescent homes where the sick can be rapidly nursed back to health. In case of the death of a workman, a sum of money is paid to his dependants. The sick insurance is only possible for those men and women who are in more or less regular employment.

By the accident insurance laws, all employes, or in case of death their dependants, are insured compensation for the consequence of accidents incurred in the course of their work. At first the injured man comes on the sick-fund; but after the expiration of the fourteenth week responsibility for his case is taken over by one of the insurance companies to which the employers transfer their risks. Meanwhile, from the fifth week of his disablement, his sick-allowance has been raised to at least two-thirds of his wages. When a workman is only partially disabled, he receives an allowance proportionate to the diminution of his capacity to earn a livelihood. In case of fatal accidents, the dependants of the deceased receive funeral expenses and a pension, which together must not amount to more than 60 per cent. of his wages.

In the case of old-age pensions and invalidation insurance, the object of the German Government is to secure a pension to all who have reached the age of seventy years, or before that age have been incapacitated by illness or bodily infirmity from earning a livelihood. Its provisions extend not only to workmen, but to clerks, shop assistants, and members of the teaching professions, whose yearly income does not exceed one hundred pounds. Certain classes of employés whose incomes are more than one hundred pounds, but do not exceed one hundred and fifty, are also admitted as voluntary contributaries to the scheme. The payments to the funds by employers and employed alike are made by means of stamps, which can be purchased at the post-offices, and which are stuck on a card. Each stamp represents a week's subscription. The stamps are fastened on the card on pay-day, and the employer is entitled to deduct one-half of their face-value from the wages of his workpeople. In

some cases this right is not made use of, the employer preferring to bear all the charge himself. This is frequently done in the case of domestic servants where good relations exist between them and their masters. The stamps required for a person earning a wage of fifty-even pounds amount to threepence halfpenny per week to effect this insurance, but are of course less for smaller wages. The insured must have contributed for thirty years or have been in employment for a specified time to secure a pension for old age, and for an invalidation pension contribution for a period of five years are required.

Such are the main features of the German scheme, which I have taken from the valuable statistics sent over by the Berlin correspondent of the Daily Telegraph. One of its most important provisions appears to be the co-operation of the master and workman in contributing to the State fund. When the onus of insurance is thrown entirely upon the employer it is apt to breed a sense of injustice, especially in the case of small business men who have to struggle along under great difficulties. A quarrymaster whom I know to have suffered severely in the time of bad trade found the ten pounds or so which his workmen's insurance annually cost him a great burden on the top of other hardships. Moreover, when an Act of Parliament enforces a payment of this kind, the workmen who benefit feel no sense of obligation to the master who has to pay. But supposing the workmen took their share of the cost, it would be in the power of the employer to promote kindly feeling between himself and them by taking the whole charge upon himself.

In framing these Acts of Parliament very little thought or consideration is shown for the aftereffects which may be produced, though harmony between employers and employed is the most important factor in all trades. The tendency of social legislation is to become one-sided, and not to recognise that there are two parties to be considered in all these changes of the law. The householders of England will not say 'Thank you' for their fresh responsibilities, and in one way or another those who benefit by the Act will be made to feel its natural consequences. People will do with fewer servants, and there will not be casual employment for old people to the same extent. It matters little what the premium may be which has to be paid by the householder; he will naturally feel that the State has added to his expenditure, and will resent it. This would not have been the case had the burden been shared between the servant and himself, and in most cases he would cheerfully have paid the whole sum.

While considering this question of State beneficence and care for the welfare of the bodies of its citizens, it is extraordinary how utterly regardles the State is of the savings which a workman during his life may have accumulated for the benefit of his children. I quote from a letter written by a

working-man as far back as the year 1898: 'SIR,—I am a working-man, and I was persuaded to invest the savings of a lifetime, nearly three hundred pounds, in 2½ per cent. Consolidated Stock at 111. It is now 108. Is it a swindle?' The gentleman to whom this was addressed wonders what the man's feelings must be, if he is still living, when he finds his interest cut down to 2½, and the value of his stock depreciated and standing at 84. That working-man is only one out of hundreds of thousands of unfortunate people who under trustee settlements were compelled to go into Consols.

Perhaps the transaction effected by the Chancellor of the Exchequer of converting 3 per cents. into 2½ may find its defenders among certain economists of a political school; but, looked at broadly from the standpoint of those who entrusted their substance to the care of the State, it savours very much of downright robbery. It is true that trustees have now enlarged powers, and give Consols a wide berth; but it is too late to save the enormous mass of people who were involved in this financial

earthquake, for it is nothing less. The political economists will say that the State should not pay more interest than is absolutely necessary, and that indirectly even the robbed holders of the stock benefit by less taxation; but this is the only possible defence, and a poor one at best. The inducement held out by the State to invest in its funds was their absolute security and safety, and relying upon these the victims took the bait.

People wonder why Consols do not rise. They would if there was a great demand, but happily trust funds are no longer compulsorily invested in them. No doubt if they were, and if confidence returned to the public, the price would again rise to a fair level, but at present there is no sign of it. Had the State really considered the pockets of those who entrusted their money in its funds, Consols would have been made redeemable at par after a certain period or after due notice; and it appears to me this would have been as important a matter as the consideration of accident insurance or old-age pensions.

A SHIP'S BELL

By W. E. CULE.

THIN two days of her destination, the steamship Northgate, of the Jellocoe Line—Captain Pritchard—Liverpool to Halifax, ran into difficult weather. The wind went dead east, blowing hard and attended by

the thick fog and sleet which invariably accompany easterly gales in that chilly latitude. The ship crept along at half-speed, feeling her troubled way with consummate care and with frequently repeated mournful echoes from her siren. But the fog hung before her like a curtain, stiffing the warning screams and muffling every sound aboard.

The captain and the second officer were on the bridge, chilly in their oilskins, and silent. There was nothing more to be said about the weather, and there was no cheerful influence to encourage conversation. Suddenly, however, an invisible sailor below struck an invisible ship's bell, whose notes broke the silence sullenly and briefly.

A moment later Captain Pritchard turned towards his subordinate. Tired of the weather before, he was now weary of the silence, and the voice of the bell had suggested a theme.

'I never hear a bell,' he said abruptly, 'without remembering something that happened when I was a child. Were you always normal, Gibbs?'

'Normal, sir?' asked Gibbs, an unimaginative young man from Newcastle.

'Yes, normal—ordinary, and not extraordinary.'
The captain did not express himself happily.
Apparently becoming conscious of this, he passed on.

'For my own part,' he said, 'I believe I was not. I must have been curiously fanciful. I remember some of those fancies even now. That affair of the bell, however, was not exactly a fancy; it might rather be called a curious experience. It did not trouble my parents much, so they must have explained it in some satisfactory way. I was too young then to be given the scientific explanation, and I have never troubled to get one since. Probably any doctor could give me one at five minutes' notice.'

What was all this leading to? The mate stood and listened very respectfully. It was sufficient for him that the captain was in a particularly good humour. Things might so easily have been worse.

The captain yawned as he proceeded.

'To come to the point,' he said. 'Two or three times during my childhood, before I was five years old, I suffered severe frights through hearing a bell ring when there was no bell near me, and when no one else heard it. It was either a hallucination or it was a disease; something due, I mean, to some defect in my auditory organs. But I certainly heard a bell ring on several occasions when no bell rang, and was extremely frightened in consequence.'

'Enough to send any youngster into fits,' ventured the mate, not a little impressed.

'Quite so! quite so! But I was, no doubt, a fairly healthy child in other ways. Now, I distinctly remember the last occasion, and the way in which I sobbed in my amazement and alarm.

It made such an impression upon my mind that

I can recall every detail.'

He moved to the end of the bridge and came back, staring intently but hopelessly into the white shroud on every side. The Northgate's siren gave a long, melancholy wail, and then dead silence

'We lived in a country cottage, semi-detached,' said the captain carefully, 'and an old lady who lived next door was a great friend of ours. On this particular day my parents were sitting at a little round table in the cottage of this next-door neighbour, an old woman of eighty. She, too, was sitting at the table, knitting, and I was sitting idly on my father's knee listening to their talk. I was a rather quiet child, and loved the company of my elders. I cannot remember the talk, but I recall the scene very distinctly. I was not facing the table myself, but sitting sideways to it. I can even remember a point like that. Suddenly, it seemed to me, a very awkward and somewhat startling thing happened. The old lady, who was knitting, had her wools upon the little table. As she moved her arm she happened to bring it into contact with a small hand-bell standing near her, and swept it clean off the table. It fell with a sharp doubleclang upon the stone floor, and there lay still.

'That, of course, was to me simply an accident. I had no doubt that the thing had occurred, that such an accident had happened. Under that impression, I turned half-round, waiting to see the old lady stoop from her rocking-chair, pick up the bell, and replace it upon the table. I was simply interested, and on the alert to handle a new toy. Most children, as you may know, enjoy playing with a bell.

'To my astonishment, however, neither of the others present paid the slightest attention to the accident. The conversation went on without a break, and neither the old lady nor my parents so much as glanced at the floor. I was surprised.

'After that came the sensation. I wanted to see for myself what had become of the bell, and in my movement to do so attracted my father's attention. He asked me what I wanted, and I told him I was looking for the bell which the old lady had knocked down from the table. They were so astonished that I had to repeat my explanation, and that more than once. Then I became alarmed, for I saw them look meaningly at one another; and my alarm developed into terror as I realised the truth. They had heard no bell fall, because no bell had fallen. There had been no such article on the table; there was no such article in the house!'

The captain paused, and the second officer pursed his lips in an expressive whistle. He felt that the shrouding fog gave a particularly uncanny cast to a story which was sufficiently mysterious without such a ghostly accessory. He also felt that henceforth the ship's bell, so ordinary a signal under the hands of the thoughtless apprentice, might have a new significance for him.

Captain Pritchard had finished his story, and was satisfied with its effects. 'Well,' he concluded, as he took another turn, 'you can imagine how such an incident would influence a rather shy, quiet child of four or five. It simply terrified me, and it was a long time before I could be soothed. I can even remember the assurances which my parents used, backed by the grandmotherly consolation of our old neighbour. There was nothing wrong, they said, nothing to be afraid of. There was really no bell, and the noise I had heard was caused by nothing more than a little trouble in my ears. Many people had had the same experience, and I would soon grow out of it.

There was a pause. 'I've heard, sir, of people suffering from fancies of that kind, said the mate reflectively. 'But I never heard a case given with so much detail, and so altogether remarkable. Were you ever troubled again in the same way?'

'Never that I know of,' said the captain. 'Appa rently I grew out of it, as my parents expected. The experience, however, made a deep and lasting impression, and I often recall it when I hear a ship's bell struck. Another result is a certain consideration which I feel for the sometimes unreasonable, or apparently unreasonable, fancies of children.'

The captain was a family man, a master-mariner of the best modern British type, with a skill in chess that almost equalled his love for the game, and with several good shelves in his cabin piled with the best writers in colonial and other editions. So the Northgate was a good and comfortable ship, and one of the best of a popular line.

'And that's a very good result, sir,' agreed the second mate. 'But have you ever told your story to a medical man?'

'No,' answered Captain Pritchard, 'I haven't Somehow, the opportunity hasn't turned up, or if it has, I have been reductant to relate what, after all, may be a very simple and easily explained affair. Indeed, I hardly know why I've told the yarn to you to-day. As far as I can recollect, I're never told it to any one else.'

The mate felt not a little flattered, but Captain Pritchard at once tried to cover the compliment with reservations. 'It is the weather, perhaps,' he said. 'It is bad enough to account for anything Six times I've sailed this course before, but never have I seen it so thick—not even in January. One needs to feel sure that there's two hundred miles of blue water straight ahead still.'

'Yes, sir. But I think it won't last much I notice the wind's going round a bit longer.

'Let's hope so. And now, Mr Gibbs, I leave you on the bridge for a few minutes. I'm going to get a cup of coffee.'

So, after another unsatisfactory look round, the captain departed, and Mr Gibbs roused himself to the responsibilities of his position. The Northgate was doing rather less than half her speed, and screaming at every step; but the fact remained that she was plunging along her course with little more than her own length clear before her. Her signals could be heard for perhaps a quarter of a mile, but still there was the element of risk and uncertainty. He stared straight ahead into the dense white wall, and in two minutes had succeeded in forgetting the captain's curious narrative. Almost immediately afterwards, considerably to his surprise, his chief once more mounted to the bridge and joined him.

'Almost as thick as ever,' he said grimly. 'Eh?'
'Yes, sir,' answered Gibbs. 'One might just as
well stare straight into a marble mantelpiece.'

Captain Pritchard made no reply. He glanced at the compass, noted what speed the ship was making, and walked to the end of the bridge and back. Apparently he was uneasy, and he had certainly lost that pleasant communicativeness of the last half-hour.

'He's a bit rawed,' thought the mate. 'In ten minutes, unless it clears a little, he'll put us on quarter-speed. And I sha'n't be the one to blame him.'

With that he descended the ladder, leaving the master alone. He had remembered something that wanted seeing to, and it was plain that Captain Pritchard was inclined to silence. Moreover, one man on the bridge was as good as two, and only half as useless.

When he reached the deck he went forward to speak to Collinson, a seaman who was standing in the bows. As he went he noticed that in all there were about half-a-dozen men on deck, one of them being the third engineer, then off duty. Afterwards he remembered precisely what men these were.

The second officer did not reach Collinson just then, for the incident of the voyage took place while he was yet three yards off. Suddenly and urgently tinkled out the engine-room bell, clear above the churning of the engines. At the same instant there was a hoarse shout from the bridge.

The bell had rung out 'Shut off steam!' but in an instant tinkled again 'Full steam astern.' After a long and fearful pause there was a sudden silence as the machinery halted in its motion; but the Northgate surged helplessly on through the white seas. Another instant and she seemed to be struggling with herself as her huge bulk answered to the engines.

A second afterwards the mate gave a cry. Out of the white wall before him loomed an almost formless mass, a vast black body pricked out in fog and snow. Another breathing-space, and they were on it, the Northgate's bows striking with a slock that threw the men off their feet. The bow-plates crashed in, and there was a sickening noise of rending woodwork. The great ship stood still and shivered as if she had received a fatal blow; but in a moment more her bows were clear, and the

hulking death in her course was drifting away into the mist from which it had emerged. When the first man from below came tumbling on deck there was nothing in sight to explain the disaster which had taken place.

п.

For a few seconds there were signs of panic, but it did not spread. The engines were still, and the Northgate rode shivering in the gray and silent sea. Then the captain's orders rang out from the bridge in straight, plain terms that gave no suggestion of danger, and immediately everything was done in the best order. All hands were on deck in three minutes as a matter of course, and it took no more than five to prove that the ship had suffered little damage. Several plates had been started, but there was no injury that threatened her safety. Just in time the captain had given his saving signal. Otherwise—

'Otherwise,' said Mr Gibbs under his breath, 'it would have been a hole in our bows big enough to build a house in, and about an hour to take to the boats. Captain Pritchard, I'll drink your health. You're the finest man in the North Atlantic to-day.'

'A derelict, I guess,' said the third engineer blankly.

'A Canadian timber-ship,' answered Mr Gibbs, 'waterlogged. Been drifting in these seas since the days of the *Flying Dutchman*, waiting for you and me. And we came.'

Then he turned to stare out into the blank wall of fog which had swallowed up the enemy. 'But it beats me,' he said slowly—'it beats me how the old man could have seen her!'

He put the question aside for more pressing matters during the next half-hour, but it was to come up again in a most bewildering form. That was when things had been made good as far as possible, and the first officer reported the Northgate rendy to resume her voyage. It was then that Captain Pritchard laid bare the secret of his action in a somewhat astonishing declaration.

'Confound it, Mr Bruce,' he cried anguly, 'do you think I'm going to steam away and leave the poor fellow to his fate? What do you take me for?'

The first officer's bewilderment was extreme.

'We're going to stand by,' declared the captain, 'till the weather clears a bit. That won't be more than an hour or two; but if it was a week it would be all the same. That man saved my ship, and I'm going to pick him off before I stir a yard.'

The first officer was a long-headed, cold-humoured Scot, who never lost his temper or his reason. While all the others stared at one another, convinced that Captain Pritchard's brain had been turned by the recent shock, he began to make inquiries.

'I beg your pardon, sir,' he said calmly; 'what man do you mean?'

'Why, the man on the derelict,' answered Captain Pritchard. 'The one who gave us warning of its

whereabouts by striking the bell.'

Again the clustered members of the crew glanced at each other for light. The first officer simply looked thoughtful, and preserved a discreet silence; but the captain, who knew these signs, waxed

'You were below, of course,' he said; 'but every one on deck can tell you all about it. If it hadn't been for that bell, sir, you'd be in command of the lifeboat by this time, with the Northgate settling by the head. That's all !'

But that was not all. A dead silence followed the speech, instead of the chorus of assurance and declaration which might have been expected from the watch on deck. It lasted so long that the captain was struck by its significance.

What in thunder is the matter with you all?' he rasped angrily. 'Where's the second officer?-Mr Gibbs, you were on deck; you heard the bell ?'

'Very sorry, sir,' said the second officer, 'I don't remember it. I didn't hear a sound. I only saw the hulk crowding over our bows.'

There was a pause. Every one began now to realise that there was a sensation afoot. Captain Pritchard turned to the third engineer.

'You heard it, Mr Knight?' he asked.

'I heard your bell ring in the engine-room, sir,' answered Knight. 'That was the first and only bell for me.'

The captain stared from face to face. Not one of the other few men of the watch came to his aid, and he realised what this meant.

'Very well,' he said grimly; 'but it was a good thing for all of us that I heard it, anyway. And we'll just stand by, Mr Bruce!'

Imagine, then, the Northgate, with her voyage suspended, drifting before the wind at the rate the vanished derelict had been seen to drift, waiting for the leisurely clearing of the weather. Imagine the captain, solitary and grim, on the bridge with his still useless telescope, the first and second officers conversing in low tones now and again, and the men attending to their appointed tasks with sly glances at one another that spoke louder than words. And under these strained conditions glances were certainly safer.

The point of it was that they were all dead against their shipmaster. Those who had seen the derelict were unanimous in their decision that there could have been no one on board; and Collinson, an experienced seaman, who had had the best view, was prepared to wager his last half-ounce of tobacco that she had been a sea-washed wreck for at least a year. As for the bell-

The man who thought most and said least was the second officer. He had something to think of, and his paucity of speech was due as much to his good feeling as to his good sense. He realised that the captain's story was really something confiden-

tial, and that he must not impart it to any one else. In this he was undoubtedly right, and his conduct gained its acknowledgment.

That was late in the afternoon, when the sensation was over. Meantime the new south wind gradually thinned the curtain of fog until the telescope could resume its ordinary functions with a good face. Then expectation became keen, every glass was brought into use, and every acre of the tumultuous northern seas was eagerly scanned. And more than a mile to leaward a black spot appeared and disappeared, looking like anything but a ship in the utterness of its ruin. But the engine-room bell tinkled again, and the Northgate steamed triumphantly on her mission of rescue.

During the next half-hour a curious silence held almost every one. They were in the grip of a mystery, but the circumstances were not of a character to encourage free comment or audible speculation. It lay between the captain on the bridge and the derelict on the water; and while no one expected the captain to win, it would not be politic to say so aloud. Indeed, the silence became even more general when they drew nearer, and were able to examine at leisure the helpless hulk which had

so nearly proved their ruin.

Once she had been a ship of some two thousand tons, but it was generally agreed that Collinson's estimate had been over-modest. Of course it was impossible to say when her ruin had come, but she had certainly been the sport and butt of the storms for a long cycle of months. There was no lift in her ghastly hull, but she lay like a log, with the seas breaking over her and their waters streaming through the gaps in her shattered bulwarks. Long ago the last fragment of her deck-houses had been swept away, but the stumps of three lost masts and a bowsprit still reared themselves in tragic mockery out of the ruck of disaster.

There was no sign of a name on her paintless timbers, no hint of life from stem to stern. For many minutes the glasses searched her in vain, and then, at a signal from the bridge, three shrill screams from the Northgate echoed over the water. After that a strained silence fell once more.

In response to another command from the captain, the Northgate moved round to leeward of the wreck, whose hulk was listed over to starboard. Then at two hundred yards they got a square view of her sloping deck, and there was no further question No human being could by any possibility have lived there. As she lay, her whole deck was naked to the seas, and in scores of gales the thundering billows of the wild North Atlantic had hurled themselves upon it and climbed in triumph over it Every fragment of furnishing had long been swept away, and she lay so deep that water could be seen welling from her gaping hatches as she rolled. There was no shelter on that hull for anything larger than a bird, no resting-place for any creature without wings wherewith to fly.

The men glanced at one another cautiously. Only

one or two could see the tragic side of the situation, while its absurdity was apparent to all.

Suddenly the captain spoke. 'Mr Gibbs, come up here.'

'Yes, sir,' said the second officer; and when he reached the bridge he found Captain Pritchard ready to speak.

'Mr Gibbs,' he said curtly, 'I was convinced that this morning I heard a signal from that hulk yonder—a bell. As a matter of fact, it is to that warning that we owe our escape. You follow me?'

'Certainly, sir.'

'Well, Mr Gibbs, I have eyes, and can see what is before me. But you know as much as I do, and I want your confirmation. After looking at that wreck, do you agree with my conclusion that the thing is impossible?'

For an instant they stood eye to eye. Then the second officer touched his cap.

'Nothing but a bird could live there, sir,' he said emphatically. 'It's out of the question.'

'Thank you,' answered the captain in the same curt manner. 'That will do.'

The mate turned and retired. The bell rang again in the engine-room, and instantly the propeller began to lash the gray water. But no man smiled as the Northgate resumed her voyage. That dismal spectre of loss and ruin, drifting upon a still and barren sea, had crept upon their spirits, and they turned their backs upon it with a great relief.

A simple entry in the Northgate's log gave particulars of an encounter with a derelict in a certain latitude and longitude during a fog, and described somewhat minutely the damage to the steamer's bowplates. The entry did not suggest that the escape was miraculous, and there was no mention of the bell mystery. The derelict, however, was duly reported on their arrival at Halifax, and was subsequently sought out and destroyed by a British gunboat.

The second officer went ashore, and one night told his story to a medical acquaintance in the port over a pipe and a glass. This auditor enjoyed the yarn greatly, and was ready with a practical explanation.

'Ringing noises in the head, of course, are no great mystery,' he said, and forthwith explained their origin and peculiarities. 'Nevertheless, I don't believe Captain Pritchard suffered in this way on this particular occasion. He simply imagined it. His early experience was upon his mind, and he was nervously anxious. He was listening, too, with all his ears, and possibly some kind of sound did come to him through the fog. And it adapted itself to his nervous condition of mind—to the peculiar trend of his senses. Indeed, with such a man in such a state of mind the experience is hardly ontside the range of natural phenomena.'

'But,' said Mr Gibbs, 'there's the result of it! It saved the Northgate and perhaps every man-Jack aboard her.'

'Ah,' said the medico reflectively, 'now you are going farther afield. What men call Providence—let us put it like this—what men call Providence has a curious knack of using human sensations—or perhaps we may say the human senses—for the good of the human, and in ways that can only make us wonder and admire. And if you want anything more direct than that, Mr Gibbs, you will probably get it from the first parson you care to apply to. It's their business to put these matters very plainly.'

The mate, however, was satisfied, and presently returned to the harbour and the Northgate. He sailed two more voyages with Captain Pritchard, but neither of them ever mentioned the mystery of the bell. It was just a trifle out of the normal, and could only be explained by a curious conglomeration of science and the supernatural. And as some plain men have an abhorrence of such phenomena, they were probably wise in refusing to discuss the matter at all.

CARRAGEEN.

By J. S. REDMAYNE, M.A.

ARRAGEEN is a substance the virtues of which were more widely known fifty years ago than they are at present. To be exact, carrageen in the raw state is a seaweed of a greenish-brown colour which grows

in bunches three or four inches long, and is found in plenty on the west coast of Ireland, and in lesser quantities on the west coast of Ross-shire, the Hebrides, and here and there on the east coast of our islands.

In its growing stages it is unlikely to attract even passing notice. But when torn up and washed about by the waves it gradually assumes a yellowishwhite colour; and when cast ashore, if left long enough beyond high-water mark, it gradually bleaches and dries into a crisp, shrivelled atom. But comparatively little carrageen ever reaches this dry stage—first, because, under the influence of sun and moisture, carrageen, if covered by other seaweed, quickly dissolves and disappears; and, secondly, because all animals and birds appear to be incordinately fond of it as food. That it possesses some valuable food-properties is clear by the manner in which most animals devour it when they find it.

At Ullapool, in Ross-shire, I have frequently been amused watching the eagerness with which the cows nosed it up out of the larger masses of other seaweed along the shore, and their curious rejection of all other kinds except the dainty bits of carrageen. The hens and chickens, too, search for

it, and even the dogs pick it out and eat it with evident relish. It is not, therefore, surprising to find that carrageen is amongst the number of those substances which are known as 'old women's remedies.' Indeed, amongst the 'wise women' of the peasantry on the west coast of Ireland carrageen was formerly in great repute as a sovereign cure for weak chest, influenza colds, and as being useful in the earlier stages of consumption and after rheumatic fever and all other ailments which are accompanied by considerable waste of tissue. How far the modern patent medicines and invalidfoods have penetrated into these western wilds it is difficult to say; but thirty years ago it was quite a usual thing to see old peasant women at Kilkee, on the west coast of Clare, collecting, bleaching, and drying large quantities of carrageen for use amongst the invalid peasantry. I fancy that the practice must be discontinued and the value of carrageen forgotten there now, because I have tried in vain to procure any when inquiring for it recently.

Carrageen was collected in small fragments (it is never found large), carefully separated from all other seaweed, and washed in fresh running water, and then spread on short grass to bleach and dry. Under ordinary conditions this process will occupy about a week, and cannot be hurried. The weed must be spread out thinly and turned every second day so as to expose every part to the air. To attempt to dry it close to a fire would probably cause it to partly dissolve (such is its nature); but in we weather, after it is bleached in the open air, the drying process may be conducted under cover so long as it is turned over once a day and exposed to the air.

When dry, it will keep good for years if put away in a warm place free from moisture. It is not desirable to store it in a box; a sack or bag is better.

When it is required for use, the mode of preparation is as follows: Take a handful of the dried carrageen and sprinkle it loosely into a jug, pour on it a pint of boiling water, and stir. The water must be boiling, and then the seaweed will gradually dissolve to a considerable extent into a glue-like mass. This should then be placed in a covered pan to stew slowly till the greater part of the weed has A few of the tougher stalks may be dissolved. allowed to remain undissolved. When it has boiled for about twenty minutes, add a quart of new milk and stir till it boils, and then strain through a fine sieve, taking care to rub the jelly-like seaweed as much as possible through the sieve with the liquid, which is then flavoured and sweetened to taste and set aside in moulds to cool. The result is a stiff grayish-white pudding with a curious sharp fracture when broken-quite unlike that of either ordinary jelly or corn-flour. It is eaten in this form, and is an excellent food for invalids suffering from loss of tissue. The undissolved portions of the seaweed left in the sieve may be boiled up and used

My impression is that carrageen supplies just the very elements required by nature to make up lost tissue after any wasting illness, such as influenza, and that herein lies its special value. Without being a professional medical man, I know of many cases where its use has produced marvellous results, and particularly in curing difficult cases of chronic indigestion which no other remedy seemed able to touch. In this twentieth century we are, perhaps, too apt to think lightly of old-world remedies, forgetful of the fact that while the people who have for a long time made use of these simple medicines may have had no scientific knowledge of their constituents, or why they were remedies at all, yet they had, at any rate, a wealth of experience older than the data of many modern pharmaceutical chemists' text-books. On the west coast of Scotland, the money-value of carrageen found there is quite unrecognised at present, and I have had difficulty in persuading small boys that I was not an amiable lunatic in offering them pennies to collect carrageen for me along the shore, and when I did succeed, that one variety of seaweed was not just as good as another. But I never visit the west coast of Ross shire without bringing back with me a large bag of dried carrageen as being the most useful pick-me-up and cure I know of for influenza and such-like ailments. Since writing the above several friends suffering from (1) after-effects of influenza, (2) chronic weak digestive organs, have used carrageen

with excellent results.

[Mr Redmayne has discovered for himself what was fairly well known to a past generation, as the recipes given below demonstrate, taken from a druggist's label of fifty years ago. The label was furnished by Mr W. Gilmour, 11 Elm Row, Edinurished. The old spelling of Carrageen is identical with that of the place Carragheen, near Waterford, Ireland, where it was found abundantly.

CARRAGHEEN OR IRISH PEARL MOSS.

Directions for Making Jelly.—Steep a quarter of an ounce of the moss in warm water for half-an-hour, then take it out, shake out the water, and boil it in a quart of new milk until it is of the consistence of warm jelly, strain, and sweeten it to the taste with white sugar.

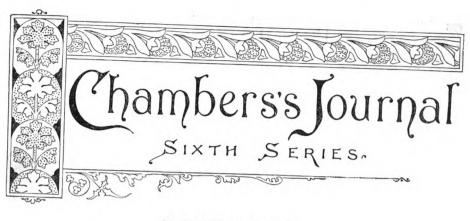

For Consumptive Persons.—A small tea-cupiul should be taken in the morning, and repeated every four hours.

For Catarrhal or Consumptive Cough.—A tea-cupful of the jelly should be taken at any time when the cough is troublesome.

To Make Blanc Mange.—Prepared in the same way, boiling it until it becomes sufficiently thick to retain the shape, and sweeten it with sugar.

To Make Jelly.—After washing the moss boil it in water, carefully straining it, and add the usual flavouring.

For Soups.—Boil the moss in a little water, and then add the strained liquor to the soup.]

MONEY-MAD.

By T. C. BRIDGES.

ie:

*

HERE appeared recently in a London daily paper a letter on the miseries of two thousand pounds a year. Ludicrous as such a complaint seems to most of us, the writer really made

out a very strong case. He pointed out that he had to rent a house in town, to keep a motor, and to entertain. Most of his own circle had from two to five times his income, and spent it, with the result that he found himself the earthen pot among brazen vessels, and lived up to his neck in debt.

The mere fact that any one could consider himself poor upon an income of forty pounds a week is proof-positive of the amazing extravagance of modern life. Incomes are growing so rapidly that a man who twenty years ago was considered wealthy is now only moderately well-off; yet, in spite of the increase of wealth, expenditure is more than keeping pace with it.

American millionaires, with their bottomless purses, first set the foolish example which others with less money but equal lack of sense have since followed.

The American watering-place Newport is known as the town of millionaires, and it is the thing for all the wealthiest New Yorkers to have a house there. Now, New York hostesses are bitterly jealous of one another's claims to social supremacy, and the result has been that when a number of these millionaires' wives find themselves cheek by jowl in little Newport the rivalry becomes intensified to an unheard-of degree. In a recent novel there was a delicious description of guests at a Newport house shrimping in an artificial lagoon for sham oysters with real pearls in them. Fiction here hardly outstrips fact; for American papers are full of descriptions of tramp dinners, snake - weddings, appendicitis - suppers, and every freak - entertainment which the mind of the money-mad can possibly conceive of.

The amounts lavished on performances of this kind are almost incredible. Sums which would No. 511. -Vol. X.

build a steam yacht or purchase a twelve-inch gun are flung away upon a single evening's amusement. Of all the magnificent mansions in Newport, the most splendid is Beaulieu, the home of young Mrs Cornelius Vanderbilt. The brilliant idea occurred to this lady to give at a private entertainment the play Wild Rose, then drawing large audiences at the Knickerbocker Theatre in New York. To enable her to do this, it was necessary, first, to buy up every seat in the theatre for that particular night, to pay the expenses of the whole company-more than one hundred in number-from New York to Newport, and to erect a temporary theatre in the Beaulieu grounds. Five hundred guests were asked, and afterwards a dance was given on a floor laid upon the lawn. The grounds were turned into a fairyland by lavish use of electric lights and flowers; there were three bands, and a supper of unparalleled perfection. No outsider knows precisely what the bill was, but five thousand pounds is the lowest estimate.

Mrs Vanderbilt got something for her money. Her guests all vowed they had had a 'perfectly lovely' time; and as no one but royalty had ever previously given a 'command performance,' she herself gained enormous social prestige. But not the most distorted imagination can conceive that the guests at a certain Californian supper, which certainly cost a great deal more than Mrs Vanderbilt's entertainment, got any good out of it. The supper was given by a young millionaire (who shall be nameless) to his bachelor friends on the eve of his marriage. By way of showing his contempt for mere money, he ended the supper by jerking the cloth off the table, and sending a costly dessertservice to smithereens on the floor. Not to be left behind, a guest jumped upon the table and pulled the chandelier out by the roots. Then the fun became fast and furious. Some flung full bottles of champagne at the mirrors; others ripped the carpets and broke up the furniture, which they then proceeded to make a bonfire of. Everything they could lay their hands on was piled on the fire, including [All Rights Reserved.] SEPTEMBER 14, 1907.

costly ornaments and even their host's wardrobe. Finally, having practically wrecked the whole house, they all had a bath in champagne. How well and happy they must have felt the next day!

Please do not imagine that mad expenditure is confined to the United States. London sees extravagances of the most amazing kind, though fortunately our newspapers do not encourage them by double-leaded headlines, as does the yellow press of America. There was, for instance, the 'gondola dinner' at the 'Savoy,' when the 'Savoy' courtyard was transformed into a lagoon, adorned with exquisite flowers and lit by an artificial moon. Within a few minutes after the order for the dinner had been given, one hundred and fifty electricians, carpenters, and scene-painters were at work; and the marvellous part of the performance is that the whole preparations, including even the fancy-dress costumes for the waiters, were completed within twenty-four hours. This dinner cost its giver, Mr George A. Kessler, a trifle of three thousand

Then there was the Kimberley diggings dinner, given to Mr Harry Barnato at the New Gaiety; and the freak-entertainment for the choir of Austrian millionaires, where fountains flowed, in good old fairy-tale fashion, with real champagne.

The ordinary evening parties of London's smart set make money run like water. It is nothing nowadays to pay the principal singer at a musical 'At Home' three hundred pounds for singing a couple of songs. A second will get a cheque for fifty pounds, and a popular actor twenty-five pounds for a short recitation. Flowers, too, cost fortunes. At one such entertainment last summer, the whole house was decorated with masses of orchids—purple, cream, scarlet, and white. The bill for flowers alone was four hundred and eleven pounds; and within the next day or two, four hundred and eleven pounds worth of orchids were swept out and carried away in the corporation dust-cart.

For another entertainment—a dinner-party

merely—the flowers cost three hundred and eightythree pounds. They consisted of pale pink roses of a special kind and lilies of the valley. These roses cost a trifle of half-a-crown a bloom, and the lilies of the valley were one shilling a spray.

For food alone the sums expended are almost incredible. The great idea of the smart-set hostess is to feed her guests upon delicacies as entirely out of season as possible. There are dishes of December green-peas at seven-and-six a spoonful, asparagus at half-a-crown a stick, winter strawberries at two guineas a pound, and marvellous peaches at a sovereign apiece. Another enormously costly dish in great favour just now with those who have more money than they know what to do with is truite au bleu. To secure the absolute perfection of flavour it is essential that the trout shall be alive when they reach the hands of the cook. The fish must therefore be brought, in special tanks laden upon special trucks, from the river to the kitchen, and the water

must be kept constantly aerated or the fish will die. A single dish of truite au bleu may very well cost twenty pounds. Quails stuffed with ortolans, Chinese birds'-nest soup, and kangaroo-tail soup are other items of the modern millionaire menu. Lucullus spent a sum equal to seventeen hundred pounds of our money on a single meal. It is confidently affirmed that a London hostess recently entertained sixteen people to a dinner which cost for food alone thirty guineas a head.

for food alone thirty guineas a head.

The salaries paid to the men who prepare the food are equally beyond reason. Plenty of chefs in private houses receive from eight hundred pounds to fittee hundred pounds a year, and such men are, as a rule, extravagant to a degree. One young English peeres, whose husband has an income of nearly a thousand pounds a day, was so disgusted with the waste of costly food which she found in her country house that she dismissed the chef and engaged instead a woman-cook at sixty-five pounds a year. She declares that her household now fares just as well at one-third the former cost.

There is a story that the Sultan of Turkey once

found a favourite son in tears. Asked the reason, the boy said, between sobs, that his father had made him an admiral; but what was the good of that when he could not see his ship from the nursery window? 'We will arrange that,' said the Sulian, and at once ordered that a man-of-war should be brought from the dockyard and moored in front of the Dolmabagtcheh. He was told that the new bridge, nearly completed, was in the way. Then pull it down, and rebuild it later,' said his Majesty coolly; and the order was carried out at a cost of something like one hundred thousand pounds.

This yarn savours somewhat of the Arabian Nights, but it is merely typical of the power of unlimited wealth; and there are plenty of modern millionaires who indulge their lightest whims with equal carelessness of cost. A young Frenchman who had lately come into a gigantic fortune strolled one day into a menagerie at Cherbourg. The anionals alleviated his boredom for the moment; and, walking up to the proprietor, he asked what he would sell out for. 'A hundred thousand francs' (four thousand pounds), was the reply. Without another word the youth wrote a cheque, and ordered the whole collection to be sent to his country house.

Mr Charles Fleischmann, an American millionaire, is himself the architect of his own fortune; but, unlike most of his countrymen, he has retired to a country house in the Catskills to enjoy his wealth. Being devoted to the American national game, he keeps a dozen of the best baseball-players in the country at his house, pays them thumping salaries, and treats them like princes; and when he feels in need of a little recreation, asks them to play before him on one of the several excellent grounds which he has made near his house.

It occurred to another of these money-kings, Stephen S. Marchand by name, to distinguish himself from other men by the possession of the most self from other men by the possession of

beautiful bedchamber-it would be profanation to call it bedroom-in the world. So in his new house he had a first-floor room constructed, elliptical in shape, seventy-six feet long and twenty-two feet The walls he had panelled with costly carved woods at the trifling cost of twelve thousand eight hundred pounds. The panels were hung with purple-and-gold Genoese velvet at seven pounds fifteen shillings a yard. There are twenty-eight panels, and for each ten yards of velvet were used. To adorn the ceiling special artists were brought from Paris, and these decorations cost nearly four thousand pounds. The chairs are of solid carved ivory, with ebony-and-gold inlay; the chimneypiece cost twelve hundred and thirty pounds; the washstand, seven hundred and ten pounds; one cheval-glass, seven hundred and thirty pounds; and other furniture in proportion! But the crowning glory of this amazing apartment is the bed. This, like the chairs, is of ivory and ebony, marvellously carved; and it is said that in order to procure a tusk large enough to form its head a special expedition was sent to Africa at a cost of four thousand pounds. The carving employed the time of four skilled artists for two years, and the bill for the bed alone reached a total of thirty-eight thousand pounds. The completed room represents an outlay of one hundred and ninety-three thousand seven hundred and fifty pounds, or, say, an income of about ten thousand pounds a year.

Speaking of beds brings to mind a whim of the French Marquise de la Roche Fontenille. When confined to her room by illness, she had the quilt entirely covered with orchid blooms, which were renewed three times a day. The result of this and other like extravagances was that the affairs of the marquise were, according to the wise French law on the subject, placed in the hands of trustees.

A popular craze of the day is the lavishing of small fortunes on pets. Gold collars studded with precious stones are clasped round the necks of lapdogs, and a San Francisco lady's cat named Beauty walked abroad adorned with diamond earrings and a gold necklace. Parisian-cut garments and dainty manicure sets are provided for the delectation of these pampered pets. Pet-dogs have their travelling-costumes, their night-shirts, their boots, and monogrammed handkerchiefs. When washed, yolk of eggs is used instead of soap, lest their tender skins be irritated; and when one of these poor little brutes becomes ill through over-feeding, its dainty appetite is tempted with chicken, partridge, and sweetbreads served on silver dishes.

The record in wasteful expenditure of this kind was probably reached by the American lady who owned three pet-dogs known as the Bat-eared Babies, and valued at two thousand five hundred pounds apiece. They had a special maid to look after them and a footman to exercise them. The former received seventy-five pounds a year, and the latter the comfortable salary of one hundred pounds. The clothing of each dog costs one hundred pounds a

year, and for their food the bill was ten shillings a day. The owner of these dogs had a miniature of them painted by the famous animal-artist Mrs J. C. Chandler, which was set in a gold frame surrounded by diamonds and pearls.

So much has been written of late about the extraordinary sums spent upon dress and personal adornment by the modern society woman that there is little to be added. It is a sign of the times that quite young girls think two hundred pounds a year an allowance upon which it is barely possible to present a decent appearance. Their mothers were passing rich on fifty pounds a year.

Perhaps it is in toilet accessories, more than in any other direction, that the feminine spendthrift lets herself go. The Empress Poppæa used to keep a troop of asses to supply milk for her baths. The ultra-fashionable woman of to-day does not stop at baths of milk. She daily empties whole bottles of costly essences and scents into her silver or marble bath, and pays literally any price for a new and distinctive perfume of which she can retain a monopoly. The wife of a Chicago millionaire has a small factory at work for her distilling scent from a certain variety of water-lily. It takes many tons of these lilies to make a four-ounce bottle of the perfume, which is valued at the incredible sum of twenty-five pounds a drop.

Some people seem literally to have more money than they know what to do with. In February last a young man crossing the Atlantic on the Kaiser Wilhelm II. distributed six hundred pounds in tips among the stewards. One got five pounds for bringing him a cup of coffee, another four pounds for opening a bottle of wine.

Some aver that extravagance of any kind is good for trade and therefore to be encouraged. There may be a modicum of truth in this statement; but if making money 'roll' is good for trade it is bad as bad can be from every other point of view. Nothing demoralises labour worse than the prodigal distribution of money which has not been justly earned. Besides, it is a selfish performance; for others not so well off, or not so extravagant, fail in consequence to get the service which they pay for and are justly entitled to receive.

But the worst harm that the money-mad do is the vile example which they set. Mrs A. does so and so, therefore Mrs B. must do the like. B. is only half as rich as A., but that doesn't matter. And Mrs C., observing Mrs B.'s new motor or sables, must have the same. So it goes on; and presently C. finds himself in the Bankruptcy Court, and B. has to sell his place and go abroad.

The canker runs, spreading lower and lower, through all classes of society. The shopkeeper is no longer content to live over his shop, the maid spends every penny of her wages on her back, the mechanic's wife runs into debt to the tallyman, and the love of luxury and consequent decay of morals affect the whole nation from the highest to the lowest.

FLOATING DOCK. THE ROMANCE A OF

CHAPTER VIII.

HEN Don Santiago saw the steamer moving from the bank he ran quickly forward, but he was too late, and the loose mooring-rope was already beyond his reach. He saw Sandford spring into the engine-well and turn

on the steam, and he also saw the feeble response of the screw. Then he knew that the engineer, on coming ashore, must have let his wood fire die down. He heard Sandford's shouted order to the men to get out the anchor. The piles of billets hid the two men from him, but, as the order was not obeyed, he guessed that the anchor was not available, perhaps not even on board. He saw his daughter standing up. She did not look frightened. The vessel was quickly receding, and presently was too far off to distinguish what was doing on board. He saw her swing broadside to the current, and knew by that that she was helpless. Still he did not think her in danger. The Englishman seemed alert, and was probably clever enough to get the fire going. The wood would burn up quickly, and, steam once obtained, she could be steered and brought back. At the worst, she might drift on the bank and stick there. It was impossible to follow her down the river-side, for the impenetrable jungle began close to the landing-place. He looked round for a boat, but there was not one

'Have you not a canoe?' he said to the alcalde.

'Yes, Don Santiago, of course I have a canoe, but it is round in the arroyo.' This was a muddy brook flowing into the river a quarter of a mile farther up. 'Here, Juan! Pedro!' he cried to two men standing by, 'Run and get the canoe.'

'A dollar to each if you are quick!' cried Don Santiago, and the two men whom the alcalde had called set off at a run with several others of the bystanders. Meantime the Vigilancia drifted quickly out of sight round the first bend of

The alcalde suddenly struck his breast. He the river. remembered that the canoe had been sent to a

planted clearing for a load of corn.

'Carrai!' he said, 'if they have begun to load her, these fellows will dispute whether she should be brought as she is or unloaded again. I will myself hasten, señor. You had better remain here in case they should be already on the way round.' He bowed and hurried away.

Don Santiago was helpless. By this time several more of the inhabitants of the village were standing round him, full of interest and eager to help

and advise. 'Do you know,' he asked, 'if that canoe has oars?

'Yes, señor,' cried several voices, 'two oars.'

'And who are the best rowers?'

They looked about among themselves. 'Juan, señor, and Pedro. They have gone for

He tried to think of what might possibly be the canoe.' needed. Then he took a coin from his pocket. He knew that the alcalde kept a general store.

'Look,' he said to the lad nearest him, 'run quickly to the bodega for two coils of strong

rope.'

'Yes, señor.' The lad darted off up the slope

to the village. It seemed a long time before the men appeared coming down the river with the canoe. The alcaldt himself was in it. It was a big clumsy boat, cut by hatchet out of a great cedar trunk, and had in the bow two heavy ill-balanced oars, each tied with rope to the front of a single thole pin. The men rowed in a short jerky style, making 110 attempt to keep time with each other, and impeding the boat's way at every stroke by their bad recovery. But they were strong fellows, not easily fatigued, and their pulling, uncouth as it was, sent the boat on faster than the current.

Don Santiago got in quickly and they pushed off, the alcalde steering with a third oar put over the side near the stern. The captain and the engineer now came running from the village 10 the top of the bank and shouted, but Don Santiago would not stop. The alcalde skilfully turned the boat to the swift current in the centre of the river, and they sped downwards. Quickly they rounded the first bend, and at once came in sight of the half-submerged branches of the giant ceiba with the brown water foaming through them. But beside them there was now something else. At first they could not make it out.

Then the alcalde cried, 'Dios mio! It is the

chimney!'

It was indeed the funnel of the Vigilancia slanting upwards from the rushing water. Immediately they were able to distinguish the tiltedup edge of her wooden awning with two figures

Rowers and steersman began shouting contraclinging to it. dictory advice, no one listening to another. They stopped rowing, but the current bore them swiftly on, and the alcalde kept away a little. He did not dare to run right on the snag for fear of being swamped, and yet, once past it, it would be next to impossible with their oars to bring the boat up again. But Don Santiago was a man of experience and swift resource. He unwound one of the colls of rope, and, taking an oar from the hands of one of the rowers, he quickly knotted one end of the rope securely round the middle of it, giving it several turns so that it should not slip. Then, kneeling in the bottom of the canoe as they passed the tree, which lay with its head up-stream, he launched the oar, harpoon-fashion, through the submerged branches. In spite of his precaution, his effort nearly upset the canoe. Recovering himself, he quickly gave the other end of the rope a couple of turns round the thwart. As it dragged, the oar, being tied by the middle, was pulled across the branches and held there. Letting his end run a little, Don Santiago brought the canoe up with scarcely a jerk, and it hung in the current securely anchored to the ceiba, while the Indians looked at him with admiring respect.

Then he saw that the figures clinging to the awning's edge were the two steamer hands, and his heart sank. But he did not lose his head. The strain on the rope was considerable, and he uncoiled the other and threw an end of it to the men, telling them to make it fast to one of the awning stanchions. There was nothing to be seen of his daughter or the Englishman.

'Where are your passengers?' he cried.

The men only shook their heads.

The canoe was now cautiously hauled up alongside the wreck, and the two men taken on board. Don Santiago asked again for the lady and the other passenger. The men did not know. They had themselves scrambled quickly to the top of the awning. There was no time, they said, to do anything but try to save themselves. They could do nothing to help the passengers. The steamer had struck the snag, and turned half over and filled in a moment. They were forward, with all the stacks of firewood and cargo between. They could not see the lady and the senor. No doubt they were drowned, said one of the men, and the other, who wore a little picture of the Virgin on a string round his neck, made the sign of the cross.

With despair Don Santiago looked over the side into the brown water which foamed through the sunken steamer. It was somewhat muddy with the first freshets, and he could not see far below the surface. Could his daughter and the young Englishman have been entangled below? Or had they been washed out and carried away by the current?

The Indian of the upper waters of the Moyocuilean rivers, although unskilled in the art of rowing, which on his own account he never practises, being content to go down-stream with the current and up-stream by poling alongside the bank, is nevertheless a perfect swimmer and diver. He is quite at home in the water, in which indeed he spends a large part of almost every day. Juan and Pedro immediately offered to go down and make a search, and, fastening a rope round his arm, each of them alternately plunged in several times. Pedro brought up Sandford's valise, which he found jammed below the seat. Everything not fixed had been washed out of the little steamer. Even the stacked firewood was all gone. She lay canted over in some

ten feet of water. They were certain there was no one in her. Don Santiago looked round. There was nothing in the branches of the *ceiba*, which, besides, lay up-stream. There was no sign of any one on either of the river-banks, on which the rising water had almost reached the matted vegetation. But the strongest swimmer could not have got ashore without being carried far down-stream.

It was hopeless to look any more in the steamer, and Don Santiago, with a heavy heart, ordered the canoe to be pushed to the river-side. Slowly drifting down, he examined the bank minutely, but could find no sign that any one had landed. After going down nearly a mile, he crossed over to the other side, and began the slow process of poling the boat up-river as near the shore as possible, while he scrutinised every yard. Hours passed and no trace of any one was found. One thing was clear. Anybody who had managed to reach shallow water, or to land where some bit of the shelving bank had fallen down (and no one could land anywhere else), must have remained there, unless he had an axe or cutlass with which to cut a path through the dense grassy jungle that came down to the river's edge. There was no such path to be seen.

The sun had almost sunk to the horizon when they got as far up-river again as the wrecked steamer. Nothing more could be done in the dark. They ceased the vain search, and poled wearily up by the bank to the village landing-place again. The captain and the engineer were waiting for them.

The men were tired, but Don Santiago scarcely felt fatigue. He resolved to start again at earliest dawn, and, drifting down the river, to examine minutely both its banks, visiting every snag and tree-stump where anything might possibly be entangled. He had indeed given up expectation of finding his daughter alive. His best hope now was to save her body from the crocodiles.

'It will be useless, señor,' said the captain, shaking his head. 'The señorita could not swim far, and the gentleman had his boots on.' He did not mean to be callous, but only sincere, and so he added, 'In about a week you may find them at Culebras.' Culebras was fifty miles down-stream. 'Don Emilio had his canoe upset last year just above this, where the ford used to be, and he was found there.'

The alcalde nodded his head. 'Yes,' said he, 'I remember it.'

But Don Santiago never thought of giving up the search. Sometimes a glimpse of some possibility would cross his mind. Sandford or his daughter might have clung to a loose plank or to one of the firewood billets. Who could tell? It is the impossible that happens now and then. Ignorant of the river, and foreigner as the young man was, the mere fact that he was an Englishman was favourable. He would not desert the girl anyway. So the father thought. But these sanguine

fancies quickly passed. He felt in his heart that he would never see his daughter again. Yet he would not lose the faintest chance. He could not rest.

Had he been less absorbed he might have noticed, and perhaps understood, a furtive hesitation in the captain's manner. The alcalde saw and comprehended it.

Both were, like Don Diego Lopez, and half the Moyocuilean nation, mestizos - that is, of partly white and partly Indian blood. In them the Indian predominated, with its physical and moral inheritance. The Indian is not only callous about death, but is superstitious about the saving of life. Like the peasant of the south of Ireland, he believes that if you save a man's life he will probably do you a mortal injury. Perhaps the obligation is too much for human nature to bear.

The captain of the Vigilancia, though he did not say so openly, wanted the canoe. He did not wish the story of his careless losing of the steamer to reach the office of the Company till he had got her raised, so that his employers should not learn that she was lost before they learned that she had been recovered. He was not scientifically trained in the laws of hydrodynamics, but he knew that her heavy hull and engine would be lighter under water, and he thought he would go down with his engineer and the two men in the morning, fix ropes to her, carry them ashore, and with the help of a few others drag her to the bank and pump and bale her out. It was unlikely that she was seriously damaged, and he was in hopes that he might navigate her down, with his news, little the worse.

He glanced at the alcalds as Don Santiago was making his plans, but the alcalde would not meet his eye. The alcalde wanted to please the captain, but he wanted to please Don Santiago too. Both were his very good friends and customers. After a little the captain rose and went out.

Don Santiago was giving instructions for the morning, when it struck him that the alcalds was listening with a slightly preoccupied air, assenting to everything and promising everything a thought too fluently. Don Santiago knew better than to place any reliance on his promises. He knew how readily the resolution of overnight evaporates before morning, and how calmly the mestizo offers, and expects to be accepted, an excuse in lieu of a performance.

He instantly resolved that he would run no risk, and, rising, he said, 'My friend, you will pardon me. I cannot rest. Let us get these things ready now. It will divert my thoughts and save time to-morrow.'

'Ah senor, rest. There will be plenty of time in the morning. I charge myself with getting all ready for you,'

'No,' said Don Santiago; 'do me the favour.' He pushed open the door that led from the house into the shop. 'Here, boy,' he said to the lad |

behind the counter, 'get me down half-a-dozen blankets.'

'Yes, señor.'

'And some tinned meat, a jar of aguardiente, a drinking-cup, some bread, candles and a lantern, and a basket that will hold them all.'

He had them brought and laid on the floor, and packed them all in the soft basket of matting. Then he sat and smoked for a while. The alcalde prepared to close for the night.

'What time will you have your coffee in the

morning, señor?'

'Four o'clock, if it will not trouble you.'

'I shall attend to it myself.'

But Don Santiago knew that, this promise notwithstanding, the alcalde and his household would very possibly be wrapped in the deepest slumber at four, and that he might be lucky if the coffee were ready at six. A Moyocuilean promises anything you like for 'to-morrow.' A promise costs him nothing. If you wish it, why should you not have it? It is a polite and meaningless form of words, indicating good-will, but having no relation to performance, which will not be affected by it one way or another, but will depend on the convenience and motives of the moment.

Unable to keep still long, Don Santiago strolled out on the veranda. All was dark, except where, a few yards off to his left, a bar of light shone from the door of the bodega. He walked back and forward once or twice. As he reached for the third or fourth time the darkest end of the pillared walk, he heard a whisper.

'Don Santiago,' some one said from behind one of the pillars. He could see nobody. 'Don Santiago, it is I, Pedro. Do not speak loud, señor. I have something to tell you.'

'Have you any news? Have you found any

He caught at any straw of hope.

'No, señor. It is not that. But the captain and the engineer and their two men are going to take the canoe very early and get away with it to raise the steamer. If you want it you must be before them.

'Have they taken it?' asked Don Santiago, after

a moment's thought. 'No, señor, not till the morning. At three they will take it.'

'Then, Pedro, come with me.'

'He took Pedro into the house. The packed basket lay on the floor.

'Take it up,' he said, 'and follow me,' and he led the way to the river-bank, where the canoe was moored.

'I shall sleep in her,' he said. 'Go you and find Juan and bring him here. Tell no one.

When Juan came, Don Santiago made both men get into the boat with him. Then they pushed her quietly off, and dropped down stream a quarter of a mile, and Pedro stepped into the shallow water with a rope, and tied her up to a tree on the bank.

Then the two Indians wrapped themselves in their blankets, lay down in the bottom of the boat, and went to sleep. Don Santiago lay down also, but he could not sleep. He pondered over every faint chance of his daughter being alive, and went over and over again in detail his plan for searching the river.

As soon as there was light he woke the men, and, after giving them a little breakfast, set out, first to visit again the steamer, then to drift slowly down

the river, examining the banks and every snag on which anything might have caught. Hour after hour they patiently continued the search, often delaying to look more carefully at some possible place. When they found a firewood billet which had drifted ashore, or got fastened in the branches of a sunken tree, they searched much around it.

But night fell and they had made no discovery.

(To be continued.)

A PLAIN TALK TO DEAF PEOPLE.

I is a strange thing that people will receive gratefully all delicate attentions in the way of glasses for the eyes or apparatus for deformed legs or ankles, but will seldom use any

aid for the ears. I really am quite tired of hearing people say to me, 'I do wish we could persuade granny, uncle James, aunty, or my friend Miss Jones, to use an ear-trumpet as you do.' It is so tiring to need to raise one's voice or to shout at them. Yet we find that the old people often prefer their friends to shout at them.

It is so much harder for the young to have to use a trumpet and conversation-tube than for older people who have had their life and pleasure, and whose deafness is the result of old-age! My first advice to all ages, young and old, is to use these aids, which surely come as a boon and a blessing to the deaf. Deaf people should consult an aurist re a speaking-tube, for some forms of deafness, I am told, do not improve with its use. I was recommended by a very well-known aurist to use one while I was losing my hearing, and before I did not, but only laughed scornfully at the idea. Later, I quickly took to one when I found it enabled me to hear again when I did become deaf.

Some of my hearing-power has certainly been restored to me, to a certain extent, and thanks to using a trumpet; and all my friends and many strangers remark how very well I do hear with it. Therefore I am told many little stories of deaf persons, and taken a good deal into confidences, and have a far better time than many other deaf folk that I know and hear of. Many deaf people think that a trumpet looks funny; it's only a prejudice again, and I prefer to look funny rather than not to hear. So, the first thing is to banish the idea that you will look ridiculous when using a trumpet and tube, and don't be sensitive in any way about it! Being young, the amount of fun people get out of my conversation-tube generally keeps me in fits of laughter; they ring me up as if I were a telephone. One young fellow asked some one who was talking to me to 'pass the drain-pipe,' &c. People always talk to me through my tube when otherwise they would look at me sympathetically but say nothing.

Perhaps what helped me a lot was meeting a lady who was quite deaf, and who used a trumpet and conversation-tube. She was then, and still is, I might say, so bright and cheerful that when my time came I followed her example.

I am asked out a great deal. I am always very cheerful. I put this down to the pleasure I get in life through my tube. The excuses generally given me for not using a trumpet or tube is a dislike to the idea, which seems to me due to sensitiveness more than anything; and deaf people seem to think they will make themselves conspicuous, though they are really far more so without an aid to hear. I am stared at a good deal when out, but I only pity those who stare for their very bad manners; it does not affect me at all!

When any one has to raise the voice to talk to a deaf person it usually casts a spell on those around, who stop talking to listen, as in some cases it must be most laughable to hear a totally inappropriate answer given to some question. This greatly taxes the politeness of the company, who strive to contain their laughter, and causes much embarrassment to the speaker, who probably moves off as soon as possible, leaving the afflicted one in an aggrieved state of mind at being deserted so rapidly, for no apparent reason; but if he is sensible and does not mind being told of his mistake, the best thing to do is to join in the laugh. I think we all know the story of the two women one of whom was deaf. They were oblivious to all around, and were conversing upon what appeared to be a subject of deep interest. It was probably the raising of one lady's voice that made the company stop talking, and they were amused to hear in the sudden silence the loudly ejaculated. 'We always fry ours in lard!'

It is a mistake to think that people will not talk to those who use anything in the shape of a trumpet or tube; in fact, I so often hear it said, 'I would go and see her more, but it is really too much bother to have to shout, and it makes my throat ache.' And then a deaf person will remark, 'People are so unkind, they will not talk to me.' I really do not think we can expect our friends to

make themselves conspicuous and ridiculous and wearied out by shouting loudly enough to be heard by every one else in the room the pleasant little commonplaces which make the sum of most of our conversation. Deaf people will find that many friends will talk to them with the help of a trumpet, and they can always comfort themselves with the reflection that those who will not take the trouble to talk down a conversation-tube are hardly worth caring about.

For those who are not accustomed to speaking into a trumpet or down a tube I will own the idea is sometimes terrifying; but in these days the telephone is used by so many that to talk down a conversation-tube is not difficult, and I find I can soon put people at their ease. The great point is for the deaf person to have plenty to say. Some one laughingly said to me, 'You may be deaf, but you will never be dumb!'

It is a good thing to explain to any one who is not used to speaking into a tube or trumpet that it is only necessary to speak distinctly, they can soon judge if they are making themselves heard by the answers given; so many, though, imagine they must shout, others whisper, and I am not sure which is the more aggravating. Also, they think they must say something unusual or startling, and so begin to think what to say, and thus the time lost causes both to become nervous, and only disjointed remarks are the result.

Though one is deaf one is still human, and, like other people, speech need not be elaborate because it has to be spoken down a tube. There is a little anecdote of a young man who on speaking down a tube for the first time was so nervous that he could only gasp the unfortunate inquiry, 'Have you heard the cuckoo this spring?' Had that been said to me I should have laughingly replied, 'Oh yes, the cuckoo never fails to come and cuckoo to me every spring down my tube.'

Plenty of going about helps to keep one cheerful and bright. There is no reason why one should stay at home because one is deaf, or not go about alone. For myself, I ride a bicycle-although I hear nothing coming behind me—always alone, without finding any difficulties. Many people think it very dangerous, and often remark to me, 'If you were my daughter I should not allow you to cycle.' But it all falls, in every sense of the word, on deaf ears. I am much more independent than half the people who go about with full use of their auditory apparatus. Policemen in London, every one I meet, talk into the tube when I say distinctly I am deaf, and I want to find out my way, &c. I am sure this independence, and always having to be on the lookout that one will not be run over, &c., prevents the vacant, unintelligent look that so many deaf people get. I go everywhere, and am always ready for anything; while the great kindness I meet with on all sides both from strangers and friends helps to keep me going and makes me feel how necessary it is to live up

to the character of plucky cheerfulness that many kind people give me.

Concerts, of course, are out of the question, also dances, although I do go to them occasionally. I go to dinner-parties. This reminds me of a dinnerparty I was at when every one suddenly laughed at some joke, except one man who also was deaf. He sat amidst the general laughter with a face of marble, looking thoroughly out of it. That was 110 reason why he should not have smiled. My advice is to look pleasant on all occasions, especially when others are laughing. You can smile until the joke is explained; and, even if it is not, it looks better. Of course, there are many occasions on which one does feel very much out of it; all I can advise is to grin and bear it. I am often told I have not lost much when perhaps a lot of people have been talking together. I generally pick up a book or picture-paper on these occasions. Certainly, though deaf we have some benefits; we can sleep in peace all night through wind, rain, and storms while those who hear come down in the morning feeling weary and cross; we can read, and nothing disturbs us; it is a great thing at bridge, and crying babies have no effect on our nerves. We can be sworn at, and we are perhaps totally unconscious

of it. Oh yes, we have some benefits!

Now, a great many who have read so far may wonder why I do not recommend lip-reading. I do. But it requires perseverance as well as money, for the lessons are expensive. I am afraid I must own to a lack of perseverance. I have not perfected myself in it. I know enough to find it very useful on many occasions, and my lip-reading teacher will not at all agree with the foregoing teacher will not at all agree with the foregoing remarks on trumpets and tubes. But, alas! there are many who cannot afford these expensive lessons, or feel they are too old to begin to learn; and it is for these I am writing this article, because I have come across many who have been advised to use an ear-trumpet and will not.

Of this I am quite certain, that if you are deaf and use a trumpet you can still have a very good time, if only you will be lively and take interest in people and in what is going on; at least, such has always been my experience, and I can hear nothing without a trumpet.

Max O'Rell has a chapter on deafness in one of his books, and he is not over polite about deaf people. He goes on to say, 'Nobody would dare to make love down a trumpet.' This is rather a delicate subject, so I will content myself with saying, 'Don't believe him!'

People who dislike using aids should remember that the strain of trying to hear is extremely had for the ears, and the use of a trumpet will help to sharpen the sense of hearing. By experience, again, I know that one is more deaf than one supposes, and people often say, 'Oh, she is much deafer than she realises.' My aurist told me, too, how little deaf people realise this. So, if you find your friends coming close to you and

speaking right into your ear you may safely come to the conclusion that you are deaf, and perhaps very deaf. Go and consult an aurist about a conversation-tube, which I greatly prefer to a trumpet; the latter I only use in church to hear the singing. The aurist will tell you what kind to use and where procurable. I took to one like a duck to water. I wear my tube round my neck and shoulders much like the stole and scarf of the day, and people pick it up and lay it down just as they please; it is always ready for use, and I am always ready to listen. In church one can follow the service but not the sermon; and, being deaf, I take the privilege of reading a nice book. So, if the sermon is dull, I am somewhat envied, I find, by those who have their

Some deaf people would do well to rid them-

selves of the idea that their relations and friends talk about them and abuse them both in and out of their presence-in fact, at any time. It is a very bad habit, simply acquired because they can't hear, and get suspicious. I am glad to say I do not and have never suffered from this tormenting idea, and I know quite well people are only likely to wish one could join in the conversation, or wish one would use an aid, or feel sorry for one in some way. Therefore, fellow-sufferers, if you cannot lip-read, and friends try to persuade you to use a trumpet or tube-and there is no reason why you should not-do do it for their sakes as well as your own, and don't allow funniness, sensitiveness, shyness, or silly self-consciousness, as I call it, to destroy what pleasure you may still get out of life; and, as I have said before, sensitiveness is the first thing you have to banish for ever.

SOME SORT OF A HERO.

CHAPTER II.

F, after leaving the great Cathedral Square in Caleta Malo, you turn to the right and walk along the glittering Calle Estrellia, you will, on taking another turn to the left, plunge at once into the slums of

that city. They are not a salubrious locality either in atmosphere or in moral tone. The odours rise from the river with peculiar insistence at night; and the smell of rotting vegetation is heavy in the air. The croaking of innumerable frogs breaks through the gloom, for Caleta Malo—the slums at all events—is built on land reclaimed from the river, and the water has a habit of sometimes returning to its old haunts. The consequence is that a wide marsh reaches from the limits of the slums and stretches away into the country.

The riff-raff of the world congregate in the purlieus of Caleta Malo. There is no extradition treaty yet with any of the European countries, and criminals of various hue find safe harbourage there. In consequence, there is much crime, and the sight of a body floating in the river, with a knife-thrust between the shoulders, is no uncommon sight. In this nefarious haunt dwelt one Casseras, already mentioned as forming a subject for Edward Seymour's thoughts on a night we wot of. He had appeared in Caleta Malo about a month after an atrocious attempt on the life of a reigning Sovereign in Europe, and was wont to dilate, when in drink, which was frequent, on the noble part he had played in that ineffective drama. Putting two and two together, it would appear that Casseras and no other was the prime criminal in that case. He had a mission in life: it was to right the wrong. He had told this mission to many other fellowspirits; he told it most frequently when the gensdarmes had passed out of hearing on their patrol.

Casseras was seated in the Café Almeria, a low haunt in the slums of Caleta Malo. He was haranguing a not disinterested audience on the enormity of one man holding supreme power in the enlightened republic of Estrellia.

'This President you speak of,' he was saying, 'what is he? A fool! A man who passes impossible laws by which the hard-earned bread is dragged from our children's mouths! He would have his city the best in the world; he would purge it of its crime! Pah! the man dreams. He is aspiring to become emperor of this land. He will then grind you still deeper into the mud, and will put his spurred heel across your face! I know him. Well, comrades, shall we sit still and let this debonair President crush us?'

There was a mutter of discontent from his audience, and one or two knife-hilts—your true Estrellian would as soon leave off his shirt as his knife—were fingered venomously.

'There is no need to form a revolution,' went on Casseras, who was in the pay of one who wished to become President, and who had instructed the plotter to sound the inhabitants of the city; 'we have but to put the one man out of the way, thus paving the way for the enlightened General La Mancha. Ah, you know him! He is a friend to the people, is he not?' For once again that deep-throated hum had broken out from his auditors.

'It is easy. A knife-thrust in the dark—thus, and the work is done.' He illustrated the suggested action by a quick upward thrust of his right hand, and one or two men smiled significantly.

'It will be done,' he concluded, and turned halfway in his chair to watch a man who sat apart at a small table, apparently engrossed in a winestained paper. This man had sat there during the whole of the conclave. He was in no wise different from the other frequenters of the Café Almeria; his hat and capa were equally shabby, and, in common with the rest, the bright lining of the shabby cloak was picturesquely displayed over his shoulder. His face, however, was in deep shadow, and no one there had ever seen more than a passing glimpse of it. But Casseras's eyes had wandered in that direction many times to-night; many times on previous nights also, and something of a caustic smile curled the conspirator's lip. That one should attempt to hoodwink him, Leon Casseras!

'But the President, he is no chicken,' said one of the men about Casseras. 'To approach him with a knife from behind—ah no, that would never do.' He put out his hand palm downwards, and shook it to and fro from the wrist. It told the listeners and watchers that a man might as well attempt to stem the passage of the Rio de la Plata with a child's spade as approach the President with intent to stab him from behind. 'Besides, he is too well guarded. Who has ever seen him without a squadron of cavalry at his elbow? Answer me that.'

Casseras said nothing of what was in his mind. If any work were to be done in the way of exterminating presidents he was the man to do it single-handed, and would thus reap a rich reward which no man need share. But he never took his eyes from the man in the opposite corner who was still engaged in reading the wine-stained newspaper.

'Pooh! there are other ways as well as the kuife,' he said with a shrug of compassionate pity. 'A little bomb—just such a one as I used at the wedding of the Crown Prince of — That would be enough.' This was said in a whisper so as not to reach the ears of the man in the corner. The conspirators drew back in alarm, for it would appear from Casseras's manner that he had the bomb in his pocket even then.

There was silence for a while, and then the man who was in the corner rose to his feet, threw his cloak over his shoulder, and bade the remainder of the café's guests a deep-voiced 'Buena noche.' He had barely passed the door before Casseras had risen to his feet and was slinking in his wake.

The streets were dark in the vicinity of the café. From time to time the man in the shabby cloak—who was the quixotic President of Estrellia—glanced back, but there was nothing to be seen. He walked on steadily, turning over in his mind the action he must pursue with regard to clearing out that hornet's nest he had just left. Like one or two other dreamers, he had adopted the habit of mixing with his subjects incognito, in the hope of hearing wrongs that he might redress. He had heard more than he had bargained for to-night.

Had the darkness been less pronounced, President de Fuella would have seen a dark figure slinking murderously in his rear, and pausing at every

infrequent light to slink back into the shadow of a doorway. Casseras was primed for murder, and he had the means in his pocket. He was merely awaiting his opportunity. In less than five minutes the President would pass the next patrol, then there would be no other for close on a quarter of a mile. There would be no need to run useless risks with a knife. He saw from the way the President walked that he was a Hercules in physical strength; he had no longing to come to grips with him. The little thing in his pocket should be hurled at the correct moment, and President de Fuella would go out in a flame of blue fire, and shattered limbs would be all that was left to tell the tale.

the tale.

Casseras had recognised the President for the first time that night. He had seen him the day before at a review, and had noted a certain peculiarity of gesture which had been observable also in the silent frequenter of the Café Almeria. He had not the slightest doubt in his mind. Very well, he would remove this President who stooped to spy on his subjects, on his free and right-thinking subjects.

Casseras never looked back as he walked. Otherwise, he might have seen that a third dark form was dogging his footsteps: some one who followed the anarchist's tactics, and crouched in a doorway whenever a lamp was passed. This third person also was attired as a citizen of Caleta Malo, and yet there was a certain springiness in the step that told of athletic training. So the procession of three passed on its way down the deserted streets of the lower city. It was very late, and a sultry stillness brooded over the night; the turgid lap-lap of the river along the banks sounded almost like low thunder. Now and then, afar off, the long-drawn cry of the city patrols, as they called to each other that all was well, drifted down the empty streets. But the men whose duty it was to care for the well-being of the vicinity of the Café Almeria were stowed away in a dozen unlikely hiding places. Nine out of ten of these vigilantes were in the pay of the villains who consorted in these precincts; five out of ten were blacker villains perhaps than the men who subsidised them.

The three men, shadowed and shadowers, had reached an open place—an embryo plaza. A baffling network of dark streets ran in every direction out of the square. A man night perpetrate horrible crimes here, and escape unseen. The moment for action had come.

The President was passing under the wan light of a half-ruined lamp, his head was sunk in deep thought; he heard nothing of the stealthy footsteps that crept in his rear. Casseras plunged his hand into the pocket of his jacket, withdrew it, and stopped, balancing on one foot as an old-time discus-thrower balanced for his throw. There was a certain amount of grace in the movement; but a sudden sound in his rear gave him pause. Like lightning the hand was dropped and thrust again

into its pocket. He paused, listening, but there was no repetition of the sound now. Once more his hand stole into his pocket; he crept steadily forward until he was almost under the lamp. The President seemed to have slackened his pace, and had thrown his head into the air; it would seem that he had at length arrived at a decision with regard to his future actions. Now was the moment for the liberator. Ah! perish tyranny! Perish the man who would grind the faces of the poor! One bold cast, Casseras, and the work is done. But what was this? Silently, even as his hand was in the very act of withdrawal from that pocket, a aleuthlike figure had darted in upon him, had thrown itself on his shoulders, and was bearing him down, down, to the ground.

There was very little sound to be heard, for the new actor in the scene had made no exclamation. Instead, he had grasped Casseras's right hand with his own stronger right hand, and was bending it to and fro at the wrist, until it released its hold of the something in his pocket. With a savage snarl, Casseras felt the wrist-bones crack; he heard the snap, and it sounded to his fearful ears like a pistolshot. The President had heard the scuffle now; but, though he had turned, he advanced no nearer, thinking perhaps that it was merely a midnight fracas, no uncommon event in the streets of the enlightened capital of Estrellia. Yet, with the curiosity of a man who loves to share the intimate life of his subjects, he stood motionless at some little distance, watching the struggle. It was well worth watching.

The man who had thrown Casseras now dragged out the useless hand, and bent it deliberately back over the prostrate assassin's shoulder. A cold aweat grew out on the fallen man's forehead; he writhed in mortal fear, striving to keep his body from contact with the stones. It would appear that he was in danger of being hoist with his own petard, for the slightest concussion on that pocket would blow both conspirator and rescuer into the air. A cold, clammy moisture dropped from his akin; but he fought still like a rat in a corner.

The strong thin hand that had twisted the fellow's arm almost out of joint now let go its hold, and dived into the pocket in question. Finding what it sought, it was withdrawn, and then the man who had arrived so opportunely leaned back slightly, and cast the small object he had secured far out to the water. There was a faint splash, nothing more; and, for the first time, the man who had saved the President's life raised his head. It was Seymour—that could plainly be seen by the light from the uncertain lamp. The President saw the face upraised, but it conveyed no meaning to him. He had not, as yet, met the young attaché. Yet there was something so peculiar in this prolonged struggle that De Fuella was constrained to remain watching. He had noted the direction from which the splash in the water had come, and his eurious mind began to work intelligently on the happening. But he made no motion to advance. Once let him be seen at close quarters, and his identity would be disclosed, his incognito would be no longer preserved, and then, farewell to his dreams of learning all he might about the inner workings of his subjects' minds. So he stood and waited.

In that brief interval that had elapsed since Seymour threw the bomb with unerring aim into the river something had happened. Casseras had managed to wriggle his left hand down to his sash, and now the lamplight flickered on something that shone with a dull, steely shimmer. There was a quick, eel-like twist of the body on the ground, the left hand was wrenched free, and Casseras stabbed upward with a vengeful spite. But he might have saved the trouble. A man who had won the reputation of being the finest athlete at his university was not to be caught napping. The left hand was caught in as merciless a grip as had been the right. Once again there was that breathless straining, then followed the sharp snap of a breaking bone, and something fell to the stones with a tinkle. Seymour straightened himself, and picked up the knife. He looked at it quizzically, and then with a sweep of the arm that too followed the bomb. Then he lugged the prostrate, moaning villain to his feet, looked at him earnestly as though fixing his features indelibly on his memory, and spoke.

'Don't play the dashed fool again, my man,' he said in drawling Spanish, 'otherwise you might get badly hurt. Now, go!' And he turned him deliberately round, kicked him severely on a painful portion of his anatomy, and then turned away from the place. He vanished whistling, while the astounded President made his way cautiously to the bank of the river. He groped about in the mud and shallow water for some time, but that which he found was thrust into his own pocket, while he too pursed up his lips in a soundless whistle.

CHAPTER III.

ADY CLAVERING was fond of giving these little unofficial balls, for she dearly loved to have young and happy faces about her. This one was being held within a month of that other one which had opened the gates of Paradise for Seymour. In the interval he had had many opportunities of seeing Inez de Fuella, had, indeed, made a somewhat nonchalant apology for his conduct on that other night; but though he had been forgiven tentatively, Inez had taken op pains to hide a certain ladylike contempt for the casual, bored man who had kissed her against her will.

'Yes,' she was saying brightly to Lady Clavering, 'my father has been detained. He will come just as soon as he can spare the time. He desires that

you should not wait.-Ah, Señor Seymour! we

meet again.'

Seymour strolled up with a certain masterfulness in his eyes. He held out his arm in invitation, and Inez took it with a little moue. It was in her heart to give this presumptuous Englishman a lesson to-night; he should writhe beneath the lash of her tongue. On the few occasions when they had met, between dance and dance, there had been certain obstacles in the way of giving free vent to her anger. And yet, she asked herself, was she so very angry? Of course it was entirely outrageous that she, the daughter of the President, should have been seized in a pair of strong arms and kissedyes, actually kissed against her will! And still, though she had endeavoured to work up her anger to the sticking-point ever since she knew Seymour would be at this dance, she had felt inward tremors that were half-frightening but wholly delightful. There had been something in the quiet masterfulness of the attache's action that had touched an hitherto unsuspected chord in her somewhat romantic being.

'No, I will not dance—yet,' she said, as the band crashed out. 'I am hot-I wish to be cool. Take me to the patio.' Seymour obeyed, and Inez seated herself once again on the coping of that merry little fountain that seemed almost to chuckle with glee. It had seen many such sights had that old fountain; it was a wise old fountain, one well versed in the

mysteries of love.

It would be time enough to lash him with her anger, thought Inez-afterwards-when they had talked aimlessly. Meanwhile, well, he was certainly an interesting study, if only by reason of his utter contrast to those loud-voiced heroes of fiction whom she secretly adored.

'Still the same lazy, indolent Señor Seymour?' she said archly, tapping his hand with her fan. 'There has been no attempt to win a place amongst

Seymour twisted his watch-chain and smiled

the world's heroes since a month past?'

inanely.

11.....

'Lots of chance of winning fame, and-er-all the rest of it, in Caleta Malo!' he said. 'No, there's nothing to report, I'm afraid. I licked Battersby-he's our junior secretary-at tennis last Saturday though. A jolly good game it was, but a bit of a bore. We Britishers are not a romantic race, I'm afraid.'

Inez sighed a little. After all, there was much to be admired in this man. There was a quiet determination in the gray eyes, at the back of the lazily quizzical glance, that told her he might, in emergency, rise to heights of fame. If she were to be the woman to bring out that latent heroism! The thought set her blood dancing furiously. She had to bend her head to hide the sudden gleam that came into her eyes.

But she raised it again, for now was the time to vent her spleen to the full. She looked him coldly in the face, and began to think of a suitable commencing phrase, but somehow the words failed to

Seymour, as though reading her thoughts, forestalled her.

'I was a cad-that other night,' he said. 'I think I was mad. It was your beauty, your wonderful beauty. It would turn the head of any man. I apologise; and yet if you look at me with those eyes of yours I fear I shall commit the same crime. Inez, I love you!'

Ah! that was her cue. The words came now in a torrent, flowing like barbed lightning from her rich red lips. He writhed beneath her scorn; that she, Inez de Fuella, should have been embraced by a poltroon, by a lackadaisical idler, a trifler with time! It was incredible, unforgiveable, it was-

'Yes, your Excellency, I saw Inez come through into the patio a few moments ago. Ah! there she is, by the fountain.' Lady Clavering was showing the President of Estrellia into the courtyard, and both Inez and Seymour rose to their feet.

'It was nothing, poquita,' said the President, advancing. 'I had a little message for you. It

will wait. But-who is your friend?'

Seymour lounged forward, with a slight smile on his lips. He was perfectly sure that he was unknown to the President. He took no pains to efface himself from the scene.

'My father, it is Señor Seymour, of the British

Embassy. I-I have met him before.'

There was just light enough to enable a man to distinguish another's features, for a stream of brilliance came through the open door of the ballroom. Inez saw her father advance with a formal bow towards Seymour, then he started slightly, and looked intently into his new acquaintance's face. Suddenly the formal Spaniard had become the voluble Estrellian, for he darted to Seymour

and seized his hand rapturously. 'As I live,' he exclaimed, 'it is my brave friend

of the Calle Entrados! So we meet again, señor! It is to you I owe my life, and many other things. But I forgot.—Inez, this gentleman is your friend from now on. He saved my life a fortnight ago. I was in the city—you know where—and an anarchist attempted to throw a bomb at me. He was seized from behind, and a brave man seized him, for the rescuer knew that he had a bomb in his pocket. It might have meant instant death to both. The bomb was thrown away, but I found it in the mud of the river. And my brave rescuer had vanished, as though he had done nothing, by the saints! And now I meet him again.—Señor, von will forgive, but do I not see my gallant rescuer before me?

'Oh-er-that little thing. Well, yes, I believe there was a bit of a tussle; but I never thought you'd seen me, sir. Nasty fellow that Casseras; I'd had my eye on him for a long time; but when I saw you in that café night after night—well, I thought I'd better keep my eye on you too. One never knows what's going to happen, you see. Glad I was in time though; Estrellia can't afford to lose her President yet.'

Inez was standing like a statue, her eyes blazing. Every detail of the occurrence flashed through her mind; she could see that silent, strenuous struggle in the night, with a deadly bomb as the prize. Her hand went up to her throat, for a sudden wave of feeling threatened to choke her.

'I must pay my devoirs to our host and hostess again,' said the President, turning to go; 'but I will see you afterwards, señor. I owe you a debt I can never repay.'

'Then perhaps you'll do it for him, Inez,' said Seymour, when the President had disappeared through the door. 'Not that I want any reward for doing what any fellow would have done, but I must say I want you pretty badly.'

She flung herself into his arms like a passionate child, sobbing and laughing in a breath.

'My hero!' she exclaimed. And then, throwing back her head with a sort of sweet defiance, she said, 'But oh, Edward, Edward, my love! shall I ever be able to understand you wonderful Britons?'

THE END.

THREE DEVONIAN TOWNS.

III.-BRIXHAM.

RIXHAM claims to be the very oldest fishing-town in the land. It also has its boast of having perfected the useful art of trawling, and of being the instructress of the Grims-

by and Lowestoft men, as sons of hers settled on those eastern shores to be within easier reach of the great northern resorts of the sea-harvesters. It has also its glory in the past, for long before steamships hustled and bustled their own, she was a great trading-port with rich argosies, whose white sails were familiar in every harbour in Europe.

No one can question the antiquity of the town—it speaks for itself. The very houses, the ancient church which crowns one of its many precipitous hills, announce its claim to ancient honours. Here, they say, Vespasian and his soldier-son and successor, the noble-hearted Titus, landed nineteen centuries ago, when there was an ancient British settlement somewhere by the creek which now exists no more, the waters having receded, and the town being built over it. They were half or wholly Celtic, those old inhabitants of the place, and it is more than probable there was a dash of the Viking searover in their blood; but they have long since vanished from off the face of the earth, while their conquerors are also gone.

Later—fifteen centuries later, in 'the giant days of great Elizabeth'—a great day dawned for the town, because one of the mighty captains, a Devonian sea-king, brought hither the first-fruits of another ocean reaping and harvesting. How these gray and rosy cliffs must have echoed to the triumphant shouts of the men of Brixham as Drake drove in before him the mighty Capitana, the first prize of that wondrous fight which we now, so many centuries afterwards, can scarcely read of with quiet pulses. Here began the rout of that wast Armada which Philip II. sent out to crush England like a walnut shell. How sorely he was crushed himself let those who care to read find out

for themselves in the pages of England's story. Drake only waited to tear from the great lumbering ship the ammunition which was as the very breath of life to him ere he gave her into the charge of 'sundry fishermen of Brixham,' who towed her into port and made great rejoicing over her, while he sped after the flying ships, eager to fight and conquer. They never dream of faltering or of failure, those great sea-heroes of old, and verily, their faith was justified.

Drift down the stream of time for another century, and again Brixham is alive and awake, for there, in the blue waters of lovely Torbay, are lying the tall ships of another invading fleet, not this time come to trample upon the cherished liberties of the land, but to free it from a bondage bitter as death, from a false man of a degenerate race. The leader of that host which is about to land here, in this quaint old town, is the greatest soldier of the time, who has, with a mere handful of brave men, held his own against all the powers of Europe, and matched his generalship against the famous captains of the day. He is no stranger. He is half a Stuart himself, but of very different mettle to the dastard who could not stay to see the effects of his bad work, but fled away. His mother, the lovely Princess Mary Stuart-what volumes of romance hover round that name !- was elder sister to the gloomy tyrant whom England has cast out; and had he not to wife another Mary Stuart, 'the finest woman of her time,' whose lovely face Lely has left for us to admire, and who died all too soon.

Well, while the Devon gentlemen came trooping to greet the Deliverer, the clouds which had darkened the November day lifted, and the sun came out as he can shine out over that lovely, tranquil bay on any day in the year, and William saw the fair land he had come to rescue smile upon him in all its beauty. Not at the spot where the Brixham men at a later date set a memorial statue of the hero, William of Orange, but much higher up the town, almost where the Town Hall now stands, did the mighty little man set foot on shore. The

shingle sloped so abruptly and the tide ran so fast that the Prince could not reach land dry-shod, so a gallant fisherman, Varwell by name, rushed through the waters, and, hoisting the welcome invader on his sturdy shoulders, bore him safe to land. His descendants are still flourishing in the good town. William rested and refreshed himself in an old house, which was not old in those far-away days, but a handsome mansion owned by one of the 'quay lords' who then held high position amongst their fellow-townsmen. Then, after receiving many of the local magnates, including the Mayor of Totnes and other heads of corporate towns, he rode on to Paignton, where he slept. The house exists to this day; but, alas! it is now tottering to its fall, and in a few years its place will no more be found. Here he held what has been called his first Parliament, while the army he brought along with him was being entertained by the worthy countryfolks, who came crowding into Brixham to welcome them. Never did an invading army meet with such a reception. For bullets they were pelted with rosy apples, and that by fair and possibly dangerous hands; for your Devon lass of to-day is comely beyond most country maids, with rosy cheeks and bright, soft eyes, and she has a very winsome smile upon her red lips. Her ancestresses in the seventeenth century must have been just as pleasant to behold, and be sure, there were nothing but smiles to greet the Dutch soldiers who came to defend their liberties.

Well, the Revolution is a very old story; but the town is a very old place, and the memory of these old things clings close to the daily life of Brixham to this day. It is a retentive place, absolutely untouched by the modern spirit, and not wishing to change its condition. A thoroughly conservative spot, suspicious of strangers, and given to think that old things are best; but it is a town that grows upon you with a tender and old-world charm. While its memories are those of stirring times, it is by no means a lively place, but one in which to rest and dream. What dreams, we wonder, passed the seething brain and bitter soul of the baffled tyrant who had come to the end of his wondrous career and knew, as he paced the deck of the great warship on which he had taken refuge from the fury of the nations, that his race was run. Here lay the Bellerophon, with Napoleon on board, awaiting the verdict of the nations; here tradition says that he stood upon English ground for the first and last time. Here, rocked by the peaceful waters of Torbay, basking in the beauty of the sunshine, and, it is said, gazing in unbounded admiration at the fair and peaceful prospect before him, he may have felt the spirit of the scene and taken in a little of its peace. But the great ship sailed away into farthest seas, and the little man, before whose frown Emperors had quailed, survived the memory of his greatness and died alone. The Brixham fisherman, whose light craft skims the bright waters of his native bay, possesses a treasure

unknown to the man who had set Europe quaking
—the gem of contentment, whose price is above

Brixham stands in a cleft of the rocks, hemmed round on all sides by hills that rise up almost precipitously, while through the green, such of it as can be seen, break stern cliffs of that lovely pinkish-gray so prevalent in Devon when the bluffs are not actually red. Against these bluffs the town clings like a swallow's nest under the eaves. The houses tower one above another in irregular piles, like another cliff formed by the careless powers of Nature rather than built with stone and mortar by the hand of man. At the first glance, these abruptly-rising lanes and narrow streets huddled together on the slopes seem novel and rather startling; but then, a closer acquaintance makes the quaint place grow upon you, together with the quaint inhabitants thereof. There is an apparent spirit of contentment abroad everywhere. The town, with its one industry and all that appertains to it is, in its way, prosperous. It is quite satisfied with itself and its surroundings. Its one trade is a flourishing business—the harvest of the sea, that, gathered but never sown, yields a rich return. It is a beautiful sight to watch the fleet sail away into the distance, some of the larger boats to sweep the bays and inlets of the Irish coast, and some to cross the Channel to the Channel Islands, and all to return home heavily laden to the fine harbour below the houses and the hills. There are nearly four hundred fishing-smacks of various sizes attached to the port. The larger boats are fine upstanding craft, worth one thousand pounds each, and fortunes have been, and still are being made by the lucky proprietors of these beautiful trawlers which go quietly slipping out into the bay, their richly coloured sails making a lovely bit of colour against the blue of sky and sea. Of course, there are tragic tales of cruel losses, of lovers and husbands, fathers and sons who, sailing away in the sunshine, never return again; but these incidents are common to all seafaring populations, and the number of worthy old sea-dogs well advanced into the vale of years that one sees hanging round the quay, looking with longing eyes at the beautiful boats as they go slipping out into the distance, is touching. They have taken their last voyage. No more for them the glorious battle with wind and wave, the snatching of wealth from the bosom of the deep. They are in harbour, laid by until the last great voyage waits them into lands unknown and other conditions; only, they linger round the scene of past delights and joyous enterprise with a regret that is touching to behold. They are quite ready to talk, if one is a little bit tactful and shows interest in their town; but it must be carefully done, for your true Brixham man is suspicious of strangers, and the town is by no means anxious to encourage the influx of foreigners, as all new-comers are called. A selfcentred place, unsophisticated and contented with things as they are, and in everything-except its

flourishing trade—satisfied with the conditions that existed in their forefathers' days.

Upon several mornings in the week an auction takes place, and the sight is worth seeing. The boats are in, their teeming cargoes are on the quay piled in mighty heaps, glittering, snowwhite, and brown, smelling of the brine. Here are glorious turbot and halibut, superb fish that fetch big prices. Here a pile of the far-famed Torbay soles—one hundred of them reached the record price of fifteen pounds the other day. Then the local hake, a delicious fish, is here in multitudes. As to plaice, whiting, haddock, they are simply innumerable; while crabs and lobsters-the delicious Torbay lobsters-are crawling about and nipping and pinching everything within reach. Lo! the catch is parted into heaps, and the work begins. Sharp work this. Pile after pile is put up; and to-day being close to a Lenten Friday, the competition is very brisk indeed. The whole of the prey must be despatched by a certain train-some to Grimsby, some to Birmingham, some to Billingsgate-and there is not a moment to be lost. So the bids follow sharply as pistol-shots. All is animation and bustle. Keenfaced buyers, who in a very short time will lapse back into their native easy-going ways, are all on the alert, while the sellers are just as keen. Byand-by they will lounge against the quay-walls and smoke as if there was nothing else to be done or worth the doing in life; but just now they are as eager as the rest, and in an incredibly short time the hubbub is all over. Not a fish remains on the quay, the corrugated zinc roof no more reverberates to the sound of upraised voices, the packers are blowing on their chilled hands, the last cart-load has gone to the railway station, and the few empty crates and boxes that remain are left to the mercy of prowling cats, who are ubiquitous here-for the place swarms with rats, and grimalkin has her work cut out for her. But if you are a lover of fish you need not come to live in Brixham, because none of the magnificent treasures of the deep that you have seen on the quay are vended in her streets, neither is there a fishmonger's establishment in the whole of the town. You must go to Paignton, Torquay, or Dartmouth—yea, even inland Totnes or Exeter if you want to procure a Torbay sole or crab, and you will be asked London prices for them-or, peradventure, a trifle more, so great is the demand upon the Brixham trawlers and their harvest. There is a special manufactory of ice in the old town, an innovation that has met with the success it deserves.

The formation of the town has altered. Once a deep creek ran in between the old row of houses that look as if they had slipped off the hillsides and tumbled into the hollow; but many years ago the waters receded, and now the market-place stands where once the sea ebbed and flowed. Therefore, when the inhabitants erected a statue in honour of the landing of the Prince of Orange, afterwards William III. of these isles, they did well to qualify

the announcement cut upon the plinth of the statue and tell that 'near' that spot the Deliverer set foot upon English soil in the year of grace (or was it disgrace) 1689. The figure is quaint, the attitude suggestive of the pangs of sea-sickness from which the little man with the gigantic mind may have suffered during his toilsome passage across the troubled waters of the narrow seas, and the sculptor has dwelt with force upon the eagle-beak which spoke the great commander. But the figure makes a brave show, and the Brixhamites are proud of it.

Come away from the quays, with their fisher-folk hanging about, looking delightfully lazy and content. Those eager lads who rush about and form a very restless element in the population are not home-grown. They are from distant reformatories, and in their hot hearts there is a strong spice of the 'hooligan.' They are a rough lot; but in many instances the rough life they lead brings to the surface all that is best in them, and in after days they have been known to make good and gallant sailors of the King. But this neat building overlooking the bay does much for the Royal Navy. Here is the sailors' Orphanage, the Boys' Home for the western ports. They are a noble set of lads, these sons of our sailors, to whom the State is father and mother. The generosity of a noble Bristol man gave these orphan homes to the nation. All honour to his name!

And now, here is the way to Berry Head, the most southerly point of Torbay, a lonely, stormbeaten bluff that faces the open waters of the channel and looks across at a lovely land of wooded height and sloping down. For there, facing you, stands the fair, new town of Torquay, beautiful for situation, with her gleaming feet washed by the purest blue water, her houses gleaming whitely in the spring sunshine, her church towers soaring into the blue. She was not there when Napoleon looked upon the bay; she is younger than the story of Waterloo and its results. A century ago she was a mere cluster of fishing-folks' houses, with no name or fame in the world, and now she is the most select, the most aristocratic and reserved of all seaside resorts. Set like a queen upon her throne in the heart of the hills, she is essentially a town wherein to rest. But all Devonia is restful; there is a dreaminess in the air even here, with the wind rushing down from Dartmoor to the sea beating upon your face and plucking at your skirts. Here is a brand-new lighthouse with a very kindly and intelligent caretaker, an old man-of-war's man, who is now in the service of the Trinity Board, ready to explain this newest development in the way of sending a warning light across the stormy seas. But, alas! time presses, and a fiery little Dartmoor pony is dancing about in perilous proximity to some old crumbling walls, eager to prance off home with us behind him. We must not loiter, kind son of the sea. There is not time to hear half the interesting things you have to tell in your quiet, deep-toned voice, neither can we do more than

glance at the ruins of the old encampment-or fort, was it?-made here in the days when the whole country was astir at the thoughts of invasion, and afterwards utilised as a prison for the captive French soldiers, who fretted out some years in this solitary spot. No, something else is waiting for us -as it waited for, let us say, a million or so of years, before the eyes of man rested upon the hidden wonders which Nature held in her bosom. Along this hilly road and back into the town, up a street which the pony climbs with the air of one born and nurtured in such acclivities, and here, under the wing of the most utterly commonplace house, we find a barred door-about the last place in the world where we would expect to discover one of the wonders of the land. The door opens upon some slippery and irregular steps, and behold, a marvel! This is the great cavern accidentally discovered in 1858, when the very ordinary little terrace here was in course of erection. Levelling the foundations out of the steep hillside, for the hills are everywhere, a workman was amazed to see his crowbar vanish out of his hand. Investigation of the mystery followed, and the result was the discovery of this most wonderful cavern, which is more than six hundred feet long, and contains treasures of prehistoric value. Remains of wondrous extinct animals abound in its depths; stalactites and stalagmites adorn it in wondrous variety. It is beyond the powers of any but an expert to say more than that this wondrous discovery added a page to the story of the earth, and deserves a whole article to itself.

It is well to be out into open air and sunshine once again; and here, down a flight of steps so steep that from below the vanishing-point narrows to a span, we reach the church where the fishermen worship-for your sailor-man is a reverent being, and likes a stirring service and a stirring sermon. Well, he finds both here. The church is crowded with men at almost every service, and below the church is the school, out of which a crowd of happy young Devonians comes tumbling as we pass, with such bright eyes and rosy cheeks as does one good to see-sturdy lads and hearty little lassies, wellclad, well-fed, and happy. Long may Brixham flourish! Long may such teeming young life play in her streets, no man making them afraid!

But here is the upper town, with its huddle of ancient houses straggling up the hill to the venerable church, whose list of vicars goes back to the twelfth century, and which has been restored in perfect taste by the present incumbent. Here are the oldest houses in the town, some with the quaint outside chimneys, which ceased to be built about the thirties of the seventeenth century; and here we pause, for this is our rest, this quaint old house, overgrown with flowers, which has been in the hands of the same family for nine hundred years, and now the place knows them no more. So even in sleepy Brixham the old order passeth away, and

It would be impossible to close an article on this dear old town without a word about one of its sons who has left a lasting memorial of a quiet and saintly life behind. Here the Reverend Henry Lyte wrote the lovely hymn which is familiar with all classes and creeds, 'Abide with me,' and here, upon the hillside, a fine church is rising to his memory.

THE CRY OF THE LITTLE ONES.

Sir Francis Tress Barry made it a habit to send to Truth every Christmas a new sixpence for every child in the London workhouses. The identity of the donor was only revealed after his death. These lines to his memory.

FAR removed from sounds of gladness, 'mid the vice and sin and sadness

Of a mighty city's commerce and its care,

There are little children crying, little homeless outcasts dying,

And abroad the world is gay and bright and fair. But these little eyes have never watched the ships upon

And the little ears have never heard the sounds Which are sweetest to the hearing-Nature's music soft and cheering-

Never known the joy in which the earth abounds!

Little sisters, little brothers, without fathers, without mothers.

Little faces pinched with want and deathly pale, Young in years but old in sadness, all in gloom and none in gladness,

Little hopeless mites of sorrow, weak and frail. Unrequired and unrequited, little blossoms sadly blighted, Which the sunshine might perchance revive awhile;

But they languish there unsightly, while the sun is And the eyes are filled with tears which ought to shining brightly,

smile.

You have children whom you treasure, and your heart is filled with pleasure

As you watch them chase the sunny hours away; And you love to hear them calling when the evening shades are falling,

And you go to lead them homeward from their play. Do your thoughts, then, ever wander to the mighty city vonder

Where the little hearts are lonely and forlorn; Where the little ones are sighing and the little eyes are

And the little lives had better ne'er been born?

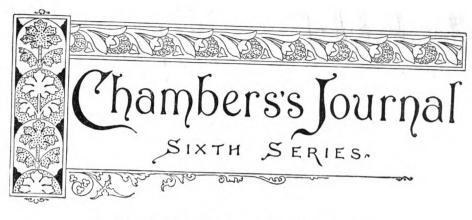

And when night has fallen later, and you thank the great Creator

That He gave your children happiness and love, Do you send a prayer in pity, for the sad ones in the

To the footstool of the mercy seat above? Then may God your heart awaken, in your cry for the forsaken,

To the sorrows that surround these little lives; And remind you, in your grieving, they are happy in

But a double blessing rests on him who gives.

A NOTABLE ANNIVERSARY.

By Major-General W. TWEEDIE, C.S.I.

PART I.

Arma virumque cano.

1

1

TORIES of the Indian Mutiny and of the Sepoy war that proceeded out of it are 'ever fresh and ever new,' to borrow the refrain of a song of Hàfiz. The other day the revolving years brought round the fiftieth anni-

versary of one of the most memorable episodes of that historic drama—namely, Havelock and Outram's forced passage through a part of the revolted city of Lucknow in order to save the defenders of the British Residency. And hence the thought occurs that if I can succeed in putting on paper a slight sketch of what I witnessed when, as a young ensign carrying the regimental Colours of the 'Rossshire Buffs,' or Seventy-eighth Highlanders, I took part in that romantic feat of arms the labour will not be wholly wasted.

It lies apart from the present object to notice the extraordinary train of circumstances which in the early months of 1857 changed the Bengal Sepoys from useful servants of the East India Company into incarnate demons, so that they shot down hundreds of their attached and confiding British officers, ruthlessly murdered Christian men, women, and children wherever they could find them, and afterwards transferred their fealty to the titular and phantom representative of the Mughal emperors, whose seat was at Delhi; thereby imparting at least the semblance of a political or dynastic struggle to what was in its inception nothing more than one of those passionate outbreaks to which all mercenary armies,* and especially those composed of inflammatory oriental material, must be regarded as more or less subject. The episodical character of the present writing will not, however, be too much broken if,

*Bacon says: 'As for mercenary forces, all examples show that whatsoever estate or prince doth rest upon them, he may spread his feathers for a time, but he will mew them soon after.'—In Greatness of Kingdoms and

instead of going straight into what the Arabs significantly call 'The Day'—that is, day of broil and battle—the 25th of September 1857, I go back a very little, and the while that Havelock and Outram's small field-force of about three thousand men, after fighting a pitched battle the previous evening with the flower of the Oudh insurgents, is halting near Lucknow, try to show to the reader the situation, or, as one of our captains called it, 'the really good thing' awaiting us on the morrow.

THE DAY BEFORE.

The 'really good thing,' then-the 'oyster' having to be opened with the bayonet-was this. Lucknow, forming as it did the latest of the East India Company's territorial acquisitions or 'annexations,' had been stirred to its depths by the revolt of the Bengal army. In a surprisingly short space of time the 'saddle-cloth of submission,' to use a Persian figure, had 'slipped from the back of its existence.' The wholly inadequate body of white troops had, after a calamitous effort † to dominate the situation, been forced to evacuate its cantonments, and, throwing itself into Lucknow, take up a defensive position on a gentle acclivity, some thirty acres in extent, which had been fortified and provisioned beforehand. On the slope of this, the last stronghold for the time being of our race in Oudh, there stood up amid innumerable subsidiary bungalows and other buildings an imposing château, the seat before the annexation of the Company's political Resident, as afterwards of the 'Chief Commissioner,' whence the name 'British Residency' by which the position as a whole is known to history; and room having been made within the same enclosure for a great company of ladies, soldiers' families, and civilians, it is easy to imagine the terrible hardships suffered - the pathetic commingling of men's resourceful exertions with

[†] Affair of Chinhat, June 30, 1857. SEPTEMBER 21, 1907.

women's courage and devotion—during the close besiegement, from the lat of July onward, which had thereupon followed. Throughout that long period the urgent necessity of relieving the entrenchment had pressed heavily on the mind of the Governor-General, Lord Canning; but the only force up till the middle of September available for that duty, having proved far too slender to fight its way over more than a third of the road—forty-two miles long—separating Cawnpore from Lucknow, had been fain to fall back on its starting-place.

To-day, however, the doughty deed of succouring our people-a deed recalling the times of chivalry -is half-accomplished. The seizure on the previous evening of the palatial country residence of A'lambagh * has given us a point d'appui of the highest value. The domes and minarets of the princely city, chequering the horizon, mark where the Residency lies hidden; and, indeed, it was only the interposed palaces bristling with batteries, and bazars swarming with trained soldiers, that prevented the operations of yesterday from carrying us right up to the goal of our enterprise. Best of all, the dull boom of the cannon at once of the besieged and the besiegers is fraught with the assurance that the words 'No surrender' whispered by Sir Henry Lawrence after he had been mortally wounded through the bursting of a shell in his room in the Residency continue to inspire the garrison. Major-General Sir James Outram, having been appointed to the combined command of all troops serving in that division and Chief-Commissionership of the province, accompanies the force in a not too well-defined capacity, with Henry Havelock as his 'fighting General.' Such were the words in which this arrangement was spoken of round the camp-fires by men fresh from service under both these commanders in Persia; but, to state the case accurately, the 'Indian Bayard,' content with the laurels already won by him both in peace and in war, had assigned to his junior officer-junior in rank but not in years-the glory of raising, if that might be, the siege of the Residency. Noble, great-hearted James Outram, when shall there be seen another like him? This moment I have him before my mental vision, as for the first time I saw him, when after a brush with the enemy on the Oudh bank of the Ganges he was driving his lumbering blue-gray Cape charger 'Peter' at the heels of a light-footed matchlockman, across whose swarthy shoulders he was laying his stout malacca, the only weapon I ever saw him wielding.

THE DAY.

On the 25th my experiences began early. Before it was morning the adjutant entrusted me with a message relating to a suggestion which had been made and promptly rejected that the Colours of regiments should be left at Alam-bagh, after the example of the commanding-officer of the Second

Madras European regiment—that Neill whose strenuous qualities had been displayed so remarkably at Benares, Allahabad, and Cawnpore, and who, ahead in this particular of his contemporaries, had lodged his standards in a magazine. With the monsoon at its worst, tents of course were carried; but on the belated camels bringing in their burdens the previous morning, no sooner had the officers of the Seventy-eighth set up a mess-tent than the Sepoy gunners, not too badly beaten to indulge in bouts of distant cannonading, had thrown a shell into it, the missile bursting in the thick of us without doing any harm, after knocking over the major's charger at its pickets.

at its pickets. Either to escape such favours or for coolness, the torrential rain of the past few days having now spent itself, the Highlanders were sleeping, as slept their forebears on the morn before Culloden, under the vault of heaven as I passed by on my errand. Early as the hour was, the hum of life and motion had begun. At, Cawnpore the encumbrances of the column had been put on a scale of lightness till then, I suppose, unknown in the annals of warfare in the burning plains of India; and yesterday had seen the stripping process carried even further. Every personal attendant, every horse and transport animal not on the strength of regiments, and every pound of dead-weight had been sent into the A'lam-baghen closure; but many preparations had still to be made

In picking my way among the tent-ropes I suddenly came on a never-to-be-forgotten picture. Within a small tent a candle burned; and beside it Henry Havelock, with his blue frock-coat rigidly buttoned, was engaged in his devotions. A little buttoned, was engaged in his devotions. A little later the same war-worn veteran, and Outram with him—par nobile fratrum—rode slowly past the tree under which we were breakfasting. Naturally, we all saluted, and company after company sprang to attention; but so preoccupied were the two men attention; but so preoccupied were the two men entire frates of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that the lines of anxiety on their faces of history that his history history and history hi

According to the Indians, it is September's sun that gives to the black-buck's back its intensity of colour; and none of us would have questioned it as we stood in column of route in the eight o'clock sunshine awaiting the order to step out Kilt and feather-bonnet had long ceased to distinguish the ranks of the Ross shires. Both of these stage-properties—if it consist with due respect so to call them—had been left behind in different places, as detachment after detachment of the regiment passed swiftly from the gulf of Persia towards the theatre of the Mutiny. The former vesture—or cincture rather—had been replaced by honest trousers of the commonest cotton stuff, dyel A turbaned helmet of either blue or khaki.†

[&]quot; 'World's Garden.'

[†] Khàk, an Aryan word (our 'chalk') used in Persian and Hindustani, = earth; khāki = earthy, or earth-colourd.

alight canework, made in the Cawnpore bazar, and costing only about a shilling, warded off the sun's rays. In lieu of the perished coatees, free and easy body-coverings, not all of the same cut or colour, but chiefly khaki, showed how surely peace establishment uniforms go by the board on active service. Something must have happened to the razor-cases, for the faces of the men, many of whom were gravbeards, retained their natural fringes. The martial inspiration of the national music was wanting; for, tell it not in Assynt, the pipes lay dormant in Cawnpore, while the pipers carried stretchers for the removal of the wounded. Cooked rations for three days lay in every man's haversack, the theory of the advance being that within that time we should return, bringing our sheaves with us. But alas for our forecasts! To take a single glance forward, twenty times three days were numbered before A'lam-bagh was seen again; not so much the stars in their courses fighting against us as the tremendous advantages held by the enemy, the objections to the taking of the guns off the made roads with the surrounding country so saturated, and, sooth to say, the divided manner in which, both on the 25th and before it, the chief command was exercised.

And now the 'drum's stormy music'—meet prelude to the din of the conflict—is sounding, and the three thousand, their ranks not unthinned, are advancing. Very little of the 'pomp and circumstance' is present. The only bits of colouring are where the radiant sunshine is reflected back from the silken folds of standards emblazoned with the records of past victories. The whole array is 'magnificently stern;' a resolute step, a high-strung air, and a solemn silence well becoming men who have set their teeth firmly, and in many cases even bared their arms, for the rescue of women and children. The force marches in three brigades.

The artillery brigade will always be identified with the names of the captains of its two light batteries, Maude and Olpherts, the Castor and Pollux of the hour of peril. The first infantry brigade, consisting of the Fifth Fusiliers, the Eighty-fourth Regiment, with a detachment of the Sixty-fourth added, and the Second Madras European Regiment, has been given to Neill. In the second or left brigade, the Seventy-eighth Highlanders, the Ninetieth Light Infantry, and a battalion of longlimbed, turbaned Sikhs-brave among the bravefollow Walter Hamilton, a Scottish gentleman and soldier of a type no longer extant. For mounted service about a hundred volunteers of our own race, and half that number of Indians-faithful among the faithless-draw sabres at the word of command of a captain of the Madras Cavalry. The Sepoys seem never to have doubted that we should choose the main road to the Residency, now only three or four miles distant; and the result is conformable with their anticipations, an opener route favoured by Havelock having been pronounced

impracticable. Thus the line of advance is precisely that, up to a certain point at least, on which preparations for resistance have been made beforehand. A large bungalow by the roadside only a few hundred yards past A'lam-bagh gives cover to cannon; along both skirts of the road field-pieces well supported by musketry are posted in stretches of tall elephant-grass and in garden enclosures. Neill's brigade holds the place of honour, with Maude's battery, drawn by teams of nimble white oxen, patient under fire, acting as escort. By the side of Maude rides Outram, still serving as a cavalry volunteer. Hamilton's brigade, in which, as already noted, is his own regiment, the 'Ross-shire Buffs,' follows; and with it Havelock, as erect on his chestnut Arab as if his threescore and two years meant nothing.

The first step forward, and indeed the previous day and night, had brought their foretastes of the coming entertainment; but it is not till the force arrives within close range of the enemy's positions that the running fight begins in earnest. A storm of round-shot and of grape-shot, variegated with musketry fire, is filling the air with hurtling, hissing noises, when a halt is called by Havelock to let the rear close up. This stoppage, however necessary to prevent the advance from assuming a helter-skelter or 'devil take the hindmost' character, is hard on troops formed in column of sections; but it yields to Maude a signal opportunity of developing the prowess of his battery. It is a goodly sight to see this ideal gun-captain bringing his two leading pieces into action, and pitching into the enemy's heavier ordnance like a hawk into a bird of five times its bulk. Havelock had written in one of his Cawnpore despatches that 'Maude's fire electrified the enemy.' Doubtless the same officer's feats of gunnery are equally effective to-day also. And yet, in the course of the short artillery duel, the Sepoy gunners, standing more or less under cover, while Maude's gun detachments are absolutely in the open, can hardly be catching it so hot and heavy as ours are. Outram, too, has received a bulletwound, which, however, serves only to whet the keen edge of his ardour. Altogether, it is not a moment too soon that the order to go on again is

Of the occurrences witnessed at this time some are too moving to be needlessly recounted, while others have found their way into print already, despite the absence of war-correspondents. But there also happened one of those picturesque incidents which occasionally brighten War's grim visage. The Seventy-eighth had been ordered to lie down behind a piece of shelter, and was afterwards falling in again, when a staff-officer—a Scot of Scots—rode slowly past. Raising his hand and flourishing a pair of gloves which he carried in it, he quoted:

Scots wha hae wi' Wallace bled! Scots wham Bruce has afttimes led! That was all. Possibly he thought that, with the 'gory bed' so near to many of us, the less that was said about it at that particular moment the better. But however that may be, the response was a fervent cheer-and it took a good deal to make the Ross-shire men cheer. The familiar lines seemed to get into our hearts and circulate with our blood. And if, as some have it, the strength of a country is closely connected with the quantity and quality of its national thoughts and feelings, then, truly, Scotland's greatest treasure down to this day is Burns.

(To be continued.)

FLOATING DOCK. ROMANCE OF THE

CHAPTER IX.

HEN Sandford, on the drifting Vigilancia, saw that there was no steam to drive the engine, and that the anchor was not available, he glanced at the water-gauge, and found that there was plenty of water in the

boiler. So he quickly thrust wood into the furnace. A wood fire dies down quickly, but is quickly revived. He knew that as soon as he could raise enough steam to get steerage-way on the boat he could get her head up-stream; but meantime they were rushing down towards the bend where the grounded ceiba lay in midstream, with the water foaming over its giant branches.

As they swept round the two men shouted and pointed to it. Sandford saw, but could do nothing. He looked at the girl. She was sitting quietly, her eyes fixed on his.

'I fear we may possibly be upset,' he said, trying to speak without any excitement. 'Can you by chance swim a little?

It was a forlorn hope, but he thought if they were thrown into the water he might perhaps manage to keep himself and her from sinking till they could reach the bank somewhere. It would probably be far down-stream, but he was a good swimmer and by himself would not have despaired.

'Oh yes,' she answered, 'I can swim a little.'

'Then please,' he said, 'try just to put your hand on my shoulder if we slip into the water.'

'I shall try to do as you wish, señor.'

The possibility of his wishing to save himself independently of her did not occur to either. They did not think of being separated. She had spoken calmly, showing no panic, and the calmness of her voice and the steady, friendly look in her eyes made him calm also and even confident. It was as if he had beside him a comrade on whom he could

depend.

He turned towards the fast-receding group on the bank. They could not help. He looked downstream again. The protruding knees of the big tree and the ridge of angry water over its trunk seemed to rush at them. The little Vigilancia touched, slid, swung broadside on, and leaned over. A torrent of warm, brown water poured into her. He held out his hand to the girl, and she took it. He paused an instant to see how they could best leap so as to get clear of the boat as she went down.

Then he noticed the Indian fisherman's canoe. It had floated lightly over the tree, and still held to the stanchion by its cord. He dragged it quickly to them.

'Can you get in?' he cried.

In the roar of the water she could not hear, but she guessed.

'Yes,' she said, nodding her head. She did not hesitate. She evidently knew how to get into a canoe, and stepped lightly and quickly, placing her foot in the very centre and instantly sitting down in the bottom of the boat. He looked round for the two men, but could not see them. The steamer continued to sink, canting as she did so, and threatening to turn over on the canoe. He scrambled into the little craft on his knees, and crouching low, leaned forward, cut the rope with his knife, and pushed free. A moment later they were a dozen yards down-stream and Sandford saw the two men. They had climbed up and were clinging to the upper edge of the awning as she fell over more and more, the water pouring over her hull. They had not observed the canoe, or had forgotten it. They were looking up-river for some help, and neither of them noticed the little 'dug out' and its occupants as it passed swiftly down the river and out of sight.

The cranky bongo (as the Indians call such a boat) needed guidance, and there was no time to think of anything else. It was but a narrow log of cedar, hollowed by fire and shaped by axe, and was worn and cracked, and black with long saturation. It had neither thwarts nor keel, and was liable to upset on the slightest excuse. It avoided the next snag on its headlong course by mere good luck Then Sandford got hold of the pole which the Indian had used. The girl really knew better than he how to manage it. She had often seen it em ployed. He could only trust to his wits. But he had some experience of boats and the general handiness of an engineer and an active young fellow accustomed to athletic exercise. Yet the first movement he made nearly upset them, and he looked to see his companion shrink. But she only and the with only smiled encouragement and confidence. With much anxiety and perspiration he managed to feud off a sunken log that only showed its presence by the swirl of water over it. He discovered that area

that even with the bladeless pole he could steer

They were running down with the sudden floodwater from the higher country which had caught the Vigilancia from her careless moorings. The river was rising fast, and the pace was increasing, but their motion, though undulating, was smooth. No dash against opposing waves, no throbbing, coughing machinery, jarred the little vessel. She did not seem to advance. It was the banks that rushed by, while she lay easily oscillating in one spot on the dancing water. And when she passed over a broad shallow, where the stream was almost clear, they saw over the side the river-bottom flying backwards, as one may see a road from the rear seat of a dogcart. Their journey was noiseless, except for the murmur of the water in its friction on the banks and bottom, and the continuous grating of the stones, large and small, which it rolled along. All Sandford's senses were at a strain. He was conscious of these sounds, and wondered he had never heard them before. Sometimes they sped through narrows, where the water was jammed and heaped up in the centre of the stream, and he held his breath as they rode on the flying ridge.

The river gradually broadened, they grew almost accustomed to the situation, and Sandford began to feel more comfortable in his mind as he felt more cramped in his seat. He looked at his watch. It was five o'clock. They had steamed up-stream in the Vigilancia for ten hours, and during the last few of these their progress had been slow against the strong current. They were now going down much faster than they had come up. But where were they going? The sun was already low. In an hour it would set. They must land somewhere before night. To remain on the river in the darkness, unable to see and to avoid obstacles, was to court certain destruction. Sandford had not seen any landing-place since they had left the place where they had breakfasted at the Tienda de la Santa Fé.

'Señorita,' he said, 'do you know of any ranch or village near which we might try to land?' She shook her head.

'No, señor; I think there is no place till we get back to Santa Fé. I believe the country is all swamp and jungle.'

'I am afraid we must try to land,' he said.
'We could not go on without great danger after dark. And your father will come down to look for us.'

'Yes, señor, he will come as quickly as he can.'

For a long time he could see no sign of a possible landing-place. Then all at once the channel widened greatly, and there appeared what looked like the mouth of another river. The girl was looking at it as well as he. In a moment or two she said, 'We have come to the Great Island.'

The main current and the larger volume of water seemed to flow to the right. They were carried into it, and saw on their left hand a long gravelly beach. It had a point which stretched out into the river, and Sandford tried his best to turn the canoe towards it. They were swept past the point, but floated into an eddy behind it. He felt bottom with the pole and pushed into the shallow water. As the boat touched he stepped out, and, holding it with both hands, drew it close to the shore. Then he gave the girl his hand and helped her to land. But he took care not to let go the canoe. He lifted its bow up; she took hold also to help, though he protested, and together they dragged it high on the gravel.

They stood and recovered their breath, and she looked at her clothes. Her dress was bedraggled and her shoes were soaked. That did not much matter, for the air was very warm though the sun was low, and the stones under foot were dry and hot. Sandford turned the canoe half over, emptying out the water it had shipped. The Indian's second fish remained in the bottom.

'We are safe for the moment,' he said. 'You say this is an island in the river?'

'Yes,' she answered. 'We went up on its other side, where the current is not so strong.'

'Do you know if any people live on it?' he sked.

'I do not know,' she said. 'I do not think so. I have heard that *Indios bravos* sometimes come here.'

Sandford knew that *Indios bravos* meant 'wild Indians' of some kind. Just how wild they might be, in the sense of being dangerous, he did not know, and did not wish to ask her. But he thought it would be well to find out, while daylight lasted, whether any were present.

'If you will wait here for a little,' he said, 'I shall go and see if I can find any path or house.'

Then, on a sudden impulse, he unbuckled the belt which held his revolver.

'Do you know how to fire it?' he next asked her.

'Yes, señor; I have fired one.'

'And I think you would have courage to use it if necessary?'

She hesitated. 'I—I think so, perhaps. Why?'

'I shall leave it with you. You see it is loaded.'

He showed her the cartridges in the cylinder. Then he laid it on the canoe beside her.

'You had better put it on,' he said.

She did not look at it, but, with evident anxiety, which she tried ineffectually to conceal, she said, 'You are going away, señor, to leave me here alone?'

'For half-an-hour only. You see the beach extends beyond the point there. I may find signs of people. If you fire,' he added with an after-thought, 'I shall hear, and shall come back instantly.'

'But I do not'- She stopped with a little,

half-hysterical laugh. She raised her hand to her throat, and then, controlling herself, said softly, 'Está bueno ['It is well'], señor. Go, and I shall await your return.'

He wished to examine the place, but he also wished to be alone for a little that he might think of what he should do if he could not find

'He meant me to feel that I could defend myself against him,' she said to herself. 'He wants the poor native girl to know that he is a gentleman, and not like her countrymen.'

She laughed again, but her laugh was almost a

sob. She watched him till he passed out of sight. Then she turned away and sat down on the cance and cried a little over the pistol. But soon she dashed the tears from her face and walked down to the river's edge. She tried to see herself in the water, but did not succeed very well. But she washed her face and hands, and wiped them with her handkerchief, and spread it out to dry, and arranged her hair a little, and shook and pulled about her dress. And then she went back to the canoe and sat down on it again, for she too wanted to think.

(To be continued.)

RAILWAYS IN ICELAND.

By D. A. WILLEY.

HE builder of the steel highway has cut through the jungles of Mid-Africa, he has laid the metals over the tops of mountains high above the snow-line, and has bored through the backbone of Europe in piercing

the Alps. But probably he never ventured into a stranger country than the little group of islands washed by the waters of the North Atlantic and the Arctic Oceans. Odd as it may seem, the tramway-builder is to invade Iceland. Its great waterfalls will generate the magic current of electricity which is to carry the traveller in modern coaches from one end of this little Danish colony to the other. Already the engineers have made their way through its valleys and over its ice-capped hills, and have found a route for this road of steel which is to take the place of the patient ponies, the only means of going from place to place except one's feet.

Truly, the people of Iceland are fully a thousand years behind the rest of the world's people in their life and customs. It is a quaint, old-time civilisation that will be transformed and lost when the modern spirit enters. As everybody knows, the purest of Teutonic tongues is spoken in Iceland; and the same isolation which has kept the language from contamination has preserved society in much of its pristine simplicity. If the twentieth century finds men living as they did in the tenth anywhere in the world, it is in Iceland. There each byre or farmstead is still a little commonwealth in itself. The head of the family sees his sons and grandsons living around him, tilling the ancestral fields. Through the summer they till the hayfields together, and through the long, dark winter they feed their cattle and sheep, and spin and knit, and read aloud. All is in common, for a journey to the nearest town is a serious matter, occupying several days.

But a journey in Iceland is one of the most picturesque of adventures. With no railways, and indeed no roads of any sort, all travel and

transportation must be carried on by means of ponies. And every conceivable thing does the sturdy pony carry. You will see them linked together in a group of twenty, each hidden by a heap of hay or bulging with great packs of dried fish. Or you will see them on the homeward march from town bearing a stove or dragging beams of lumber. In fact, these little beasts frequently carry a load greater in bulk than themselves.

It is a sorry day for the traveller when he leaves his ship and starts inland on a pony. First there is the rainy weather. A testy wanderer once asked his guide, 'Does it rain here every day in the year?' 'No,' replied the honest guide; 'some days it snows.' Sooner or later, every day, you have got to face a storm, and a drenching one. Then there is the gait of the Too shrewd to gallop over the rough, dangerous paths, the little beasts trot; and as they have no more resilience than milking-stools, the first eight or ten hours leave one in a state of collapse.

But homely comfort ends the day, for every farmhouse is the home of hospitality. Just when you feel you can stand it no longer and must 'shoot' your pony and proceed on foot, you find yourself entering a peaceful vale. It is perhals ten o'clock in the evening and the sun is low. Men and women in long rows are raking up the fragrant new-mown grass—it is the chief labour of the farm, for grass is the only forage crop; flocks and herds are coming home, ducks swim in the stream, and chickens are scratching in the flower-besprinkled turf on the house-roofs. But the farmer is never too busy to give you supper and a bed—and that of the best-brook-trout, most excellent coffee, delicious skeer (a sort of junket), and a mattress of eider-down.

One's first approach to an Icelandic farmhouse is disconcerting; the building seems so tiny and so dark, its few windows are so small, and its stone and-peat walls look so prison-like! One believes

one's self to be entering a hovel, and is surprised at the cleanliness and the evidence of culture presently to be disclosed. Indeed, it may be said that poverty is the mark of Icelandic life that makes the deepest impression on the visitor. But how can it be otherwise? Nature has shut up the activities of men to so few avenues. They have no lumber, for trees grow only to the height of twelve or fourteen feet; for lack of coal they cannot develop the little beds of iron ore that have been discovered; the summer is too short for the maturing of any grain except a poor sort of rye. So nothing is left but the pastoral life, and that all Iceland has pursued from time immemorial, except the fishing and the gathering of eider-down. These are the industries of the coast. The richest man in Iceland is one who owns some islands suitable for eider ducks. His income is said to be as much as twelve hundred dollars (two hundred and fifty pounds) per annum.

Yes, poverty is the mark of life in all its aspects. An Icelandic kitchen tells the story. It has few utensils and no stove. For chimney it has a hole in the roof, through which the smoke slowly and reluctantly makes its way. And such smoke! It is the stinging, pungent smoke of the peat. The range consists of a heap of rocks in the middle of the floor. On top of this heap the fire smoulders between three or four boulders. On the boulders stand the iron pots. As one dries one's clothes in the bitter smoke it looks most unpromising. But the result is unexpectedly good. The mutton, prepared in every fashion, is incomparable. So, for some reason, is the coffee. The bread, however, is among the food curiosities. Made entirely of rye, it is so hard that if a lad is sent to the village baker's for a loaf, and wishes to rest himself on his way home, it is a common thing for him to place the bread on the ground and use it for a seat; but after you have cut into it you find it soft and palatable, although the outside may be a crust which seems as hard as iron.

There is many a reminder of the early ages in Iceland in the rooms of one of the farm-homesevidences of an ancient culture which indicates plainly the standard of civilisation from which it must be said the people have little degenerated. First one observes the carvings. Every little butterfirkin has its carved lid; grotesque or graceful figures adorn the beds and bread-boards; the horn spoons have intricate designs running up the handles; the harness of the ponies is studded with little lions' heads or rosettes of brass. Then there are the famous belts. Every girl and woman rejoices in a beautiful belt of silver or silver-gilt adorned with lovely carved work. Some of them are very ancient, having been handed down from mother to daughter for many generations. Among them are belts ornamented with engravings on the silver which are indeed strange considering that these people are nearly all followers of Martin Luther. Upon the metal is wrought pictures of masses and other ceremonies of the Roman Catholic Church, proving that the ornaments must have been made long before the Reformation.

Strange as it may seem, the poverty of Iceland has not resulted in sloth or ignorance. In no country in the world is the percentage of illiteracy so low. Actually, the whole population is educated, and well educated. Around the fires of the long winter nights the sagas are repeated, and the old tales retold, and the old songs sung. Every community boasts its poet or essayist. One man in ten, they will tell you, is an author. Thus the humble, pastoral life, so cramped by poverty, is not sordid or base, but full of romance and cultivation. It is not easy to say what is the exact relation between the study of literature and the state of morals. But a story they tell in Reykjavik, the capital, sheds some light on the subject. Many years ago, when modern ideas were being introduced by scholars who had travelled abroad, it was thought proper to erect a prison. So the jail was built-a large structure of stone. But year after year passed and the prison stood empty. There were no criminals to put in it. Finally, some practical person suggested putting it to use. 'Let us turn it into a school,' he said. And the thing was done; and there it stands to-day in constant use as a school for girls, the only prison ever erected in Iceland.

In a country where the only murder in a halfcentury was committed because the victim interrupted a man who was reading, it is not strange that its inhabitants should desire independence. Although but seventy thousand souls have their homes upon this bleak point of the world which sticks out of the Northern Ocean, they have had a Parliament which has made their laws and administered the affairs of the people for over nine centuries. It is perhaps the oldest body of lawmakers in the world. Iceland is practically a little republic in itself, although considered a part of the Danish possessions. Situated as it is, a thousand miles from the mother-country, and five hundred miles from the British Isles (its nearest civilised neighbour), the very isolation of this Arctic colony causes it to be independent. In short, it is in such an out-of-the-way corner of the globe that one forgets its existence until some extraordinary occurrence causes the fact to be remembered that here is a centre of humanity which has survived the rigours of the frigid zone for over a thousand years.

With the advent of the whizzing and whirring trolley car we may expect that the island community will awake from its slumbers of the ages, for the metals are to be laid across the largest island, so that Reykjavik, the metropolis of Iceland and its principal seaport on the west coast, will be connected with Eskifjorhr, its chief eastern seaport. For a distance of not less than two hundred and fifty miles this railroad line will traverse not only the valleys deep down between the snow-clad peaks, but in some places will pass

over glaciers so hard that even the summer's sun does not melt them. The tourist who ventures over it will thus see formations of ice which have been in existence since the days when the world

was first created, for Iceland well deserves its name, being partly covered with masses of the substance gray because they have been millions of years in the making.

тнЕ LINE.

By OWEN OLIVER.

HAD come off the dog-watch about an hour, as I reckon, and was sleeping hard, when we struck upon the reef. The jerk pitched me out of my bunk, and I lost my bearings, and couldn't think where I was till

I heard Tom Hands swearing. It was generally a few words and a lot of swears with Tom; but this time it was no words and all swearing, and I sat up on the floor and laughed at him.

'Must have struck a whale,' I said.

'Whale!' roared Tom. 'The cargo's shifted. That's what it is; and we'll be working double

shifts till it's right.'

And then the cook's mate rushed in snivelling and crying that we'd run on a rock and were going down; and Tom flung him outside, and said we weren't going down to that tune, anyhow.

We scrambled into our clothes and ran on deck; and the first-mate told us off to get out a boat for the passengers. We had about a boatload aboard, though we were mostly cargo. Tom and I climbed into the cutter on the starboard beam; but as soon as we were in her the ship gave a lurch. We hung farther and farther over the water, and I saw the deck tilt and tilt till it was like a wall, and the people went sliding down it and clung to the bulwarks. Little Mrs Williams, that had always a pleasant word for us common sailors, was just beneath us; and Tom cut off a life-buoy and flung it to her, but she missed it.

Then the sea seemed to rise up at us, and we were doused with a crash just as I grabbed an oar. I was whirled about underneath the water till my breath was gone; and when I came up I went spinning round and round in a sort of whirlpool, and bobbing under and up again till I was nearly choked. I stuck to the oar. But something had hit me on the head and half-dazed me, and I never remembered what happened properly, only that I saw the ship had broken in two, and left a bit of the bows sticking up on the reef; and a woman swept by me, and I grabbed at her but didn't catch her. I heard one or two cries from the water, but none from the ship-what was left of it -and judged no one was there. And the cries soon stopped, and I tucked the oar under my chin to keep my head up, and floated about in the dark. I kept saying to myself as it was 'a bad business, a bad business;' but couldn't think about anything properly, except that I'd like to smoke if I had a

pipe and matches and tobacco. And soon I began to feel drowsy, and thought it wasn't much good holding on any longer. And perhaps I shouldn't have, only the moon came out between some black clouds, and I saw land ahead, and so I stuck to the oar. When I dozed and half let it go I got the water in my mouth, and that woke me. Presently something knocked my legs, and I found it was the land, and got ashore like a half-drowned rat, and squeezed the water out of my clothes. Then I tumbled down on the beach and went to sleep.

When the sun grew hot enough it woke me. My clothes were dry, but stiff and musty with the salt, and I ached all over, and was hungry and thirsty. I saw some fresh water running down from the land, and lay beside it and lapped it like a dog; and found some shellfish like whelks, and ate them. Then it occurred to me that some of the others might be left. I went and looked out to sea, and saw the bows of the old ship on the reci about a mile away; but it was plain enough that no one was there. So I started along the shore to look for them.

I came across some of them on the beach-what used to be them. I'm not a man to make trouble over things; but I took it a bit hard finding them like that; and when I found little Mrs Williams, with her fair hair all loose, and looking like & young girl instead of a woman of five-and-thirty, I broke down and cried like a baby. She spoke to us common sailors just as if we were anybody else, and if you did anything for her she smiled at you and thanked you.

Five washed ashore altogether, and a quantity of wreckage. I dug five graves in the loose earth with a bit of plank for a spade; and I dug hers deepest. I cut five strips off the plank with my knife-hers was the widest-and stuck them up and scratched their names on them; and on hers I put 'In loving memory,' and I said a bit of the

service that I could remember.

That took the morning. I had dinner off shellfish and water, and thought I'd look round the island. It was about a mile each way, mostly flattish, with a few trees and lots of bushes and birds, and no animals. I found some eggs, and liked them better than the whelks, never caring for shellfish.

There was a strip of sand all round the island, and the land rose up a bit inside it, mostly loose earth, but here and there lumps of rock. In one

of them, near where I came ashore, I discovered a big cave, with an entrance like a low doorway. I thought I'd make a house of it, the same as Robinson Crusoe, and call it 'The Moorings,' because that was the name of our little house when I was a boy; and now I was thirty or thirty-one-I wasn't sure which. I took two empty boxes that floated aground into the cave for a seat and a table, and thought I'd make it cosy in time.

Next I walked along the shore, looking for more wreckage; and presently I came round the corner of a sandhill, and had a turn, seeing a woman rolling a little cask up the beach! I didn't recognise her at first without her gold eyeglasses; but when she stood upright and stared at me, I saw it was Miss Horton, that we called 'Miss Haughty' because she was so high and mighty. She had a bit of money and a lot of book-learning, and she was about eightand-twenty. She was good-looking in a scornful sort of style, and turned up her mouth, and hardly looked at you when you spoke to her. So I'd rather have seen any of the others. 'Howsomever,' I thought, 'she'll be better than nobody; and she's a woman, and not used to roughing it, and I'll have to give her the cave; and I walked up and touched my head with a friendly grin.

'Glad to see you, miss,' I said. But she backed away from me with her eyes wide open and her hands going as if she was swimming, to keep me off. It was plain enough that she was in a mortal

fright of me.

'Bless you, miss,' I told her, 'I sha'n't hurt you. I'm Thompson-Jack Thompson-off the old ship. It's a bit of rough luck, this wreck; but we'll be more comfortable than you'd expect. There's eggs and shellfish and fresh water; and I reckon we'll get no end of things from the wreck; and I've found a nice little cave that will do for a house, and'-

She gave a shrick and clenched her hands.

'If you touch me I'll kill myself,' she declared.

I drew myself up, and was near turning on my heel and leaving her to shift for herself; but I saw that she was off her head with fright, and no wonder, poor thing! And I was unshaved and dirty, and a fierce-looking, hulking chap at the best, so it wasn't surprising that she misdoubted

'You've got wrong ideas of me, miss,' I said. 'I wouldn't hurt you on no account. You shall have half the island to yourself, if you like."

'Swear it!' she cried, in a great state of excitement. 'Swear it!' As if the word of a common sailor wasn't any account!

So I made as if I kissed a book, to pacify her. 'The truth, and the whole truth,' said I. 'S'welp

'Draw a line,' she screamed, as if she was going to have hysterics. 'Draw a line across the sand. That will be your side, and this will be mine, as if it went right across the island, to those

'Very well, miss,' I agreed, shrugging my shoulders. 'I'll draw a line and I'll keep to it; but you'd best change sides first. There's a cave this way'-I pointed to where I'd come from-'what will come in useful to you. The weather don't make so much odds to me.'

She crossed over without even saying, 'Thank you,' and I made a deep furrow in the sand, leaving the cask on her side.

'There you are, miss,' I said; 'but I've got to have liberty to go just there and back.' I pointed to where the graves were.

'Why?' she asked sharply.

'Well,' I told her, 'I don't want to give you cause to fret; but you'd soon see for yourself. It's graves. Five of them.'

'Very well,' she said with a shudder. 'Now go, please, so that I can fetch the cask.

She evidently wouldn't trust herself within arm'slength of me, thinking that a common sailor hadn't the feelings of a man to a helpless woman.

'Well,' I said, 'I'll go. You'll find most shellfish on that little spit; and there's a freshet of water just opposite; and there's birds' nests in the low bushes, but they're prickly. You'd best take a bit of plank to open them; but don't beat them down, or they'll not lay there again. And some day you'll know that you thought wrong of me.'

Then I turned round and walked off, and when I got out of sight I sat down with my face in my hands. For I wasn't my proper self yet, through weakness, and I'd never expected to be taken for a blackguard; and the line on the sand seemed like a great wale across me. Howsomever, I didn't blame her, thinking that she was upset and would soon come round and know better.

I slept in a hole in the sand that night; but the next day two boat-sails washed ashore, and I dried them in the sun. Then I cut out the middle of a big prickly bush, and a doorway into it; and I laid the biggest sail over the part that was left, like a round hedge, and made a sort of tent, and put in reeds for a bed, and some dry grass on top. I expected the other sail would come in useful to her for a curtain at the door of her cave. So I took it up to the line, and threw it over. I saw her out on the spit gathering whelks, or whatever they were, in the afternoon; and in the evening I heard her singing. I fancied it must be very lonely for her, being a woman, and I was half a mind to shout to let her know that I was there; but I thought it would only frighten her more.

There was a high wind on shore the next day, and the bows of the poor old ship rocked on the reef till I thought they would topple over; but they didn't. A lot more wreckage was blown ashore, and mostly on my side of the line. In particular there were two barrels of salt pork, and one of biscuits (rather soiled by the wet), and a case of tinned beef. It was wedged cornerways in a big grating, and that had floated it. I noticed she'd

taken away the sail I threw over. So I rolled one barrel of pork and one barrel of biscuits over the line, and carried some tins of beef there; and I scratched a note on a plank that if the biscuits were salt with the sea she'd better put them in the freshet for a bit, and that would make them all right. I knocked in the heads of the casks with big stones, thinking she mightn't be able to open them. I went up to the line in the evening and listened to her singing, and joined in under my breath, so as she shouldn't hear.

The day after I saw her near the line, and wanted to call out and ask how she was getting on; but I noticed that she'd stuck a chopper—that must have come ashore-in her belt, and knew that she was going armed, as if I was an enemy. I took it rather to heart, and kept well away from her part of the island in the daytime for a fortnight; but I always crept along to hear her sing in the evening, feeling

Except for the lonesomeness I didn't do so badly. At first I lived mostly on the biscuits and tinned beef, not fancying the raw pork or even the eggs, though they were easy enough to get. But after a while it occurred to me that I could cook them up a bit in the sun; and I did, and liked them better that way. I thought she might not have hit upon it, so I scratched a message on a bit of wood, and left it for her: 'If you want eggs I've plenty. You can cook them in the sun. On a white stone is best, and another behind them.'

She scratched an answer underneath, and left one of the glasses out of a telescope beside it: 'Thanks; I've plenty. You can light a fire with this lens. I 've another.'

I thought it showed a neighbourly feeling, and I'd hail her next chance; but I happened to go to the graves, and found she'd been there and put up a new plank for Mrs Williams, instead of mine. I learnt long afterwards it was because mine had cracked with the sun; but I thought then it was to correct the spelling, because I saw she put two I's in the name, and only one 'm' in the middle of memory, and I'd put two. It annoyed me as you wouldn't think, and I spent three afternoons cutting a cross with proper spelling, and put it there instead. And after that I didn't try to speak to her; but I knew she got on all right, because I saw her cooking things in big shells. She used them for plates too, and a corned-beef tin for a cup; and I took the hint for myself.

One day I saw that she dragged herself about, as if she wasn't well; and she didn't sing in the evening. The next day she seemed worse. The day after I didn't see her out at all. I was afraid to frighten her by calling after it was dark; but I sat down by the line to watch if she came out in the morning; and when she didn't I decided that the promise had got to be broken, and went along to the cave and called to her.

'Don't be afraid, miss,' I shouted. 'I thought perhaps you weren't well.'

'I am ill,' she answered in a hoarse voice. 'It's some kind of fever. I-I'm so thirsty!'

I picked up the can that was lying outside, and

ran off for some water. 'Shall I put it round the corner?' I asked.

'I can't stand,' she said with a groan. So I went

She was lying down on the sail I'd thrown over to her, and her teeth were chattering like ague; but she tried to laugh.

'Don't be afraid of me, miss,' I said. 'You needn't be; ' and I held her up and gave her some water.

'No,' she said. 'I've seen that for some time. I beg your pardon.

It made me go red to have a lady beg pardon of a chap like me, and I turned and looked about the cave.

'A bit hard, those stones,' I suggested; and she fetched a great sigh.

'They make me ache,' she owned.

So I fetched a lot of grass, and rolled up my coat-I didn't want it, having a jersey-for a pillow, and lifted her on to it, and covered her up with the sail. Then I boiled her an egg in the tin, but she only ate half of it. The next time she wouldn't eat any, and I couldn't get her to touch anything else, though she kept drinking

'If only I could have some milk,' she was always 'There was such a lot aboard!' She saying. meant the tinned stuff.

'Well,' I said, 'there might be some in the bows now. Perhaps I could float out with a plank when the tide's going that way, and back again when it turns.'

'No, no!' she cried. 'Don't leave me! Don't leave me! Those horrid little goblins will take me if you do.' She was light-headed, off and on, and I had to sit beside her and pretend that I kept the goblins off.

'Don't you worry, miss,' I promised. 'I won't

leave you. 'Tisn't likely.' I did't leave her for four days, except to get fool and water; and then she was generally crying after me, like a child, when I came back, and half the time not in her right senses.

She got worse and worse, and at last she was so bad that she only moaned and didn't open her eyes, and couldn't swallow anything but water, and kept clutching as if she wanted to hold something and I had to give her my hand to quiet her. Then she went off in a stupor, and I thought the end was coming. I didn't believe it was the fever that was killing her so much as having nothing she could take except water; and at last I made up my mind that I'd try to get her some milk from the ship.

I'd noticed the tide set that way when it was going out. So, about an hour before the turn, I took a plank, and floated with it, swimming and guiding it as well as I could, though I wasn't much of a swimmer. It was slack water by the reef, and I managed to steer into a little cove and climb up the rock, where I could jump on the side of the old ship, as it lay over, and crawl in at a porthole; and then I slid and clambered about inside till I got to the galley and the bunks and lockers in the forecastle, and I found a lot of things there. I tied up several bundles of clothes and blankets and other articles, and lashed them to spars and boxes, and threw them over, thinking some of them might chance to float ashore; and I put a lot of milk in boxes, and some tools; and then I fixed up a grating with some planks, and fastened the boxes on, and some more blankets, and let it into the water with a rope, like a raft, and slid down the rope, and cut it with my knife, and floated off. It seemed as if I was going to miss the island altogether; but I stuck two marline-spikes through the grating for rowlocks, and sculled with an oar I'd taken. And, after about two hours going backward and forward with the contrary currents, I got into a useful one; and at last I fetched the island, just at the corner, and ran ashore. And then I walked knee-deep in the water, towing the raft till I was opposite the cave, and hauled it up on the beach there.

I opened a tin of milk, and mixed it up with water, and gave her spoonfuls (I'd taken a spoon); and then I gave her some brandy that I'd found aboard; and afterwards I covered her up with some blankets, so that she would get hot and sweat out the fever. And she breathed harder, and I hoped she'd be all right. And I fell asleep unawares, being dog-tired; and when I woke she was lying with her eyes open, looking at me, and she said, 'I'm going to get better.' And I said, 'Thank God!' And she said, 'Yes,' and smiled and went to sleep.

When she woke up I gave her some more milkaud-water; and when she'd drunk it she looked surprised and asked me where it came from; and I told her about my trip to the wreck, and she lay staring at me with her eyes looking big in her pale face.

'If you hadn't reached the island again!'she said with a shudder.

'You'd have been no worse off than if I hadn't gone,' I explained.

'Oh!' she cried, 'I wasn't thinking of myself; I was thinking that you risked your life for me!' She held out her hand, and I shook it. 'I wish we were—the same side of the line,' she said; and I felt as if I'd been doused with cold water.

'Ah,' I said, 'the line! I know I am a rough sort of chap, and not fit company for the likes of you; but you needn't be frightened of me.'

'I'm not frightened of you,' she told me. 'I think you are good and brave and honourable. I know you are. I trust you entirely. Only, I wish there wasn't any line.'

'You can rub it out with your foot,' I said with a laugh.

'No,' she said with a choke, 'I can't. It is you who must remove the line.'

But I shook my head.

'No, missie,' I contradicted. 'You set it betwirt us, and you must take it away; and if you don't I stay my own side, once you're well and strong; but till you are I'm going to look after you.'

She put her hands behind her head and lay there and laughed.

'I shall take my time getting well,' she declared.
'I like being looked after.'

And I grinned.

'Come to that,' I owned, 'I like looking after you; and you can take your time and welcome. And now you go to sleep, while I go along shore and see what's washed up.' And off I went, and managed to knock down a bird with a stone and cooked it for her dinner.

I fed her up all I could, and after two days she was able to sit up for a bit of the time in a chair that I'd knocked together now I had tools and cushioned with blankets, a big bundle washing ashore, as I had hoped, and some men's clothes. I hadn't found any clothes for women, but I'd brought needles and thread, and she started making a new dress for herself out of sheets, and sat and talked and laughed very pleasant; and I made a door for her house so that she could shut herself in when I went to my tent at night, and I always waited outside for her to call that she had 'locked up' before I went. And she used to say, 'Good-night, and God bless you! And be sure you come early.'

Soon she got well enough to take little walks, and began to do the cooking, that she was wonderfully clever at, while I hunted or made things; and one evening she said she was 'almost quite well,' and we'd have another walk after tea. It was bright moonlight, and we walked along the beach; and we came to the line, and she stopped and looked at it.

'The line that separates me from a good man!' she said with a catch in her voice.

'It's easy to rub out, missie,' I told her; 'but it's for you to do, not me.'

'This line?' she said. 'Yes. It's gone.' She brushed her foot over a little bit. 'But not—not the line between you and me. Don't you see it—the line between our lives; the line that will be, if we are rescued?'

'Why, of course, miss,' I agreed. 'You're a lady born and bred, and I'm a common sailor. You can't rub out that line.'

'No,' she said. 'I can't; but you can. If you tried you might rise. You could try, anyhow. I wish you would.'

I looked at the moon a bit and considered. I saw what she meant well enough, and that I wasn't the sort she could introduce to her friends, and so on; and I didn't blame her, though I thought it bit hard that a man should be judged by his booklearning and way of speaking and dressing, and how he'd been brought up, and not by himself; and I

thought I'd like to be as good as anybody else, and her to think so. But if she didn't think so, now she knew just what I was, I didn't see what odds a bit of education would make. And besides, I didn't think it was in me.

'It's no use, miss,' I told her. 'I'm what I was brought up to be, and what I am; and there's the line between us, and there it's got to be.'

'It hasn't!' she cried, stamping her foot almost in a passion. 'If you wanted to be friends with me—wanted badly—you'd cross it. You'd try, anyway.'

'Come to that, miss,' I said very quiet, 'if you wanted to be friends with me, there wouldn't be any line; leastways you wouldn't trouble about it.'

'That is nonsense,' she said sharply. 'There is a line, and I do trouble about it. Won't you let

me teach you spelling and grammar ?'

And then I thought about the plank that I'd set up to little Mrs Williams—not yet knowing the real facts about it—and felt as if I boiled up, and I just drew my toe along the line and made it deeper.

'There's the line of spelling and grammar,' I said, 'and I'll never step over it on this island or off it unless you ask me; leastways, not without good cause, like I had. Well, now you'd best go to sleep and keep those roses in your cheeks, missie; and it'll be good cause enough to step over when I can do things for you.'

For I didn't want to upset her, having a liking for her, when all was said and done. But she stamped her foot and looked at me with her eyes blazing.

'You have made the line now,' she cried, 'and I'll never set my foot over it;' and she turned and ran.

For three days neither of us crossed the line, though we spent most of our time talking, one on each side, and were friendly enough, both wishing we hadn't said what we had. Then a ship came and took us off; and when we got aboard the line was plain enough!

The captain gave her his cabin, and I went into the forecastle. She wanted to pay for a first-class passage for me, but I wouldn't have it; and I wouldn't go and talk to her, only just enough to show that there was good feeling between us. We were both anxious that every one should know that; and I always told everybody as she was a lady it was a pleasure to be shipwrecked with, and I heard from the captain as she had nothing too good to say for me.

She wanted me to go to her friends when we landed, but I wouldn't; and I stayed at the port to look for a ship, and got a job meanwhile from my old firm, who were very good to me. And then her solicitor came to see me. He was a pleasant, gray-haired old gentleman, and wanted to lend me money to start in a business.

'A man with your abilities,' he said, 'my dear Mr Thompson, ought not to be content to pursue

the calling of an ordinary seaman, respectable and —er—honourable as that calling may be.'

'That's all I'm fit for, sir,' I said, 'thanking you kindly. And I know who sent you, and you can tell your client, as you call her, that I'm much obliged, and take it very friendly and nice of her, and like I'd expect. But what I did for her was what it was a man's duty to do, and his right; and I don't look to be paid in one form or another. And my best wishes to her, and it isn't that I wouldn't like to see her; but I don't care to go and feel that things are different from when we were on the island and good friends. But I know she was right when she spoke about the line what was between her and me, and I'm off on Saturday week.'

'Ah!' said the old gentleman. 'Umph! Your feeling of pride does you credit, Mr Thompsongreat credit. But—er—you are too chivalrous a man to—er—to wish to hurt the feelings of a—a woman. You see—women have their duties and their rights too, and—er—my client naturally desires to show her gratitude for you; and I think you ought to consider her a little in the matter. Really, now, my dear Mr Thompson, you wouldn't think so well of her if she didn't desire to be of friendly assistance to you. Now, would you?'

'No, sir,' I said; 'that's so. She's quite right to make the offer; but I'm right, according to my ideas, to refuse. Please give her my very grateful thanks, and say I shall think more kindly of her for it—more kindly than ever.'

'Umph!' said he. 'Umph! I think you would show your appreciation better by sinking a little bit of your pride and going to thank her yourself. She'll be very hurt if you go off abroad without seeing her.'

'I'll come up to-morrow,' I said very prompt; for I wanted to see her badly enough, and was glad of an excuse, though I told myself I was a fool to think so much of one who was the other side of a line that there was no crossing.

I was a bit nervous when I saw her fine house, and stammered when the servant opened the door and stared at me; but Miss Horton ran out and caught hold of my hand, and pulled me into the drawing-room, that was all ornaments and pretty things, when I came to remember afterwards. But I didn't think of that then, for she looked so lorely that she took my breath away; and I made a line in the pattern of the carpet for a warning to myself, and felt as though there was sea-spray in my eyes.

I choked down a lump in my throat and began telling her about the berth I'd got, and how she wasn't to worry about me, because it was what I'd been used to, and rather better. I was carrying it off very nice and cheerful, when, all of a sudden, she put her hand in mine.

'Dear friend,' she said, 'won't you let me offer you the least thing—when you offered your life for me?'

And I took my cap and staggered to my feet and

turned to go, feeling that I couldn't stand it any longer.

'I'd do it any time,' I said—'a dozen if I had them. Don't think it's because I don't want to come that I won't come any more. It's just—just the line, missie—the line. God bless you!'

I turned and was going. I couldn't see her for the mist in my eyes, and then I found her clinging to me.

'I've come—over the line,' she sobbed. 'Because I love you! And you love me!'

And I kissed her and held her at arm's-length; and then I kissed her again.

'My girl,' I said, very solemn, 'before God, I do. Now, listen to me, my dear girl. Love isn't a matter of lines; and I'm not going to let my pride come between us. I've took you for my sweetheart; and my sweetheart you're going to be, and some day my wife.'

'Yes,' she said-'yes!'

'But first,' I told her, 'I've got to cross the line. I'm going to educate myself, and make myself a bit fitter for you; and I'm going to do it by myself, without your help; and when I've done it I'm coming to you. Well, I'm not going to wait till then, either. I'm coming to see you every time I'm home; and you shall tell me how I'm getting on, and when I'm over the line.'

She agreed that was right, and so we settled it.

I went to the head of my old firm, that my father served too, the next morning, and told him the whole story; and he wouldn't have me go to sea yet, but gave me a shore-job, so that I could go to night-school; and the young governor had me to his house sometimes, and taught me to speak properly; and I got on faster than I expected. And when I'd learned arithmetic and got to algebra and geometry I found I'd a gift for mathematics; and they sent me to their place at Havre for a bit, and I picked up French in a way that surprised everybody; and then I passed some examinations, and went for a voyage as a sort of supercargo; and I did some very good business for the firm, and when I came back I went straight up to see Violet. That is her name.

'I don't speak of the line now,' I told her with a laugh after we'd got over the first excitement and I'd sat down with my arm round her. 'I call it the equator.'

'Couldn't you cross the—the equator—now,' she whispered—'and stay with me?'

'It will be very nice,' she said.

So we crossed the line of matrimony, and ever since we've sailed in smooth waters.

THE INTERNAL-COMBUSTION ENGINE AS A SOURCE OF POWER.

O one whose lot is cast in a modern hive of industry, surveying the myriad whirring factory-wheels, the question arises, Will the sources of energy so utilised always be available, or will a time ever come when

these wheels will cease to revolve by failure of energy-producers? And would this mean national disaster, affecting every one; even the man of sesthetic temperament, who would welcome the disappearance of forests of factory chimneys, unsightly heaps of smoking refuse, and the palls of black smoke which becloud the light of heaven? Such failure might paralyse us as a manufacturing people, doing besides the chief carrying trade of the world.

The sun is not yet a source of practical energy, although it has stored potential energy ages ago in our coal-seams, oil-wells, and shale strata, upon which we are drawing at present with extravagant haste. Wind, tides, and waterfalls are only partially exploited. Our main sources of energy are derived from coal, oil-wells, shale, and the vegetable kingdom. Coal is our chief source of energy, and we are assured that there is no likelihood of a dearth in Britain for many a decade to come, although it

is obvious that such supply is not unlimited. This fact cannot be too strongly impressed on our minds, as well as the necessity for its economical use, especially in the United Kingdom, where, for long periods, power-users all over the world have drawn only too freely. Not entirely from fear of future days of scarcity, but rather to secure a diminished coal-bill, power-users are beginning to adopt the means with which science and mechanical skill have equipped them for extracting the maximum amount of energy from every pound of coal.

It is to some modern sources of power, including producer-gas and the gas-engine, that we would direct attention. The day of the internal-combustion engine has hardly yet come; but it is close at hand. We ask, What, then, is an internal-combustion engine, and what is producer-gas?

In an internal-combustion engine, fuel in a gaseous condition mixed with air in definite proportions is introduced into a cylinder, compressed to a high degree, then exploded behind a piston. The consequent motion of this piston is transmitted to a shaft, the turning of which can be usefully applied in numberless different ways. The constituents of producer-gas are carbon monoxide, hydrogen, and traces of methane occasionally, when

the gas is made from coal. These are the heatgiving constituents of the gas, but it contains inert elements as well whose presence is due to the process of manufacture. These inert constituents are carbonic acid gas and nitrogen. When coal, or more generally carbon, is heated to incandescence in a retort, say, in a vertical cylinder, and air and steam are blown forcibly through this mass of incandescent carbon, chemical reactions take place between the carbon and the oxygen of the air on the one hand, and between steam and carbon on the other; reactions which give rise to a combustible gas -- producer-gas -- composed as already mentioned. The heat necessary for the above reactions to take place is obtained by the burning of part of the fuel, the reactions requiring heat to be supplied them as a condition of their occurring. The gas is of very low heating value as compared with illuminating gas, but it is produced at a very cheap rate, one ton of bituminous slack giving, on the Mond system of production, one hundred and fifty thousand cubic feet of gas, with a calorific value of one hundred and fifty British thermal units per cubic foot.

The combination of gas-engine and producer-gas plant has furnished a means of extracting more of the heat-energy from every pound of coal burnt than that pound of coal could have given up burnt under a boiler in the cylinder of a steam-engine. A well-known pioneer in the field of producer-gas, J. M. Emerson Dowson, recently tested a steam and a gas power plant, each of two hundred and fifty horse-power. This comparison showed a saving in fuel of 53 per cent. in favour of the producer-gas plant and engine. Two smaller gas and steam plants, each of forty horse-power, were similarly compared, and the saving in favour of the gas-plant was as much as 70 per cent. The producer-gas plant has, however, other features to recommend it. An ammonia-recovery process can be readily worked along with the producer-plant, and sulphate of ammonia, much in demand as a manure, manufactured therefrom. Very poor qualities of fuel may be used in the producer. The Mond producer uses bituminous slack; lignite and peat may also be used as fuel in modified Mond producers, and the latter often contains as much as 2 per cent. nitrogen convertible into ammonia, and gives a gas of a comparatively high heat-value. The Power Gas Corporation (Limited) is now constructing at Stockton a two thousand horse-power ammonia-recovery peat-gas plant worked on the Mond principle for a central electrical distribution station, and this plant will probably be in operation at the end of the year. It is interesting to note in passing that the utilisation of peat for power and furnace purposes was worked out in England and communicated from England to Germany, where peat as a source of power is now being exploited to a considerable extent.

Waste products from many industries may be used in the production of producer-gas in plants

modified to suit the nature of the material to be gasified; tan-bark, sawdust, rice-husks, and sugarcane refuse may be mentioned as examples of such waste products. On the estate of M. de la Ville in the south of France, where non-alcoholic wines are being so successfully produced, vine-prunings are chopped into lengths and fed to a retort, where they are distilled, giving off a gas which is utilised in gas-engines developing about one hundred horse-power. It is said that four pounds of prunings give one horse-power for an hour.

Petroleum of various specific gravities, from volatile petrol to heavy, viscous oil-refuse, can be applied for the generating of power. If the petroleum is to be used in an internal combustion engine, it is first vaporised, then exploded in the oil-engine cylinder with the requisite quantity of air. In the United States, where denatured alcohol for industrial uses can be bought for forty cents per gallon, it may be expected that alcohol manufactured from grain and rendered unpotable by the addition of wood spirit and benzene will become a formidable rival to petrol in the uses to which petrol is at present applied. It has been completely proved that alcohol is perfectly adapted for an engine-fuel; but in this country its use cannot become general till denatured alcohol for power-uses is made duty free.

With these facts before us, perhaps we may attempt an answer to the question as to the constancy of a fuel-supply for power purposes. Any thing, however, of the nature of prophecy in the domain of mechanical science should be guardedly made. The late Sir Benjamin Baker used to instance the fallacious forecasts of eminent engineers and statesmen in this direction. Watt, for instance, used to rest his claims to immortality upon his parallel motion, now almost obsolete; Smeaton condemned the crank and flywheel as inefficient and clumsy; Lord Brougham advocated a law restricting railway speeds to a maximum of thirty miles per hour, arguing that rapid motion must be dangerous. In his presidential address to the Institution of Civil Engineers, Sir Alexander Kennedy discussed, among other things, mechanical evolution - whether definite laws could be traceable in the development of mechanism. He said: 'As a species, machines may certainly be said to represent a "separate creation." One species after another starts suddenly into being, sometimes through the inventive talent of a single man, perhaps through the joint endeavour of many minds directed to one special point by some requirement of practical industrial life. With the warnings, it might be dangerous to imitate Mr H. G. Wells in his Anticipations; still, were the world's supplies of coal, of oil, or of peat to give out, we have the inexhaustible products of the vegetable kingdom to press into the service of the power-user as long as the sun shines and the rain falls. That period of dearth of coal must be remote; and before it comes some means will doubtless have been devised for using directly the energy which the sun is constantly giving out. The thought of a country dependent for powersupplies, as well as food-supplies, upon the soil is

surely a pleasant one. It suggests a more even distribution of population, which our cry of 'Back to the land' is less likely to bring about under present conditions.

SNAKE-VENOM AS A COMMERCIAL PRODUCT.

N Australian employment—at present in a small way, but capable, it will be seen, of great expansion—is that of collecting snake-venom for sale. The demand for this curious product

is growing rapidly. It is found useful in medicine, and has a valued place in several departments of the mechanical arts and sciences. There is a constant call for it among naturalists and experimenters generally; and when it is known that it can be bought in the open market additional uses for it will certainly be discovered. The value placed upon some small quantities lately exported from New South Wales was so high that during the last warm season, when snakes were numerous, a boom in the collecting business set in, and the industry promised to swell to considerable proportions. Valuing the venom by weight, we find that it fetches more per ounce than any of the precious metals. The market price at present is from twenty to twenty-five shillings a grain, or something coming up to six thousand pounds per pound troy; that is the rate quoted on the Sydney side. But even these huge figures fail to bring to the market a quantity to meet the demand in more than a partial way.

The difficulties and dangers connected with the collection of the venom largely account for this. The inadequacy of the appliances used in capturing the snakes prevents many from undertaking the work; other causes also contribute to deter persons from adopting the employment and following it in a systematic manner. The venom-bearing snakes near the large centres are mainly found in swamps and morasses, and have to be sought for in early morning or at twilight, when a slight inadvertence might have bad results. The snake whose venom is wanted for the market must be captured alive. Almost any one acquainted with the bush can kill a snake; but capturing it alive is quite a different matter-that needs nerve, dexterity, and certainty of touch. Snakes, as a rule, try to get away from the person who attacks them; but exceptions have to be taken into account. At the nesting season a snake may develop unusual courage, and even advance upon the person attacking. Even, however, with snakes retreating, the capturing act must be swift, neat, and perfect. It seems easy to an onlooker, but it is because the capturer has begun with a superb nerve and has practised his art till his hand moves as rapidly and noiselessly as his eye. Some men depend on their fingers alone with many kinds of snakes; others use a

batten to hold the head down till the fingers obtain the requisite grip on the back of the head. The fingers must grip tightly and hold firmly till the reptile is deposited in a bag or box. If it were struck with a stick, or held down with a forked stick, as is the usual process when a snake is captured for show purposes, it would empty its venom-sac in the fight, and perhaps break its poison-fangs, thus seriously reducing or destroying its market value as a venom-producer. It is, therefore, necessary to capture it in its natural state, and preserve it in that state till it goes into the hands of the operator.

Some operators extract the poison by cutting out the poison-bag in its entirety. They cut into the snake's head, and, having detached the glands, fasten the valves and store them away in bottles; others goad the snake to bite through india-rubber bands and eject its venom on to a glass plate beneath. Either way secures the venom; but in the latter case care must be taken to prevent the intrusion of impurities. A venomous snake has two poisonfangs in the upper jaw; and when goaded by the operator it pierces the india-rubber band and pours on to the glass below two streams of poison, just as if it had penetrated the human skin and injected the venom into the human body. The venom is afterwards scraped off the glass, placed in hermetically sealed tubes, and becomes forthwith a marketable product. The operator's work is, it can be seen, in some respects more dangerous than that of the capturer, as the reptiles are handled alive under both processes, but in the second are goaded to anger and generally restored in that state to bag or box for further treatment. Though proportionally few Australian snakes are deadly, most are venomous, and are therefore marketable in the sense considered. The ringed-snake, the whipsnake, the banded-snake, and a number of others do not fatally injure, but carry enough venom to make them worth pursuing. The more venom, however, and the more deadly it is recognised as being, the better the reward to capturer and operator.

The death-adder is probably the most deadly of Australian reptiles. In comparisons made during the past year it puts up the largest proportion of deaths to bites. In one hundred and ninety cases of snake-bite recorded over a period, the death-adder is credited with ten cases, and in five of them death resulted; the tiger-snake figures in thirty-three cases, with fifteen deaths, and the brown snake in thirty-two cases, with sixteen deaths. The

dreaded black snake is credited in this official list with eighty-seven cases, of which not one was fatal. But the much-dreaded snakes have larger poison-glands, and, apart from the potency of the poison, are valuable for the copiousness of the supply. Four of the six families of fresh-water snakes are venomous, and all Australia's marine snakes are so. The area over which the snake-venom industry may be pursued is, therefore, taking the small with the large, extremely extensive.

Presently attention is concentrated on the snakes whose bite is fatal or reputed to be fatal-these are the basis of the enterprise. The venom of the non-deadly snakes, though desired in some chemical processes, does not command such wide or profitable patronage as that of the deadly. Hence the worst dangers are encountered at the very threshold of the enterprise. The price per pound for venom takes away the breath; but such a quantity as a pound is hard to collect. All so far collected in Australia falls considerably under a pound. A robust snake of the most deadly class, treated with the greatest care and the best apparatus, will not discharge more than a grain at a bite. This grain will sell on the market for a little over twenty shillings; that is, supposing the venom has reached its tube free from all impurities. The twenty shillings has consequently to be divided among all who have contributed, from the catching of the reptile to the selling of the poison. Those who work in the swamps and gullies must camp in these places to catch their prey morning and evening; they have to shift camp frequently to keep in touch with the best varieties; they must keep their snakes alive till they deliver them to the operator in town, and must then lose them if their fangs have been broken accidentally or otherwise. A fair estimate is that the capturer gets five shillings for every snake of high-class venomous order he delivers safe and sound to the operator. The operator has to divide the balance of the twenty shillings between himself and those who help him to negotiate

The calculation is based on the assumption that each snake is valued at one discharge only. That used to be, and is still, except in rare cases, the snake's value; but already a beginning has been made in what some call snake-milking; that is, the snake, after discharging its stock of venom, is put away and called upon after a time for another and another discharge. A snake's discharge after a long rest differs in quality and quantity from a discharge on a second bite immediately after the first one. On this ground the bites of a snake fatal in one case and non-fatal in another are easily explained. The poison in the second bite was simply less in quantity and quality than in the first. But with time to rest, the poison-glands refill and the original degree of potency is regained. This principle being recognised, the deadly snake is treated as a valuable pet. After intervals of a couple of days it is taken again to the apparatus

with the india-rubber and glass slide, and once more delivered of its supply of venom. This, it is obvious, can go on indefinitely; but it means the housing of the reptiles and a systematic form of management not yet thoroughly understood. If adopted on a large scale, the system will lead to a pronounced change in the commercial value of the reptiles. Whether it will increase the value of the services of the capturer and operator, or lead to a reduction in the price per ounce of the commodity, remains to be seen.

What is absolutely necessary for the cultivation of the industry on satisfactory lines is a classification of the venoms. This work is proceeding, but much remains to be done. The official paper published recently by Dr Tidswell, of the New South Wales Health Department, states, as the results of laboratory experiments on rabbits, certain conclusions which may be taken as the beginning of a classification system. The experiments referred to place tiger-snake venom first. It was found fourteen times more deadly than that of the black snake, and four times deadlier than that of the brown snake and death-adder. The average amounts yielded at a bite show that the death-adder gave three times more than the tiger, seven times more than the black, and almost seventeen times more than the brown snake. These computations are scientifically interesting, but most valuable from the commercial point of view, and when carried over the venomous snake-field will enable those engaged in this industry to turn their time to the best advantage.

TO MABEL.

OH, sing to the heart that is lighter than laughter!
Oh, sing to the heart that is beaten with pain!
To the eyes that are bathed in the glory of summer.
To the eyes in which hope lies shattered and slain.

Oh, sing to the toiler whose brow, deeply chiselled,
Is lined with the furrows life's battle has ploughed!
Oh, sing to the idler who sits in the noondsy,
And laughs with the sunshine and frowns with the

cloud!

Oh, sing to the footsore on Time's rocky pathway
A song that shall cheer them and banish their fear!
Oh, sing to the lips smitten dumb with swift sorrow
A song that is liquid with sympathy's tears!

Oh, sing to the youth whose long, deep horizon
Is fearlessly met with a vigorous gaze!
Oh, sing to the aged, their way dimly groping
Through the shadowy vale to the river's dark haze!

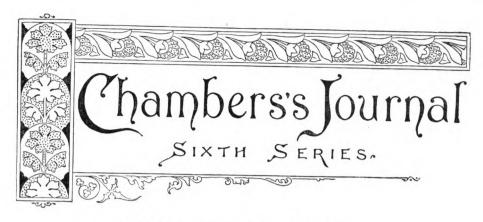

For yours is a heritage rich in possession,

That wealth cannot purchase nor jealousy spoil:

So give to the poor or the rich of your treasure,

To lighten their burdens and sweeten their toil.

JOSEPH FRANCE.

THE HEART OF THINGS.

By HENRY LEACH.

13

ORE emperors and kings are coming to London soon, and already the town is abuzz with interest and eager anticipation concerning the early visit of the Kaiser William,

for the importance of the meaning of this visit is understood by all people; and it is certainly the fact that of all the brilliant achievements in diplomacy and statesmanship by King Edward, surpassing those of any Minister, and being of incalculable service not only to the State but to the world-of all these achievements none can be more splendid and none more popular than his fine success in improving relations between Great Britain and Germany, and making it easy for the Kaiser to come to see us as a friend. With the exercise of his superb tact he has at one stroke neutralised the bad feeling that many industrious and misguided persons both here and in Germany have been engaged in fostering for years past. Think of the difference in our situation now and what it was only two or three years ago, when neither France nor Germany was our friend; and little wonder that when one goes about on the Continent now one hears King Edward referred to everywhere most affectionately as 'Uncle Edward' as the result of all his famous pilgrimages of peacemaking. What some pessimists say, that at some time or another a war between Britain and Germany is inevitable, may be true; but the time may be so far distant that for many practical present-day purposes the contingency may be overlooked; and it is surely true that this possibility has not brought the general public of this country to any universal dislike of Germany, as some would have us believe. Germany's naval policy is, of course, a menace, but a better understanding may bring about a modification of it. The spirit of peace is everywhere abroad; and the people, because they are tiring of so much distrust and so many sinister innuendoes, rejoice exceedingly in the coming of the Kaiser, many of the points in whose character—his masterful independence, No. 513. -Vol. X.

his enormous energy, business-like kingship, and common-sense-are such as appeal strongly to them, and for which they are prepared to overlook occasional errors of tact in the past. It may be taken for granted that the Kaiser's visit in November will be one of the greatest visits of its kind that have ever taken place; and assuming that a part of the programme will include a visit to the City, without which no sojourn of a foreign sovereign in this country would be complete, we may be prepared for something quite exceptional in the way of civic entertainment and hospitality. Some of the City's greatest feats in this respect have had connection with the visits of German sovereigns. One recalls the wonderful hospitality accorded to the Emperor and Empress in 1891; and then, a long way farther back, the famous banquet that took place at the Guildhall in 1814, when three kings sat at the Lord Mayor's table, these being the Czar of Russia, the King of Prussia, and Louis XVIII. of France. On that occasion the banquet was served on plate that was valued at two hundred thousand pounds, and the entire cost of the entertainment came to about twenty-five thousand pounds. Nowhere are the results of King Edward's diplomacy more highly appreciated than in the City, where they 'spell hard cash,' and nowhere is the importance of a good understanding with Germany more desired. It will be with a full and a happy heart that the City will go forward to the entertainment of the Kaiser, and one may be very sure that there will be nothing but sincerity in all the nice things that will be said.

There is a little of sadness in the fall of the leaf, even for many a Londoner who is confined unceasingly to the town, and who, it might be supposed, is little enough acquainted with the changes in the fall of the leaf, even for many a Londoner who is confined unceasingly to the town, and who, it might be supposed, is little enough acquainted with the changes in the fall of the leaf, even for many a Londoner who is confined unceasingly to the town, and who, it might be supposed, is the curious fact that it is the slightness of his acquaintanceship that leads him to an effort towards intimacy whenever the chance comes his way; and [All Rights Reserved.]

therefore it comes about that of trees and their peculiarities many such town-prisoned folk know more than the people who live their whole lives in the country, and claim to a full knowledge of what is going on about them all through the year. It was once said by Leigh Hunt that there was scarcely a street in London but could boast of a tree. That, unhappily, is no longer true, and the exigencies of modern conditions, it is to be feared, will prevent the busy thoroughfares from ever again showing verdure in the summer-time. But here and there, only just a little removed from the arteries of traffic, there are trees about which are clustered many traditions and long histories and much affection on the part of the Londoners who pass them by on six days of the week almost every week of the year. And it is wonderful how in the most uncongenial surroundings, with but a minimum of sunshine to feed upon, and built in all round, these cockney trees do thrive, and in the summer-time make such a show of the greenest leaves and new wood as would do credit to the trees overhanging a country lane. The plane-trees that are to be found in the busiest parts of the City are wonders of their kind. There is a splendid one in the garden at the back of Stationers' Hall, and that one which flourishes just off Cheapside is quite famous in its way, and has been the most beloved tree of some generations of Londoners, to say nothing of many more generations of London birds, for long ago its branches were inhabited by rooks, who eventually deserted it, leaving their nests behind them to be at once taken possession of by sparrows, while in course of time a new era came about with the advent of pigeons to the tops of the tree. At the very centre of the whole world of commerce, the point round which the business of two hemispheres chiefly revolves-in the Bank of England itself-there is a garden, and trees and shrubs and flowers and creeping plants give of their best in the summer-timea pathetic contrast, this, between the simplicity and the unapproachable charm of Nature and the fiercest and ugliest complication of civilisation. Here and there round about the City there are mulberry-trees to be found, which for the most part have the sudden zeal of King James in 1609, in the interests of the silk-trade, to thank for their present existence. In an age when there was much fine dressing and extensive use of silk, the King thought it would be well if it were produced at home, and he therefore sent out a notice offering packets of mulberry-seeds to all who would promise to sow them, whilst he further recommended his courtiers to plant the trees, and offered young ones to them for the purpose at the modest price of two farthings each. Of almost every old tree in London now there is a story to be told, and there is even romance in connection with some of the trees in the more public places, as in Hyde Park. Here, near the superintendent's house, there is a stump of an old oak, covered with ivy now and needing much artificial support, which, it is said, was grown

from an acorn taken from the famous Boscobel oak in which the second King Charles hid himself from his enemies after the battle of Worcester. And as the leaves fall down, so also are the migratory birds departing, and another of the reminders of the beautiful, simple world outside is being taken away from the pent-up Londoner, leaving him more entirely to his stones and bricks and electric lights and petrol-and to his various comforts. Observers of such matters find much to interest them in the bird-life of London, and it would surprise other people to know how varied is this life. Why do the wild birds of Nature haunt a place like this? It used to be that even the heron lived constantly in the heart of London, and even now he is to be found at Richmond Park and Wanstead, and a few months ago both herons and barn-owls were noticed passing over Kensington, making probably for some destination not far away. The kite, the raven, the robin, spoonbill, jackdaw, snipe, jay, and magpie were at one time all to be found within the four-mile radius of London; and though these have gone, there are many other varieties remaining, the list of surviving cockney birds including the rook, the blackbird, the wood-pigeon, the sparrow, the black-headed gull, the black-backed gull, the misselthrush, the moorhen, the dabchick, the crow, the blue tit, and the guillemot, and in the north-western outskirts, as at Wembley Park, the nightingale may be heard at the time of his song in the spring.

The country will soon be following the lead of London, and to a further extent the horse will be displaced by the motor as a means of traction, for the taximeter cab is a proved success; and, with so much money evidently in it, we hear almost every week of some fine new scheme for placing on the streets hundreds more of these new vehicles. They are clearly a great gain in convenience; and not ior that alone, but because they are tired of some of the ways of the modern cabman, are the public taking eagerly to them. It may not be long before the cab is a rarity; and, with all its faults, it will not be without a sigh that the old Londoner will regard the passing of such a prominent feature of the life of the town. It is a little over a hundred years since cabs were first seen in the streets, for it was in 1805 that a member of Parliament of the name of Rotch, in partnership with a man named Bradshaw, obtained licenses for nine cabriolets which were something after the style of the modern gig, and could only accommodate one passenger at a time, and he had to sit next to the driver. So many restrictions were placed by the authorities as to the places in which these cabriolets might ply for him that they proved a failure from the business point of view, and were taken off the streets, and nothing more was seen of such horse vehicles for another eighteen years. Then, however, licenses to ply for hire with practically no restrictions were granted to the owners of a dozen vehicles of a new design, made so that the driver was on a separate seat, and two passengers could be carried. Owing to the peculiar shape of these cabriolets they came to be called 'the coffin cabs,' and eighteenpence was charged for a journey of a mile in one of them, and fourpence for every half-mile afterwards. From the day of the introduction of these affairs, April 23, 1823, it was—and the promoters declared they were introducing them to the public in honour of the King's birthday-London has always had its cabs; and though we have been complaining daily about the system for many years past, their position as a necessary convenience, with no alternative, seemed to be unassailable until lately. Despite his often annoying ways, one will regret to see the extinction of the London cabman, if he is to be extinguished, just as one sympathises with him in the bad times that he has had lately; for he is a distinct type, and a most interesting one. It has always to be said in his defence that his occupation is very precarious and very hard, while the skill and intelligence of the driver of the hansom are of a high average—how high one can only appreciate after a little experience of the cabmen in the chief Continental cities. It has often been said, and is certainly true, that there are to be found among the ranks of the London cab-drivers some men of first-class education, who at one time held good social positions, but who through bad luck or fault of their own have been driven to this mode of earning their living. The late Lord Rosslyn used to tell a story of how he encountered such a cabman on one occasion. One night he hailed a hansom, and told the man to drive him home. When he got out at his door the cabman touched his hat and said, 'I think you are Lord Rosslyn?' 'Yes,' said his lordship in reply; 'but why do you ask?' 'Do you not sometimes sell Gordon setters, my lord?' 'Yes,' was the answer, and then, with some asperity, 'but I do not sell them to cabmen.' In an easy and gentlemanly manner the cabman then proceeded to observe that that might very likely be true; but, at the same time, if he might say it without offence, he thought that he (the cabman) had the advantage in the matter of education, and he stated that he had been educated at one of the universities, and could speak several languages fluently, one of them being Italian, of which he knew his lordship could not understand a word. Then he explained that an Italian nobleman who had once been his intimate friend happened to be in London at the time, and was in need of a brace of Gordon setters. The whole story turned out to be true, and eventually Lord Rosslyn sold the setters to the Italian nobleman for fifty guineas, and at the same time he made the cabman a present of a five-pound note.

* *

The autumn publishing season is upon us, and the publishers are saying that they expect it to be brisker than for some time past. Certainly the autumn

crop of novels seems to be unusually large; and, despite all the stories that have been told about the damage done to book-fiction by serials, and so forth, the public demand seems to be at least equal to the supply—the supply of good writing, that is. The making of a novel and the publishing of it is not always such a lengthy and anxious business as it was once regarded; perhaps from one point of view it is a pity that it is not. The present writer was assured the other day that a man who is by way of becoming popular as a novelist wrote his latest book-which was only recently brought out and received some very flattering reviews for the 'deep thought' that it bore evidence of-in the very short period of three weeks, and that it was actually in the libraries within three months of the plot having been conceived. Whatever a writer's capabilities and temperament, few men of any experience in such matters would agree that it is possible for him to produce anything like the best work of which he is capable at such a high rate of speed. But many other marvellous feats in literary production have been accomplished in late years. Though it is becoming quite a long time since he died, new novels by the late Mr Guy Boothby are still making their appearance; but by this time the stock of this prolific writer's posthumous work must surely be exhausted. The secret of the wonderful literary fruitfulness in his case is, of course, very simple, although it is none the less curious and unique. Mr Boothby made no pretence of being a great artist in fiction. He wrote a kind of story that pleased his own class of readers very well, and he got into the way of turning them out literally by machinery, for he dictated them at lightning rate into a phonograph, and from that his secretaries wrote them out afterwards. It used to be said that in this way he regularly turned out ten or twelve thousand words in a day when he really regarded himself as at work. That rate of production means about a novel a week! You will generally find that a literary man who takes any considerable pride in his work does not produce more than about fifteen hundred words in a day—that is, if it is imaginative work. I was told by some one who seemed to know, that Sir Arthur Conan Doyle once wrote a complete Sherlock Holmes story, running to about twelve thousand words, at a single sitting. It is hard to believe, although the circumstances are said to have been exceptional. Generally he is a slow writer, and thinks he has done very well indeed if he writes a couple of thousand words in a day. Mr Hall Caine, I believe, when busy on a book, produces about fifteen hundred words in a day, and does that on four days of the week. Generally women are faster writers than men, and I have heard it unkindly suggested that it is because they do not think so hard. It is said that Miss Marie Corelli works for three hours a day, and writes three thousand words in the time, which is remarkable if true; but, on the other hand, the late Mrs Craigie, one of the most brilliant womenwriters of recent times, used often to say that she thought she had done very well indeed if she could turn out a thousand words in three or four days.

* * *

For a sustained period, as against a particular day or two, such as at Christmas, there is more travelling of one sort and another at this time of the year than at any other. On the one hand, there are so many people just finishing their holidays and going home; and on the other, all the people who have finished holiday-making have a leeway of work to make up, and, feeling unusually energetic, they go forward eagerly to it, and in a large proportion of cases this obviously means extra travelling. But people of all kinds travel much more now than they used to do; and this is not altogether because it is necessary for them to do so, or because travelling is so much cheaper than it was only a few years ago. Another reason, which is almost as good as either of these, is the increased comfort that the various steamship and railway companies now afford their customers. Instead of its being a trying ordeal, a long journey in these days is often enough a distinctly pleasant experience. Think of the difference between a journey from Edinburgh or Glasgow to London by either the East, Midland, or West Coast routes and the same thing twenty years ago! Once a week a 'theatre-train' is run from Clacton-on-Sea to London, and supper is served on the return journey. On the celebrated luncheon-trains that run between Penzance, Plymouth, and London, ladies'maids are carried. An interesting circumstance in connection with this particular feature of the Great Western Company's arrangements is that it cost the company a hundred thousand pounds, besides the price of their trains, to start this luncheon-service

at all; for it happened that in 1842 they made an arrangement with the Swindon Junction Hotel Company to stop all trains for at least ten minutes at Swindon Station for the special purpose of the refreshment of passengers there, and the sum mentioned had to be paid in order to cancel the agreement. On some Midland trains chess and draught boards are provided free of charge for passengers who ask for them; and before long we shall, no doubt, have telephone installations on long-journey trains, which can be instantly connected at all stopping places with the local exchange by means of wires brought on to the station. Such an arrangement obtains on both the Union Pacific and the Southern Pacific Railways in America. Then think of the luxury of ocean-travelling in these days, and do not be surprised when it is said that, chiefly because of the return of the holiday-making Americans to their own country, there was not a passage to be booked on scarcely any steamship sailing to New York between the middle of August and the end of September, the crush on the vessels this year being phenomenal. It would not have been so if oceantravelling in these days were not such a pleasant thing. The wonderful Adriatic is fitted with passenger lifts, Turkish baths, electric baths, photographers' dark-rooms, a gymnasium, and a variety of other such 'extras;' and I am informed that Messrs Harland & Wolff are building a new ship at Belfast for the Hamburg-America Line, which will be the largest twin-screw steamship in the world, and which will contain a tennis-court, a swimming-bath, and a shooting-gallery! The tennis championship of the Atlantic Ocean is evidently a possibility of the near future. Will the deck-golf, with which we have been wont to amuse ourselves hitherto, not soon give way to the real thing?

THE ROMANCE OF A FLOATING DOCK.

CHAPTER X.

EÑORITA CARMEN VELASQUEZ had rightly divined part of Sandford's motive in giving her the revolver to keep. He had in his mind some vague recollection of girls in romances who kept daggers con-

cealed in their bosoms for defence in the last resort, and who found comfort in doing so. It has been explained that his knowledge of feminine character was not experimental. He meant well. He wished her to feel safe from Indios bravos and from him too—as safe as possible in the circumstances. The pistol was to be to her what the daggers, or stilettos, as they were sometimes called, were to the girls in the stories. She was to be practically convinced that he meant her no harm, and had placed in her hands the means of defending herself against him as well as others. 'She won't think it melodramatic, as an English girl would,' he said to himself. 'How can

she know that I am different from her blackguard countrymen who look on every woman as fair game, and would no more spare one who happened to be in their power than they would a partridge?

What was he to do next? He had no hope of finding any house on the island. If he fell in with natives, would the girl be safe with them? He did not know. He explored the gravel-beach. It was not know. He explored the gravel-beach. It was the river rose. It would be covered as the river rose. And where the gravel ended the jungle began. He walked along its margin as far as it was possible to go, but found no opening. In some places the tall, sword-like grass was as high as his head; in others the trees were festoned to the top with a thick wall of creepers sprinkled with purple and white flowers. Here and there he saw a blaze of scarlet blossom, and once he came upon a clump of bananas, with large bunches of fruit

hanging on them. Choosing the one that seemed ripest, he managed easily with his knife to cut through its soft trunk and bring the tree to the ground. When he turned back he brought the bunch of bananas with him. He had seen no sign of human presence.

As he came in sight of the girl she was moving about and gathering something. She saw him immediately and came to meet him. She had laid aside her scarf. Her clothes, like his own, had already dried in the warm air, and she had almost banished the traces of their rough journey.

'I have found nothing, senorita, except some bananas,'he said. 'There is no sign of people either here or across the river.'

She turned and went with him towards the canoe. Her arms were full of dry grass and scraps of driftwood. She had left the pistol lying where he had placed it. It did not seem that she was afraid of him.

He looked at the sky.

'It is nearly sunset,' he said. 'I think we must stay here till daylight. We should probably be upset if we tried to go down the river in the dark.' He thought she choked down something like a sob. 'But if you think we ought to go on I am entirely at your orders.'

She looked at him but said nothing, though she seemed as if she tried to speak, and he went on: 'If we were sure your father would come straight down here, we should of course only wait; but we do not know. The question, then, is, should we wait here—provided the river permits us—or should we try to make our way down as quickly as possible to some settlement, if not to Garapatas itself?'

'Señor, I am sure my father will search the river. I am afraid he will not think of the bongo. He will think that if we have not been drowned we have perhaps got ashore somewhere, and he will search very carefully. I do not think he will imagine we have got so far as this—alive. He will have to search both banks.—Oh, poor papa!' And she burst into tears. But she immediately checked them, and, drying her eyes, said, 'You must forgive me, señor, and not think I am ungrateful.'

He felt all his resolutions about her becoming as water before the look she gave him.

'Do not think about it, senorita. To-morrow evening I hope we shall be in Garapatas, and then we shall find the quickest means of sending word to Don Santiago. To-night we shall make a fire, so that if he comes down-river he will see it.'

'I do not think he will come down in the dark, for he will wish to examine the river all the way. But I do not know.'

'And if he has not arrived by daylight we shall set up a signal on a pole and leave a letter for him.'

She smiled. 'How good you are, señor! And papa will have only one night of anxiety, but it will be bad enough.' She turned away to wipe her eyes. 'Excuse me; I am very stupid. Now I will be of

use. You see I have found some dry grass and sticks, and perhaps you have matches?

'Of course; and I shall make the fire.'

'Oh no,' she cried; 'you will let me do it.'

She placed a stone or two cleverly to support the sticks, and quickly arranging them in star-form with the dry grass beneath the centre, she took the matches from his hand and struck one and lit the grass. Then she knelt down and blew the flame with very serviceable lungs.

'I shall get you a fan, señorita,' he said, looking

round for some big leaf.

She stood up smiling and a little red and breathless.
'It goes nicely,' she said. 'It will help to drive

away the mosquitoes. But now, if it will not trouble you, would you get me one or two of the large leaves of the pozol?

He looked an interrogation.

'It is a thing with soarlet flowers,' she said; 'you are sure to find some. And, señor,' she added after he had turned away, 'have you a knife?'

She laughed a little as he gave it to her.

'Now I have all your weapons,' she said.

When he came back, besides the pozol leaves, which were two or three feet long and proportionately broad and thick, he brought as much as he could carry of withered jungle grass.

She was kneeling at the water's edge. She had taken the other fish which the Indian had left in the canoe, and had cut it into pieces and washed it.

'I am going to try to cook it, señor, and if I do not succeed very well I hope you will be indulgent.'
—'He will take me for an Indian squaw,' she said to herself; 'but never mind!'

She wrapped the pieces of fish in the thick leaves of the pozol and laid them in the fire. He watched this with great interest. Neither of them, it will be remembered, had had any dinner.

'I must do something to help,' he said. 'I shall make knives and forks out of this piece of stick.'

'And I shall lay the cloth;' and she spread one of the great leaves on the upper side of the canoe. 'This will be our table, and also our chairs.'

He gave her two of the bits of wood. 'They have points at least,' he said.

'What a beautiful knife and fork!' she said as she took them and carefully lifted the blackened parcels from the fire. 'Iron or even silver would have quite spoiled the flavour.'

They both laughed. They felt very hungry. He broke off some of the ripest bananas from the bunch, and they sat down.

'Really,' said Sandford, 'for a thoroughly satisfactory supper, give me baked fish and bananas, the fish, of course, baked in pozol leaves.'

She was ready to laugh again.

'With a little salt, perhaps,' she said.

'You forget, señorita, our conversation.'

They concluded their supper with a draught of water, which he brought from the river in the cup of his pocket-flask. By this time the short tropical twilight was passing, and it was nearly dark.

'Señorita,' he said, 'I do not offer to go for help, leaving you here.'

'No, señor.'

'I should probably-indeed certainly-get lost. That is of no consequence, but it would do you no We shall start together at daylight, and

meantime you must have some sleep.'

He went and hauled the canoe farther up, turning it on its side so that it lay open towards the fire. He put on his belt with the pistol, for he saw by this time that she understood and trusted him. After a little consideration, he turned the canoe still farther over, supporting it on stones at the ends. It would now form as nearly a complete shelter as he could make it, in case it should rain. He spread a quantity of the withered grass in it, and laid his coat on that. He placed some for himself at the other side of the fire. Then he set about collecting all the driftwood and dry sticks he could gather, going farther and farther away and labouring on till it was almost quite dark. She had gone down to the river to wash her hands after the cooking and eating. She had had to help the wooden fork a little with her fingers. When he came back with his last armful she was sitting on the canoe.

'You see,' he said, 'I have tried to make some kind of couch. I hope you will lie down and sleep as comfortably as you can. I shall keep up the fire.'

'You have made a beautiful place. But you have given me your coat. You are too good to me, señor. If I have the canoe, you must at least have your coat.'

'I beg that you will keep it, señorita. I should not use it at any rate, the night is so warm. Do me

the favour to keep it.'

'Oh no, señor. You are very, very good. But you must wear it yourself, or you will perhaps-I am afraid you do not know the danger-you might have a calentura.'

She seemed so much in earnest that he answered, 'Very well, I shall wear it. As they say at home,

obedience is better than sacrifice.

She laughed with pleasure. 'Yes, yes, it is,'she said. The night had come quickly down, and the stars, at first sparkling points in a gray-blue vault, were soon blazing lamps that seemed to hang, some farther, some nearer, in a black abyss. They threw a faint gleam on the moving water. The fire made a little circle of brightness with an undefined periphery, the canoe and Sandford on its opposite sides casting dark shadows whose edges wavered in the flickering light. When one cannot see, one listens instinctively, and the gurgling and lapping of the river, not noticed in the daylight, were now audible, as well as a soft, thin rustle that never ceased in the jungle; but no other sound broke the stillness. Sandford heaped more wood on the fire and sat He hoped the girl would sleep, but she down. seemed inclined to talk.

'There is the Southern Cross, señor,' she said. 'It is just over your head. You do not see it inin your country perhaps?'

He rose and turned round. 'No,' he said, 'I have never seen it before.'

'Perhaps your country is too far north,' she said, 'and it belongs to the far south. Even here it does not rise very high. And it is not a very good cross. You see one of the stars is out of place.

'Yes,' he said, 'it is disappointing.'

'That is perhaps because you have expected something very splendid. For me, I like it because it is an old friend. I used to see it at Valverde when I was a child. The window of the room where I slept looked to the south, and I could see it as I lay in bed. All the fine constellations are away in the north, or high up in the sky and out of sight from a window, and I used to be almost sorry for the poor thing down there all alone with its broken arm.

By the firelight he could see that she was looking

rather wistfully at the sky.

'They are all heathen, too, you know,' she continued, 'or mere animals-bears and lions' She was smiling, and yet spoke with nervous eagerness 'And they are all so splendid. This is the only Christian one, and the only one imperfect! Is it not rather pathetic, señor?'

'Oh, as for being imperfect,' he said, 'I think the others require a little imagination too. But the Cross: ought we to associate any splendour-in its appearance, I mean-with that?

'No,' she said softly; 'you are right.' Then with a quick afterthought, 'Not here. But, senor, that is in the skies!'

They both looked at it a while in silence, and then he said, 'You live at Valverde, señorita?

I was born there. We were on our way to the hacienda.'

'And is the hacienda near the town?'

Valverde, where the steamer is going. I was going to Valverde.'

'You were going to Valverde? But that is the hacienda. There is no town. And you were going to our house? But papa did not know. Ah, you did not know who he was? How strange it is!

A warm colour rose in her face and she turned

her head away. Sandford once more felt himself a straw on the tide of fate.

'I am very stupid,' he stammered. 'I wanted to go as far up the river as the steamer went. As she was taking cargo and passengers I supposed her destination would be a town, and I did not doubt there would be a hotel of some kind. But I came away hurriedly and never inquired.'

The girl was silent. He looked across the fire, All at once he felt but could not see her face. as if something had come between them. She was perplexed. On an impulse he instantly resolved to trust her entirely. He forgot that she was the probable wife of Don Diego. The frustration of his plans was nothing compared with the loss of her confidence.

'Let me tell you how I come to be here,' he said.

'I am the engineer of the dock that is to be built at Garapatas. I required some timber of a certain kind for scaffolding. A man wished me to buy from him some that was—that was unsuitable.' (He would not charge with fraud the man whom he supposed she was likely to marry). 'I,' he went on—'I had reason to believe that I might find what I wanted somewhere up-country, but that if I permitted my purpose to be known in Garapatas obstacles might be put in my way. So I did not intend to make inquiries till I had got as far upriver as possible. I took a passage for the whole journey, and here I am.'

She nodded her head. 'I understand,' she said. 'But it is a pity you did not speak to papa. I am sure he could get you what you want if it is to be got. You will speak to him when we get home, will you not? He will be so happy to help you.'

Sandford hesitated. He knew very well why he had not spoken to the prospective father-in-law and doubtless intimate friend of the man who was trying to cheat him, but he could not tell it to her. She waited for his answer, and when none came a light seemed to dawn on her.

'Ah!' she said, 'you thought he was one of'——She did not finish. He saw that she had guessed at least part of his motive, and he expected her to be deeply offended. He looked across at her face, and was surprised to see that she was smiling. But the firelight might have deceived him.

After a moment of silence she said very gently, and without any sign of annoyance, 'Of course you did not know him, señor. But perhaps you will ask him when you meet.—I am sure,' she added earnestly, 'he will help you to the utmost of his power.' He said nothing, but it still seemed that she was not offended, for presently she went on: 'Would you like me to tell you something of Valverde?'

'Very much indeed.'

'It is a beautiful place. It is on the falda—the skirt, as they call it—of the Cordillera, away behind these hot jungle-lands of the coast, and just where the high land and the low land meet. No maps have yet been made of that part of the country, and there are no roads to it but bridle-paths through the swamps and forests, and no bridges over the streams. It is a hundred miles at least from the nearest town.'

'Is that Garapatas?'

'Yes. Perhaps you have seen our house there. It is almost as much a fortress as a dwelling-house. That was necessary, you know, in the good old times. The tobacco and coffee go down to it by the river, and the vaqueros bring the cattle down by tracks that only Indians and native cattle could use or even find.'

'Then the river is your highway?'

'Yes; and it is rather an uncertain one. Till the company began last year to give us a steamer, we had nothing but the big canoes to travel in, and to bring up our supplies and take down the crops,

except the timber, which goes down in rafts. The canoes go down in a day or two, but take two or three weeks to come up.'

'That must have been tiresome.'

'Oh no. It taught us to be rather lazy perhaps. But there is something charming in never feeling that there is any hurry. And it was interesting. The canoes are very large, you know. The canoas grandes are eighty feet long, bigger, papa says, than the ship in which Columbus discovered America. And we had a nice awning, which made a little house by itself, and a stove to cook with. And we stopped at the Indian ranches to buy eggs and chickens. And we fished, and the men caught the river turtle, and papa shot birds and sometimes a big alligator. Then often, when mamma and I worked, papa used to read aloud. He read Don Quixote to us. And all day the men poled the boat in a leisurely way along the banks where the current is not so strong, and at night we moored comfortably to a tree, or, if there were no trees, the men carried the anchor ashore and fastened it in the ground, and we slept as safely as at home.'

'Did you make the journey often?'

'Since I was a little girl, once a year. We only go to stay a few weeks. And mamma does not go any more. She says she grows old, and likes to live in a house and sleep in a bed, so she remains at Garapatas, and I go with papa. I like to go. And I can inspect the kitchen at Valverde and see what the cook is doing. That is very important.'

'True,' said Sandford.

'Ah, you laugh at me.' She laughed herself. 'But it is true. The people at the hacienda are very good, and are my dear old friends. But they put too much garlic and lard in every dish, and they boil the eggs in the coffee, and they do not wash the pots very well.'

'I do not laugh,' he said. 'It must indeed be good for your father to have you there. But do you not find it dull?'

'Oh no. There are all the old servants, and the manager and his wife, and the Indian women, and the babies, and the horses. I am always renewing old friendships and making new ones.'

'And for the rest of the year you live at Garapatas?' She did not reply for a moment, and then, before she could speak, a wild, startling, long-drawn-out cry came pealing across the river. It seemed to come from almost close beside them, and Sandford felt his hair stand on end, but the girl said calmly, 'It is the tiger.'

Sandford knew there were no tigers in America except in wild-beast shows, but he said nothing. The cry was repeated from farther away. The girl settled herself down among the dry grass in the shelter of the upturned canoe.

'Good-night, señor,' she said.

Sandford put another piece of driftwood on the fire. The girl's face was now in shadow. Soon he supposed she was asleep. Clearly she did not feel any nervousness about the 'tiger,' which he now thought might be a jaguar or a puma. He suddenly realised that there was an imperfection in her language. His own knowledge of the Spanish language was by no means perfect, but he had been well taught, and had been accustomed to converse with educated Spaniards. It was not her pronunciation that he judged by. Though she did not use the lisp of Spain, she talked with fluency and ease.

Yet he had noticed that both her idiom and her vocabulary were defective. 'She speaks as a child might speak, or perhaps an Indian,' he said to himself. 'She has not read. No doubt she is uneducated like other girls here. How could it be otherwise?'

Well, it made no difference. She was herself.

(To be continued.)

A NOTABLE ANNIVERSARY.

By Major-General W. TWEEDIE, C.S.I.

PART II.

HAT the poet says of Rumour, that it 'grows through moving and acquires force by going,'* equally applies to battalions; and we had not gone far when a truly refreshing piece of work offered. It rather seemed as

if a newly brought-up battery would smash our rear and cut into our centre, when out there dashed upon it the Ninetieth Regiment. In a trice the guns were taken; and William Olpherts-the Rupert in his day of the artillery arm-harnessing to them horse-teams of his own battery, carried them off in triumph, thereby winning the Cross of Valour. But this was as nothing compared with the superb deed of arms which about the same time fell to the share of Neill's brigade. Midway between A'lam-bagh and the Residency, just where the open country lost itself in the 'blackness' + of bàzàrs and buildings, a ravine crossed by a narrow bridge came between us and the city; and this crucial passage had been made into a veritable deathtrap. The Lucknow end of the bridge was blocked by an earthwork, behind which five guns showed their muzzles. A group of tall houses, barricaded, loopholed, and occupied by marksmen, commanded the thoroughfare. The onslaught by the relics of Maude's battery at a range of one hundred and fifty yards, and by infantry at the point of the bayonet, which gave into our hands, at the cost of a heavy loss of life, this entry into Lucknow, was heard by me rather than closely witnessed; and it were idle here to introduce a description taken from the chroniclers of how the fateful bridge was carried. When the regimental Colours of the Seventy-eighth came forward the situation stood somewhat thus: the guns had been captured, the dusky forms behind them bayoneted, the fortalicelike buildings opened, and the crooked places straightened; less through the genius of Generals than through the fell and hard-bitten qualities of the rank and file, the 'noble rage' of the staff, and the dash and forwardness of the regimental officers. After a halt to gather its skirts together, the

column was again advancing; no longer, however, by the main road, but—as a point had now been reached whence every route led to the Residency—along an opener way of approach. And, lastly, it had been ordered that the Seventy-eighth should hold the bridge till the rest of the force should have passed on, and then form the rear-guard.

Here begin some stirring experiences. One of those talented Bengali graduates who are produced in shoals annually by the Government colleges, without there being much scope in India for them, is said to have put it in an essay that 'the army is in peace a noble and distinguished profession, but in the time of war a damned dangerous department. Precisely so, Mr Babu. † Your representation is as accurate as your language is idiomatic. Had an ambitious father never sent you to the Calcutta University, and had you been posted as a commissariat purveyor to the Ross-shires, this would not have been a day of happiness. But to proceed. On the point of how long it was before the Sepoys began to assail the bridge position my memory is hazy. If the case was that we remained unmolested all the time that the column was passing, and only were attacked after becoming isolated, that is intelligible. If, on the contrary, other regiments were still within hail the while that we were being pressed so closely, it is difficult to account for our being left unassisted. But this is a small matter; and in connection with it there will here be noted only one point: which is, that before we found ourselves free to follow our comrades the sun was long past its meridian. Certain it is that after a longer or shorter interval overwhelming numbers of Sepors came down upon the bridge-head, and with them motley bands of curiously armed swashbucklers naked to the waist, and dancing like savages, their tawny skins glistening with palm-oil and begrimed with gunpowder. A fire both fast and furious was poured in from the four quarters During several hours the hurly-burly seldom slackened; and had it not been for the shelter afforded by the loopholed houses it is hard to say what would have happened. To make the fight

^{* &#}x27;Mobilitate viget, viresque acquirit eundo.'— Eneid. † An Eastern word, meaning the 'obscurity' which hangs over a town.

[‡] Lit., 'master,' &c: a kind of generic title (meaning but little) of the Hindù 'gentleman' of Lower Bengal.

the more unequal, the barrels of the new Enfield rifles grew too hot for handling, partly from the sun's rays and partly from incessant firing. Some of them also became lead-clogged, so that it was impossible to ram down the cartridge; while others split towards the muzzle—with all the time their makers purchasing great demesnes in England. Owing to the exertions of the younger Havelock—his father's chief staff-officer, and a death-defier if ever there was one—we were kept supplied with ammunition.

The reader may take it for granted that there are degrees of courage, just as there are degrees of the opposite quality. If there are soldiers who love fighting for fighting's sake, as the bull-dog and the game-cock loved in their day the battle, there are others who, although they do not run away, * anxiously desire to live till the honours are gazetted. Seldom have men been tried more highly than were the Ross-shires during the long-drawnout episode now under notice; and signs were not wanting to connect their perfect steadiness with the circumstance of their ranks being full of soldiers of many years' service. About a hundred yards up the road there stood a small pagoda in and around which our assailants swarmed. So harassing was their musketry fire that it was necessary to storm the temple; and splendid was the stubbornness with which it was defended. Its occupants were not so much driven out as slain where they fought, or taken up in brawny arms and thrown through the windows. Defeated in numerous attempts to regain possession of their strong place, the Sepoys afterwards brought into play three brass cannon. To pass on leaving our rear to be followed and lacerated by these pestilential pieces was out of the question. By this time the men's blood was on the boil with hand-to-hand fighting. The spectacle of their wounded comrades being dealt with by the surgeon in a corner thick as the pit itself with sulphureous vapour added passion to their courage. Short and swift was the charge that gave to us those brass cannon, to be afterwards hurled into the great ravine already holding in its depths the armament of the bridge battery. Writers like Froissart are apt to suggest the idea that 'gentle blood' can alone produce the martial virtues. There could hardly be a greater error. Scott was true to the life when he sang of Flodden:

Groom fought like noble, squire like knight, As fearlessly and well.

And so it was at the bridge that day.

The reader must not wonder if a thread of floundering—by which word is not meant blundering—here began to be perceptible. The circumstances in which the Seventy-eighth became separated from the rest of the column have been seen already. The same regiment, after setting out again, un-

pioneered by any staff-officer, chanced to strike into a different route from that of the main body. This deviation in no way affected the day's operations: but as it is from the Seventy-eighth's standpoint that I am filling in my picture, the line taken by the Highlanders is that which has here to be followed. The limits of space begin to be realised, however; and, besides, there are scenes associated in my mind with this stage of our progress which I would gladly think that in the course of years I have imagined, rather than feel sure that they were ever actually witnessed—a reference more particularly pointing to scenes connected with the abandonment of some of our wounded. This apart, the reader's interest will perhaps be sated if I thus suggest, rather than try to describe, the situation.

At first the way proved tolerably open; but gradually the plot thickened. As we neared the great regal palaces of Kaisar-bagh† and Farhatbakhsh, the deep bellow of big guns and the reverberations of musketry-fire rendered the words of command inaudible; and it was easy to understand that some desperate conflict was in progress. But enough for us was our own immediate encompassment. From behind solid walls, from shuttered windows, and from housetops, marksmen of whom we saw little or nothing beyond the muzzles of their pieces were taking aim deliberately. The very women were girding at us; for as yet Oudh loved not the British rule. Twice at least the Queen's Colour went down; once when Lieutenant Kirby received his death-wound under it, and again when a colour-sergeant shared the fate of his officer. The adjutant, Herbert Macphersona typical fighting Highlandman-had his 'gallant gray' 'Hyæna' shot under him, only to be replaced the next moment by a horse that chanced to come up riderless, when many a man of moderate mettle would gladly have remained dismounted. What more words are needed-unless it be to mention the sense of having lost ourselves that came over us when the afternoon began to pass into the evening? The patter of bullets does not particularly favour the revolving of abstract questions. But when I saw the paladins among us apparently courting death, and not finding it, the while that the less conspicuous were falling, I remember marvelling what it was that determined these matters. Was it a 'special providence' in each particular instance? Was it that which was 'written beforehand' in the individual's 'book of destiny'? Or was it merely blind chance or accident? The road that we had taken proved to be a kind of short-cut. After a time it brought us out slightly ahead of the column, which either then or soon afterwards was halted.

Overflows, so to call them, into the labyrinthine courts and purlieus of the stately palaces skirting the route had meanwhile been occurring. Over the spaces thus opened, as well as on the road itself,

^{*&#}x27;You are afraid,' said one man to another during an engagement. 'Yes; and if you were half as afraid as I am you would run away,' formed the ready answer.

^{+ &#}x27;Cæsar's Garden.'

[&]quot; Pleasure-giving garden, or 'Pleasaunce.'

combatants and non-combatants, guns and wagons, maddened horses, recalcitrant camels, and sullen bullocks, with wounded men in dulis* or on the backs of staggering comrades, were all jammed together. Parts of regiments had become mixed up with other regiments in the surging tide of confusion. The great outstanding fact was that every man had his face set firmly in the right direction-vultus ad hostem; but a chance spectator might easily have mistaken us for an army in full retreat. In the thick of the turmoil sat Outram on his charger, as cheerful as if he had merely been waiting at the jungle-side for the 'boar of the sounder' to issue. Havelock, too, was there, dismounted; his horse having been shot under him -the seventh time, it was said, that this misfortune had befallen him, or his horse rather, in his countless battles. The Seventy-eighth was lying low because of the round-shot.

Less than four months previously a musket-ball had passed through my right shoulder, + and the part was as yet hardly equal to the strain of the Colours, the pole of which, having been broken in Persia, had been replaced by one of greater weight. Utterly exhausted, I threw myself down on an earthen bank, and for the first time that day tried my haversack. But, alas! the outfitter's flask within it, instead of being of metal, belonged to the interminable series of 'ineptitudes,' or 'sensuous appearances,' on which the Seer of Craigenputtock expended so much of his elephantine humour in the 'clothes philosophy.' The glass part, broken in fragments, was working its way through the leather, and the oozing tea was soaking into our messman's dainty sandwiches. Just then the commanding officer, Colonel Stisted. whose heart was like a woman's, chanced to pass that way on foot. Putting his hand on me, he said, 'The poor boy has fainted, but the Colours are in his arms;' and so sealed up for the time being were the springs of life within me that I did not take the trouble to undeceive him as to the fainting. Nay, when, a few minutes thereafter, a shot from a twentyfour pounder came and buried itself with a thud in the earth, it failed to excite the smallest feeling.

At last, however, a stimulus was imparted to which only the dead could have proved irresponsive. When it was getting dusk, the magic words 'Seventy-eighth to the front' were suddenly given by Havelock's staff-officers. How far we then were from the head of the column has escaped my memory; but our first steps were through an avenue of cheering, if jealous, comrades. Thereafter the 'nettle of danger'—the very throat of the enterprise—came fairly within the clutch of the Ross-shires. The path of death—barely half a mile long—led through narrow streets running zigzag into one another, intersected by alleys, and gaping with trenches.

There was a hot and telling fire from balconies, roofs, and lattices. Many of those behind the loop holes, as I learned long afterwards from one of them, were of those unsexed and beardless creatures who in the king's time had guarded his Majesty's most sacred treasures, and who had learned to strip the mango-tree of its unripe fruit with their 'Sam Smiths' and 'Lancasters,' and knock the necks off glass bottles careering down the swollen Gumti.; On our part a rush rather than a charge carried us onward; and the rest must be left to the imagination of the reader. Keeping in touch as best we could with the mounted officers in front-and mounted officers sometimes forget that they are mounted-we let nothing stop us till the archway over the entrance to the entrenchment rose up in the twilight. The massive wooden gates that closed the passage were sealed up with loads of earth well compacted; but another way of access offered. Outstretched arms from within a battery on one side of the gatehouse helped our soldiers to scramble through an embrasure into the Residency.

Thus at last did the two forces come within mutual hand-clasp; thus went down the curtain on the first act of a drama unique, I suppose, in military history; the closing scene of which was not, howerer, witnessed till some days later, owing to the difficulty experienced in bringing in the wounded (about forty of whom were diabolically burned alive in their dilts), the heavy guns, as much of the impedimenta as escaped the hands of the enemy, and the rearguard. About one-third of the force got into the Residency somehow that night. During the next day another third or so followed. But reckoning from the date of our crossing the Ganges, there still remained about one in every three to be written down as killed, wounded, or missing.

Naturally, I saw less than did the senior officers of the demonstrations of welcome—the means of showing hospitality were much restricted-which our arrival evoked. Private servants, as already seen, had been left at A'lam-bagh, and the privilege of employing soldier-servants was in abeyance. Without any other supper or refreshment than a draught of river-water, without bedding, and without even my haversack, which had somehow caught fire and been burned, I took up my night's quarters in one end of a veranda. Soon afterwards a spent bulki came and flattened itself against the ground outside Bravo! I thought, there is at least one Sepoy on the hover who does not know when he is beaten. But the truth was somewhat different. In the whish and the whiz of that piece of metal the history of the next two months was adumbrated. In reality, no 'relief' at all had been effected, in the technical military sense of that term. Every minute make it more and more apparent that we had entered, not to raise, but to share the leaguer of the Residence.

^{*} Dùll='litter,' a cruder form of the palanquin or malkl.

[‡] Gumtl = 'serpentine.' What the 'links' of the Forth are to Stirling, the windings of the river Gumti are to Lucknow.

To us it had merely been given to throw in a strong reinforcement, by means of which the defence was rendered possible till, towards the end of November, there appeared on the scene General Sir Colin Campbell, who, having the flower of the British army at his back, was able to extricate from their perilous situation at once the reinforced and their reinforcement.

Far be it from me to pose as a military critic. In the course of thirty-five years of tolerably varied service, a Sandhurst professorship never came my way. Fifty years after the event, it would be easy to expatiate on what might, could, would, or should have happened, had this course or that other course been followed; but this would be unprofitable. There is, however, one point to the clearing up of which the corner of space still remaining may be usefully devoted, lest any reader should be left under the impression that Havelock and Outram's deed of daring savoured more of knight-errantry than of sober nineteenth century strategy. Every operation has to be considered in the light of its determining circumstances; and in the present instance some of these were as follows. Only the old can now remember the profound sensation caused by the news of the Cawnpore tragedy.* And did not the entrenchment on the Gumth contain all the elements of a similar catastrophe, involving the lives of some fifteen hundred women and children? The tension, and the pressure, and the outcry for prompt action which the thought | little sketch now presented to the reader.

of this produced all over the Empire is an oft-told Moreover, the means of communication between the Residency and the outer world had fallen to a very low point indeed; and there was only one messenger who could contrive to carry, for a reward of five hundred pounds every time, a scrap of writing between Lucknow and Cawnpore. The result of this was that the information possessed by the chiefs of the relieving force as to the conditions prevailing in and around the entrenchment was neither full nor accurate. And there is no doubt that, from the very day of Outram's arrival at Cawnpore, down to that supreme moment when Havelock gave the order that an impetuous advance, headed by the Ross-shires, should be made on the Residency, both Generals, and especially Havelock, were more or less under the impression that even the briefest delay on our part might have the effect of adding yet another page of horrors to the book of Mutiny-history.

The lapse of fifty years, I find, has made no difference in the feelings of unbounded admiration which I cherish towards those heroic figures whose shadows have seemed to flit around me during this recital. Just as it is natural for the flowering plant to shed its seeds in autumn, so does it beseem the veteran, when for him the stage is darkening before the fall of the curtain, to write down his experiences for the use of those who are to follow. And this is just what I have tried to do in the

APPARENT DIFFICULTIES WHICH BROUGHT GOOD FORTUNE.

R some years past a Chinese Roman Catholic resident of Tientsin, belonging to the Tung family, has lived by stocking each winter a large quantity of ice in a pit dug in the ground in

a part of the French settlement there. A little while ago, and at a period which was inconveniently near the time when his stock of ice would have to be laid in, he received notice from the French Municipal Council that the land occupied by his ice-pit would be required for another purpose, and that he could no longer have the use of it. There being little enough time to argue the point, our friend Tung arranged, by the aid of the usual 'palm-oil,' to hire another plot of ground in the Japanese settlement. However, when the authorities saw that he was digging a pit of considerable dimensions they informed him that he could not be allowed to disfigure the ground in that particular spot, and insisted upon his at once filling up the hole. He thus lost the outlay upon the digging, as well as incurring still more by filling in the pit. The Japanese made no objection to his using the ground for packing ice on the surface; but as a pit is necessary to keep the ice from melting, the privilege was of no use to him. He was consequently glad enough to avail himself of their permission to dig to his heart's content in another part of their concession.

Now, no time was to be lost, and Mr Tung engaged many labourers to expedite the digging of the pit so as not to let slip the opportunity of stocking it whilst the ice was at its best.

However, the navvies gave him so much trouble and worked so slowly that the elder Tung became quite ill, and could no longer superintend the work. He had several sons, and one of them, Tung Sextus, who is a vigorous and strongly built young fellow, determined to see the job through. But after a while he too was well-nigh worn out, not only by the idleness of the ditchers and delvers in his employ, but also by the unmanageable nature of the ground, for the farther they went below the surface the more the water accumulated.

On June 25, 1857, General Sir H. M. Wheeler, commanding the Cawnpore garrison and entrenchment, after a three weeks' besiegement of perhaps unparalleled severity, capitulated under a solemn promise of safety. Of the hundreds of women and children contained within the entrenchment, every one was afterwards butchered by the myrmidons of the infamous 'Nana.'

Determining to get a fresh supply of labourers, when he came to pay the old hands in the evening he gave them notice that he was going to do the work himself, and should not require them the next day. The workmen accepted the notice, but they persuaded the other workers in their craft not to take the job at less than fifty cents (about a shilling) a day.

As this price was more than the market value of their labour, and quite prohibitive, Tung Sextus set to manfully, and continued the digging himself. Very fortunate, as it turned out, was it that he did so, for in the course of the morning he came across a large coffin of very thick and heavy wood. At first he looked upon this as an aggravation of his difficulties, for the relatives of the dead man might easily come and prevent his prosecution of the work.

After resting a while to think the matter out, he determined, as no one was in the secret but himself, to break up the coffin, and, mixing it with the mud, to throw it out without any regard to what it was. On his applying his spade to the coffin, the affair assumed another aspect when he discovered that it contained, not grave-clothes and bones, but shining bars of silver, Mexican dollars, and other articles of great value.

Rushing home, he informed his father and brothers of his lucky find; and after he had with some difficulty disabused their minds of their impression that he was practising a little pleasantry upon them, the brothers went in a body to the place. Congratulating themselves that the workmen were not there to noise abroad the discovery or to claim an exorbitant share of the spoils, they determined to hire a jinrikisha for the day, and gradually to remove the pelf in sacks to their own house.

This they succeeded in doing with perfect safety, until the last sack was being conveyed, when a wheel of the jinrikisha slipped into a hole and the whole concern was overturned. As the sack had been burst open by the fall, the neighbours had their curiosity satisfied as to what the brothers had been carrying all day, for they discovered that what the sacks had contained was of no less value than pure silver. This circumstance soon came to the ears of the Japanese authorities—whose senses are quick to discern the sound of the clinking of the precious

metals—and their representatives were not long in appearing at the Tungs' door and putting in a claim to treasure discovered in their concession.

Tung Sextus, in anticipation of some such eventuality, had made a timely offering to some of the subordinates in the French Municipal Council; and when the claim put in by the Japanese was not backed up by the French, in whose concession the Tungs live, young Tung was able to make light of the affair by insisting that it was a question of only a few ounces of silver, and our friends the Japs had to make the best of a bad job.

However, a few days afterwards an old woman of seventy, attended by several sons, all belonging to the Te'ai family, appeared, and informed the Tungs that it was themselves who had hidden the money at the time of the Boxer outbreak, and they gave such an accurate and circumstantial description of the contents of the coffin that there can be no quetion that their story was accurate. Acknowledging their own ill fortune in not being able to find the place in which the treasure had been hidden, and bowing before the extraordinary good fortune of the Tungs in being led to the spot by such a series of what appeared at the time irritating disappoint ments, they begged that they might have some small portion of their property restored to them.

However, it is not known in what spirit their request was received, as it was most important that the whole transaction should be kept in as much obscurity as possible. To this end, and ere against the advice of his elder brothers, who are in respectable employment, Tung Sextus continued the digging of the ice-pits—but now with a sufficient of coolies to lighten the burden—with the object of throwing all persons with ulterior motives of the scent.

A strange thing has happened to the elder Tungfor he is now quite recovered of his bodily ailment, only he never speaks a word to any one, but laughs and rubs his hands continually, apparently without realising any cause for his joy. The boys in the street amuse themselves by asking him, 'How are you, Father Tung?' 'Have you had your rice yet!' and similar questions, and the only response he even makes is to chuckle inanely and to rub his hands quietly the one against the other!

THE MONTH: SCIENCE AND ARTS.

THE TURNER DICTOGRAPH.

N ingenious device, the dictograph, evolved for the purposes of facilitating and expediting office-work, has been exhibited in London by its inventor, Mr K. M. Turner. This apparatus, which is simplicity itself,

is intended to supersede the ordinary private telephone installation with which every modern large

business house is equipped, whereby it is possible for the controlling heads to be brought into direct communication with any department in the building for conversation, dictation of letters, &c., without requiring the members of the staff to leave the sown rooms or to cease in their tasks. There is a small box, about twelve inches in length by six inches wide and four inches deep, having two recessed orifices on its outer face, and with a row of switch-buttons along its base corresponding to

the number of departments within the building. One orifice corresponds to the transmitter and the other to the receiver of the ordinary type of telephone, the box being connected through a flexible wire with the ordinary wiring system on the premises. A notable feature of this invention, however, is that the box may be placed in any position that is convenient, or even covered with papers, without impairing its efficiency in the slightest degree. This is due to the fact that the transmitter and receiver are fitted with special microphones of great sensitiveness, whereby the sound waves are collected, focussed, and then intensely magnified. Thus one can converse as easily with the person at the other end of the wire when walking round the room, or from a distance of ten or fifteen feet, as when seated at the desk on which the instrument is lying, and in all cases speaking in a purely normal tone. Similarly, the sound-waves transmitted along the wire are projected into the room in a strident tone, dispensing with the necessity of holding a receiver to the ear. Consequently, while the speaker is engaged in issuing instructions through the instrument he can still pursue other operations at his desk. If secrecy in conversation is desired, however, the depression of a lever at the side of the box throws the loud-speaking attachment out of gear, and a small receiver hung on the side of the box is placed to the ear in the usual manner. The advantages of the system are obvious, while, moreover, absolute privacy between the speaker and listener is ensured, as the line cannot be tapped at any intermediate point. The loud-speaking attachment, we may point out, however, is no distinct novelty, there being several telephonic fire-alarms in the country so equipped; but its application in such a novel direction as this is a decided advance in the scientific time and labour saving equipment of the modern commercial office.

THE FERTILISING PROPERTIES OF HOUSE-REFUSE.

At first sight it does not appear that the contents of the domestic dust-bin, in view of its heterogeneous character, can have many serious claims to value as a fertiliser for agricultural purposes. Hitherto the most generally adopted means of disposing of the mixed assortment of cinders, broken glass, empty cans, paper, rags, and decomposing organic matter has been by cremation in a dustdestructor, and the subsequent utilisation of the vitreous clinker thus produced for the manufacture of concrete paving-slabs, blocks for house-building, &c. An ingenious machine, however, has been devised, and is now being experimented with by a London borough council, whereby the garbage can be turned to more profitable account, and yet in a perfectly hygienic manner. This apparatus combines the three operations of disintegrating, pulverising, and mixing in one. The assorted garbage is discharged into a hopper, through which it falls into a small compartment in which revolve four

fifty-pound hammers at a speed of one thousand two hundred and fifty revolutions per minute. This is equivalent to five thousand strokes for a cumulative weight of over two hundred and fifty thousand pounds per minute, irrespective of the impetus produced by the centrifugal force of the machine; and under this treatment the incongruous mass of rubbish and filth is turned out of the machine in one operation in the shape of a uniform black mould. Tins, bottles, ashes, slates, vegetable refuse, and other garbage are completely reduced to powder in the apparatus, and so assimilated and intermixed as to constitute a new substance of great value. The rubbish requires no preliminary picking over before being dumped into the machine, since there is an automatic device whereby those articles which cannot be pulverised, such as pieces of steel or wrought-iron, are thrown out without the machine stopping. The plant occupies but little space and can deal with some five tons of rubbish per hour. The operation is effected at a low cost, and is perfectly hygienic, there being no dust, smoke, or noisome effluvia, while the resultant manure is entirely odourless. This latter point is a distinct advantage when the substance is distributed over the land. The rich value of the fertiliser has been quickly realised, and the demand at present easily exceeds the supply from the destructor works of the above municipal authority where it is in operation, and the results show that the process can be carried out upon lines showing a substantial profit on each ton produced.

AN EASY METHOD OF DETECTING ADULTERATED COCOA.

Cocoa is possibly more liberally adulterated by the unscrupulous, especially in its powdered form, than any other beverage of the household table. The substance generally utilised for this reprehensible practice, especially in the cheaper qualities, is starch. The presence of such adulterant, however, can be easily and simply detected. Dissolve a small quantity of the cocoa in water so as to form a paste, and to the mixture add a few drops of iodine. The starch is instantly betrayed by the mixture turning a deep-violet colour.

DENATURED ALCOHOL FROM PEAT.

The attention of the motoring world has recently been directed to the possibility of producing alcohol direct from peat as a fuel for internal-combustion engines at present using petrol. The process is both simple and inexpensive, consisting in the breaking down of the cellular construction of the moss by the addition of sulphuric acid in enclosed vessels under pressure, whereby the peat is converted into a gummy substance. This is then subjected to fermentation, the acid being partly neutralised by the addition of carbonate of lime, and the alcohol distilled from the resultant liquid or wash. This is not the first attempt to produce alcohol from this vegetable material, and if it could be made com-

mercially practicable it might be possible to turn our thousands of acres of peat-bogs and wastes to distinct commercial advantage. Unfortunately such fuel cannot compare in power-efficiency with petrol, and the experiments that have been made in other countries with alcohol as a fuel for the petrol-motor have not been attended with very conspicuous success. In Germany the Government endeavoured to stimulate the efforts to produce alcohol from various products, including peat, of which there are immense tracts in that country, by the imposition of a heavy duty upon the imported petroleum spirit. Moreover, when motor-cabs were first placed upon the streets of Berlin, the authorities stipulated that alcohol was to be used exclusively. It was soon discovered, however, that this fuel was unsuitable, so the authorities so far relented as to permit the engines to be started up on petrol and then switched over to the other fuel. Even this remedy proved abortive, and at last the embargo upon petrol had to be removed, and now alcohol is not used at all. A similar result has attended experiments with alcohol-fuel that have been carried out in the United States. The cause is due to the fact that certain modifications in the design of the motor are necessary before success with alcohol can be achieved, and until such alterations are effected, in which direction the manufacturers appear somewhat lethargic, probably for ample reasons, the application of alcohol will not become very extensive.

FERRO-CONCRETE MASTS FOR WIRELESS TELEGRAPHY.

An interesting development in the application of ferro-concrete is in course of being carried into effect for one of the companies at present interested in the problem of transatlantic wireless telegraphy. Hitherto the mast for carrying the overhead equipment has been built of steel, the production, erection, and maintenance of which is an expensive operation. At the same time, a high degree of strength at the top of the mast is imperative in order to carry the heavy weight of the gear, which approximates some three tons. The ferro-concrete masts will comprise a tubular monolith with the reinforcing steel-work carried vertically up the sides in the concrete, and additionally armoured horizontally by circular hoops placed at frequent intervals. Arrangements have been completed for the building of such masts up to a height of one thousand feet, and they are to be of sufficient internal diameter to permit of a man ascending from the ground to the top of the structure from within.

THE PROLIFIC FECUNDITY OF THE RAT.

The rodent, against which an exterminating war is being waged in all countries, is one of the most fecund pests with which mankind is afflicted. They breed from three to six times a year, the females having their first litter when about three months old. The average litter numbers ten, but often it will aggregate fourteen or more. If three litters of

ten each are produced every year, a single pair, if permitted to breed unchecked and no losses from death were experienced, would in three years have a progeny of ten generations, numbering twenty million one hundred and fifty-five thousand three hundred and ninety-two. The eleventh generation, due at the beginning of the fourth year, would number over one hundred millions. The United States, like India and other oriental countries, is now confronted with a rat-plague which has grown to such proportions that the Department of Agriculture has found it incumbent to prepare a bulletin setting forth extermination remedies for the benefit of the assailed farmers. This rodent is more destructive than any known mammalian pest. In France rats and mice are responsible for damage to the tune of over eight million pounds per year. A single rat will eat two ounces of com a day, but destroys and spoils more than it eats. The greatest indictment against the animal, however, is that it is one of the most dangerous mediums for the dissemination of disease, due to the parasite with which its fur is thickly infested.

AN ECONOMICAL FIRE-GRATE.

Some months ago the Prince of Wales, during his inspection of a block of tenements in London, drew attention to the advantage and possibilities of a more economical grate for the working classes than that in vogue, especially in the direction of enabling the fire in the cooking-range to be used for warming the sitting-room after the duties in the kitchen have been completed, and thereby avoiding the necessity of maintaining two separate fires. The royal suggestion was duly acted upon, and in the course of a recent visit to a new block of similar buildings a grate fulfilling the requirements advocated by the Prince was shown. The fireplaces of the sitting-room and kitchen are placed back to back, and the grates—in reality only one divided centrally by a sliding partition which can be moved up and down—are served by one chimney. While the range is in use the fire only suffices for the kitchen. Cooking completed and the range no further required, the sliding partition forming the back-plate of the grate is raised, the fire tilted into the grate behind belonging to the sitting-room, and the partition once more lowered. For such purposes where economy in fuel-consumption is an important consideration, this grate has been warmly appreciated.

PURIFYING THE AIR OF RAILWAY CARRIAGES.

The provision of some more efficient means of ventilating railway carriages, especially those of the separate compartment type, when carrying a full complement of passengers, has long been urged. The ordinary cowl ventilators in the roof and the shutters over the doors are quite inadequate for the removal of the vitiated atmosphere from within especially in wintry weather when the windows have to be kept closed and the warming apparatus is in action. The system that has now been evolved for the supply of a constant refreshing, cool current of air without any accompanying draught is of a simple character. There is a water-tank through which the contaminated air is drawn by the suction of an electric fan actuated by an electric motor fed from the dynamo carried on and driven by the axle of the carriage. In passing through the water the air is purified, and it can then be recirculated through the compartment. If necessary, the water can be decomposed by electrolysis during the operation, the oxygen thus liberated by the process being mixed with the cleansed air.

PAPER THREAD.

It is announced that a French inventor has discovered a cheap and easy process by means of which thread, similar in texture to cotton or linen, and possessing great strength, can be manufactured from paper. No details of the method of production are vouchsafed, but the thread is stated to be suitable for a variety of purposes such as dress materials for ladies' costumes, being impervious to damp and non-inflammable. It can also be used for the manufacture of bags, towels, hats, and so forth. It is claimed that the thread can be made at a cost 90 per cent. below that of linen, and some 60 per cent. less than that of cotton.

THE DANGERS OF LEMONADE.

The popular and refreshing summer beverage lemonade is evidently not so harmless as it is generally opined to be, according to the recent report of the medical officer of health for the borough of Poplar. He relates that cases have come before his notice in which the drink has been impregnated with metallic impurity, the contamination in one case amounting to 01 grain of tin in ten ounces of liquid. The presence of this impurity in lemonade, and also in other saccharine beverages, is attributed to the use in manufacture of glacial acetic acid obtained from the distillation from acetate of sodium and sulphuric acid, and also acids which are secured from the dressing of calcined bones with sulphuric acid, or by boiling phosphorus and nitric acid with water. The last-named acid is also made with sulphuric acid, which is liable to contain arsenic and other metallic impurities.

OXYGEN MADE AT HOME.

The increasing and varied purposes to which oxygen is now being applied, combined with its frequent use in cases of illness, has resulted in a process being evolved for its production in a concentrated form similar in nature to many other medicaments, and ready for instant use whenever desired. For many years past the only practicable means of securing supplies of this gas has been in a compressed form in steel cylinders, quantities being drawn off as required by the simple turning of a tap. But the weight and cumbersome nature

of these cylinders, combined with the difficulties in transport, has proved a deterrent factor in the more extensive use of the oxygen. With the gas preserved in its concentrated form, however, the most isolated country house or cottage can always keep a sufficient supply of the gas for use in a case of emergency. This new substance, known as oxylithe, is oxygen in a latent state, and is sold in the form of small cakes. To produce the gas it is only necessary to add quantities of cold water in precisely the same manner as that in which acetylene gas is produced by dissolving calcium carbide in water. Directly the water comes into contact with the substance gas is emitted with great violence, generation ceasing immediately the supply of water is withdrawn. Oxylithe will keep for an indefinite period without any signs of deterioration, no gas being given off until it is brought into contact with water. One pound of the substance will supply approximately three cubic feet of oxygen. Even the residue which is produced, being soda lye, can be profitably used for washing, bleaching, and other purposes. The gas obtained by this method contains 100 per cent. of oxygen, and consequently is chemically pure. No especial precautions are necessary in its production, since it is perfectly harmless and cannot explode, so that it can be prepared by any one when required. For respiratory purposes, such as cases of illness, a special vessel is provided, comprising an outer glass receptacle containing the water, in which is immersed a cage carrying the latent oxygen, and the gas as it is generated is drawn off by a nozzle fitted with a tap passing through a rubber tube to the inhalation-bag.

PLANT CULTURE UNDER THE ELECTRIC LIGHT.

Some years ago the late Sir W. Siemens, by his experiments, demonstrated the possibilities of assisting plant-culture by means of the electric light, investigations which have since been followed up in the United States. In this country, however, no further researches have been undertaken until recently, when Mr B. H. Thwaite once more resumed operations. His system is now being practically tested at the Royal Botanic Gardens in Regent's Park, London, but upon more advanced lines than has yet been attempted. The electric light is so arranged that it traverses the whole of the greenhouse in which it is installed, and returns. The light before reaching the plants passes through a glass trough of water so coloured as to resemble the density and character of our atmosphere through which the sun's rays have to penetrate, so that the conditions are made as similar as possible. The current is generated from a dynamo driven by a gas-engine of special design, and this not only furnishes the requisite energy for the actinic light, but also the heat and chemical gases necessary to stimulate growth. The experiment is one of great interest to those concerned in the problem of intensifying plant-growth under glass, especially in view of the fact that the Thwaite system is

based upon novel lines, since in addition to the light the economic use of the waste gases and heat generated in the water-cooling circulation for the engine dispenses with the necessity of the usual heating arrangements. The inventor claims that the whole cost of his apparatus and its operation represents an expenditure of only one penny, as compared with threepence per hour for the general system of assisting propagation by heat. The progress of the plants under the influence of his culture at the Botanical Gardens will be closely followed by horticulturists during the next few months, especially in those periods of dull, foggy weather when plant-growth is almost reduced to stagnation.

GAME AND GAME-COVERTS.

Mr John Simpson, author of the New Forestry, which was commended in the paper on 'Forestry for Beauty and Use' in Chambers's Journal for 1900, has written another work of much practical value for landowners, gamekeepers, foresters, and all interested in making the most of game upon land, entitled Game and Game-Coverts (Sheffield: Pawson and Brailsford). The book, which is copiously and beautifully illustrated, was suggested by the number of queries asked of Mr Simpson as to the best gamecovert. Here he answers that question very fully, and in the process discusses the importance of gamepreservation in these days of worry and losses connected with landed property, pheasant disease (which is more prevalent amongst artificially reared birds), and the best trees and shrubs for forming covert for game. He says: 'The most excellent sport for guns that we ever knew of was afforded by a small or rather thick mixed wood, on a rising ground, about one hundred and fifty yards long by one hundred yards wide, with a field on one side and a wide glade on the other. On each side most of the guns were posted, the beaters bringing up the centre in a line. The pheasants, wild ones, usually rose at once, and the hares bolted through the hedgerows. The shots were constant, mostly high in the case of birds, and hardly one escaped good shots.' Coverts should be laid out so as to afford protection from cold winds and wet, and should afford sunshine and shade, natural food, and water. As to position, he says: 'Dry slopes and knolls or rising grounds on sunny aspects are the best spots on which to form coverts; if in the vicinity of water so much the better. Indeed, water is an absolute necessity in or near coverts on dry soils, and in dry localities where streams or brooks do not exist means should be taken to provide a supply of water —if in the form of a natural runnel all the better. Sometimes a supply of water may be secured in connection with a hydraulic ram where one is employed on the estate, and sometimes small pumping windmills might be employed for the purpose. In any case, a constant supply of water in some form throughout the year ranks next to food in keeping game on the ground.' The best roostingtrees are the common spruce, silver fir, and Douglas

fir. In certain woods in Scotland where there was much fir, capercailzie and blackcock were more plentiful than anywhere else. Every wood and copse upon an estate should be a covert. Under natural conditions, pheasants and other kinds of game distribute themselves rather thinly; and converting old and thin woods into good coverts is much easier and less expensive than planting new ones. Rank bracken is no cover, as it kills the grass. Rhododendron is neither a good roosting-tree nor a good covert plant; it may be a harbour for rabbits, but suits neither pheasants nor hares. Good marginal trees for coverts are hawthorn, crab, plum, yew, myrobalam, mountain-ash, holly, spruce, deodar, with barberry, snowberry, wild rasp, bramble, furze, and blackthorn, which are good examples of natural covert and natural food-producers. Birds and pheasants prefer sweet fruits. There is a list of rabbit-proof plants, and Mr Simpson says there are woods on almost every estate, practically useless for any purpose but harbouring game, which would produce an income from rabbits alone if the rabbits were allowed to breed and have access to pasture The whole book is of the most practical nature, and affords sidelights of an interesting and instructive kind upon the habits of our wild animals, and the best methods of rearing and protecting them.

THE PASSING OF SUMMER.

THE branches of the mountain-ash are showing Their heavy-berried bunches red and gold, Down country lanes the tinted leaves are blowing, The grain is garnered in, the year is old. The childish eyes, that laughed to find the flowers, Bend over slates and weary lesson-books; The lone wood slumbers through the quiet hours Bereft of birds in its sequestered nooks.

Across the moor September's breath is bringing Rose to the lip, red to the tinted face; And heather sprigs and blue harebells are springing 'Midst ferns and grass, arranged with Nature's grace, Purple and mauve and amber-regal splendour; Gulls wheeling wildly o'er a churning sea; Soft sunset hues no earthly touch can render-Summer's farewell is Nature's harmony.

So summer passes as a dream, as day dies, Haloed with light, circled with queenly crown. May we have just such memories when life's new ties Speak to our hearts, 'Lay June's red roses down. RDITH RUTTER-LEATHIN.

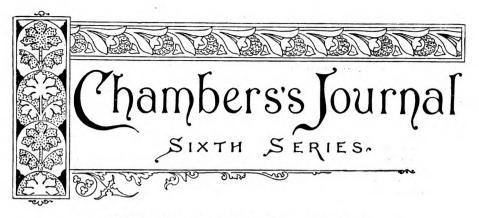

* TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage stamps should accompany every manuscript.

Srd. To secure their safe return if ineligible, ALL MASC SCRIPTS, whether accompanied by a letter of advice of otherwise, should have the writter's Name and Address written upon the

4th. Poetical contributions should invariably be accom-panied by a stamped and directed envelope.

VENGEANCE IS MINE.

By COMMANDER E. HAMILTON CURREY, R.N.

IN TWO PARTS .- PART I.

OME away, Jack; surely you've had enough of this tomfoolery.'

The man addressed turned halfround from his seat at the gamblingtable, and laughed as he tore open the last rouleau of fifty napoleons

left to him. 'Just one more flutter to get rid of this, dear old boy, then I'm your man.'

The scene was the gambling-room at the Cercle Mahomet Ali in Alexandria, where, in the days we now speak of, some two and a half years after the bombardment of that city, play was abnormally high; also a strong residuum of the scum of the earth, who had unfortunately not been hanged for arson and robbery, still remained in the streets and preyed upon the unwary.

Jack O'Farrell and his brother Jim had arrived in Alexandria a week before, and the latter, who was no gambler, had hoped to keep his elder and more reckless brother away from the tables; but it was not to be. Dining at a military mess the night after they landed, they had been taken by their hosts to the Cercle, and since then they had not missed a night among the rich and reckless Alexandrian Greek habitués, whose gold was poured out like water every night on the discreetly shaded green tables of the club. Jack O'Farrell had been losing steadily. He was a rich man; but two thousand three hundred and fifty pounds in six nights was a staggerer, and he had come that evening determined, as he put it, 'to make it three thousand pounds or get a bit of my own back.'

Jim, who never touched a card or made a bet, smoked cigar after cigar, and frowned discontentedly over successive cups of Turkish coffee. He was a strong, very quiet, self-contained man, a fine sportsman, an expert boxer and fencer, but withal well read and a buyer of books and rare engravings. The brothers had been shooting tigers in the Terai and lions in Somaliland; and the younger and infinitely better man of the two was filled with

No. 514. -Vol. X.

vexation when he saw that two years away from temptation had not in the least weaned the brother he loved so well from his all-absorbing passion for gambling.

To-night Jack O'Farrell seemed possessed with an incarnate spirit of gaiety; he was not drunk or anything approaching to it, but he had had his fair share of champagne at dinner, and had just called for and opened another bottle. The silent attendant filled a huge glass to the brim, and the laughing blue eyes of the gambler sought the steel-gray ones of his brother.

'Come out of the corner, you old owl,' he shouted, 'and drink luck to the last rouleau.' He had been losing steadily all the evening, and the fifty napoleons that remained to him were the remnant of the six hundred and fifty pounds with which he had sat down.

'Make haste and get rid of it,' retorted Jim, pointing with his cigar at the freshly opened rouleau, 'and then we can get aboard the steamer and have some sleep before she starts. No, I don't want any champagne after all this coffee I've been drinking.'

'So much the more for us, Maxwell,' laughed Jack, turning to a colonel in the Egyptian army sitting next to him. 'Here's to the luck that's coming!'

As he finished speaking he drained the glass to the dregs, and, looking backwards to see that there was no one behind him, tossed the goblet over his shoulder on to the parquet floor, where it fell and was naturally shivered to atoms. The reckless act and the light laugh with which it was accompanied drew general attention to the man who had done it, but he seemed in no way put out.

"You will now observe, Maxwell,' he said to the colonel, 'that I am going to win. I can't make my unnatural brother take any interest in my luck, singer and liled with left and the colonel, 'that I am going to win. I can't make my unnatural brother take any interest in my luck, so I'll ask you to watch me. Now, since, I have been here everything has gone against me; I must begin with something unlucky to break the spell. [All Rights Reserved.]

Observe, I back the red and the number 13.' As he spoke he put five napoleons on the number 13, and the balance of forty-five on the red-the game was roulette.

'Le jeu est fait-rien ne va plus,' droned the croupier as he spun the wheel. 'Rouge gagne, le numéro treize.'

'I win exactly two hundred and twenty-five naps, which ain't so bad for a beginning; and once more I back 13 and red.'

Incredible as it may seem, 13 and red turned up three times running; and then began such a display of recklessness as even the Cercle Mahomet Ali never saw before, and those who remember the club in the eighties know what went on there at times. Jack O'Farrell seemed unable to lose, and when he rose at the end of an hour and a half's play he had recovered all his previous losses, with eight hundred pounds to the good. The sum of six hundred napoleons in gold he put into a wash-leather bag; the remainder was left to be paid into the bank in the morning.

Play was over, and men scattered about the club animatedly discussed the events of the evening. Jack O'Farrell went up to his brother and hit him on the shoulder. 'Confess now,' he said, 'that that hour and a half was worth a cycle of Cathay.'

Jim smiled. 'It may be so, old man, and I'm glad you won. Should be more glad if I thought you'd never gamble again.'

'Well, perhaps I never shall,' laughed the other. Quien sabe? as the Spaniard says.

The night was very dark, and it was raining heavily as the brothers came downstairs. slipped into a waterproof coat, while his brother flung a heavy boat-cloak around him, which fastened at the neck with a metal clasp; the clasp was refractory, but at length closed with a snap which caused Jack to look round and say, 'Sounds like the crack of doom. You'll never get that blessed thing off again.' To which Jim replied, Well, it will still be keeping me dry when that flimsy waterproof of yours is done for, anyhow.'

At the harbour they had a boat awaiting to take them to the steamer leaving for Malta at daybreak. No conveyance could be obtained, and together they stepped out into the pelting rain.

If high play was the rule at the Cercle Mahomet Ali, it was none the less so at 'La Gata Negra;' but the gamblers who frequented the inn with the sign of the black cat were not in the habit of breaking open rouleaus of napoleons. In the circles in which they moved the possession of even one gold piece had its dangers, and of this they were well aware. All the same, play ruled high for the somewhat exiguous finances of the punters, and the francs and occasional five-franc pieces which figured on the board represented perhaps more to their owners than did the gold of players in more aristocratic resorts.

'La Gata Negra' was squeezed in at the end of a

filthy blind-alley turning out of one of the big streets which gave on the Place Mahomet Ali; it possessed a very strong and sufficient front door, heavily bolted and barred, into which was let a small shutter by means of which any one wishing to enter could be inspected, while he in his turn could see nothing, his reflection being cast on an ingeniously arranged mirror. Miguel Tenorio, the proprietor, had so far had no dealings with the police; but he had taken a full-and lucrative-share in the robberies which had followed the bombardment, and had bought this house and set up a gaming table on the proceeds. Having, however, seen the stern justice meted out to thieves and house burners in those strenuous days, he had, with great good sense, retired on what he had been able to secure before the British blue-jacket and marine routed out his companions and handed them over to the provost-marshal, by whom they were promptly

and incontinently hanged.

Miguel was a Spaniard from San Lucar de Barnmeda. He had been first a labourer in the vineyards around Xeres, then a smuggler of tobacco from the Rock into Spain, a dock-labourer at Gibraltar (where he learned this trade), and he had then further graduated in the school of blackguardism in a cuadrilla of bull-fighters, attaining to the rank of a picador; but a furious quarrel over a woman in a venta at Almeria had ended in a fight, in which Miguel's great navajo de Sevilla had sunk haft-deep through his adversary's collar bone down to the heart. This was too strong even for Andalusia; and, taking to the woods, aided by friendly charcoal burners, he had evaded the Guardia Civile, and eventually turned up penniless and desperate in Alexandria, a hardened ruffian with no object in life but to prey upon his fellows. He was a genial blackguard, however, and to 'La Gata Negra' gravitated a scum of criminals who enjoyed the freedom and license of the house, but they made no mistake as to who was master inside these doors; for Tenorio, to do him justice, was ready to fight the father of evil himself had he a dispute with him, and there were maimed and disfigured creatures in Alexandria who, having had the temerity to stand up against him, had been scientifically carred to their own great discomfiture and the deep delight of those privileged to witness these duels a outraine with the knife. Just over middle height, strong and active as one of the fighting bulls of his own land, Tenorio—beyond a few shrewd scratches in his numerous battles—had passed through his adventurous life comparatively unscathed save for a terribly mutilated ear. Once, while he was in the bull-ring as picador, his horse had been the first to feel the fury of the charge of the bull. Horse and man had been lifted and flung aside, the rider's head coming into contact with some hard substance in the sand. He had been rendered insensible, and the right ear crushed and torn out of all shape and semblance. What remained after healing was little more than a vivid scarlet lump, unsightly to behold; but, curiously enough, the hearing was not in any way affected.

There came a faint tinkle of a bell at the door of 'La Gata Negra;' and Miguel, who was presiding over the roulette-board, stepped from his chair. 'Here, you, Lorenzo,' he called to a villain-ous-looking Brazilian-Portuguese with whom he was in partnership over the gambling proceeds, 'take my chair, so that the senores may not be disturbed in their game.'

Lorenzo did as he was bidden, and Miguel stepped over and turned up a lamp which illuminated the mirror; he then slid back the shutter and looked at the man's face which he saw reflected. 'Bueno,' he said; 'the little François! What can he want so late?' He opened the door and admitted a small man in a rough overcost.

'Nom d'un chien, mon cher Miguel, but it is a pig of a night!' he ejaculated as he stripped off the coat and shook the water from the brim of his hat.

'Por dios,' answered the innkeeper, 'you did not come to tell me that.—Here, a cognac for Monsieur François.'

The brandy was brought and swallowed, and François talked earnestly for some minutes.

At the time of which we speak it was by no means an easy matter to get servants at all—to get servants with characters was flatly impossible-in Alexandria; and therefore no blame could attach to the steward of the Cercle Mahomet Ali that François was on the strength of that establishment as a waiter. The latter was a capable man in this capacity, but he was a robber by nature, a gambler upon every possible opportunity. Dismissed from a Messagerie Maritime Liner at Port Said for peculation, he had drifted to Alexandria via Cairo, and spent his time and his earnings—as much, that is, as possible—at 'La Gata Negra.' Robbery from the club or from the persons of the members, who often carried large sums both to and from the Cercle, had frequently been discussed by François and Miguel; but no opportunity had ever occurred. Men were cautious, went armed, and were ready to use their weapons, and far more frequently drove than walked.

François called for more brandy and pulled out a cigarette. Miguel struck it out of his hand with an oath. 'Madre de Dios, would you sit here smoking when there is work to do? Repeat that again.'

François, looking daggers, complied. He hated this man, with his masterful, imperious ways; but he feared him far more than he hated him.

'It is thus, then,' said Miguel when François finished speaking. 'See that I have it correctly. Two senores, Ingleses, leave the club for the harbour. One carries six hundred napoleons in a bag; he is the taller of the two, and wears a light waterproof coat. The other has on a big cloak and a sombrero hat, with a light stick in his hand. Neither of them carries weapons.'

'Bien; that is quite correct.'

'When did they leave?'

'Five minutes ago, by way of the Square.'

'There is a police patrol to-night at the far end of the Square?'

'Ves

Miguel rose and called, 'José!' A man came from the gambling-room.

There was a whispered colloquy; then Miguel spoke again. 'Listen, you, François, and I will tell you how it will be. Men fight for six hundred napoleons. The man who carries these shall fight no more after to-night; him I settle.' François nodded, and shuddered a little as Miguel hitched the pommel of his great knife farther to the front of the silken faja or sash which he wore round his waist. 'José here is as strong as an ox, but stupid; but he will be with me; he will have his instructions. The other man will be knocked out with a sand-bag.' Here José affectionately stroked a green baize roll he carried over his arm. 'He may be killed, but I hope not, as there will be no necessity. Now for you.'

'Moi! Mais, mon dieu'- began François.

'Silence, son of a rat! For you—you will go to the cross street where they, the Ingleses, turn to the left to gain the harbour. You will turn to the right, walk up one hundred yards, turn to the right again where there is a garden-gate you can get through, and so over a wall into the main street, you know?'

François nodded.

'Bueno! You will take this revolver, will fire three or four shots from it, and scream murder at the top of your voice. The police patrol will come to rescue you. You will not be there. Entiendes puerco?' ('Dost understand, pig?')

'But you—the revolver?' stammered François.

Miguel bent his great black brows together and glared into the face of the other.

'Dost understand, pig?' he repeated once more. 'Yes.'

'Art ready, José? Yes! Bueno; we have plenty of time.' He poured out three full glasses of brandy, which were tossed off by the trio. Then from a peg he took his circular cape, which, with a familiar swing of the right arm, he sent across his mouth and the lower part of his face; he pulled a broad-leafed sombrero down over his brows till nothing was visible but the tip of his nose and the fierce eyes, shrouded but flashing. José made haste to don a similar costume, and the traitorous waiter struggled once more into his rough overcoat. They did not pass through the gambling-room, but by a back kitchen, from which a door gave upon an open space; this was seldom used, and was, indeed, only known to the inhabitants of the house.

Miguel called Lorenzo to him and muttered some instructions in his ear, opened the door, pushed François and José out in front of him, and closed and locked it. They went across the open space and dived into a labyrinth of streets, while the gale hooted, lightning flashed, thunder bellowed, and the rain descended in a pitiless cataract.

(To be continued.)

THE CONQUEST OF AUSTRALIA.

By Albert Dorrington, late of N.S.W., Australia.

THE WHITE AUSTRALIAN'S UNEASINESS.

the Roper River to the Gregory, sometimes halts and gazes across the endless expanse of spinifex country towards the Gulf of Carpentaria. If he is Australian-born his

eye will be somewhat dulled to the half-terrifying perspectives, the illimitable folds of thorn-covered land and poison-weed that decimates his stock and cripples his old camp-horse. As his eye rests on the sullen brown haze that merges into the skyline, a question flashes through his brain which may be answered to-morrow or a century hence; and across his mind moves a picture more terrifying than the sandhills and poison-weed country—the picture of an invading army streaming south from scores of Japanese transports and convoys. 'Who will oppose them when they come?' muses the stock-rider. 'How can our forces quartered around Sydney and Melbourne ever hope to reach them?'

The stock-rider, like the majority of Australians, has been taught by a section of his press that in the next naval war Great Britain will suffer to such an extent as to compel the withdrawal of the squadron stationed on his coast, leaving him at the mercy of the Asiatic invader. Such a theory, put forward by our democratic press, has its origin in the fact that the Home Government considers India of more moment than the more isolated continent of Australia, holding as it does a comparatively mere handful of white settlers. The Britisher in his turn may well ask the sturdy Australian what he is doing to prevent his ultimate effacement or subjugation by an Asiatic Power; and the Britisher will discover that his Southern relative has no direct answer available. the land there is not a single factory capable of producing an ordinary fowling-piece, much less a modern rifle. There are not a score of Australianborn men who understand the mechanism of a torpedo or submarine, and apparently they do not want to. It is possible to excite their enthusiasm on any conceivable subject save that of national defence. Few will deny that the Australian is physically capable of holding his own in every branch of sport against all comers. During the late South African war he proved himself an intelligent guerilla-fighter, and won for himself the admiration of Continental military critics; yet in his own land he regards himself as unfit to take a part in the planning of his own defences. Minus ammunition factories or a single military college worthy of the name, he spends his life and leisure hours in sport and games. At present there appears one gleam of hope for my country in the

matter of repelling a foreign invader—the plentiful use of the stock-whip. After travelling from one end of the continent to the other, I can declare with truth that the stock-whip was the only weapon of defence I saw among the people of the far north

Innumerable theories are put forward, mostly by the dwellers in the cities, to prove that Japan will inevitably attack Australia. One set of thinkers argue that, Australia being a land of milk and honey, it only requires a series of strained relations between England and Japan to give the Children of the Rising Sun an excuse for invading our unprotected north. Others argue that Japan lacks the financial resources necessary to carry out so gigantic an undertaking. Despite the Australian's general apathy in the matter of arming himself, it is understood that he would fight 'for ever and ever' rather than forgo a square mile of his continent; and in view of this assumption, it is asserted that Japan would be forced to keep open a long stretch of sea-communications between Port Darwin, say, and Nagasaki, a distance of nearly three thousand miles. Others declare that Japan's unprovoked attack upon White Australia would bring upon her the wrath of France and the United States. The latter argument is much in favour among the sentimentally inclined, and they are numerous enough along the shores of the lazy north, where the low-caste white already salutes the well-to-do Chinese.

Another section of Australians preach the gospel of the open door, and are persistently urging the Government to allow the better class of Hindus, Chinamen, and Japanese free admission into our ports. They claim that the educated Asiatic is our equal, and that his ideas of citizenship are as good, if not better, than the average European's. But Australian Democracy will have none of it. We have set ourselves the task of preserving the white man's caste, we are to become the whitest of white nations, even though millions of black and brown peoples are pressing upon our northern seaboard; and, strangely enough, our mandate has been accepted by China and Japan almost without

protest.

The latter circumstance suggests two things: either the Children of the Rising Sun are patiently biding their time until a favourable excuse for bursting open the shut door presents itself, or Japan and China are utterly indifferent to tracts of uninhabited land practically adjoining their own. It would be difficult to find a politician within the Commonwealth callous enough to uphold the latter suggestion. Within the brains of every Australian is the fixed idea that every acre of his country has been mapped and portioned

off by his wily brown neighbour. The quality of the soil, its stock-bearing capacities, the value of its mineral deposits, and the possibilities of Australia generally as a revenue-raising country—that all these facts have been ascertained by the ruling powers at Tokyo goes without saying. Having satisfied himself that Nippon is crouching, pantherlike, for a spring, the Australian writes to his newspapers pointing out that Great Britain will offer up his country to Japan as the price of peace during the next great war.

AUSTRALIA THE GRAVEYARD OF JAPAN.

When the desire for national defence rises to a prolonged murmur some one is sure to state that the very physical formation of our country would render an invasion extremely hazardous and costly; and that, although we might be unable to concentrate large bodies of troops at a given point, there are possibilities of a prolonged guerilla war serious enough to compel a richer nation than Japan to hesitate before committing herself to a desultory struggle with a race of skilled horsemen and athletes. The bombardment of Sydney and Melbourne, and their occupation by foreign troops, would not mean that Australia had succumbed. It is only reasonable to predict that the white bushman, with unlimited supplies in his rear, would fall back in great numbers towards the interior. A thousand miles of country means little to the well-mounted bushman. Stock would be driven from one state to another as circumstances dictated; and if the railways survived the first year's struggle they would certainly be rendered useless to the invaders, it being assumed that an army of six hundred thousand men would be required to guard them. And the invader would have to face a nation-breaking struggle similar to that which England undertook during the Boer

Japan, says our critic, would certainly flood our eastern and northern coast-lands with a huge coolie population. But what of the million unconquered white men flung back upon their bush-lands and sheep-runs, men absolutely independent of supplies, who would perforce of circumstances arm themselves to the teeth, for money begets arms, and the gun-runners from Europe and the Pacific slope would attend to such affairs as long as Australian gold was forthcoming? The fleets of Japan, continues the critic, could hardly hope to watch even a very small portion of our eastern seaboard.

Our exports to Japan are insignificant. It is to Great Britain, Germany, and France that we look for our markets; and the maritime transports utilised in the carrying of our raw materials are owned and controlled in every instance by European companies. Any attempt on the part of Japan to paralyse our deep-sea trade would certainly bring about a violation of the law which governs the conduct of neutrals.

Many of our younger men argue that Japan has

weighed her chances of success and failure in her attempt upon Australia, and the world can only speculate upon her final attitude towards us when the psychological moment arrives. But in justice to Japan it is only fair to ask if she has ever included Australia in her scheme of territorial expansion. Would the acquisition of the Southern continent repay her after the spending of incalculable treasure and lives? The Ministers at Tokyo have doubtless answered the question emphatically and with no uncertain voice. Until the present year it may be asserted that the prestige of Great Britain has maintained for Australia her independence and immunity from aggression.

JAPAN AS A COLONISING POWER.

The displacement of Great Britain from her present position among the Powers might not mean the overwhelming ascendency of another European nation or Japan. The prestige of Japan, no matter how great her ascendency, would not uphold her undisputed right over a vanquished Australia. There would be partitions and annexations by other Powers, and the fight for its ultimate suzerainty might rest with three or more white nations, including Japan. The far-seeing rulers at Tokyo have looked well into these things; and although Japan is sure of her military strength at home and in Manchuria, she is not likely to spread her wings over perilous distances to satisfy the cravings of her ambitious youth. Her colonising powers have yet to be tested. Under their own government, surrounded by their ancient traditions, the samurai and coolie alike are ideal citizens; yet something more than mere citizenship is required in the making of new empires, something which the homeloving German and Frenchman have failed to discover. Under new skies and other influences, young Japan may develop tendencies not in keeping with the spirit of successful colonisation.

AUSTRALIA A HALF-MADE CONTINENT.

Another unconsidered factor in regard to Japan's attitude of silent toleration of our Aliens Restriction Act lies not in her attachment to England, but arises from considerations of a purely economical nature.

It is always assumed by the over-enthusiastic Australian that his continent is the cynosure of Asia's eyes. The thought appeals to his vanity. He likes to imagine himself the owner of unlimited territory while the North is echoing with the sounds of overcrowded cities and land-hungry peoples. It has not yet occurred to him that the business-headed Jap and Chinaman do not consider Australia a sufficiently good investment to warrant an expensive invasion. The three million people gathered mostly on the eastern seaboard of Australia care or know little of the vast Sahara-like expanses that go to the making of their continent. If the habitable regions were carefully mapped out, with reliable rainfall statistics appended, it would be

found that the fertile regions could be crowded into a ridiculously small area. Scientific agriculture has done much to improve the desert places of the earth when their vicinity to populated centres warranted the pains and expenditure. Unfortunately the desert places of Australia are more adjacent to the South Pole than to the immediate centres of civilisation.

The writer of this article has travelled through Japan, and he knows of no syndicate or combine in that country yearning to acquire the uninhabited spaces of our continent. It is safe to say that if five hundred million acres of our best northern lands were put up for auction we should not get a single bid from Japan. The reasons are not far to seek. Since the discovery of gold in Queensland the north and north-west portions of the continent have suffered from the irruptions of inquisitive Japanese shellers and prospectors. The vast regions extending from Port Keats to the Batavia River are practically uncontrolled by the Commonwealth authorities. Malays and Bughis men, Japanese and Kanakas, enter unbidden and depart silently as they come. From Hannibal Island on the eastern shores of York Peninsula, round to Cape Leeuwin in the far south-west, the country offers small inducement to would-be invaders. The pearlinggrounds of Torres Strait have been denuded of shell and spat by avaricious divers; the creeks and gullies of the northern inlets have been prospected by white and yellow men to a greater extent than any other portion of the continent. The day of big gold discoveries is apparently at an end; the country west of the Flinders and Fitzroy has been pot-holed and tested in a way that would make the Transvaal gold-seeker gape in astonishment.

These facts, combined with the absence of great rivers, have had a deterring effect upon the irrigationloving Chinaman and Japanese husbandman who have already visited these shores; and that the northern limits of Australia have been exploited by bands of Asiatics we have ample proof. In August 1896, while crossing from Port Roper to the

Nicholson River, I came upon a party of blacks in a pitiful state of disease and poverty. One of their number escorted me to the edge of a dry streambed, and pointed to hundreds of naked footprints which followed the sun-blighted depression for several miles to a place where water was still obtainable. As I stooped to examine the tracks, the aboriginal informed me that an overwhelming body of Chinamen had passed south only a day or two previously. Three weeks later I came suddenly upon their camp-fires in the M'Kinlay Ranges. They were evidently pressing south towards the Diamantina Valley in the hope of finding gold. No one knows what became of them afterwards. In September of the same year I wrote to the Queensland authorities in reference to the matter, but received no reply.

The Northern Territory is the graveyard of innumerable Asiatics, who enter by way of the Gulf of Carpentaria in quest of gold. Death from thirst and starvation accounts for thousands. The few who survive return to China to spread the fame of Australia's relentless solitude and hunger-

tracks.

If China and Japan were in earnest about Australia as a suitable country for their overflowing population, we should have to patrol our seaboard with gunboats and water-police, for the Chinaman, at least, would come even though we pinned our Aliens Restriction Act on every stone and mangrove-tree north and west of Rockhampton.

It seems to one who has travelled far over the desert places and hunger-tracks that Australia's fight must be with her arid regions and bush-lands, her unpeopled spaces and drought-ridden west.

Japan has measured and weighed. Let us be sure that neither our strength nor our weakness has escaped her. That she will take no fresh leaps, even towards the brilliant sunlight of Australia, is certain, for she recognises that her failure to control the vast spaces separating her from the great Southern continent would imperil her national existence, for which she fought so strenuously.

THE ROMANCE OF A FLOATING DOCK.

By Andrew Marshall, Author of Comedy East and Tragedy West, &c.

CHAPTER XI.

OM time to time Sandford put more wood on the fire. When he felt sleepy he rose and moved softly about to keep himself awake. Twice he heard again the cry of the 'tiger'

from the other side of the river, and

once he was startled by the flapping wings of some invisible night-bird which passed. But the fatigue and excitement of the day and the monotonous murmur of the water gradually made him drowsy, and at last sleep surprised him.

He woke with a start, feeling cold and stiff. It was almost dawn, for there was a faint clearness in the east. His clothes were drenched with dew, and he felt grateful to the girl for having made him wear his coat. She might be uneducated, but how wise and kind she was! The fire still smouldered He stirred it up and piled on more wood. At the noise the girl moved, and he turned away. He picked up his knife and went off to cut a thin sapling he had observed the night before. In half-anhour he returned. The girl was busy over the fire 'This is our flag-post,' he said, 'on which we shall leave a message for your father.' With the help of some stones he set it up after tying his handkerchief to it. 'He will be sure to see it.'

She received him with a smile. 'Yes, he will be sure to see it,' she said; 'and you see I am making breakfast, señor.' She had placed the rest of the fish on the fire to broil, and stood up with an air of expecting commendation.

What an invaluable housekeeper you are!' he said: and they both laughed.

They were young, it was morning, their breakfast was ready, and care had flown away. She picked out the blackened parcels of the fish from the embers and laid them with some bananas on one of the big leaves. There was still a good deal more than they could eat.

'I have cooked it all,' she said. 'I am sorry it is a little burnt.' She did not say that she had burnt her fingers also.

'All fish ought to be a little burnt,' said Sandford.

'And all bad cooks,' she said, pressing her fingers surreptitiously on the cool stones.

'The best cook,' he said, 'on this or any other island is going to write a letter on this pocket-book leaf which shall be her testimonial, and it shall be fastened to this flag of the island for all the world to see. Please take the pencil and write, señorita. If Don Santiago passes on this side of the island he will see this signal and will learn that you are safe so far, and that you are on your way to Garapatas. If he passes on the other side we cannot help it. It is impossible to get across to set up a signal there. You see I have cut another branch for a well as I could with my knife. It will serve to steer with—in a way.

'Now I have been thinking about our voyage. Judging by the journey we made yesterday in the steamer, I think we may feel sure that we shall reach Garapatas this evening if we have no accident. I am afraid we cannot go to that place where we breakfasted. It is some distance up another stream, and you know we can only go down-stream.'

'Yes, señor; and I should not like to go there. We will try to reach Garapatas.'

'Let us go, then,' he said.

She pinned the paper on the fluttering handkerchief, while he righted the canoe and made a seat for her of the grass with his coat spread over it.

'We must take the rest of the fish and bananas for our dinner,' she said, 'and some of the largest leaves of the pozol. We can make sunshades and umbrellas of them.'

When he had got some leaves, they dragged the canoe together to the water's edge. The distance was much shorter than the night before, for the river had risen. They embarked very cautiously, Sandford holding the boat while she seated herself. Then he set it afloat and stepped in himself, kneel-

ing down. In this position he had to remain. He poled gently out from the shore. The current caught them, and soon they were in the centre of the stream. Their quick motion made a refreshing breeze, and the mosquitoes were gone.

It tried all his skill, and sometimes all his strength, restricted as his movements were, to keep the canoe in the centre of the river and her head straight, and to clear the snags, generally halfsubmerged trees, which frequently threatened them with destruction. The girl, who, as he believed, knew better what to do than he did, yet committed herself to his care with an absolute confidence that was exquisite flattery and encouragement, and was indeed the best help she could have given him. In the most headlong swirls she kept her seat and never moved a muscle. But his arms and his back were aching, and his nerves had been severely tried, before they floated with gradually lessening pace out of the swift Carrizal on to the broad Mariposas. Then he was able to rest a little and take breath.

The great river was deep and smooth, and though its current was swift it did not race like the Carrizal. Their movement no longer created so strong a breeze to fan them. They had now been sitting for a good many hours in the narrow, cranky dug-out, having no room to change a position, and scarcely daring to move for fear of upsetting. They were sitting in water, too, for a wave-top had lapped over occasionally in spite of Sandford's care, and the old cedar was a little leaky. They were both sore and cramped. The sun had long been high in the heavens, and its heat, both direct and reflected from the water, was almost overpowering. They had each made sunshades of one of the big leaves which the girl had had the forethought to bring, but Sandford had soon found it impossible to hold his up and at the same time use his paddle. The girl was looking white, and he saw that she often shut her eyes. It was becoming physically impossible to endure the heat longer in such conditions. He knew she was used to the climate, and in some measure to roughing it, but not to strains like this. She looked deadly fatigued. If she should faint they would probably be upset, and that would be the end. Either one or both of them might have sunstroke. Remembering a device he had learned in Spain, he scooped up water and drenched his head and the back of his neck and ears; and the girl, at his suggestion, soaked her handkerchief and wetted her face and neck. But they could not bear the situation much longer.

They had now reached the region of the sandy, swamp-intersected, treeless region of the coast-belt. Behind them in the far distance they could see the mountain ridge of the interior. In front and on each hand the river-bank was their horizon. Now a feathery excrescence came into view, which soon showed itself to be a solitary clump of palms. Sandford resolved to make for it in the hope of

being able to find a place of rest in its shade. It turned out to be close to an opening in the bank where a sluggish brook joined the river. He pushed into this creek and found a place where they could land. He first got ashore himself stiffly enough, and then helped her. She tottered and would have fallen but for his support. But she recovered immediately, and, after he had made the canoe fast, they slowly clambered up over burning sand to the level ground and the shade of the palmtrees. Not far off stood a hut, and after they had rested a few moments Sandford went over to it. He made a sign that it was empty, and the girl followed him. It was built of uneven saplings laced together with vines and roofed with palmleaves. Through its sides there was a view and free ventilation in all directions, but its shade was thick and perfect. The plain around was arid and brown, with a dry tussock of thin grass here and there. No living creature was to be seen, and no sign of any road.

'It is a hut of the vaqueros,' said the girl. 'They come here with the cattle after the rains

when the grass is good.'

The hut had no door, and its only furniture was a billet of wood polished by much use as a seat and perhaps a pillow. But the floor had been baked hard by many cooking-fires, the traces of which remained in white ashes and bits of charred sticks.

'I think you should rest here for an hour or two,' said Sandford. 'I will go and wait where I can see the boat, in case it should drift away. If you come out and call I shall hear you.'

He was really rather afraid to leave the boat, their only hope of deliverance, long out of his sight, lest by any accident it should drift away. But he also felt that he must carry out his resolution, and see no more of her than he could help. In her presence he could not trust himself to keep his soul his own. Her innocent confidence, her sweet intelligent helpfulness, every way and look she had, undermined his vow and weakened his decision, appealing to him as the one woman appeals to a man. So he left her alone.

It was afternoon when they embarked again.

'We should keep over towards the northern bank,' she said. 'There is a road on it which leads to Garapatas. We have sometimes ridden up there. I do not know how far it goes up.'

Sandford worked steadily at his paddle, gradually finding out how to use it to the best advantage. After a while signs of cultivation became visible, patches of maize, clumps of banana, and in an hour or two the sugar-cane in regular rows on the top of the high bank. Soon they saw the top of a high chimney. It bent like the leaning tower of Pisa, looking as if it would fall over. As soon as the girl saw it she said :

'Ah, I know where we are. That is the sugar plantation of San Feliz. It is only a few leagues

from Garapatas—seven perhaps.'

- 'Are there women there?' he asked.
- 'Oh ves.'
- 'Would you like to land there, señorita ?'
- 'Oh no,' she answered impulsively. And then in a changed tone she said, But if you think it best, señor.'

'But do you think it best, senorita?'

'No,' she said, her eyes meeting his fairly and a brilliant colour rising in her face. 'I will be frank with you, señor. I do not know these people They are half Indian. I would rather stay with you if you will take me home.'

Without his will she read his answer easily in his face. But he only said quietly, 'Very well; we

shall not separate till you are at home.'

He did not trust himself to look at her any more, but devoted himself to keeping the cance in the strongest part of the current, and helping its progress as much as he could. They floated quickly

Once she said, 'There is a large canoe behind

He looked round. A trading-canoe with piledup bales and a large canvas awning at the stern, her big sail set and two long sweeps out, was slowing overtaking them. It offered a chance of a quicker passage to Garapatas, and he glanced at the girl's face. Neither spoke. But he understood, and quickly turned the bongo's head shoreward They crept along under the bank, and were taken for a couple of fishing Indians. The great cance passed. They heard its crew singing an unmelodious chant. Sandford paddled out again into the main current, and they glided on.

The Mariposas winds towards the sea for its last fifty miles through an alluvial plain. On its banks great stretches of pasture-land alternate with cane and maize fields and banana grores. Late in the rainy season the river rises almost to the plain's brim, but now the banks were twenty feet above the heads of Sandford and his companion. She had begun to recognise each hacienda by the big chimney of its sugar-mill and its row of huts shaded by tall coco-palms. But the land was too flat and the river too far below its level for them to see the road, or anything of the houses except their roofs. It would have been impossible to land, except where a sloping way had been made for cattle to get at the water to drink, or rough steps cut where people came down to draw water or to bathe. At some of these children were playing and women washing clothes Sandford carefully kept too far from them for recognition.

Night came upon them suddenly. The bank on their right fell dark, and its shadow ran across the water and covered their boat and them. Then the left bank faded from below upwards into gloom. A planet dawned above it. In a few minutes the sky was set with all its stars, and the river banks became but a black border round the skirt of heaven. The restless water faintly reflected the starlight in oily glint and ripples.

They drew near the side, and gladly found a place to land. There were steps cut in the firm sand, and a canoe was moored near their foot. No one was about. Sandford caught the edge of the moored canoe, and held it while they both slowly and painfully got into it. Then they let their own drift away.

They were forced to rest for a little when they were safely on shore. Then he took her hand and helped her up the steps. It was darker than on the water, and they had partly to feel their way. On the top they rested again. A narrow pathway led to the road through growing maize which rose high above their heads. Sandford felt among the stalks and leaves till he found two ears. They were full though scarcely ripe, and he plucked them and thrust them into his pocket. They reached the road, and felt with their feet that it was deep with dust. It ran parallel with the river, and on the other side of it, across some dark foliage, they could make out the steep, pitched roof of a house against the sky.

They turned at once down the road. Their feet made no noise, for there were no stones. A faint whisper was breathing through the high maize, and they could hear the distant murmur of the river. But neither sound seemed much louder than their own breathing. He still held her hand, and she did not wish to let his go. Both felt as if they might lose each other in the dark.

'Do you know how far we are from Garapatas?' he asked her.

'I am not sure, but I think that house may be the ranch of José Domingo. If it is, then we are about two leagues from home, and so we shall be there before they have gone to bed.' They instinctively spoke in whispers.

When they had gone a long way without meeting any one, he drew one of the cobs of the Indian corn from his pocket.

'I think we might have supper now,' he said.

He let go her hand to strip off the husk, and she put her arm gently through his. They stopped, and he broke the cob in two and gave her half. The grains of the young maize were soft and juicy. She began to eat, biting them off with her teeth and laughing softly.

'If we could have boiled them and had a little butter and salt,' she said, 'how good they would be! But they are very good, and I am very hungry.'

Sandford could not help knowing by her voice that she was terribly tired, notwithstanding her effort at gaiety. She leaned on his arm as they marched along the road. It was perfectly level, dry, and dusty. The heat no longer oppressed them. Sometimes they passed through open ground, and could almost make out the line of the river in the starlight, sometimes through sugar-cane or tall maize, and occasionally by trees sheltering a house.

When they came in sight of the lights of the town she was so utterly worn out that she could go no farther, and he made her sit down on the ground, seating himself beside her. Her head fell against his shoulder, and in an instant she was asleep. He struck a light, carefully concealing the flame, and looked at his watch. It was eleven o'clock.

For about twenty minutes he kept quite still, supporting her with his arm. Then she awoke.

'Oh!' she said, 'forgive me. I am very tired.' She resolutely sat up. The sleep, short as it was, had done her good. 'Now I think I can go on,' she said. 'We are very nearly at home.'

He helped her to rise, and placed her hand in his arm again.

They crossed the bridge and entered the long street of Garapatas. It was almost deserted, and nearly all the houses were dark. Lights, however, still shone in the Café Frances, and on the pavement outside it two or three men still sat at the little iron tables sipping cool drinks and smoking. As Sandford and the girl passed on the opposite side she dropped his arm and walked respectfully behind like an Indian woman.

'To complete our disguise, you should give me a heavy bundle to carry on my back,' she whispered.

(To be continued.)

LONDON IN THE TIME OF ROMNEY.

By W. ROBERTS, Joint-Author of Romney.

EORGE ROMNEY is so much in evidence nowadays, in exhibitions of pictures by old masters, in public and private galleries, in print-shops and in the saleroom, that it becomes increasingly difficult to realise that

one hundred and forty-five years have passed since he came up to London, friendless and unknown. He was doubtless animated by the hope which Dr Johnson has declared to be a 'species of happiness,' but he little thought that it would be his good

fortune not only to assist in the formation of the Early English school of painting, but to be one of its three chief glories. With English art it was just the parting of the ways. Reynolds was breaking down the traditions of Hudson; Gainsborough was establishing his fame as a fashionable portraitpainter at Bath. Reynolds settled in London in 1753, and almost at once monopolised the patronage of 'the town.' There seemed, indeed, to be no room for a second great painter, and yet as a matter of fact the times were singularly propitious. The

gradual increase in the wealth of the country; the accession of George III., an English king by birth and sympathies, and one who, in spite of his failings, had a friendly feeling for what one of his ancestors described as 'boets and bainters,' all these and other conditions, unthought of by Romney, contributed towards the success of what looked like hopeless failure.

The London of Romney's first years was the London of the Middle Ages, a congeries of narrow, picturesque, and dirty streets, with a few fine architectural monuments scattered here and there. Goldsmith had just taken 'respectable lodgings' in Wine Office Court, passing rich on the three guineas which he had just received from Newbery for the pamphlet on the Cock Lane Ghost, and fourteen guineas for the copy of the life of 'Mr Nash.' He was on the point of cementing that lifelong friendship with Dr Johnson which is such a fragrant chapter in the Grub Street literary history of the period. Johnson himself had passed through the early vicissitudes of his life as a literary hack; he was a more than middle-aged man; he had done most of his work, such as it was, and had just come into unexpected wealth in the shape of a pension of three hundred pounds a year. Boswell was still thirteen years in the distance; The Vicar of Wakefield was not yet written; Henry Fielding had been dead eight years, and Samuel Richardson about twelve months. Reynolds and Johnson were doubtless discussing the tour to Devon on which they started in August; Baretti was in Italy, receiving the long newsy letters from Johnson. English painting was not quite neglected, for among the officials of the year 1762 we find 'Joseph Shackleton, Esq.,' as 'Principal Painter' at two hundred pounds per annum, whilst the 'Sergeant-Painter of all His Majesty's Works' was one William Hogarth, who appears to have been satisfied with the honour. Whitehead, as poetlaureate, on the contrary, was receiving a pension of one hundred pounds; the official 'rat-catcher,' John Gower, received forty-eight pounds three shillings and fourpence, apparently computed at so much per head; John Mason, as 'Master of the Barges,' was enjoying one hundred pounds a year; Mark Akenside was one of Her Majesty's physicians; there were also official pin-makers, comb-makers, 'distillers of milk-water,' whatever that may mean. The Duke of Devonshire as Lord Chamberlain was in the receipt of 'wages one hundred pounds a year,' with 'board wages eleven hundred pounds a year' thrown in. Cornwall returned forty-four members to Parliament, as against four for Cheshire. John Wilkes was sitting for Aylesbury, Soane Jenyns for Cambridge, Henry Pye for Berks, and a Sir Wilfred Lawson for Cumberland. Henley was Lord High Chancellor, Secker Archbishop of Canterbury, Sir John Cust Speaker of the House of Commons, and the elder William Pitt had only, in 1761, resigned the long-held premiership of the Cabinet.

In a less exalted sphere we have the names of Jeremiah Bentham, father of the celebrated Jeremy Bentham, and Henry Woodfall, of 'Junius' celebrity, acting as directors of the 'Amicable Society for Perpetual Assurance,' and Mr Jonathan Buttall, jun., doubtless the father of Gainsborough's famous Blue Boy, one of the directors of the Handin-Hand Fire Office. John Udney, the famous picture-collector, was English Consul at Venice, Richard Cumberland, to whose enthusiastic and poetic 'log-rolling' Romney owed so much, was English agent in Nova Scotia; Cadwallader Colden was Lieutenant-Governor of New York, Thomas and Richard Penn were 'proprietors' of Pennsylvania, and Benjamin Franklin was also an official in America. Louis XV., 'le bien aimé,' was still reigning, but going down to the grave unwept and unhonoured by his people, from whom England had wrested their colonies in the East and West Indies, and Canada, the long feud between the two nations being concluded by a peace signed a few months after Romney reached the Metropolis Clement XIII. was Pope of Rome with a large and powerful military organisation; Venice and Genoa were governed by a Doge; and the political map of continental Europe showed no signs of the radical change which commenced at the later part of the eighteenth century and concluded with the Franco-German war of 1870.

Letters to New York cost one shilling each, or ii one ounce in weight four shillings was the charge; to the East Indies a letter cost one shilling and sixpence. The journey from Kendal to London was then a matter of several days; it is now accomplished in a few hours. In London the fare by boat to Gravesend was four shillings and sixpence, to Woolwich two shillings and sixpence, and from all the stairs between London Bridge and Westminster sixpence. London itself was almost as dangerous as the wilds of Africa; the narrow footpaths were separated from the carriage-ways by a line of unconnected stakes, and were constantly blocked with 'chairs,' wheelbarrows, coaches, and so forth The life of the pedestrian was held cheap indeed; he or she had to submit to the wilful splashings of the chair-men, to their filthy retorts, and to the dangers of a total absence of all traffic regulations Thieves abounded, often aided and abetted by swarms of link-boys. It was to this London of the good old times' that George Romney came in 1762

Yet another interesting point may be mentioned; a glance at the list of the members of the House of Commons of 1762 will show that quite a remarkable number of them were in after-year associated with Romney, and either sat for their own portraits or gave him commissions—for example, Richard Neville Aldworth, George Amyand, Henry Bankes, William Beckford, Charles Bone, Richard Wilbraham Bootle, Thomas Calcraft, William Cartwright, John Chaplin, Francis Child, Henry Curwen, the Dashwoods, W. De Grey, Gilbert Elliot, John Evelyn, the Fanes, Nicholas Fazakerler,

Sir Richard Glyn, T. Grosvenor, Charles Jenkinson, Augustus Keppel, Sir William Knatchbull, William Lawrence, Owen Meyrick, Sir Rodger Newdigate, the Pitts, the Townshends, Sir George Warren (the large picture of whom with his wife and little girl was Romney's first great success)—all these and many others entered later on into the artistic life of George Romney.

THE CONVERSION OF CONKY.

ARCOURT!'

'Etheridge!'
'Why, what in the name of all that is wonderful, old chap, are you

doing in this benighted locality?'
'On guard, Hal—on guard!'

'What! Doing duty hereabouts?'

'Nothing else, I assure you.'

'Marvellous! Harcourt of Balliol—old Blue—Silver Sculls man—first on the "pitch"—No. 1 racquets—parsonising in the East End! Sir, as an ex-O.U.B.C. member myself, I demand instant and complete explanation.'

'Very simple, old man. In seeking a curacy in this, as you truly term it, benighted quarter of the Metropolis, I was actuated by two notives: a strong desire to know the East Ender by personal contact and experience; and secondly, being, as you know, a very glutton for work, I came where there is plenty of it and to spare.'

'Well, my dear fellow, of course it's all very noble and self-sacrificing, and so on, on your part; and equally, of course, I congratulate you upon and admire your pluck; but will it last, do you think? I mean, shall you be able to stick it?'

'I hope so—I believe so,' smilingly responded the Reverend Cyril Harcourt. 'At any rate, I am going to have a right good try.'

'Bravo! Good old Cyril! May I be somewhere about at the finish, to see the win!'

The Reverend Cyril Harcourt, B.A., smiled again at the other's good-humoured badinage; though beneath the laughter of the eye a close observer could have detected a curiously deeper something, the thinly veiled evidence of a high and strenuous purpose.

Just over six feet in height, with shoulders broad enough to have carried with ease a typical suit of armour of his forefathers, the ex-Oxford athlete, with his clear blue eye, his mop of tightringed fair hair, and a general expression—especially about the mouth-corners—of will and determination, which might on occasion become obstinacy of the better, if more pronounced, type, looked as perfectly equipped a champion of the Church to which he belonged as could well be found in any quarter of this, the capital of His Majesty's dominions.

Canning Town—the neighbourhood, that is, of the Albert Docks—is, to say the least of it, a trying battle-ground for the average fighter for the faith. The docker, for instance, is, from the very fact of the precarious nature of his unskilled occupation, difficult and often dangerous of approach. Because of his surroundings he is, with few exceptions, given to a morose, almost aggressive, state of mind and manner, and as a rule regards the black coat and white neck-band of the genus parson as a hostile flag, to be fired upon wherever found and upon every opportunity.

Cyril Harcourt accepted a commission in these waters with his eyes open, and with a full know-ledge of the shoals and rocks ahead, but also with his back straightened and his spirit braced to tension-point for anything and everything that he might encounter.

With the female element in his district he was already an attractive personality. They waylaid him in his vestry, at the door of his lodgings, at the entrance to multi-populated culs-de-sac where escape was impossible, and where, therefore, their domestic joys, sorrows, and particular tight corners might, without regard to their reverend listener's time and patience, be poured into his sympathetic

The long-suffering wife of a noted local 'bruiser,' one 'Conky' Collins—so nicknamed from his abnormally developed nasal organ, the bridge of which, by its broken condition, bore irrefutable evidence of many a hard-fought fight—was an especial and enthusiastic admirer of our athletic curate.

'My dear,' she said once to Mrs M'Kinlay next door, ''e's a hangel, strite! The w'y 'e stands quite respeckful-like, wiv 'is 'at in 'is 'and, a-torkin' ter me that pleasant, my dear, any one 'u'd fink I wos a bloomin' duchess wiv a dimon' tarara in me 'air!'

'Yer right there, girl,' agreed Mrs M'Kinlay; 'I allus says ez if any one ever deserves ter go up ter 'eving in a charit o' fire, Mister 'Arcourt does, an' no bloomin' errer!'

'Well, well, there ain't no knowin', o' course; but I on'y 'opes ez 'ow 'e'll live ez long as that ole bloke 'e was a-tellin' us abaht t' other d'y—Methusylum, er some sech nime ez that.'

Now, it was for the abode, in Shepherd's Court, of this identical Mrs Collins that the Reverend Cyril was bound when he met his quondam Oxford friend hard by the West India Dock gates, in the Barking Road.

The court, as a place of residence, is, from the average citizen's point of view, anything but an enviable one, its malodorous atmosphere, its tumble-down, not to say dilapidated, tenements rendering a visit by an outsider somewhat of a trial to be borne as patiently as circumstances may permit.

Hitherto the curate had congratulated himself upon having escaped coming into contact with the redoubtable Conky. In fact, the personal appearance of that aggressively pugnacious gentleman was altogether unknown to him. When, therefore, on this occasion, the entrance to Shepherd's Court hove in sight, the young clergyman, to his annoyance, saw that the familiar iron post was acting as a leaning-place for a burly, sinister-looking man with a short pipe in his mouth.

The nose of this individual was of giant proportions, but damaged to the extent of a broken bridge. This latter fact placed his identification

by the curate beyond all manner of doubt.

Eying the approaching clergyman with an air of truculent and contemptuous dissatisfaction, Conkyfor it was he-removed his pipe, sniffed warningly, and prepared for business.

'Mr Collins, I believe?' said the Reverend Cyril,

politely persuasive.

"Oo sed I wasn't?' hoarsely demanded the bully. 'Oh, no one, I'm sure,' hastily returned the curate.

- 'Well, then, wotcher gittin' at wiv yer "Mister Collins, I believe"? Fink I'm a bloomin' waxwork figger, wiv a label'—he said "libel"—'on? Never ast yer your nime, did I? Wot's it got ter do wi' you wot mine is?'
 - 'My dear man'-

'Wot!' roared the enraged Conky; 'your dear man? Well, strike me fat !- 'Ere, Bill !- 'Ere, Nobby !'-this to a couple of dirty-looking loafers, who, with their hands shoved into the nethermost recesses of their pockets, and diffusing a distinctly unpleasant perfume of bad beer and worse tobacco, lounged up to see the fun.

'Twig this 'ere bloomin' sky-pilot believin' my moniker is Mister Collins! 'Specks 'e's arter my ole woman-that's abaht the size o' it!-Aht wiv it, nah,' he went on, addressing Harcourt and winking expressively at his two 'pals;' 'that's wot

you're arter, ain't it?'

The curate was one of the best-tempered men to be found in a long day's march, but he was rapidly forgetting everything except that he was distinctly and above all things human, and that his sacred office would not much longer be a bar to his trying conclusions with his tormentor.

'Kindly allow me to pass,' he said, restraining himself with an effort.

'You ain't answered my questions yet.'

'Are you going to let me pass, or must I make you?' said the curate, the flush on his face testifying to his now rapidly rising wrath.

'Oh lovaduck! 'Ear that, you blokes? 'E's goin' ter mike me! Wonder 'ow 'e's a-goin' ter set abaht it, and w'en 'e 's a-goin' to mike a stawt?'

This with our clerical friend was the very last straw. Casting discretion, priestly dignity, and every shred of conventional consideration to the four winds, Cyril Harcourt, without more ado, rammed his soft wide-awake well down upon his

head with his right hand, and drawing back his left, with a lightning-like movement he let drive at Conky's prominent and already damaged feature, with the startling result that the local champion promptly found himself on his back in anything but a satisfactory state of mind and body.

With the usual celerity of the rat-tribe, the two 'pals' of the fallen hero disappeared and left him to his fate.

Not so did his reverend opponent.

The blow struck, Harcourt instantly repented of his action, and, instead of entering the court to fulfil his mission, stooped to ascertain the extent of the damage.

Conky still lay inert and helpless.

Then ensued an incident which is talked about in the neighbourhood to this day.

Buttoning his coat and bracing himself to his self-imposed task, the clergyman, with a mighty heave (for Conky was no light weight), hoisted the unconscious pugilist on to his shoulder, and setting his teeth hard, as much from shame and remorse as from physical strain, bore his bulky burden through the court, up the rickety stair of his dwelling, and deposited him upon the bed.

Possibly the inevitable shaking of the journey, short as it was, helped materially to pull Conky together; anyway, as the parson turned to leave the room a voice, hardly recognisable as that of the redoubtable Collins, hailed him.

'Hi, mister! Jest a word afore yer goes.'

'Yes,' said the curate, much relieved, 'what can I do for you? Beginning to feel all right?'

'Never mind abaht that,' Conky went on, his voice gaining strength as he proceeded; 'wot I wants ter s'y is this 'ere. You're a gentleman, ain't yer?'

- 'Well, I suppose so.'
- 'An' a parson ?'

'Yes. Well?' 'Jest this 'ere. You're a gentleman an' a parson; but let me tell yer ez yer somefin' more'n thatyou're a man! That's wot you are, a man, an' Conky Collins don't bear yer no malice 'cos yer flopped 'im aht fust pop. I gives yer credit for it, sir; an' ef so be as yer wants a little job done at any time in my line—knockin' the stuffin' aht o' anybody, or some sech bit o' business-why, jest gimme the wheeze an' I'll do it for yer wiv a good 'eart—yus, ef it comes ter layin' aht the Archbishop o' Canterbury for yer, I'd do it!'

This, as coming from Conky, meant volumes, and Cyril Harcourt was quick to perceive it. Every trace of annoyance and righteous anger had disappeared, and he somehow divined that this man, this sometime bully and picker of quarrels, was to be given into his hand as the spoil of his bow and

his spear.

'Very well,' he responded, with a cheery smile; 'I will certainly come on you if the need should arise. Meanwhile, I observe you are a bit of a bird-fancier.'

Cyril had been gazing with interest at a wicker cage hanging outside the window, in which energetically hopped about, with an occasional whistle, a plump and volatile thrush. On the other side of the window were half-a-dozen linnet-cages, each with a well-cared-for occupant.

'I want you,' he went on, 'to come and see my birds. I am a fancier myself. I promise you that I won't preach to you, although I tell you straight that I shall do my level best to try and convince you that your old way is anything but the right way, and that if you'll let me, as man to man, I'll put you on the right track.'

'Right-o, guv'nor! 'ere's my 'and on that;' and Conky extended a ponderous and not over-clean paw, which Cyril shook cordially. 'I'll come an' 'ave a look at yer birds, an' listen ter wotever yer likes to s'y, even ef I goes ter sleep over it!'

Thus was the compact sealed between Conky and his new friend; and when Mrs Collins arrived home from a hard day's charing, her astonishment at her partner's mild, and even affectionate, reception of her was such that she actually, in sheer bewilderment, put a whole ounce of tea into the teapot.

Two days afterwards Conky, clad in his best, and with, round his neck, the choice silk 'bird's-eye' he was wont to sport on state occasions, knocked at the door of the curate's lodgings.

The house was that of a builder, who at the back had put up a wooden erection with a loft above. The lower part he retained for the purposes of his business; the loft he let to his reverend lodger, and the latter had transformed half of it into an aviary, while the remaining section he had fitted up as a gymnasium.

Conky's introduction into this sanctum of the curate was in the nature of a revelation to the tenant of No. 6 Shepherd's Court.

His first attention was paid, as was only natural, to the birds. Canaries, linnets, siskins, were all there, together with finches without end, and, king of the collection in Conky's eyes, a certain cockredpole, than which he had never, so he averred, seen a more beautiful bird.

The curate duly noted the intense admiration displayed by his new friend for the redpole in question, and, after showing Conky round the gymnasium and playing the host at 'high tea,' took the wind out o' him' (as his visitor later on expressed it) by proposing a bout with the gloves, Conky to have the bird on condition that he succeeded in knocking his antagonist 'out.'

Then awoke the spirit of battle in Conky's soul, not to say the hope and desire that such a glorious and coveted prize might be his. There is no need to give a detailed account (à la sporting paper) of the historic encounter. Suffice it to say that in two rounds, the second of which was of but momentary duration, the curate's scientific methods and superior weight of metal once more induced Conky to assume a horizontal position, and elicited from him the forcibly expressed opinion that the Reverend Cyril Harcourt could, if he felt so disposed, knock the great Gunner Moir himself into the middle of next week. After which emphatic declaration Mr Collins arrayed himself in coat and hat, preparatory to departure.

'But abant this 'ere bird,' he remarked persuasively. 'I s'pose yer don't feel like sellin' 'im, do yer? 'Cos if yer do, an' yer figger ain't too big—well, I'm a buyer.'

'No, I'm not selling Rufus,' said the curate, a curiously enigmatic smile visible about his eye and mouth-corners; 'but I'll tell you what I will do. If you will accept the redpole, as from one bird-fancier to another, it will give me the greatest pleasure.'

Hardly believing his ears, but at the same time alive to the fact that possession of the treasure was within his reach, Conky whipped out an enormous red handkerchief, and in a couple of minutes the redpole was securely knotted up in a small cage for transport to Shepherd's Court.

Conky's gratitude took its usual form of an energetic handshake and a somewhat halting valediction.

'Mine ain't much of a plice,' he said, 'but sech ez it is, parson, you're allus welcome—allus welcome, mind that. Course yer bahnd ter look in ter see 'ow the bird's a-gettin' along. I'm prahd o' 'im a-cos—a-cos—well—you jest come an' see 'ow 'e's a-gettin' along, anyways.'

As he banged-to the street door the smile on the curate's face expanded till it became almost a beautiful expression of intense and complete contentment. It was the whole-souled satisfaction of the victor after a battle to the death.

A month ago the parish magazine of St Enoch's, Canning Town, contained the following announcement: 'Mr and Mrs Charles Collins have been appointed care-takers (with a residence) of the schools connected with St Enoch's.'

It is impossible to get right down into any man's 'holy of holies,' but the Reverend Cyril Harcourt is often heard to declare, with reference to his new care-taker's sincerity of reformation, that, so far as one human being may safely judge another, he (the Reverend Cyril) would rather be inclined to doubt the fact of his own faith and belief than that there could be anything, however infinitesimal, in the shape of a twist in the 'Conversion of Conky.'

THE ROMANCE OF WILD ANIMAL COLLECTING.

AN INTERVIEW WITH MR CARL HAGENBECK, THE WORLD'S ZOOLOGICAL PURVEYOR

HE most famous wild animal exchange to-day is to be found at Stellingen, a pretty little suburb of the busy port of Hamburg. It is presided over by Mr Carl Hagenbeck, who has rightly earned the title of the King of Animal

Dealers. But his depôt is something more than a mere exchange for the sale of all kinds of wild beasts and birds; it is in many respects a zoological institution. Here you can not only purchase any animal you care to name, but note how a twentieth-century zoological garden should be laid out and constructed, inspect many new animals in the way of hybrids, and receive valuable hints as to how tropical beasts may be brought to withstand a European winter.

It was the writer's privilege recently to spend a few days with Mr Hagenbeck as his guest. I stayed with him at his beautiful home in the centre of his great zoological park, which is virtually an animal's paradise. The collection of wild beasts and birds in this one garden is larger and more valuable than the animals in any one zoological garden the world over. To enumerate them here would occupy too much space, although I might add that the collection included forty-two lions, fifteen tigers, two lion and tiger crossbreds (an entirely new animal), twentysix jaguars, leopards, snow-leopards, and panthers. There were some fourteen elephants, sixteen Polar bears, thirteen Japanese bears, thirty-one zebras, twenty ostriches, seventy-six various species of deer, and a host of other giant creatures, birds, monkeys, and reptiles. It costs over five thousand pounds a year to feed this enormous stock. The carnivorous animals alone consume seven hundred pounds of fresh meat every day. Last year the camels, dromedaries, and other hay-eating animals disposed of one hundred and fifty tons of hay and one hundred and thirty tons of straw. Mr Hagenbeck keeps lions and such rare animals as zebras in large numbers, just as a horse-dealer keeps a large stock of horses. He is always selling them to zoological gardens, circuses, and other similar institutions in all parts of the world.

Some idea of the trade done in this curious merchandise may be gauged when it is stated that the proprietor disposes of in the course of a single twelvemonth to zoological gardens alone over eighty lions, tigers, leopards, and other big cats; over sixty different sorts of bears; as many as seventy elephants, fifty camels and dromedaries, and nearly one thousand monkeys; besides a host of other animals and birds. Last year Mr Hagenbeck received a cable from Coney Island, New York, asking if he could ship immediately twenty-eight elephants. He replied in the affirmative, and the animals were duly delivered. Recently the German Government asked him to supply two thousand camels, with the

necessary paraphernalia, such as saddles, halters, &c. They required them to be delivered within eight months from the date of order to a port in German South-West Africa, and were wanted for transportation purposes by the German army. The animals were collected by his agents; saddles, halters, ointments, &c. made; and a special steamer chartered, which left port with the first portion of the consignment within fourteen days. The whole two thousand beasts were delivered at their destination within five months and twenty days from the receipt of the order. There was a loss among the animals of only 4 per cent.

'How do you manage to keep up your stock?'I said to Mr Hagenbeck one morning as we wandered from house to house, from paddock to paddock, and

pond to pond.

'From my depôts,' came the answer. 'I have depôts everywhere—six in Asia, three in Airion, several in Europe, two in America, as well as depots in Siberia. I have over sixty travellers working for me all the time, whose sole business is to collect animals and ship them to me here. They employ thousands of natives to help them. Then I buy up everything that comes into Hamburg, and I may say that if anybody abroad wishes to dispose of his animals he invariably writes to me. I then tele graph to my agent in the neighbourhood, who goes and inspects the stock, and usually purchases it For instance, the other day I received a letter from a resident in Rhodesia saying he had got a large collection of African deer and birds, and wished to get rid of them. Within three weeks I had secured the whole collection, and they are now on the way to Hamburg. I have at present several travellers on the way home, some of them with very large consignments of animals. Next week I expect one of my men from Siberia. He is bringing me deer, sheep, and other animals. Then I expect shortly some young gorillas from Africa.'

Here I asked the great dealer if he could tell me the reason why the zoological gardens made such a failure in their attempts to keep these animals.

'The general idea that the gorilla dies because he cannot stand the climate is all wrong, he said. 'The gorilla can be acclimatised like all other tropical animals. The fact is, young gorillas have died because their nature is such that they cannot stand captivity; it breaks their heart. I hope to get over this difficulty by importing baby gorillas They will be taken from their mothers when but a day or two old, before they have learned to know what freedom is.' All gorillas, of course, must be taken when quite young. The mothers are shot and the babies carried off to camp, where they are 'I have enough lions,' said the great dealer, 'to brought up on milk.

breed from for some time to come. Most of them have come from Nubia. Then the Egyptian Soudan, Abyssinia, and Senegal are the great lion-hunting countries of to-day. My agents secure the king of beasts by first killing the mothers; this work is carried out by the natives. The cubs are then removed, and brought up on goats' milk and fowl until they are a few months old. They are then conveyed down to the coast in little baskets on the backs of camels, and shipped to this depôt.'

The matter-of-fact way in which the dealer spoke took away the romance one attaches to such an enterprise. One could easily imagine the roars of the desperate mother, the cries of the young lions as they are carried across the desert to the port of shipment in order that a zoo in Europe might possess a specimen of this wonderful beast. Tigers are obtained in much the same way as lions, though many adult ones are taken in large pitfalls.

'The two animals which are exceedingly scarce just now are the hippopotamus and the rhinoceros. They are taken from their mothers when quite young—no easy feat, as you can imagine—and then brought up on milk. The feeding of them when you have finally secured them is no light undertaking. A baby hippopotamus will drink thirty pints of milk a day and bellow for more. To arrange for such a supply in the desert means that a large number of tame goats have to be taken along with the hunting-party. Thirty years ago I supplied the London Zoological Gardens with an African rhinoceros. It was the first rhinoceros brought to Europe since the days of the Roman amphitheatre.

'Another animal which is also getting very scarce is the giraffe. They are caught by the natives, who hunt for them on speedy Abyssinian ponies. When they come across a herd of giraffes they drive them forward as fast as they can, at such a pace that it is impossible for the young ones to keep up with the mothers. When the little ones are exhausted they are caught, halters are fastened round their heads, and they are taken to the camp. They are principally fed on goats' milk, corn, and various kinds of plants. It would be practically impossible to secure an adult giraffe. If you did manage to capture one, I doubt whether you could hold it. It is the same with most adult wild animals. Although you might surround them you cannot hold them, for the moment you attempt to do so they commence struggling, and in their efforts to get loose only strangle themselves. This is why we have to take the young ones. You may be surprised to learn that between the years 1880 and 1900 only three giraffes were imported into Europe, two coming from South Africa and the other from Senegal. This was principally owing to the wars in the Egyptian Soudan. Recently I have imported quite a number, though the venture has been rather a costly one. For instance, this year, out of six giraffes which were sent to us from the interior of Nubia, only one arrived alive. The remainder all

died on the way. Last year out of eight only two reached Hamburg.

'Zebras are caught by driving a herd into a corral, just as they do elephants in India. How plentiful these animals are in some parts of Africa may be gathered from the fact that at a recent drive which my traveller organised in German East Africa fully four hundred zebras and a number of antelopes were surrounded. As the corral was not large enough to take such a number, the greater portion were allowed to escape. Finally, eighty-five zebras and fifteen antelopes were secured. Snakes are caught in various ways. Those of the boa-constrictor type are captured by the natives of India and South America by means of trap-nooses. The smaller varieties are often taken in nets, into which they are driven by setting fire to the grass where they are known to be in hiding.

The various species of Siberian deer, of which Mr Hagenbeck has imported a large number, are taken when young. A herd is driven by the natives into deep snow, in which the young ones sink and are unable to extricate themselves.

The catching of these animals and transporting them to Europe entails more labour and patience than the general public imagine. When the Russian traveller Prjevalsky startled the zoological world a few years ago by the announcement that he had seen in the deserts of Sungaria, in Central Asia, a new species of wild horse, Mr Hagenbeck decided to secure some, and an expedition was at once organised. His travellers penetrated to the northern border of the Gobi Desert, where they found themselves in the land of the Kirghiz, a tribe noted for its horses and expert horsemanship. Engaging the services of nearly two thousand Kirghiz horsemen, and taking with them fifty brood-mares in foal, the collectors sought the desert home of the wild horse. After a series of exciting adventures, the travellers succeeded in capturing fifty-two young colts of the wild horse species. They were nourished by the domesticated mares that had been taken with the expedition for that purpose, and after a proper interval the homeward journey was begun. It took three months for the caravan to reach the Siberian Railway and depart for Hamburg. During the journey twenty-eight of the wild colts succumbed, and only twenty-four reached Hamburg alive. The expedition was in the field nearly eighteen months, and its expenses totalled some ten thousand pounds.

Naturally, a man who has been constantly handling all kinds of wild beasts for close upon half a century has had a few exciting moments. Mr Hagenbeck's elephants particularly have given him a few anxious moments from time to time.

'I was once laid up for three months,' he said,
'through the bruises I received from an old circus
elephant. On another occasion a freshly imported
troop of elephants ran away in Vienna. I was upon
one of them myself, the others all hugging close to
him. I lost my elephant-guiding hook, but I stopped
him by biting his ear with my teeth, when all the

others, which were closely bunched round him, stopped with him. Once I got six elephants, as I thought, all safely tethered by a rope in a railway car, but the rope broke, and there was I with six loose elephants boxed up in a closed car. When I got out I was uninjured. Another time a big African elephant got frightened at the railway station at Hamburg, and ran away with me; but I held fast to his ears, and finally brought him back to the stable. Again, I was packing animals away in a large packing-case, and was standing with my back to a six-foot tusker-elephant. This animal had been badly treated, but I was unaware of it. All at once the elephant made a rush at me, and literally pinned me to the packing-case. One tusk grazed me on my right side; the other grazed my left. My clothes were cut, and the skin on both my sides was grazed. Finally, I fell down, and escaped in a miraculous manner.

'In Suez, some years ago, a full-grown giraffe ran away with me. The rope I held him by got entangled round my arm, and I could not get free. I was dragged along the streets and fearfully banged about. When I at length got loose I was so exhausted that I was obliged to lie down for a quarter of an hour without moving. In unloading a hippopotamus, on another occasion, the animal got loose and started after me. I ran into his den, and managed to escape through the bars at the other end just as he was upon me. What I regard as my narrowest escape occurred while I was superintending the lowering of a large alligator into a pit. Suddenly, with a sweep of its tail, it knocked me right into the middle of a dozen large alligators. I jumped out in an instant, or I must assuredly have been torn to pieces.'

These adventures, too, have not been without their humorous side. Not long ago Mr Hagenbeck took a large elephant down to the docks to place it on board a steamer bound for New York. refused to go up the gangway. To assist him the captain placed forty men at his disposal. Two ropes were secured, and one fastened to each of the elephant's front legs, twenty men hanging on to each rope. They then pulled alternately, and in this way induced the giant creature to go on board. But the animal had hardly stepped on deck, when, with a quick movement of one of its feet, it sent the twenty men hanging on to that particular rope sprawling in every direction, much to the amusement of the captain and those who were watching the scene from the bridge.

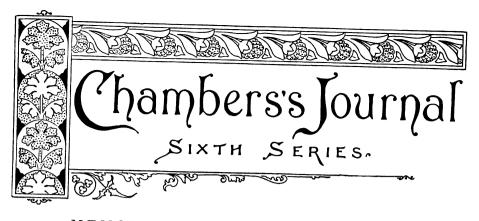

Mr Hagenbeck has been very successful in doctoring sick beasts. He narrated to me many instances of how he had purchased animals which their owners had decided to kill on account of their wounds or through disease. He secured them for a very small sum, and after having successfully treated them, sold them at the full market value. Not long ago, for instance, he procured a jaguar two years old from the proprietors of a zoo. The animal was suffering from a large and deep wound on one of its hind-

quarters. It was decided to kill the poor brute, but the dealer purchased it for three pounds fitteen shillings, the value of the skeleton. He took the animal away, fed it twice a day to get up its strength, gave it a warm bed of peat to lie down upon, washed the wound with an antiseptic, and then put oitment upon it. In ten weeks the wound was closed and the animal in the best of health and condition. It was sold to a zoological garden some weeks later for sixty-five pounds.

On another occasion Mr Hagenbeck purchased a Bengal tiger for fifteen pounds. There were no less than one hundred and fifty sores upon its body. It had undergone a sea-voyage in the middle of the winter, and had been left on deck, and the sea-water allowed to flow into its cage. The animal was placed in a darkened compartment and given a bed of peat six inches deep. It was fed twice a day, the menu being varied, consisting of beef, horseflesh, sheep, and rabbits. In less than four months all the sores had healed, and the animal had a most beautiful coat and was in the best of health and condition. It was eventually sold for seventy-five pounds.

At present Mr Hagenbeck is being much discussed in zoological circles, for he has now completed what has been the one ambition of his life-namely, the erection of a zoo after his own heart. It is, indeed, the most original garden ever conceived and carried out. Briefly, it has been erected on this plan. The animals are placed in surroundings as natural w their native haunts as is possible, and all devices such as iron bars and cages that give a prison-like appearance are almost entirely done away with For instance, Mr Hagenbeck's lions and other big cats are kept in a great open enclosure, and are separated from the public by a deep ditch which the latter cannot detect. One, therefore, looks into a den of lions from a footpath, with no iron bars, netting, or other obstruction interfering with the view. Standing at a certain spot in this wonderful zoo, the visitor can see at one time six hundred animals and birds without detecting a cage or iron bar.

The famous dealer and erecter of zoos-for one can hardly name a public zoological garden in the equipment of which he has not assisted—has received many public decorations, including the diploma De L'Officier de l'Academie Française, the French order La Croix, D'Officier de Merite Agricole, the Golden Star of the Imperial Russian Zoological and Acclimatisation Society of Moscow, besides a score of diplo mas from various scientific institutions. Standing about six feet in height, and possessing a pair of broad shoulders and a muscular frame, Mr Hagenbeck is a striking personality. If you casually met him and did not know his profession you would take him for a country gentleman, not a dealer in wild bests Mr Hagenbeck was born in Hamburg in 1844, and succeeded his father in the animal business, and is now busy writing a book on his experiences, which when published, will certainly be one of the most entertaining works of modern times.

MEMORIES OF HALF A CENTURY.

By R. C. LEHMANN, M.P.

PART VII.

parents became acquainted with Robert Browning soon after Mrs Browning's death, when the poet settled in London at 19 Warwick Crescent, and from that time forward until his death his friendship

with us never varied. My own memory of him, even in the early days, is very vivid. I can remember something of the awe with which at first I looked upon the man of whom I had been told that he was a great poet, but his extraordinary cordiality soon banished that feeling. He had the happy knack of making even a small boy feel that it gave him real pleasure to shake that small boy by the hand or to pat him on the back and talk to him about the little interests of his life. No man was ever more free from bardic pose, and, indeed, from affectation of any kind, than Browning. His dress was simple, his manner was genial, and his appearance, though he was by no means a tall man, was in the highest degree manly and impressive. His massive, noble head was splendidly set on a strong neck; his shoulders were solid, and his chest was deep, a fit generator for the resonant voice with which he held you in conversation. A vision of him standing four-square and firmly poised rises before me as I write, and I can still feel the grip of his hand and see the kind light in his eyes as he looked into mine. Then my mind's eye follows him to the dining-room table, where his special decanter of port had been set by his place, and I can hear him, 'while the great poet rolled us out his mind,' throughout the dinner. Of such dinners I have only one note written by me in a fit of (unfortunately) brief enthusiasm for the task of keeping

'17th Nov. 1887.—Dinner at home [15 Berkeley Square]: F. L. [my father], Robert Browning, H. N. Pym, Bancroft [Sir Squire], A. Shand, Sir James Hannen, R. C. L. Much good talk, though at first Hannen and Browning seemed at issue over a No. 515.—Vol. X.

question as to whether Browning had dined and spoken at the Inner or the Middle Temple on a certain occasion. Browning told us that the Waring of his poem was Alfred Domett, who was afterwards first Prime Minister of New Zealand, "a man who always impresed me," said Browning, "as capable of greater things than he achieved." Speaking with reference to the present disturbances and the calling out of special constables, Sir James Hannen told me that, at the time of the Hyde Park Riots, he, as Attorney-General's devil, attended a conference at the Home Office, at which Spencer Walpole (Home Secretary), Holt (Attorney-General), Karslake (Solicitor-General), and Disraeli himself were present, and that it was then and there decided to close the Park and prevent the meeting. He (Sir James) ventured to say that it was not by any means clear that the public had not a right to meet peaceably in the Park; but his objections were overruled, Disraeli assenting, and he was unable to make any impression on Karslake, though he argued with him up to the very doors of the House of Commons. The result everybody knows. Comyns Carr was brilliant as usual. In a reminiscent humour he afterwards mentioned a certain festive occasion, years ago, on which, in making a chaffing speech, he had spoken of M. (who was then present) as "a clown without the colour, a pantaloon without the experience, hovering midway between the cradle and the grave, not yet having lost the folly which is associated with the one, and having already anticipated the dullness which is inseparable from the other"-a remark to which M. replied in perfect good humour. Speaking of X., Carr said he had recently met him, and that X., after imbibing freely, had passed into the didactic stage, "the stage in which," Carr added, "he first lays down the law, and then falls upon it." Altogether a most cheery gathering.

gh at first I can remember how heartily Browning enjoyed to e over a these sallies. It must not be supposed, however, [All Rights Reserved.] OCTOBER 12, 1907.

that Browning was always in a state of indiscriminating good temper. I have myself seen him flash into anger at some story of meanness and wrong, and I may add an account of one of his rare explosions as related in my father's uncompleted reminiscences, from which I have previously quoted:

'The third and last quarrel [he had already related two others, one between Sir Edwin Landseer and Sir A. Cockburn, and the other between Lord Houghton and the fiery Lord Chief-Justice] was between Robert Browning, the poet, and John Forster, the well-known editor of The Examiner and biographer of Dickens. These two men had lived for years in the closest intimacy. Forster's great literary judgment, his willingness to take trouble, and his passionate desire to be consulted about all the ventures of his literary friends made him for many years a kind of Court of Appeal on all literary matters. I believe he had, during many years, prepared all Browning's and Mrs Browning's works for the press. However valuable such aid and interference may have been to Browning while he was living in Florence, it may have become irksome when Browning took up his domicile in London. Forster exercised a kind of patent-right or ownership over Browning. It was an understood thing that on Sundays Browning had to dine with Forster, and that any one wanting Browning to dinner on Sundays could only secure him after some diplomatic negotiations, of which one of the fundamental conditions was that Mr and Mrs Forster were to be invited together with Browning. Forster was kind but ponderous; Browning was nervous and sensitive, and had, no doubt, grown restive under this kind of literary bear-leading. There may have been other combustibles, but at any rate a mere nothing brought about a sudden and violent conflagration. At a dinner at 10 Kensington Palace Gardens, the house of my brother-in-law, Mr Benson, Browning and Forster began to mag at each other, and so continued for some time, till Browning spoke of the incredible neglect which had lately occurred at Marlborough House, where, when the Princess of Wales had suddenly been taken very ill, no carriage could be got for the purpose of fetching a doctor. Forster at once ridiculed the story as a foolish invention. Browning gave chapter and verse, adding that he had it from Lady ----. Forster retorted that he did not believe it a whit more on account of that authority. Suddenly Browning became very fierce, and said, "Dare to say one word in disparagement of that lady "-seizing a decanter while he spoke-"and I will pitch this bottle of claret at your head!" Forster seemed as much taken aback as the other guests. Our host, who had left the room with Sir Edwin Landseer, on his return at this moment found Browning standing up in great anger, with a decanter in his hand ready for action. He had the greatest difficulty in realising the situation. I soon made him hurry every one from the room, but all attempts to bring about an immediate apology or reconciliation were in vain.

A kind of peace was, however, patched up before Forster's death.

My budget of Browning letters begins with the following three to my father about a pony which was to have been given to me, then aged seven This kind intention was frustrated, as it appears, by the size and ferocity of the animal, which was afterwards, I believe, given to Elwin, the editor of the Quarterly:

'19 WARWICK CRESCENT, UPPER WESTBOURNE TERRACE, W. June 19, '63.

* DEAR LEHMANN,-Pen and I think we cannot do better for the pony than give him to you. He will be happier as you will treat him than if we parked him up prematurely-for he is not above six years old—during four of which Pen has ridden him. Being an entire horse, he is abundantly spirited; but your boy rides well, I am told. Of vice, or fear, or anything unpleasant to a good rider, he has not a particle.

'I know you will never put him to any other work than that to which he has been accustomed, and that if from any cause he should not suit, or become invalid, you will return him to me Consequently, at the end of next month he is your with all the heart of-Yours faithfully,

ROBERT BROWNING.

'All kind regards to Mrs Lehmann.'

'19 WARWICK CRESCERT, UPPER WESTBOURNE TERRACE, W. June 23, '63.

'MY DEAR LEHMANN, -It will be best for you to have the pony at once. Robert is far too heavy for him, and you may just as well take him at his best and while fine weather lasts. You can there fore send for him on the earliest day convenient to you—the sooner the better, since a parting must be!

'The more I see of you, the greater delight to me, be certain. Next two Saturdays, however, we are engaged. I shall remember, however, where I may go so pleasantly, and meantime we'll talk about it ere long.—Ever yours most truly,

> '19 WARWICK CRESCENT, UPPER WESTBOURNE TERRACE, W. June 25, '63.

'MY DEAR LEHMANN, - You are quite right. 10 tell you the truth, I don't know by what stopid misconception I had got into my head that your boy was some four years older. The pony has always been abundantly spirited even with Robert's weight and required his strength, unless more steadily worked than was the case of late. I would not have had an accident spoil Rudie's pleasure for the world.—Ever yours faithfully, ROBERT BROWNING

^{*}I have to thank my old friend 'Pen,' Mr R. Barrett Browning, for permission to publish here these letters from his father.

The next letter to my father, a delightful example of Browning's friendly gift of hyperbole, has already appeared in Mr C. L. Graves's Life of Sir George Grove. My father was not himself at that time a member of the Athenæum, but became one a good many years later. My own sponsors at that club were Browning and Lord Houghton, but both had died before I came up for election in 1890:

> '19 WARWICK CRESCENT, W. Feb. 24, '71.

'My DEAR LEHMANN,-I wish I could fairly promise to oblige you by voting for Mr Grove, as your friend; but it happens that I simply oblige myself in so doing, and that I have already signed his certificate in the rooms as earnest of my purpose to do all in my power on Monday next. You must, in justice to the extreme desire I cannot help feeling to make you some slight attempt at return for the manifold kindness you have shown myself-you must tax your ingenuity to pick out, among your acquaintances, some really unpleasant and ineligible person; you will have difficulty enough, I knowbut find him, and, for your sake, be assured he shall have the vote of -Yours ever truly.

'ROBERT BROWNING.'

The next two letters are to my mother:

'19 WARWICK CRESCENT, W. Dec. 16, '73.

'Dear Mrs Lehmann,—Nothing would give me so much pleasure as forgetting sad old Christmas Days in your house, where sadness never yet came to me; but we have an engagement to receive that day, our very selves, a "lone woman" friend, now abroad, with whom it is impossible to make another arrangement. My sister feels your kindness deeply, and bids me return you the truest thanks that ever were. Pen also, who would be so happy to join your party, is only able to be abundantly grateful along with-Ever affectionately yours,

'ROBERT BROWNING.'

'19 WARWICK CRESCRET, W. Feb. 22, '83.

'DEAR MRS LEHMANN,-When I say that I am already engaged for the 28th I might leave off, so unnecessary is it to add another word about the vexation. I feel that it should be so. Do give me a second chance—have you an afternoon as of old?

I am now a hunger and thirst to see you again, and your Husband, who was so dear and kind to go and see Pen at Dinant, and all of you-such friends as you always have been and will be to yours affectionately ever. ROBERT BROWNING.

The next two are again to my father. He had in 1876 bought one of 'Pen' Browning's first pictures. Robert Browning's feelings on that occasion were expressed in a delightful and characteristic letter, which was printed in the Cornhill Magazine of April 1892:

'29 DE VERE GARDENS, W. Nov. 8. *87.

"MY DEAR LEHMANN,-I have been troubled of late with a cough which made it as necessary for my friends' sake as my own that I should stay at home of an evening; but the sight of you againand, it may be, of Mrs Lehmann-is an altogether irresistible temptation, and I joyfully yield to it, accepting your kind invitation for the 17th with all my heart. Yes, Pen was immediately informed of the exceeding goodness in the matter of the present. He acknowledged it in a letter from Venice. which I hope reached Mrs Lehmann, and on arriving here last Saturday week, he was able himself to appreciate the very beautiful clock. . . .

'With true love to Mrs Lehmann, keep me ever in mind as you have hitherto done, and believe me most affectionately yours, ROBERT BROWNING.'

> '29 DE VERE GARDENS. April 2, '89.

'My DEAR LEHMANN,-I am bound to inform you-Pen's very earliest patron-that in case you pass this way any day in the course of the week, Pen's portrait of myself will be on view. Don't be at any trouble, as you may see it at the Grosvenor. but I could not leave you unapprised that the picture may be seen. With all regards to Mrs

On the 31st December of this year my father and I were present when the great poet who had been our friend was borne to his place in Westminster Abbey, while the choir sang Sir Frederick Bridge's beautiful setting of Mrs Browning's poem, 'He giveth His beloved sleep.'

ROMANCE OF A FLOATING DOCK.

CHAPTER XIL

HE house of the Velasquez family in Garapatas is a square building of two lofty stories. It stands close on the street. The windows on the ground floor are few and small, and are protected by thick iron bars.

But the upper windows are many and large, and have shaded balconies, with flowers trailing over their

The entrance is by an archway which parapets. leads into the patio, the unroofed inner court surrounded by open corridors on both floors. The ground floor, used as a storehouse, is generally half-filled with sacks of maize or coffee and bales of tobacco, and sweet, heavy odours from it float in the warm air. In the corridor at the farther side of the patio a broad stone staircase

leads to the upper story, which is the family dwelling house. A dark, cool room, entered by a door in the thick wall of the archway, is the office.

The high doors of the archway were shut for the night when Sandford and Carmen Velasquez reached it, and the house was quite dark except for a light in one of the balconied windows above. They stood still in the deep shadow. She was now dreadfully tired, and in the relief of her arrival at home she leaned slightly against him and began to sob hysterically. He stood steadily, though his heart was beating fast, and in a moment or two she controlled herself.

'We must knock,' she whispered. 'If only mamma or Teresa could hear!' She glanced up at the lighted window. 'I don't think they have all gone to bed. If we have to wake up the porter we shall rouse the whole street first.' She laughed a feeble little laugh.

They heard a step on the pavement, and a man wrapped in a zarape passed under the electric lamp at the corner and came slowly along on the opposite side of the street. As he got out of the circle of light they could only hear his footsteps. Thev both stood quite still in the shadow of the archway till he should pass. Sandford knew that it would deeply compromise the girl to be found alone in the street at night with a man, no matter what the circumstances, and he wished her to get into the house without being seen. But the man stopped in front of the house, and stood where the light from the upper window shone on him across the street. They could see him, and see that he looked at that window, not attempting to conceal himself, but rather appearing to court the chance of being seen from it. The window was directly over where they stood. The man threw back his zarape, and they saw that he held some large object in his arm. Immediately his purpose became plain. They saw his right hand move and heard the tinkle of a guitar. He had come to serenade some one in the house. He struck a few chords, played over a pretty air with some skill, and then began to sing. At the first words the girl whispered close to Sandford's ear, 'It is Don Diego Lopez.' In a good baritone, accompanying himself on the guitar, he sang:

> 'The dusky swallows will return To hang their nests upon your eaves, To twitter at your window-panes, And dart among the whispering leaves. But those that paused upon the wing To hear my love told o'er and o'er And see your dear averted face, Those will return again no more.'

As he paused there was a slight sound at the window. A blind was cautiously moved. Then a voice said, 'Carramba! That insolent one! But he does not sing badly.' And there was a laugh.

The singer heard the voice, but he could not have made out the words. He continued to sing:

The honeysuckle will return To climb upon your garden walls; Its buds, as lovely as before, Will open when the evening falls. But those on which I saw the dew Hang trembling, like the gems you wore, To fall like tear-drops of the day, Those will return again no more.'

'It is Teresa who is at the window,' whispered the girl. 'If I could make her hear me she would come down and open the door. Perhaps it would be better to wait till he has gone. Oh, but then perhaps she will be gone too. I must risk it.'

Don Diego went on, putting more passion into his voice as he proceeded:

> O let my burning words of love Pour all their passion in your ear! O let your too-long slumbering heart At last, at last awake to hear! For, true in faith to you alone, As Heaven itself I do adore! As I love, ah! believe, believe, You shall be loved again no more.

As the singer prolonged the last notes with a dying fall, the girl whispered, 'Teresa!' But Teresa did not hear. Again and louder she spoke: 'Teresa! Teresa! It is I, Carmen.'

'Valgame Dios!' ('God guard me!') they heard the old woman exclaim under her breath.

'I am here at the door. Come down quickly and open. Do not alarm anybody. Oh, come down quickly!'

'Jesu Christo! It is truly the senorita!' The old woman hurried from the window.

Meantime Don Diego across the way had heard the voices, although he could not make out the He had fondly imagined that the figure at the window which had slightly opened the blind was Carmen, and that she had listened to his song He was amazed to hear the voice below. There must be some one at the door in the dark. He saw the blind close and a shadow spread over it and disappear. He slipped backwards into the darkness, at the same time slinging the guitar round to his back, and watched the doorway. A hot surge of shame and fury rushed over him. Had the girl been laughing at him? And was there some rival at the door with whom she had whispered? The primitive instincts of the animal are very near the surface with the Moyocuileno, and Diego's hand went quickly to his knife.

In a moment the door was opened.

'Ave Maria Purisima!' gasped the old woman subduing her voice with instinctive discretion 'Is it you, señorita?'

'Yes, Teresa. Let us come in quickly.

They entered, and Teresa, mindful of the serenader across the way, shut and fastened the

Don Diego could not see very well. He only knew that some one had been admitted stealthill. He crossed over softly and came near the door. Within, Carmen leaned panting on Teresa's shoulder for a moment. Then she raised her head.

'You must get the señor some food quickly, Teresa,' she said. 'And then he must see mamma. And oh, Teresa, I am tired!'—She turned with a smile to Sandford. 'You will come up and see mamma, señor?—Has she gone to bed, Teresa? Well, we must waken her.' Sandford shook his head. The girl misunderstood him. 'Quick, Teresa,' she cried. 'You must get some food for the señor, and some coffee. Light the fire. And then you will prepare a room.'—She turned again to Sandford. 'I was thoughtless. You will see mamma in the morning after you have rested. Now, come and sit down.'

But Sandford would not, 'Señorita,' he said, 'you too are tired. My lodging is but a short way off. You will pardon me. I would rather go there. And to-morrow I hope to hear that you have not suffered.'

He bowed and turned to the door. Teresa went to open it. Carmen seemed for a moment about to remonstrate with him. Then she checked herself. But she took some steps forward and held out her band.

'Then you will come to see mamma to-morrow after you have rested?'

He did not reply, but he took her outstretched hand, and on an impulse he could not resist, bent and kissed it. Teresa looked her amazement, and a dark flush covered Carmen's face. As he went out she swayed with fatigue, and Teresa ran quickly from behind the door and put her arms round the girl.

Sandford, without looking round, turned to walk to Doña Concha's. But as the door shut Diego Lopez sprang behind the Englishman, threw his zarape over the latter's head, and with lightning rapidity and tremendous force drove his knife into Sandford's back. Sandford fell heavily forward on the pavement without a groan, and his assailant fled away quickly along the street.

CHAPTER XIII.

HEN Don Santiago gave up hope of finding his daughter alive, he was already nearly as far down the river as the island on which Sandford and Carmen had passed the night. Nobody remembered the Indian fisherman's bongo, or doubted that the two young people were drowned, and their bodies, if not taken by the alligators, carried by the rapidly rising flood away down-stream many miles. Don Santiago, however, would not give up the search. He relinquished it for the moment to return to it better equipped.

'My friends,' he said to the men in the boat, 'we can do no more here to-day. I know you are tired, but you will not fail me. We shall put the lantern in the bow, and the man who knows the river best will go there and look out. We shall row straight down. As soon as we get into the Mariposas we shall have a clear course. We shall be at Garapatas before morning. Then there will be five dollars for each of you, and as much sleep as you like.

'Many thanks, señor,' and 'A million thanks, señor,' said the men with enthusiasm.

'At Garapatas I shall get one of the Compañia's other steamers. There is now plenty of water in the river, and there will be no difficulty in getting up. Then we shall search the banks thoroughly. You will sleep on the steamer, too, and get back by her to your village.'

'Yes, señor.'

'Then a copita for each, and let us be off. You will take turns at the oars.'

The little measure of aguardiente was served round. The men obeyed readily, the canoe sped down the widening river, and Don Santiago sat aiding the lookout, and sometimes thinking how he was to tell his wife. They arrived before dawn.

The boats at Garapatas lie moored at night by her river quay in rows many deep, and Don Santiago and his men tied up theirs on the outside, and made their way to the bank over this floating bridge. They walked across the grass to the silent street. The moon had risen.

'Go on to my house,' said Don Santiago to the four men.—'Juan, you know it.'

'Yes, señor.'

'Knock at the door till the porter opens. Do not make more noise than you can help, and if possible do not let them wake the señora. Go in and wait in the patio till I come. I shall not be long. I am going to rouse the manager of the Compañia, and make him get ready one of his steamers.'

The barefooted crew marched up the street, Juan carrying the lantern. Under the colonnades where the moon did not shine there were dark shadows.

But there was no colonnade before Don Santiago's fortress-like mansion, and there, lying on the pavement in the moonlight, was the body of some one half-huddled in a zarape. The men started as they came upon it, and swerved aside into the middle of the street.

'Holy Saint Joseph! a dead man!' said Juan, changing the lantern into his left hand, and crossing himself with his right. He knew the attitude was not that of a sleeper. The others also made the sign of the cross and fingered the cheap amulets, one or more of which each of them wore on his neck.

'Vamonos! Let us be gone! Let the police get him,' said Pedro; and the others repeated, 'Let us be gone!' and, with scared glances up and down the street, hurried to the door of the house.

When they had roused the porter and got admission, they told him of the accident to the steamer

and of their search on the river. But, by common consent, they said nothing of the body outside the door. The Indian is rather callous in his feelings about physical suffering or death, and a dead stranger was not of much more importance to them than a dead mule. But they had a strong motive for silence.

The law in Moyocuil, made in the revolutionary times when every second wayfarer was a brigand, permits no one to move, or even to touch, a dead or wounded person found on the highway until the authorities have been summoned and have investigated his condition, lest valuable circumstantial evidence should be tampered with or destroyed. If a wounded man, who might have been saved by timely help, should die before the proper official finds it convenient to arrive, so much the worse for him. This occasionally happens, but it is considered one of the natural risks inherent in a sublunary existence. the authorities do arrive, their first act generally is to arrest the people found nearest the scene, as the most probable authors of the crime, or at least accessories or witnesses. These are promptly committed to jail, and kept there to await developments, and 'meantime' inquiries are prosecuted with ardour or with languor, as bribery or fear of the friends of the victim or of the culprit may prevail. And if innocent and unwilling witnesses can invoke neither the cupidity nor the terror of the officers of the law, they remain in the jail, a single, unfurnished, windowless cellar, lighted and ventilated only by the grating in the door, filthy and noisome, and shared by innocent and guilty, rude and refined, without distinction. People of decent, not to say delicate, life generally prefer death.

The men who had seen Sandford's body were justly afraid of getting entangled, however inno-

cently, with the law.

Don Santiago, having roused the local manager of the Compania de Navigacion, told him of the accident to the Vigilancia, and persuaded him, by a bribe for himself and an extortionate charge for his company, to let Don Santiago have the use of their remaining steamer, the Cristina, due to sail at nine for Arenas, on the understanding that she should also engage in the salvage of the Vigilancia. This arranged, he hurried towards his house.

In his haste he nearly stumbled over the body on the pavement. The upper part was covered by the gay-coloured Indian blanket, but he instantly noticed that the lower was dressed in European riding breeches and boots. He stooped and drew back the zarape, and was astounded to recognise the young Englishman.

He saw at once that Sandford was alive. He breathed. There was blood on the pavement and on the zarape. Don Santiago turned the unconscious body slightly over into an easier position, and placed a fold or two of the zarape under the head. He

feared to move it much without help, lest bleeding should break out afresh. Leaving it, he hurried to the house. He had to knock loudly, for the porter was listening open-mouthed to the tale of the boatmen, who squatted full of importance in the open corridor near the kitchen waiting for their coffee. As Don Santiago crossed the patio his wife, in her dressing-gown, came running downstairs to meet him.

'Oh,' she cried, seizing him in her arms, 'Carmen is safe, my dear!' It never occurred to her that good news needed to be 'broken.'

'Safe! Thank God! And she is here!'

'Yes. She says the Englishman brought her. I don't yet know how, or why, or who he is But she is well. She's all right, only awfully tired. She is asleep. But come upstairs and rest, and tell me about it all.'

'Wait,' he said. 'That Englishman, he has got hurt, I fear. He is lying outside on the pare ment. I want a mattress quickly. We must bring

him in.' 'Hurt,' she cried; 'and he must have been lying there ever since! Oh yes, I'll get a mattres;

and she turned and ran up the staircase. Don Santiago went across to the men. Ther

rose up respectfully as he came forward. 'Children,' he said, 'are they getting you some

'Yes, señor; a thousand thanks,' they answered coffee ?'

'Chucha is just boiling it, señor,' added the in chorus.

porter officiously. 'Very good. But first you will come with me and carry into the house a wounded man who is lying on the pavement outside.'

'Ye-es, señor.' But the words came with hesita tion and reluctance, and the men held back.

Pedro cleared his throat. 'Pardon us, señor,' he said; 'we saw the man as we came in. We think he is dead.'

'Not at all,' said Don Santiago; 'he is only wounded. Come along!'

But they still shrank back. 'It is dangerous,' muttered one of them, 'and'-

'Yes, it is dangerous,' the others repeated in

And the porter had to add, shaking his head wisely, 'It is very dangerous.'

'Pardon, señor,' said Pedro again, 'would it not be better to wait till the Alcalde has seen him They will put us in prison if we touch him. He is dead. It is better to know nothing.

Two women-servants who had brought the maitress downstairs were now listening with mouth

'Look here,' said Don Santiago, 'it is the English man who was in the steamer. I cannot leave him in the street.'

'The Englishman!' said one of the men, shuddering. 'The drowned man!' He had seen the overturned steamer, and had been active in the fruitless search in the river. 'The drowned one! He is in the street!' he repeated in an awestruck whisper.

'It is the drowned one!' the others said, looking at each other doubtfully.

'The man is not drowned,' said Don Santiago. 'His clothes are dry, and he is alive. And the senorita is not drowned either. She is up above with her mother.' Then he saw that he must try to turn the current of their childish minds. He knew them by long experience. Accordingly, lowering his voice, 'Yes,' he said, 'it seems a miracle. The saints have had him and my daughter in their keeping.' He took off his hat. 'Well, if you will not help, my lady and I will bring him in.' And he turned to his wife, who had returned downstairs.

Pedro stepped forward. 'It is well, señor. I will help,'

'And I also,' 'And I,' cried the rest, their minds quickly diverted.

'Come, then.'

The men took up the mattress and followed Don

Santiago. The porter unfastened the door, and they went out into the street.

Fortunately for Sandford, Don Diego's swift and powerful blow had missed its aim. Had he not thrown the zarape over his victim's head he would have struck sure and straight between the shoulderblades. But as the blanket fell over his head Sandford had made an instinctive spring aside, and the knife had passed along his ribs under his left arm. But the blanket prevented Diego from seeing exactly where he had struck. And the force of the blow was such that Sandford, already half-tottering with fatigue, was knocked violently to the ground. His head struck the edge of the pavement, and he lay stunned. He would have probably come to himself sooner than he did but for the stifling zarape. When Don Santiago uncovered his face and moved his body, the cool fresh air entering his lungs and the sharp pain in his side partially brought him to his senses.

But he still bled, and he was hardly conscious when he was lifted up from the pavement.

(To be concluded.)

THE EVOLUTION OF THE DEER-FOREST.

By C. H. SHARP.

EER-FORESTS in the Highlands of Scotland, as they are found to-day, are almost entirely the products of the last sixty years. At the beginning of the nineteenth century there was but one regular forest in

Inverness-shire, where now there are fully forty; while as late as 1871 the rental of the deer-forests on the mainland of that county was no more than twelve thousand pounds, as compared with thirtyseven thousand pounds a quarter of a century later, and a further steady appreciation has gone on during the last decade. Whether the limit that can be drawn as rent from a deer-forest or a grouse-moor has now been reached may be doubtful; but certainly during the last two seasons there has been something of the nature of a reaction that would seem to indicate this. The rapid appreciation in value of these bare hillsides and bleak glens has been one of the most amazing developments in the history of land tenure, and an account of it would read like a chapter from some novel on modern finance. A forest that could be rented annually fifty years ago for less than one hundred pounds will now bring its owner as much as twenty times that amount, while the modern lessee will find himself hedged in by estate regulations and restrictions that did not harass the earlier sportsman. Only, it must be remembered that the deerforest then was but the early prototype of the present carefully preserved and stocked range of moorland, and that it frequently had to serve as pasturage for sheep and cattle as well as for deer.

From a very early date, under the clanship régime, there were tracts of hill-ground more or less reserved for deer, and there were the strictest laws against indiscriminate poaching. The forest was not so much the private property of the chief as a kind of general larder for the behoof of the clan in straitened circumstances, and it required to be zealously protected. The fine for killing a deer was usually the same as for stealing a horse, and refractory offenders were subjected to mutilation or were even summarily put to death. It is on record that a notorious poacher in the forest of Ben Alder had first an eye thrust out, and subsequently, when that proved ineffectual, had his right arm struck off, and that even then he failed to live above suspicion, but was granted a certain amount of latitude as a moving testimony to the rest of the clan of what a breach of the forest laws might entail. The chief who had always a haunch of venison to present to a friend was deemed fortunate. In 1716 a Yorkshire company of wood-merchants bought the great pine-forests on the slopes of Cairngorm from the Duke of Gordon; and when their managers-among whom was the poet Aaron Hill-went north they were presented with a fine stag for their entertainment from the royal forest of Glenmore.

With the abolition of hereditary jurisdictions by the Act of 1747, an immediate and far-reaching change came over the social and economic conditions in the Highlands. The old sense of mutual obligation between chief and clansman was snapped for ever, and the great wave of emigration known as the Highland clearances set in. The glens and corries were turned into sheep-walks, and game began to be preserved as it never had been before. In 1776 the Earl of Fife publicly advertised his intentions, and warned off his land all with 'gun, dog, or net.' A few years later, in December 1791, a reward of three guineas was offered to informers against poachers, 'particularly during the present inclement weather.' But although ground was preserved, it was long before a system of letting A license to shoot at large was easily obtainable by any of the proprietor's friends or farm-tenants, usually with a restriction as to the vicinity of the castle or principal seat. Up till that time the deer were confined to the more inaccessible mountain-corries, and were few in number and exceedingly difficult to stalk. At the close of the eighteenth century the Earls of Huntly possessed two hundred square miles of the best deerground in the country, a tract of hill-land comprising the backbone of the Grampians, seventy miles long, stretching from Ben Avon in Banff to Ben Nevis in the west of Inverness, but none of it was preserved wholly for game. It is true, there were many herds of deer in the recesses of these hills, but all the best pasture was let out as sheepruns; and as the red deer either cannot or will not share his feeding-ground with any other animal, the herds were being confined to very narrow limits, and were in consequence diminishing in number. Few more striking instances could be quoted to show the extraordinary relation there is between Immediately the population and food-supply. sheep and cattle were excluded from these glens the number of deer increased in a very remarkable manner. At first it was supposed that they had crossed from some of the Perthshire and Aberdeen forests; and while that may have been true to some extent, there can be no doubt that the more favourable conditions for living created the increase in the numbers.

The introduction of quick-firing guns and better facilities for travelling to the north marked the transition from the older to the more modern The craze for record grousestate of matters. bags began, and deer-forests were now rented by southern sportsmen. Colonel Thornton, who spent several weeks grouse-shooting in Badenoch at the end of the eighteenth century, and used the flintlock gun, tells in his journal with pride how he had shot as many as twenty brace of grouse in a single day. Now it is a common remark among sportsmen that a grouse-moor will cost in rent alone about a sovereign for every brace of birds killed, so that the appreciation in value has been in proportion to the increase in the capacity of the moor to carry game. The most favoured arrangement at present is a deer-forest with grouse-moor attached, and fortunate is the proprietor who holds such a tract of hill and moor. A rent of two thousand pounds will not seem exorbitant for such a possession, which for agricultural purposes is possibly not

worth as many pence. When the affairs of the last Duke of Gordon became seriously involved at the beginning of last century, his trustees resolved to sell off those lands in the upper Spey valley which had been held by his family from time immemorial. With a fine dash of sentiment, in which he was a great master, the Duke requested that the mountain of Cairngorm, with its slopes, which had winnessed so many of the stirring events in the history of his noble race, might be reserved, and the request was at once respected. It was only a question of a barren and almost sterile hillside of the smallest value. To-day, however, that mountain brings in a rent beside which the return from adjacent agricultural land pales into insignificance.

Grouse and deer do not form a happy combination on the same land, but if grouse be confined to the low ground and the deer kept in the higher glens the arrangement is ideal from the sportsman's point of view, because deer-stalking and grouse-driving can then be indulged in without interruption. But there must be very little overlapping. To have grouse promiscuously through a deer-forest would prove fatal to many a day's stalking. The startled cry of a cock will alarm a whole herd very effectively, and there are few things more difficult than to get within shooting-range of a stag that has once become suspicious of danger. Even the springing of a lark with its trilling note is often sufficient to upset all the calculations of the sportsman, so that where deer-stalking is to be successful it is well to have the ground as far as practicable entirely reserved for the animals. To have the lower ground, however, moderately well stocked with grouse greatly enhances the value of the forest, if it does slightly increase the stalker's difficulties. Deer-stalking, if indulged in day after day, would call for more energy and enthusiasm than most wealthy sportsmen can command, and an occasional day among the grouse on the lower grounds lends that variety and novelty which is so essential to any full enjoyment. Moreover, deer, especially in the inland forests, are frequently not in a condition to be shot on the 12th of August, their new set of horns not being quite hardened of 'clear of velvet,' as the stalker says. But the majority of sportsmen like to reach the Highlands for the Twelfth. There is an infection in the very word, and the whole Highlands seems to be waiting nervously for the moment to arrive. The entire community, whether interested directly in sport or not, is seized by the atmosphere of expectancy, and the tension finds relief when the guns echo across the moors in the early morning of the day. To miss being out on the opening day is to lose half the pleasure of the whole season, and it is here that the little strip of attached grouse-moor adds so enormously to the value of a deer-forest.

To speak as if the creation of deer-forests was the primary cause of what is termed the Highland clearances shows a lack of historical knowledge

The immediate cause was the conversion of the hill-glens a hundred years ago into sheep-walks, together with economic changes that were inevitable in the newer state of social life that arose in the Highlands after the '45, particularly after the abolition of hereditary jurisdictions. It is true that the creation of deer-forests has done nothing to retard the exodus from the land-in many cases it has precipitated it; but the final result has been remarkable in another direction. In those districts where there are deer-forests the most prosperous village communities in the Highlands are to be found to-day, for, as a matter of fact, the deer-forest and the grouse-moor have gone far to make the Highlands the most fashionable summer resort for the time being in this country. Within the last quarter of a century in the Spey valley alone there have sprung up a dozen villages and little towns, all exceedingly prosperous and dependent almost entirely on summer visitors. Modern airy cottages and villas have supplanted everywhere the older types of dwellings, whose romantic exteriors were but poor substitutes for perfect sanitation and comfort; and if the ground proprietors have benefited by enhanced feu-duties, the general community has shared in the new prosperity. As a rule, the jerry-builder and the speculative contractor have received scant encouragement, preference as to building sites

being given to natives of the various localities. Life in these villages is very different from the lone existence in the glen crofts; it may have the appearance of being more effeminate, but it is none the less healthy, and it produces a class of virile and intelligent citizens that will compare well with any in our islands. Nor has the small farmer been left out in the general distribution of good fortune. His dwelling-house has been rebuilt or enlarged for him, and he now lets it for two or three months in the summer and autumn, and finds at his door a lucrative market for his surplus dairy produce, and in this way clears the rent of his whole farm. Considering the extraordinary communal benefits he enjoys in the way of education, roadways, and the like, his rates are very low. In one of those fortunate parishes the lessees of the deer-forests pay three shillings and fourpence for every one shilling which the farmer contributes to the local rates. Economic changes that affect large sections of a community almost invariably begin by seeming to be entirely baneful. So with the institution of deer-forests. For long they were decried bitterly, but subsequent events are demonstrating that the initial ill is likely to be forgotten and lost trace of in a new and permanent means of prosperity which is proving quite in harmony with the genius of the Highland people.

VENGEANCE IS MINE.

PART II.

T was a night which comes but rarely in Egypt, which is practically a rainless country; a night more like one in the south-west of Ireland than in the land of the Pharaohs, and in consequence the streets were abso-

lutely deserted. Overhead the lightning flashed in huge jagged forks, and ever and anon the bellow of the thunder drowned the vicious shrieking of the wind. A quarter of an hour's swift walking, and Miguel Tenorio and José arrived at the spot where they awaited their victims. Here a shell had completely gutted and partially thrown down a house at the corner of that street leading to the harbour along which the brothers O'Farrell were bound to pass. The door was gone, but on the ground floor one gaping, glassless window commanded a view of the direction from which they were approaching. The two men flung off their streaming cloaks and dashed the water from their hats; then, dragging a bench which remained in the room over to the window, sat down upon it and peered through the darkness up the street. On one knee José nursed his sand-bag, while Miguel unsheathed his knife and ran the inside of a horny thumb over edge and point. There came a tramping of heavily booted men, and the police patrol (a corporal and two privates heavily armed) passed, bending their bodies against the storm. When they had gone a hundred yards, faintly above the tumult of the elements came the sound of pistol-shots and wild shouts of 'Murder!' and the watchers saw the patrol double down the side-street, and smiled grimly at the spectacle.

The brothers had left the club intent on reaching the harbour and getting on board their steamer. Their baggage had preceded them; their hotel-bill was paid; but as they walked along they discussed whether it would be possible to get on board in such terrible weather. Eventually they decided to go on and see what it was like when they reached the seashore. From the dark lurking-place in which they sat the assassins saw them coming.

'Curse this lightning, José!' muttered Miguel. 'There's a deal too much of it. It's as light as day.'

'Que importa?' ('What matter?') answered the impassive ruffian. 'There's all the more light to kill them by.'

By this time the brothers were approaching, and Miguel whispered, 'It is the one on the outside that I will take—the one in the coat. Strike you heavily, José, at the man in the cloak.'

'Si, si, patron,' answered the latter.

As the O'Farrells reached the door Jack was a

little in advance of Jim. Miguel, crouched in the doorway close against the jamb, had Jose immediately behind him; both wore alpargatas, the ropesoled shoe of the Spanish peasant, on which a man moves silently as a ghost.

The brothers walked on, and as they did so Miguel sprang past Jim O'Farrell like a panther, brushing the latter's cloak in the act. Instinctively Jim raised the stick in his hand to strike, and in its swift upward passage the point caught under the brim of the man's hat, jerking it from his head; then came a flash of lightning, vivid, prolonged, appalling, and what Jim O'Farrell saw in that instant remained with him as a memory to his dying day. He had shouted as he had raised his stick, and Jack had turned half-round, necessitating his assailant doing the same if he wished to keep behind his victim; and, burned for ever into his brain, this is what Jim saw: his brother's blue eyes turned towards him absolutely unaware of danger, and behind him the figure of Miguel Tenorio silhouetted in that ghastly shimmer as if the limelight of a theatre had been turned upon him. Jim noted the fierce black eyes, the lowering brows, the drooping moustache, the pent-up vigour and terrible strength of the man; but, principally, that where his right ear should have been was a scarlet knob of twisted flesh. He saw a great knife flash in the baleful glare; he saw it ascend and then drive home to the hilt at the base of his brother's skull. Then there came a crash, and he also fell senseless to the ground.

The involuntary movement made by Jim O'Farrell on witnessing the murder of his brother saved his own life, as the direct blow of the sand-bag wielded by the brawny José would have crushed his skull like an eggshell had it descended in a straight line. As it was, it struck him on the side of the head, rendering him completely insensible, but the greater force of the blow descended from the head to the shoulder, breaking his collar-bone. When the two prostrate figures were found an hour afterwards the police patrol discovered that one was living, the other dead. A month in hospital put Jim O'Farrell on his legs again, but he came out a changed man. He had henceforth, he declared, one settled purpose in life, and one only: to find the man who had slain his brother.

The police, newly raised and unacquainted as yet with the criminal classes, which had been kept so well in hand subsequent to the bombardment, knew nothing of the man Jim O'Farrell described. decided to find him for himself-how, he frankly admitted that he did not know; nevertheless, such was his determination.

On the other hand, Miguel, José, and François were completely off their guard. The two former were firmly convinced that both men were dead, and being completely illiterate, could not read the newspapers. François could read, but took no interest in matters unconnected with his personal well-

being. They were also, all three, of the rare type of criminal which knows how to remain silent-José from a natural born gift in that direction, Miguel from shrewd politic determination, François from an innate cowardice and fear of detection.

Silently, relentlessly, with a purposeful force hitherto undeveloped in his character, did Jim O'Farrell search Alexandria for the man who had done him such deadly wrong. He was rich, and a huge reward offered privately stimulated the police to unwonted exertions; but though he adventured himself in disguise into the stews and purlicus of this semi-European, semi-Eastern city, never did he or his emissaries catch a sight of the man with the disfigured ear. Months passed; but, unresting unhasting, he pursued the search, until, weary and sick at heart, he was fain to confess to himself that he was beaten. One night, on returning to his hotel, he received a letter which had been left in the hall by an unknown person. It contained the following words laboriously printed on cheap, common paper:

'You seek the man who slew your brother. He has left Alexandria, but whither he has gone I know not. Did I know I would tell you, as I wish to see his body on the gallows and to know that his soul is in torment. His name is Miguel Tenorio, a FROM A WELL-WISHER Spaniard.

This epistle had been concocted by François, the reason being that he considered himself cheated in his share of the spoils of the murder. The day following that event a furious quarrel had occurred between him and Miguel, as the latter had given to him and José one hundred napoleons apiece, retaining the balance-four hundred-for himself. There is no need to enter into the details of the incident, eare to state that Miguel, blind with rage, had sworn that if ever François set foot again in La Gata Negra' his life should pay forfeit. François, know. ing of what his enemy was capable, and being a born coward, kept very carefully out of his way, but in prowling about the city one day came face to face with Jim O'Farrell. He knew him at once, and the shock to his nerves was considerable, imagining as he did that Jim had been murdered on the same night as his brother. But the man was cunning and revengeful, and instantly set on foot inquiries concerning Miguel. He discovered that the day subsequent to his last interview with that worthy he had disappeared; that he had sold 'La Gata Negra' for a small sum to his partner Lorento, the Brazilian-Portuguese; and that from that der onwards none of the frequenters of the inn had seen either him or José. François, mad with spile, had then written the anonymous letter to which reference has been made.

'A Spaniard,' the letter had said; 'his name is Miguel Tenorio; and so through the length and breadth of the Peninsula did Jim O'Farrell wander like an unquiet spirit. The lust of his rage against his brother's murderer could never be appeased, he told himself, until with his own strong hands he

had choked the dastardly life from the murderer, or had feasted his eyes upon him writhing in his death-agonies on the gallows. All his life, his strength, his intellect, went into the search which he prosecuted; but now, two years after the event, he seemed as far from success as ever. But Jim O'Farrell, an Irishman, had a strain of Celtic mysticism in his blood, and to himself he said that somewhere or somehow he would meet this man, this murderer, for whom he searched. He found himself in Madrid on the eve of a great bull-fight, and he determined to go, not from any love of the sport—which he had seen and detested—but because in so vast a concourse of people who could tell that he might not find the man he sought? Two years' journeyings in Spain had made him fluent in the language, and through his hotelkeeper he managed, by what the latter considered to be the most extraordinary good fortune, to secure a place next the barrier of the ring itself. To O'Farrell it was simply annoying, as he would have his back to the people, and it was they whom he wished to see, not the bull-fight; however, there was no other seat to be had, and he took it perforce, carrying with him a powerful pair of field-glasses.

The first bull of the day was one of the very finest of its species; but there is no intention here to set down any description of a bull-fight. Suffice it to say that the programme was gone through scrupulously; horses were disembowelled, darts were planted with an unerring accuracy into the shoulders of the bull, and when eventually came the time for the espada to do his work and slay the bull the aficionados—the cognoscenti of the bull-ring—shook their heads. 'Even Miguelito will have his work cut out with such a bull as this,' they said.

And then a door opened in the ring at the side opposite to which sat Jim O'Farrell, and the thousands of spectators rose to their feet frantic with excitement, cheering and crying, 'Miguelito! Miguelito! Viva, viva, Miguelito!' This is no place in which to discuss the ethics of the bull-ring; but if it has a redeeming feature it is in the skill and courage of the aspada, the man who, armed with a sword and a red cloth, steps out and slays the strongest and fiercest animal to be found in Europe.

'Miguelito!' roared the crowd in unison, and the man stepped daintily forward into the arena. Traditionally magnificent as is the bullfighter's costume, this man surpassed them all; his fine linen shirt was fastened with diamond buttons; his breeches and jacket were flame-coloured satin shot with gold; the very red cloth with which he was to play the bull was of the richest silk. Just above the middle height, lithe, alert, the man scemed the embodiment of strength and grace as he bowed to the roaring multitude. But Jim O'Farrell was staring at him in bewilderment. He had seen that man before, somewhere. Where? Turning as he bowed, O'Farrell saw that the man's right ear was not visible; it was hidden by a flesh-coloured shade. Then he knew.

The matador was Miguel Tenorio. He had found his man!

But the great company of spectators had roared itself into silence now, and 'Miguelito,' the darling of the public, was facing the bull. O'Farrell asked himself the question: Did he wish to see this man impaled upon its horns? No, a thousand times no; let him win, so that he, Jim O'Farrell, should get his vengeance upon him. 'Vengeance! Vengeance!' The word possessed him, as presently it should when he had laid hands upon this man.

The bull charged, and the crowd held its breath; but Mignelito shifted one pace and let the mighty animal go by. Twice, thrice, this happened, and then the sword flashed in the sunshine, sank home to the cross-hilt, and with a strangled sob the great bull rolled over dead. Three bulls did Mignelito kill that day, and the aficionados swore that never in the history of bull-fighting had such masterly strokes been given; and then it was all over.

Raging with impatience, O'Farrell found himself blocked by the gigantic throng, and it was threequarters of an hour before he could make any inquiries; then he found a police sergeant. 'Did he know what had become of Miguelito ?' 'Why, of course, señor, all the world knows that. He could not stop to kill that last bull-a poor beast-so, after all, no matter; but after the third bull he just caught the train for Cadiz, where the steamer is which sails to-morrow to take him to Marseilles. Ah, those Frenchmen! they want to see what our Miguelito' Without a word O'Farrell glared at the sergeant, turned on his heel, and ran like one possessed to the railway station. 'An Inglese,' said the latter to himself, 'and all the world knows that the Ingleses are mad.'

At the station O'Farrell found cold comfort. 'Yes, the train to Cadiz had gone; and Miguelito—yes, of course he had gone in it; a great honour to the railway company.' When was the next train to Cadiz? 'Maŭana, por la maŭana' ('To-morrow morning'). 'Yes, it is a slow train; but, God willing, it gets to Cadiz in the end. A special train? Such a thing was only heard of for Royalty, and the Minister of the Interior might grant permission; but many papers would have to be signed, and the señor would understand that on a day like this, flesta, with the offices closed,' &c.

Baffled and frenzied, O'Farrell sought a shipping office to find out concerning steamers leaving Cadiz for Marseilles; but he had to give it up. No one either would or could attend to business.

However, he had a certainty to go on; he had made no mistake. The drooping, heavy moustache was gone, but directly he had seen that ear-shield he had known his man. If he could get to Marseilles in time! But then, when he perforce came more to himself, he argued that now it was merely a matter of time; he was no longer seeking a needle in a bundle of hay, but he was following 'Miguelito' ('little Michael'), as the Spaniarda, with their love of diminutives, had christened their most famous

matador. He could no more hide than could a crowned head-nay, less so, as every man in Spain knew him by sight. That night O'Farrell ate his dinner with grim satisfaction, and 'mañana, por la mañana,' found him in the train for Cadiz. When he arrived there he found a steamer on the point of sailing for Marseilles, and discovered that owing to a delay on the line 'Miguelito' had only twenty-four hours' start of him. The steamer, an English cargo-boat of some two thousand tons, got away promptly, and the weather held fair till they passed Gibraltar, when it began to blow hard from the east; at midday it was blowing a whole gale, and the short, steep Mediterranean seas were climbing over the bows at such a rate that the engines had to be eased, and the speed of the ship came down to something like three knots an hour.

Jim O'Farrell, who had never known what it was to be seasick in his life, was smoking a pipe abaft the deck-house, and, cursing the delay, consoled himself with the reflection that the steamer in which his quarry was travelling, a smaller ship than the one he was in, would be more retarded than they. The captain, who was on the bridge, suddenly called down to the mate, who in passing had stopped to make an observation about the weather to O'Farrell, 'Come up here, Mr Macdonald. I want you to bring your glass and see if you can make out what that object is.' Macdonald bounded on to the bridge, and steadying his glass against the shelter of the weather-side, took a prolonged stare. Then he slowly said, 'That, sir, is a boat, and, if I'm not greatly mistaken, a ship's boat.'

'Steady, starboard, quartermaster,' said the captain.

'Ay, ay, sir.'

'See that boat?'

'Yes, sir.'

'Steer for it.'

'Ay, ay, sir.'

Soon the boat came close; she was pulling five oars. A man standing in the stern sheets was steering with an oar, keeping her head up to the sea; the men rowing had seen the steamer, and one took a hand from an oar and waved his cap. The steamer drew level and stopped, willing hands were waiting to get her alongside, a boat-rope was in readiness, life-buoys were handy, when a giant sea caught the boat and turned her completely over, leaving the men struggling almost alongside.

'No,' said the captain curtly, 'I daren't lower a boat and drown more men. We must do what we

can from the ship.'

'Here, Macdonald,' shouted O'Farrell, catching the end of a grass rope in his hand, 'make this fast to me and pay out-I can get to that fellow-and then haul me in again.' He pointed to a man drifting by who evidently could not swim.

'By Jove, you're a good-plucked un! Well, over you go, my hearty; I'll have you back anyway,'

answered the mate.

The steamer was stopped, and Jim O'Farrell skipped into the crest of the next sea which

came by, and in half-a-minute had the man by the collar. Overhead the sun shone brightly. O'Farrell drew the man towards him with all his strength, and as he did so saw close to his face a scarlet twisted knob where the man's ear should have been. In bitter irony he shouted aloud, 'And have I found thee, oh mine enemy!' and then he was face to face with a crisis. Here was the man whom, for two years, he had sought with the purpose of killing. Well, he could kill him now and none would be the wiser; he had but to loose his hold and the sea would swallow him up, and then vengeance would be his. Vengeance! Yes; but could he take it thus-in the bitter, blinding sea which was choking them both? Vengeance! No. by the God in that pitiless sky above, he would not let this man go! The rope tightened as Macdonald, with infinite care, hauled them towards the ship With every muscle tense and every faculty alert, O'Farrell watched and waited. They were just alongeide, when a sea flung them mercilessly against the plates, and through the inanimate form he gripped his rescuer felt the jar of the ring bolt which had caught him in the back.

They were got on board; also one other, saved by grasping a life-buoy at the end of a line as he floated by. The rest they never saw again. This man explained that in the night the steamer in which they had sailed had been sunk in a collision; he found himself, in the dark, in this boat with five others. The ship had gone down; they got clear in the boat, and drifted. That was all he knew.

It was an hour later, and O'Farrell stood beside the bed in his own cabin on which they had laid Miguel Tenorio. His back was broken, he had severe internal injuries, but he suffered no pain and was quite conscious. Face to face at last were murderer and accuser, but the sands of life were

slipping fast for the former.

'I will not lie, señor,' said Miguel. 'Yes, it was I who killed your brother-since you say that it was your brother-in the streets of Alexandria that night now more than two years ago. Por dies! but this is strange. And you saved my life! Listen! Your brother was not the only one I killed; but he, that other, got in my way—there was a woman in it; there generally is-and I felt no remore. But for the man in Alexandria-ah, that was different! Listen! Now I am Miguelito-ah! you know that—and all Spain comes to see me and to shout my name; and I am Miguelito because of the money I got that night. We cannot go back, señor, in this life; but now—now I think I had sooner be grubbing among the vines at Xeres all my life than that I should have done what I have done. Are you a Catholic, señor?' O'Farrell shook his head. 'I was once, and the padre spoke of heaven and hell. If there are such places I shall go'— The man's voice faltered. But if it be so, señor, you will ease my pains'-he shuddered like a frightened child—'if you could only say that for that most evil deed you could forgive me.

'I will go outside, and when I come back I will tell you,' answered O'Farrell.

He stepped into an adjoining cabin, and sat down. His brain was working with a singular clearness. Here at his hand was vengeance—vengeance more complete than any mere physical act of retribution could compass; vengeance on the pitiless and confessed murderer who had slain his brother for gold, and had prospered exceedingly on the fact that he had done so. What was his answer to be? For two years and more he had gone hungry for the one thing which was now completely within his grasp. The murderer had asked forgiveness to ease his passage into the unknown. Should he give it to him, or should he drink of that cup of vengeance filled to overflowing? He had no illusions. He knew quite well that though this man had committed a dastardly murder he was brave above the common; as it was, with no hope he was facing inevitable death without a whimper. But-he had killed Jack. Once again the lightning flamed in imagination around his head, he saw the knife rise and fall, and then Jack was dead. And this man had done this thing, and he asked him-him, the brother - for forgiveness! Surely it was preposterous. And yet, when Miguelito was dead, as he must be within an hour, would he (O'Farrell) be any the happier that he had sent him off as it were unshrived?

A light broke in upon the man's tortured brain and soul; it was himself of whom he was thinking—himself and the suffering that he had undergone. Now, for the first time in two years and more, let him forget self.

He rose and went in to Miguelito. One of the seamen was doing his rough best for him, and got up when he came in.

'Poor chap! Seems very bad, sir. Glad you're come, as you know his lingo.' He slipped out.

'Miguel Tenorio,' said O'Farrell, 'it has been a hard struggle, but I come back to say that as far as one human being can pardon another I freely forgive you; and I say to you as men in your country say when they speed the parting guest, "Vaya usted con Dios" ("May you go with God").'

'It is too late to speak of penitence, senor,' answered Miguel Tenorio—for the first time he raised himself and held out his hand, and O'Farrell took it—'but I say to you as say the people of my country to the host whose house they leave, "Queda usted con Dios" ("May you remain with God')." He smiled, the grasp of his hand relaxed, and he fell back upon his pillow. Miguel Tenorio had closed his account with this world.

SKENE OF RUBISLAW AND THE TOPOGRAPHY OF SCOTT.

January 4, 1826: 'Mr and Mrs Skene, my excellent friends, came to us from Edinburgh. Skene—distinguished for his attainments as a draughtsman and for his highly

gentleman-like feelings and character—is Laird of Rubislaw, near Aberdeen. Having had an elder brother, his education was somewhat neglected in early life, against which disadvantage he made a most gallant fight, exerting himself much to obtain those accomplishments which he has since possessed. Admirable in all exercises, there entered a good deal of the Cavalier into his early character. Of late he has given himself much to the study of antiquities. His wife, a most excellent person, was tenderly fond of Sophia. They bring so much old-fashioned kindness and good-humour with them, besides the recollections of other times, that they must be always welcome guests.'

It was early in 1797 that Scott first became acquainted with Skene; they were introduced to each other at the novelist's request by Edmonstone of Newton, and the friendship thus commenced was only severed by death. Writing to Lockhart, the artist said it was 'an intimacy of which I shall ever think with so much pride, a friendship so pure and cordial as to have been able to withstand all the vicissitudes of nearly forty years, without ever

having sustained even a casual chill from unkind thought or word.'

The advantages of this were that Skene had a friend who encouraged and probably directed all his efforts at self-culture and advancement, and Scott an admirer who frequently suggested or inspired incidents, chapters, and even the whole theme of certain of the romances. More than this, Skene was an illustrator and a careful topographer of the novelist; but his name is barely recognised in this connection, and the few sketches published as etchings are hardly known to the majority who eagerly seek the identity of the novelist's placenames. The accuracy of his identifications is unassailable. Not only was he an intimate friend of the writer whose literary geography he was illustrating, but this close and illuminating friendship commenced many years before the first of the wonderful romances was written, and continued until the last-Tales of my Landlord-was published in November 1831. It is to be supposed that the etchings published by Skene in 1829 did not appeal sufficiently to the public to be successful. The work, although sound in draughtsmanship, is without force or character; the scale is too minute, and the impressions uneven, presumably from the copper plates not being properly flattened. John Martin (1791-1855) the bibliographer apparently had or derived from them the idea of issuing a

work or further illustrations of the Topography of Scott, and approached Skene with a view to making use of the material accumulated. Three letters written by the artist in reply to these proposals are here published for the first time. Their interest, it will be seen, is exceptional in relation to the The literary topography in subject dealt with. some instances definitely corrects many inaccurate identifications that have persisted to the present day, and if accepted as supplementing Mr Crockett's volume, The Scott Country, will be found of great interest and much practical use:

'EDINBURGH, 27th Feby. 1831.

'SIR,—I shall be happy to answer your inquiries relative to the Waverley Novels so far as I can feel myself at liberty to communicate on that subject, as you must be aware that anticipating information which the author himself may not see fit afterwards to communicate in the edition of his works now in progress would not be justifiable on my part.

'As to St Roman .- The upper part of the Vale of Tweed comprehends all the localities possessing any reference to the tale; the town of Peebles is Marchthorn, and the old inn there that of Meg Dods. The public have so determinedly identified the village of Inverleithen and its mineral spring with the watering-place of the tale as almost to have already supplanted the name of Inverleithen by that of St Ronan; and although this is altogether without the concurrence of the author, his good humour may not improbably suffer the anticipation to pass undisturbed. On the same footing stands the presumed identity of Nidpath Castle with the ruin of St Ronan.

'Redgauntlet.—The sketches of localities which I have prepared for this tale are pretty numerous, chiefly on the Solway Firth, in Edinburgh, and in Dumfriesshire. The old mansion of Lagg is the chief scene of the story, and the romantic pass of Erickstonebrae that of the escape of "Pate in Perill." There are several other subsidiary localities well

suited for the pencil.

'I am well acquainted with the scenery of Quentin Durward, but the author himself never visited these regions. The château in the introduction I esteem one of the finest subjects in France for the pencil; and, being the property of a friend, where I have had occasion to reside, the scene is familiar to me; but as the author may not notice that identity in the notes of his tale, you will readily perceive that it would not be proper to anticipate his determination on that subject. The sketches I have set aside for this story likewise comprehend the principal subjects of Plessis les Tours, De la Marck, and the scenery of the Maes and Les Ardennes.

'The Crusaders [The Talisman] is the only tale in the whole series in which I find myself deficient, never having been in Palestine, and feeling rather fastidious as to confining my etchings to subjects which I had myself sketched from nature.

'As to the progress of my little work, I may

mention that having now completed a volume, and feeling the minuteness rather irksome to my eyes, and the confined scale of the subjects injurious to the effect (in my hands at least) as compared with the original sketches, I have been led during the present dark season to suspend my operations in that way, and I begin to be doubtful whether I shall have resolution to resume it again in summer. For these reasons, therefore, I have now no objection to make you welcome to draw upon my collection for any subjects which may be of use to your work, even of those which I had set apart for the prosecution of my own scheme.—I remain, sir, your James Skene' obedient servant,

'The edition now in progress' was that issued by Cadell, commencing with Waverley in 1830. The definite identity of Peebles as Marchthom is of great importance; even Mr Crockett in The South Country says of Innerleithen: 'Here Scott is believed to have laid the scene of St Ronan's Well.' Only in a single instance has any attempt been made to recognise the scenes of Redgauntlet. The authors visits to his old schoolfellow Robert Waldie, at Hendersyde Park, and the pleasure derived from the fine library, it is said suggested the Quaker home of Mount Sharon introduced into that romance. Quentin Durward we owe entirely to the inspiration of Skene. It was in 1822 that he visited his friend in France, and Lockhart in The Life of Sir Walter Scott thus writes of the result of his journey: 'It was perhaps some inward misgiving towards the completion of Peveril that determined Scott to break new ground in his next novel, andas he had before awakened a fresh interest by venturing on English scenery and history-try the still bolder experiment of a continental excursion. However this may have been, he was encouraged and strengthened by the return of his friend Mr Skene about this time from a tour in France, in the course of which he had kept an accurate and lively journal, and executed a vast variety of clever drawings, representing landscapes and ancient buildings such as would have been most sure to interest Scott had he been the companion of his wanderings Mr Skene's manuscript collection was placed at his disposal, and he took from one of their chapters the substance of the original introduction to Quentin Durward.'

The second letter evidently replies to a request for a list of drawings available for reproduction:

'Edinburgh, 13th March 1831

'SIR,—I subjoin a note of subjects in my collection which are at your service should you desire any of them for the novels you mention as deficient

'St Ronan's Well, vol. i. p. 7, and vol. iii. p. 88, Nidpath Castle, Fairport; vol. iii. p. 30, Meg Dods Inn; vol. i. p. 4, Vale of Tweed-a sketch I propose to take.

'Red Gauntlet, vol. i. p. 247, Lage Castle; vol. p. 252, Thrieve Castle; vol. ii. p. 5, Becksteirs, besides several other localities in Edinburgh; vol. ii. p. 251, Erickstone Brae.

'Niyel, vol. i. p. 40, p. 171, West Port; vol. i. p. 69, St Cuthbert's; vol. i. p. 192, and vol. iii. pp. 250, 258, Ear of Dionysius, Syracuse; vol. i. p. 287, Regent Murray's Tomb; vol. iii. p. 328, Dalhousie Castle.

'Monastery.—Besides the subjects I have already etched, I have different sketches of Glendearg and of the Ford at the Abbey, vol. i. p. 176.

'Kenilworth.—I have sketches of the principal subjects, with which doubtless you are provided already.

'Pirate.—Have explored the whole archipelago of Orkney and Shetland. I have a volume of drawings from which suitable scenery might be extracted.

'You will no doubt have remarked that the Antiquary is omitted in my series. This was done at the author's suggestion, as he had no individual subjects so distinctly in view as to justify their being given as localities, and he was desirous that no part of my plan should rest upon assumption or mere conjectural resemblance. The real abode of the antiquary was altogether different from the fictitious one. The other subjects of interest in the novel had no identity whatever; and without these leading scenes he did not consider the passing notices as worth depicting.

'As to the descriptive text which accompanies the subjects of each of my etchings, I considered it necessary to mention your request of being allowed to borrow from that source for the purposes of your work to Mr Cadell, who, as publisher of my illustrations, has an interest in their disposal. He informed me that, as he was at present engaged binding the stock on hand into volumes, with an additional frontispiece, for the purpose of being now advertised and disposed of in that shape, leaving the second volume to follow as soon as I may feel disposed to prepare it, he could not consent to any use being permitted of the letterpress accompaniments. As these have in general been previously submitted to the author himself, Mr Cadell conceives them to possess a stamp of authenticity which it must be proper to preserve inviolate. Of this I have no doubt you will see the propriety, and likewise of refraining from citing my authority for any information I may give on the subject of your publication.

'I have to request your acceptance of my thanks for the ten first numbers of your work; the eleventh number has not yet reached me.—I am, sir, your very obedient servant, JAMES SKENE.

'John Martin, Esq., 112 Mount St.'

All the references given are intended for the first editions of the novels named—published: St Ronan's Well, 3 vols. 8vo, December 1823; Redgauntlet, 3 vols. 8vo, June 1824; The Fortunes of Nigel, 3 vols. 8vo, May 1822; The Monastery, 3 vols. 12mo, March 1820; Kenilworth, 3 vols. 8vo, January 1821; The Pirate, 3 vols. 8vo, December 1821.

The drawings in the instance of *The Monastery* supplement the illustrations provided in Skene's volume of etchings, but the others offered picture scenes in the romances additional to those he had so issued. The descriptive text of the book that the writer of the letter so carefully safeguards was essential to the reproduction of the illustrations. In each instance the existing building or place is depicted, and the letterpress explains their identity with the scene of the novel. The value of these identifications can be estimated by this passage from the 'Preliminary Notice:'

'The Editor has the pleasure also to know that the task which he undertakes coincides with the wishes of Sir Walter Scott, who is desirous that the illustrations of the pencil may be added to those of description, to render as intelligible as possible the localities on which his fictitious narratives have been founded; and this circumstance ensures the most perfect authenticity to the corresponding relations between the real existing scenes and their introduction into the Waverley Novels.'

Skene, however, did more than 'illustrate descriptions'—he depicts and identifies places that the most careful student of the text could probably not recognise without his aid. The most noticeable of these are:

Guy Mannering.—'Ellangowan is Caerlaverock.
"Tod Willie."—The scene of this character's foxhunt is "a sketch taken in 1804 among the wild
pasture glens of Roxburgh and Dumfriesshire."'

Old Mortality.—'Tillietudlem is Craignethan Castle. This plate is offered, not as the actual original of the imaginary Tillietudlem, the centre of so many of the more striking incidents of the tale; for that mansion was the fine creation of fancy.'

Legend of Montrose.— 'Ardenvohr is Dunstaffnage Castle.'

Monastery.—'Coomsley Towers [Colmslie?] is Glendarg' [Glendearg?].

Bride of Lammermoor.—'The Ravenswood Castle of the tale is more beholden to fancy than to any appropriation from reality; nevertheless, the fine old mansion of Wintoun House was, so far as suitable, made subservient to the author's purpose. Wolf's Crag is Fast Castle. Wolf's Hope is Eyemouth. The Kelpie's Flow is the Links of Eyemouth.'

The third letter has not the same topographical value, but is not without interest:

'EDINBURGH, 22nd March 1831.

'SIR,—I send you the drawings specified in your letter of the 18th as those you want. I have by some accident mislaid my drawing of Dalhousie Castle, which prevents its being sent by this opportunity. There are seven in number, consisting of Nidpath Castle and the Inn from St Ronan's, Lagg Castle for Redgauntlet, along with two drawings of the interior of a fine old Scottish hall, such as I think will suit your purpose well. For Nigel there is the West Port and old St Cuthbert's. If you

should put these into the engraver's hands, be so good as to recommend their being kept clean.

'I should not think that Mr Cadell's prohibition is meant to extend to an occasional quotation, which I agree with you in thinking could not do any harm to my volume. I have no disposition to be fastidious in these matters, and shall ask Mr Cadell's consent to the extent you mention the first time I see him.

'If you should have any intentions of being in this part of the world in summer, I shall be glad to have an opportunity of showing you the contents of some of my portfolios of drawings; they are chiefly foreign, in most of the countries in Europe; and having, in several instances, had a distinct object of pursuit in collecting them, they comprise several pretty complete series of drawings of particular subjects, so that they might perhaps be made available to some more useful purpose than they at present serve in my repositories.

'As I have generally been in the practice of using a large scale in drawing from nature I have found my hand much confined by the diminutive size of the small matters I have sent you, which were prepared as copies for my etchings. -I am, sir, your JAMES SKENE. obedient servant,

'John Martin, Esq., Mount Street.'

The work for which Martin sought this information was published a little more than six months after the date of this last letter. Its title reads: Landscape Illustrations of the Waverley Novels, with Descriptions of the Views. London: Charles Tilt, Fleet Street, 1832. 2 vols. 4to: vol. i. Waverley to Legend of Montrose; vol. ii. Ivanhoe to Woodstock.

John Martin is not directly identified with the work, although presumably he was responsible for the text; but his indebtedness to Skene is amply acknowledged in the 'Advertisement' (Preface):

'The proprietors would be doing a great injustice if they did not take the opportunity of returning their best thanks to James Skene, Esq., for the valuable assistance he has afforded them, and for the liberal use he permitted to be made of his etchings-a volume the possession of which is necessary to every illustrator of the novels of the Author of Waverley.'

A sufficient acknowledgment surely, and obviously too laudatory when it is noticed that the few etchings they reproduce are without exception redrawn. The necessity for this was occasioned by the too minute character of Skene's work. Difficulties of copyright would also be overcome, and infinitely better results were of course obtained from the pencils of David Roberts, G. Cattermole, P. De Wint, W. Daniell, A. Nasmyth, S. Prout, and others, to whom this work was entrusted.

The volumes contain in all eighty plates, of which thirty only are derived from Skene's etchings or some of his drawings referred to in his letters. Of the rest of his sketches-and they must have been very numerous-there is apparently no further trace. The Album of Scottish Scenery, published by T. J.

Allman (1860?), merely reproduced some of the plates issued in Tilt's volumes, and none of the drawings were shown at the Scott Exhibition held in Edinburgh (1871). Probably they are still in existence, and some day will become the principal feature of an exhaustive volume on the topography of Sir Walter Scott's writings, a volume that is much wanted, and for which no better contemporary illustrator could be found than his intimate friend Skene of Rubislaw.

HAUNTED.

WHY should I fear your unseen, silent feet, If they should haunt the dark and solemn night, When once their echo, sounding through a dream, Would win a day's delight?

Why should I fear if, from the silence round, Some tender word should fall upon my ear; Or dread the lingering touch of shadowy hands Which once I held so dear?

Beyond these western hills, Ambition's voice Lured you to play a finer, grander part; Far off you lived, an exile from my life, But never from my heart.

Fierce was the fight that claimed your fiery soul, And long the hours you waited for release, Before slow-fading stars announced the dawn, And brought eternal peace.

Now you sleep sound, the lust of combat slain, While other leaders march your men to war; No mortal eye has seen your shadowy form Stir 'neath the midnight star.

No blatant trumpet rousing men to strife Has brought your restless soul from that far land; If your stern spirit has recrossed the gulf, 'Tis not at war's command.

No ghostly form has ever yet appeared To those who follow now where once you led; They see no rider with uplifted sword Returning from the dead.

Ambition here claimed all your stormy soul, Wide as the world our lives' divided track; But from the grim and unseen borderland It cannot call you back.

On that dread night I know, beneath the stars-Death standing by, his hand upon the key, Time measured only by the loud-voiced guns-Your thoughts swept back to me.

And I am sure that, in this world below, The power alone is mine to break your rest; Because beyond this life I still remain The woman you loved best.

So, if your soundless feet should follow mine Across the moor some lonely, silent night, I shall not fear; because I shall be sure AUTHOR OF 'MISS MOLLY.' You've not forgotten quite.

SOME OLD GHOST-STORIES.

By J. A. MACCULLOCH.

INCE the Society for Psychical Research came into existence it has been occupied in sifting and weighing the evidence for many things which belong to what we may call the x region of phenomena. Thou-

sands of strange occurrences which have happened within the knowledge and experience of living persons have been made the subject of strict inquiry; witnesses have been subjected to stiff cross-examination; and, after all doubtful cases have been rejected, enough evidence remains to make more than probable the reality of these alleged phenomena. And, wherever possible, efforts have been made to reproduce these phenomena experimentally. The result has been that such things as clairvoyance, telepathy, phantasmal appearances of the living à distance, and of the dying or dead coincidentally with the time of death, have been proved to be realities. They have been investigated by scientific men accustomed to weigh evidence, and they have found in them something more than superstitious nonsense. Other scientists, agreeing that there are many cases where fraud is out of the question, yet put them all down to hallucination. That is far from explaining everything; but, even if it did, it still remains to be shown why so many people, absolutely unknown to each other, not in bad health, and not given to be hallucinated, should yet all be hallucinated precisely in the same way.

Whether we call these phenomena hallucinations or realities, the Psychical Society has proved to the hilt that thousands of living persons, neither fools nor fanatics, have experienced them. But while it has been occupied with present-day cases and modern instances, it has largely neglected the mass of evidence dating from very early times, and proving that just such things were experienced or believed possible in those days. Whether the evidence is true or false is of no account; what is interesting is that it runs on precisely the same lines as the evidence which in our own time has been proved to be true. Apart from the names, telepathy and clairvoyance were

as common a thousand years ago as they are now; phantasmal appearances à distance of the living, as well as of the dying coincidental with the time of their dissolution, occurred then as they do now; and indeed all the phenomena of the modern ghoststory could be reproduced from these old-world tales. Are these stories true? Why should people -ancient Romans, medieval saints, and level-headed modern Englishmen-all see a ghost in precisely the same way? These are questions for the psychical researchers to answer. We only note here that the evidence is in many cases first-hand, and so far commands attention.

I shall now cite some of those ancient stories which bear so much likeness in the smallest details to our present-day cases.

In Mr Gurney's Phantasms of the Living and in Mr Myers's Human Personality several instances of problems solved in dreams or in sleep are given. There is nothing very mysterious here; the subconscious or subliminal self was presumably in possession of the facts, forgotten by or perhaps actually unknown to the ordinary 'self.' When that went to sleep the other self had its innings; it knew how the sleeping self had bothered over the affair and taxed memory in vain. It handed over its knowledge by means of a dream, and, lo! when the sleeper woke the problem was solved or the forgotten details came back with a rush of memory. But in one or two cases the dream which conveyed the knowledge took a highly dramatic and realistic form. To these some of our older instances bear the most remarkable likeness. A friend of Descartes fell asleep one night after vainly endeavouring to understand the meaning of a passage in a Greek poet. He dreamed that he was carried to Stockholm (he lived at Dijon), and taken to the library there, where he opened a book and read some Greek verses the sense of which at once explained the difficulty which had so puzzled him in his waking hours. He awoke and wrote down the verses he had read. Next day he wrote to Descartes, and begged him to go to suchand-such a place in the library, and see whether the

No. 516.-Vol. X.

OCTOBER 19, 1907.

book was there, and whether it contained the verses in question. Descartes did so, and found everything as his friend had dreamed. This is uncommonly like some cases of 'travelling clairvoyance,' but it may simply mean that the dreamer had once been in Stockholm, and had seen the book on the shelf. He may have opened it and seen unconsciously the verses dreamed of, or they may have been known to him already.

Several authentic cases of prophetic dreams are known to the society. Here are two from an olden time: Grotius relates that a man who knew not a word of Greek heard a voice say certain words to him while asleep. These he immediately wrote down in French characters on awaking; they appeared meaningless. He took the paper to M. Saumaise, who at once saw they formed a Greek sentence, the meaning of which was: 'Look to yourself; don't you perceive the death which menaces you?' In terror, the man returned no more to his house-fortunately for himself, as it fell to the ground next night. The other case dates from the ninth century. Cæsar Bardas was the principal agent in deposing Ignatius, patriarch of Soon after, he dreamed that, Constantinople. being in the church of St Sophia, he saw St Peter seated on a throne before which he himself knelt. St Ignatius was also present, and demanded of the Keeper of the Keys that justice which had been denied him on earth. St Peter made a sign to one of his servants, and bade him cut Bardas in pieces-which he instantly did. Next year Bardas was suspected by the Emperor Michael of treason. Two men were sent to his tent to slay him. In vain he begged for mercy; they drew him forth, killed him, and then hacked his body in pieces. The chief event in this dream actually came true. Was it an actual prophecy, or did the guilty conscience of Bardas haunt his sleeping hours and torment him with the death he feared-a kind of violent death all too common in that violent age?

These may serve to introduce some actual 'ghost'stories. Take, first, phantasmal appearances of the living. These are usually explained by telepathy; the subconscious self of the seer is affected by the subconscious self of his friend à distance. Sometimes he is only made vaguely uncomfortable or is obsessed by the thought of his friend; sometimes the impression, as it were, actualises itself, and he sees a hallucinatory image of his friend or hears his voice. St Augustine tells a story of a man who saw a philosopher of his acquaintance enter his house, and then explain to him some passages of Plato which he had refused to explain some time previously. This was probably a waking dream; such phantasms of the living are often, though not always, seen by the percipient when on the borderland between sleep and waking. He spoke to the philosopher about the matter when he next saw him, and received the reply, 'I did not give you the explanation, but I dreamed that I gave it.' Another case reported by St Augustine concerns himself, and

links itself on to the dream-solutions already discussed. His friend Ennodius was much perturbed about the meaning of a passage in Cicero which he had to explain to his scholars next day. During the night St Augustine, who was then at Milan, asleep in bed, appeared to him and solved the difficulty. The saint reasons on this, and comes to the conclusion that the phantasm of the living or of the dead may appear to others without its owner being aware of its excursion. That, in effect, is what Myers and Gurney deduce from similar modern phantasmal appearances of the living to friends, when the persons whose phantasms were seen were not even thinking of the percipients in question. In other words, the action of the subconscious self is not always known to the self above the threshold of consciousness. There is also the historic case of the appearance of Meletius, Bishop of Antioch, in a dream to Theodosius, investing him with the imperial mantle and diadem. Theodosius only knew Meletius by reputation, but so vivid was the impression made upon him that he was able to single Meletius out of all the bishops assembled at Constantinople soon after for a great Church Council. In all these cases the action of the one subconscious self on the other may be compared to that of wireless telegraphy; but the self of ordinary experience is not always made aware of what is going on.

The number of phantasmal appearances coincidental with death related by ancient authors is legion. Here is one of comparatively modern date, curiously like some discussed by Mr Gurney. It was told by the percipient, Baron de Coussey, to Dom Calmet, who published it in 1751. The baron was sleeping at a town more than sixty leagues from the place where his mother resided. During the night he was awakened by the barking of his dog and at the same time he saw the head of his mother, surrounded by a brilliant light, coming in at the window. She spoke to him distinctly on seven matters of business. But that very night she died in the distant town. D'Aubigné gives another case which happened to the queen of Henri IV. She was in bed, talking to the King of Navarre, the Arthbishop of Lyons, and other persons of quality, when suddenly, with a violent motion, she called them to her help, and pointed to the figure of the Cardinal standing at the foot of the bed. None of the others saw him; but the King of Navarre sent one of his gentlemen to the Cardinal's lodging, and found that he had expired at the very moment when the queen saw the phantasm. An early case from Cicero partakes more of the orthodox ghost story, but it also has some likeness to one or two similar authentic stories in our own time. Two friends were travelling together. One of them put up at an inn in the town of Megæra; the other lodged with a friend, and during the night dreamed that his fellow-traveller appeared to him, begging his help, as the host was intending to kill the former. awoke, but fell asleep again. Once more his friend appeared, saying it was now too late; the host had murdered him, and had placed his body in a cart, covering it with straw; but he must watch for that cart as he left the city next day. Struck by this second dream, he went to the city gate, found a cart there, and asked the driver what was under the straw. The driver took to his heels, but underneath the straw was the body of his friend. Mine host was arrested and put to death.

Less startling, perhaps more authentic, are the appearances of St Ambrose on the night of his death to several catechumens, who pointed him out to their friends. But these, says Paulinus, who reports the matter, could not see him because their eyes were not pure. Ambrose also appeared to several Eastern saints at the same time. They wrote to Milan, and when the times were compared, the day of the death and that of the appearance were found to correspond. St Antony saw in broad daylight the phantasm of St Ammon, who 'was carried that moment to heaven by choirs of angels'in other words, had just died. St Sulpicius had a similar vision of St Martin of Tours while asleep; but when he ran to grasp the saint's knees he mounted heavenwards. Sulpicius awoke, and immediately after two monks came announcing St Martin's death. The Acta Sanctorum are full of such coincidental phantasms. Doubtless many of them are fictitious; even if they are, they suffice to show that the idea of a dying man projecting himself, as it were, into the thoughts of a friend à distance was sufficiently widespread and must have arisen from actual instances.

The case of the 'ghost' which appeared to Lord Lyttelton and marked his wrist as a proof of the reality of its appearance, is paralleled so far as the mark is concerned by some older stories. Melanchthon reports the case of a widow whose husband appeared to her along with a Franciscan monk, and directed her to have masses said for the repose of his soul. Then he bade her give him her hand. At first she refused, but on his reassuring her, she did so. On this the two men disappeared, and she found her hand marked as if it had been burned. The black mark remained all her life. Another instance is that of Counseller Hans Steinlin, who died in 1625, but some days after appeared, surrounded by flames, to a tailor of the town, asking him to undertake various matters on his behalf. This phantasm also wished to 'shake,' but our tailor feared the consequences and covered his hand with his board. The spectre touched this, and it was marked as by fire with the impression of five fingers.

Present-day spiritualism dates from 1848, when strange noises and movements were observed in the house occupied by the Fox family at Hydeville (N.Y.), followed by a regular communication being opened up with the 'ghost' by means of rappings. Was the whole business due to trickery on the part of the Fox girls? If so, considering the following which spiritualism has gained as a result of these

disturbances, it is a melancholy instance of Bishop Butler's dictum that peoples, like individuals, may at times go mad. Populus vult decipi. But precisely similar cases have been known to occur sporadically in all ages, the manifestations taking place exactly in the same way. Again we must ask, Is there something in it? And if not, why should the deceivers always carry on their deceit with so little variation and without ever having heard of each other? And how is it known that a 'spirit' will manifest itself when desired by means of rappings? But enough of questions; here is a case in point: that of the spirit of Humbert Birck, a burgher of Oppenheim, who died in 1620. The Saturday after his death strange noises were heard in his brotherin-law's house. He, with marvellous intuition, guessed it to be Humbert, and begged him to strike three times on the wall if it were he. Three knocks followed. Intelligible communications were not entered on at this time, but the spirit continued to knock at intervals, to sigh, or to whisper. At the end of a year he, like the ghost in Hamlet, did speak and unfold himself, demanding the presence of his children and the curé. When these had come, he was asked if he wished masses to be said. He begged that three should be said, and that alms should be given to the poor, and made arrangements for altering his will. Having been asked why he infested this house, he explained that he had no choice in the matter. His faith as a Christian was then tested by his being asked to recite the Lord's Prayer and 'Hail, Mary!' He acquitted himself badly, being hindered, as he said, by an evil spirit. At a later séance, in presence of many persons, the master of the house requested Humbert, whose raps were somewhat feeble, to strike with a stone. After an interval there followed a loud knock. The brother-in-law then whispered to his neighbour that the spirit would strike seven times. Seven knocks followed. It is interesting to note that Humbert's ghost was most respectful to the clergy, answering them much more politely than he did laymen. But he explained this by saying that the priests had received the Sacrament, and in presence of that he must be respectful. Finally, after all had been done that he desired, he was heard no more.

It is easy to say that all this is fraud and delusion. What is still unexplained is why among different races and at long intervals of time, and, so far as we know, from a period of remote antiquity, such fraudulent tricks have always occurred in the same way and have given rise to the same belief. In some cases we may suspect the fourberies of a hysterical girl or boy. The case is thus one for the psychologist. He will then be able to show us that they occur according to a regular law, while the hysterical subject will be shown to be in possession of a power which is certainly abnormal. Some of the manifestations, for example, are beyond ordinary human powers. This is certainly the case with

the so-called Polter-geist. Hundreds of instances of this are known from the earliest times; some have become historical, like the case of the Wesleys; they occur in our own day-the newspapers as I write are full of extraordinary doings on a farm in Lincolnshire. The phenomena are unvarying: furniture is moved about, crockery broken, pots and pans fly through the air. Such doings are invariably ascribed to an evilly disposed ghost; sometimes, however, they were said to be the work of a brownie, himself the lineal descendant of the once-worshipped ancestral ghost. When investigated they usually (but not always) prove to be the work of a hysterical subject. But here again we are in presence of unusual powers; the movements are often such as cannot be caused

normally. And these powers are in evidence as much in the oldest as in the most recent cases.

Enough has been said to show that there is a large mass of old ghost-stories requiring sifting, a large part of the x region yet to be explored. Phantasms and spooks have always manifested themselves in the same way, or human belief on the subject has been equally unvarying. The abnormal powers of hysteria are responsible at once for strange phenomena and for strange beliefs about these phenomena, while the phenomena and the beliefs have not deviated far from certain wellmarked lines. There is an abundant supply of ancient human documents awaiting the study of the student of truth and of human error, the doctor, and the psychologist.

ROMANCE OF A FLOATING DOCK. THE

CHAPTER XIV.

HEN Sandford awoke next day he found himself in bed. He lay still for a while enjoying the softness and comfort, and tried to recall what had happened to him. He remembered in a dim way being carried

into Don Santiago's house. After that there was a blank. Whether he had fainted or they had given him some narcotic he did not know. His left arm and side felt stiff, and he found that they had been bandaged. His bed stood in a broad, shaded veranda. He could see that it overlooked a garden, which stretched down to the river's edge. The level sunshine blazed outside and the air was warm. His clothes lay folded on a chair at one side of his bed, and near the other an old Indian woman sat on a low stool knitting. He recognised her. It was she who had opened the door last night, and whom the girl had called Teresa.

She now rose as she saw that he was awake.

'Buenas tardes ['Good afternoon'], señor,' she said in the soft voice of the Indian women. 'Have you slept well?'

'Very well, thank you, I think. Have I slept

long? What o'clock is it?'

'It is five o'clock, señor, and you have slept all day.' She looked kindly and critically at him, and added, nodding her head, 'You are better, señor?'

'How is the señorita?' he asked.

'She is very well, señor, gracias á Dios!' she answered. And then, turning away, she said, partly over her shoulder, 'I go to bring your dinner, señor;' and she slipped quietly out.

He could hear the faint murmur of chattering voices in some distant part of the house, and the creak and splash of the oars of a passing boat on the river mingling with the grunts of the labouring rowers. Teresa soon returned with a tray, and he realised that he was ravenously hungry. She

watched with evident satisfaction while he ate, and when he had finished she brought him a glass. 'Your medicine, señor. The doctor said you were

to take it after eating.'

He swallowed the dose without questioning, and she smoothed his pillow and made him comfortable gently and skilfully. Then she took up the tray, and saying, 'With permission, senor,' went away. Before she returned he had fallen asleep

The medicine must have been a sleeping draught, again. for when he awoke once more the sun was high He felt refreshed and well. His side no longer pained him. In a minute Teresa stood at his bedside with his coffee, and when he had drunk it she made no objection to his getting up. He felt rather weak and shaky when he stood on his feet, and he could not yet use his left arm very well. The old woman helped him to dress. She told him that both Don Santiago and the señora had been to see him more than once while he was asleep, and that they would not let him be disturbed. Don Santiago was now in his office, and the señora had gone to

'I, at your service, señor, generally go with her, she added; 'but to-day she ordered me not to leave you till you waked, so Manuela has gone to carry

the basket.'

He did not reply, nor did he inquire for the señorita. And when Teresa had settled him in an arm-chair from which he could see away across the river, and over the green plains and the gray forests beyond, to the far-distant sierra, with its snow, peaks sparkling in the sunshine, she left him to his

It has been mentioned that Sandford had from reflections. boyhood enforced upon himself the keeping of his resolutions. He held a private promise to himself to be as sacred as if it had been made before a congregation. A habit, good or bad, only requires

cultivation. A year's practice of silence will make it easier to conceal than to betray one's thoughts, and the saint who lived on the top of a pillar for forty years probably found it easier, after the first six months, to stay there than to descend. Sandford had soon found that he could withstand any ordinary allurement to deviate from a course upon which he had once decided. He also gained a reputation for obstinacy that saved him from many importunities. He learned to cherish a comfortable confidence in the power of his will to regulate his acts, and not his acts only, but even his inclinations. Up till his arrival in Moyocuil he was sure he could guide his fancy with a light rein, and say 'Yes' or 'No' to Love itself as if it were an invitation to a picnic.

That delusion had gone by the board. He had fled from temptation, but it had followed him like Fate. And now its unfamiliar importunities assailed him no less from within than from without. His inclination was no longer subservient. Nature had roused herself and taken possession of him. It is some two thousand years since the heathen poet pointed out the futility of attempting to expel this lady with a pitchfork. She will steal in again for all that, he says, and break victoriously through your ineffectual defences. This Moyocuil girl was a woman, he was a man, and he confessed to himself that he wished for her with all his heart.

He rose up and walked about the veranda. He raised his head and took a deep breath. He forgot his fatigue. The world had changed. Carmen's disadvantages as a wife for him did not disappear, but they had already altered their perspective. She was still a foreigner, and of an inferior race, although he could not think of her as inferior to any lady living; a Catholic, who would probably obey her priest before her husband; doubtless endowed with objectionable relations; certainly ignorant of the ways of English society and bound to be unhappy in it. But then she was—herself. Those were accidents, this was the essential. He could not live without her. He returned to his chair and sat down to think.

Thinking may be done in more than one way. A usual way is to summon up reasons for doing as we wish to do. A Frenchman or a Scot would have constructed an ingenious logical argument. English Sandford, with the constitutional instinct of his nation, sought for a precedent. He cudgelled his brains for memories of mixed marriages, but could think of none among his relations or acquaintances. His knowledge of history failed him, as a man's college education does too often fail him at a practical pinch. But a stray crumb of theological learning, picked up almost unconsciously, at last came to his aid. Thus a proverb or a tag of poetry will sometimes leap to the memory to clear up a difficulty in conduct, and grown-up Scotsmen have found a scrap of the Shorter Catechism, acquired uncomprehendingly in childhood, swim

into their mature conscience with the key to a stiff problem in morals or philosophy.

Sandford's efforts set vibrating some nerve-fibre that led to a recondite pigeon-hole in his brain. He had once heard a bishop preach on the marriage of Isaac and Rebecca, and a saying of the preacher had, without his knowing it, sunk into his soul. It was to this effect:

'God gives a man a sure guide to the woman who is fitted to be his wife. That guide is just the love he feels for her.'

The words came to him as a glimpse of the Heavenly Vision. He would be obedient to it. This was the woman he loved—his Rebecca. His resolution was in his face when he looked up, and he saw her standing before him.

Something in her eyes encouraged and even invited him. He forgot the existence of Don Diego. He took both her hands.

'Carmen,' he said, 'can you marry me?'

She did not answer, and he thought she had not fully understood him.

'Ah, if I could say it in English,' he began, half to himself.

Then he felt a faint return pressure on his fingers, and heard her whisper, 'You may speak to me in English.'

For a moment he could scarcely believe his ears, for she had spoken in English, and without any foreign accent.

Then he gasped, 'You understand English?'

She blushed, but there was a spark of fun in her eyes as she replied very softly, 'Yes—a little.' She had not even said 'a leetel'!

- 'But how-but where did you learn it?'
- 'At home.'
- 'At home? At Valverde?'
- 'Oh no; at Boston.'

He looked so puzzled, and she was so wildly happy, that she could not help adding with feigned demureness, 'It is a town in the United States.' Sandford did not answer. He only kept his eyes fixed on hers and held her hands fast. 'I am not Moyocuilean,' she said. 'Are you-are you disappointed?' Still he only looked into her eyes with an expression that made her turn her own away. And she went on hastily, 'I am a quarter Spanish, and the rest of me is English-American English. I'm an American girl,' she added, raising her head a little. Then she continued speaking very quickly, hurrying to tell him all about herself. 'Valverde was grandpapa's. Grandmamma was American. They sent papa to school and college in Boston, and he met mamma there. Grandpapa died when I was a little girl, and since then we have lived chiefly in Boston. But we come to the hacienda every year.'

She spoke with an eager but low-voiced impetuosity, stopping only to take breath, and Sandford did not interrupt her, but only (she thought) drew her hands a fraction nearer his breast.

'Have you sailed down the coast?' she went on.

He shook his head.

'Oh, it is beautiful! The sea is darker, and the sun higher, and the sky bluer every day. And when we pass the Bahamas, and the awnings are put up to stay, we change our dress and begin to speak Spanish. I spoke it as a child with the servants, you know. And papa, who is Mr James Velasquez in Boston, becomes Don Santiago. I always go to the Catholic church here. I like to go to church, and there's no other.'

She had been speaking from an impulse to keep on, but she suddenly stopped. She thought Sandford was not quite attending to her words. She was out of breath, too, and felt that she was really speaking to cover her agitation. Sandford was looking at her strangely, with a smile that was more in his eyes than on his lips, and he still held her hands. She had not tried to withdraw them.

Then he said—and his voice, like hers, had fallen very low:

'But you have not told me. We are to be married?'

She did not answer at once, though her lips moved as if to speak. Then:

'Yes—oh yes,' she whispered breathlessly; 'I—I hope so!'

CHAPTER XV.

HE Floating Dock was towed in due course to the harbour of Puerto Nacional, where it now floats, in shape as graceful as a gignatic teachest its red point blistoring

gigantic tea-chest, its red paint blistering in the sun, and the green seaweeds that fringe its sides rising and falling with the ripple of the bay. There is little that is impressive, and still less that is romantic, in its appearance. Yet its construction brought about changes in manners, in fortunes, and in lives.

The ladies of Garapatas, from its time, began to discard, except at early mass, the comfortable reload, which they had worn on their heads, as the Edinburgh ladies of a century and a half ago wore their shawls, and to adopt frail hats of, as they fought, Parisian mode.

Garapatas merchants, who had lived on black beans and slept under the shop-counter in their youth, sent their sons to France to complete their education. But Don Diego Lopez was not one of these. Fearful (with good reason) of the lingering torture of Moyocuilean justice, he fiel across the frontier, and Garapatas knew him no

Doña Concha, who kept the boarding-house on the river-front, received and accepted an offer of marriage from an aspiring Yankee foreman; and her comely brown housemaid, Sanchita, was carried off by a Cuban mechanic.

Sandford, the engineer, learned that life is not all prose, and that the poets may have known a thing or two. And Mr Brandon, who, as his friend's groomsman, was introduced to Boston society, fell in love with and married the fifth bride's-maid, who already wrinkles her pretty brow over the knotty question whether her eldest so shall be educated for the position of Archbishop of Canterbury or British Ambassador to the United States of America.

THE END.

SOME PACIFIC ISLANDS BIRDS.

By Louis Becke.

LTHOUGH I had often heard of the corncrake or landrail of the British Isles, I did not see one until a few years ago, on my first visit to Ireland, when a field-labourer in County

Louth brought me a couple which he had killed in a field of oats. I looked at them with interest, and at once recognised a striking likeness in shape, markings, and plumage to an old acquaintance, the shy and rather rare 'banana-bird' of some of the Polynesian and Melanesian Islands. I had frequently, when in Ireland, heard at night during the summer months the repeated and harsh during the summer months the repeated and harsh crake, crake of many of these birds issuing from the fields of growing corn, and was very curious to see one, for the unmelodious cry was exactly like that of the kili vao, or 'banana-bird,' of the Pacific Islands. And when I saw the two corncrakes I found them to be practically the same bird, though but half the size of the kili vao.

Kili vao in many of the Polynesian dialects means bush-snipe, as distinct from kili fusi (swampsnipe). It feeds upon ripe bananas and papers (mamee apples), and such other sweet fruits that, when over-ripe, fall to the ground. It is very seldom seen in the daytime, when the sun is strong, though its hoarse, frog-like note may often be heard in cultivated banana-plantations or on the mountain-sides where the wild banana thrives At early dawn or towards sunset, however, the birds come out from their retreats and search for fallen bananas, papaws, or guavas, and I have spent many a delightful half-hour watching them from my own hiding-place. Although they have such thick, long, and clumsy legs, and coarse splay feet, they run to and fro with marvellous speed, continually uttering their insistent croak. Usually they were in pairs, male and female, although I once saw a male and three female birds together. The former can easily be recognised, for it is considerably larger than its mate, the colouration of the plumage on the back and about the eyes is more pronounced, and the beautiful quail-like semicircular belly-markings are more clearly defined. When disturbed, and if unable to run into hiding among the dead banana-leaves, they rise and present a ludicrous appearance, for their legs hang down almost straight, and their flight is slow, clumsy, and laborious, and seldom extends more than fifty yards.

The natives of the Banks and Santa Cruz Groups (north of the New Hebrides) assert that the kili is a ventriloquist, and delights to 'fool' any one attempting to capture it. 'If you hear it call from the right it is hiding to the left; and its mate is perhaps only two fathoms away from you, hiding under the fallen banana-leaves and pretending to be dead. And you will never find either unless it is a dark night, and you suddenly light a big torch of dried coconut-leaves; then they become dazed and stupid, and will let you eatch them with your hand.' Whilst one cannot accept the ventriloquial theory, there can be no doubt of the extraordinary cunning in hiding and noiseless speed on foot of these birds when disturbed.

One afternoon, near sunset, I was returning from pigeon-shooting on Ureparapara (Banks Group), when, in walking along the margin of a taro-swamp which was surrounded by banana-trees, a big kili rose right in front of me; and before I could bring my gun to shoulder my native 'boy' hurled his shoulder-stick at it and brought it down dead. Then he called to me to be ready for a shot at the mate, which, he said, was close by in hiding. Walking very gently, he carefully scanned the dead leaves at the foot of the banana-trees, and silently pointed to a heap of dead leaves which were soddened by rain. 'It is underneath there,' he whispered; then he flung himself upon the heap of leaves, and in a few seconds dragged out the prize -a fine, full-grown female bird, beautifully marked. I put her in my game-bag. During our two-mile walk to the village she behaved in a disgusting manner, and so befouled herself (after the manner of a young Australian curlew when captured) that she presented a repellent appearance, and had such a disgusting odour that I was at first inclined to throw her - game-bag and all - away. However, my native 'boy' washed her, and then we put her in a native pigeon-cage. In the morning she was quite clean and dry, but persistently hid her head when any one approached, refused to take food, and died two days later, although I kept the cage in a dark place.

These birds are excellent eating when not too fat; but when the papars are ripe they become grossly unwieldy, and the whole body is covered with thick yellow fat, and the flesh has the strong, sweet taste of the papars. At this time, so the natives say, they are actually unable to rise for flight, and are easily captured by the women and

children at work in the banana and taro plantations.

With regard to this common tendency of the flesh of birds to acquire the flavour of their principal article of food, I may mention that in those Melanesian Islands where the small chilli pepper grows wild, the pigeons at certain times of the year feed almost exclusively upon the ripe berries, and their flesh is so pungent as to be almost uneatable. At one place on the littoral of New Britain there is a patch of country covered with pepper-trees, and it is visited by thousands of pigeons, who devour the berries, although their ordinary food of sweet berries is available in profusion in the mountain forests.

On some of the Melanesian Islands there is a variety of the banana-bird which frequents the yam and sweet-potato plantations, digs into the hillocks with its powerful feet, and feeds upon the tubers, as does the rare tooth-billed pigeon of Samoa.

One day, when I was residing in the Caroline Islands, a pair of live banana-birds - male and female-were brought to me by natives, who had snared them. They were in beautiful plumage, and I determined to try to keep them. The natives quickly made me an enclosure some twenty feet square of bamboo slats about an inch or two apart, driving them into the ground, and making a roof of the same material high enough to permit of three young banana-trees being planted therein. Then we quickly covered the ground with dead bananaleaves, small sticks, and other débris; and after making it as 'natural' as possible, laid down some ripe bananas and turned the birds into the enclosure. In ten seconds they had disappeared under the heap of leaves as silently as a beaver or a platypus takes to the water. During the night I listened carefully outside the enclosure; but the captives made neither sound nor appearance. They were still 'foxing,' or, as my Samoan servant called it, 'le toga-fiti e mate' (pretending to be dead).

All the following day there was not the slightest movement of the leaves; but an hour after sunset, when I was on my veranda smoking and chatting with a fellow-trader, a native 'boy' came to us grinning with pleasure, and told us that the birds were feeding. I had a torch of dried coconut-leaves all in readiness. It was lit; and as the bright flame burst out and illuminated the enclosure I felt a thrill of delight. Both birds were vigorously feeding upon a very ripe and squashy custard-apple, disregarding the bananas. The light quite dazed them, and they at once ceased eating, and sat down in a terrified manner, with their necks outstretched and their bills on the ground. We at once withdrew. In the morning I was charmed to hear them craking; and from that time forward they fed well, and afforded me many a happy hour in watching their antics. I was in great hopes of their breeding,

for they had made a great pile of débris between the banana-trees, into which in the daytime they would always scamper when any one passed, and my natives told me that the end of the rainy season was the incubating period. As it was within a few weeks of that time I was filled with pleasurable anticipations, and counted the days. Alas for my hopes! One night a predatory villagepig, smelling the fruit which was daily placed in the enclosure, rooted a huge hole underneath the bamboos, and in the morning my pets were gone, and nevermore did I hear their hoarse crake!—ever pleasing to me during the night.

The recent volcanic outburst on the island of Savai'i in the Samoan Group, after a period of quiescence of about two hundred years, has, so a Californian paper states, revealed the fact that one of the rarest and most interesting birds in the world, and long supposed to be peculiar to the Samoan Islands, and all but extinct, is by no means so in the latter respect, for the convulsion in the centre of the island, where the volcanic mountain stands nearly four thousand feet high, has driven quite a number of the birds to the littoral of the south coast. So at least it was reported to the San Francisco journal by a white trader residing in the south side of Savai'i during the outbreak.

For quite a week before the first tremors and groanings of the mountain were felt and heard, the natives said that they had seen manu mea (tooth-billed pigeons) making their way down to the coast. Several were killed and eaten by children.

Before entering into my own experiences and knowledge of this extraordinary bird, gained during a seven years' residence in Samoa, principally on the island of Upolu, I cannot do better than quote from Dr Stair's book, Old Samoa, his description of the bird. Very happily, his work was sent to me some years ago, and I was delighted to find in it an account of the manu mea (red bird) and its habits. In some respects he was misinformed, notably in that in which he was told that the Didunculus was peculiar to the Samoan Islands; for the bird certainly is known in some of the Solomon Islands and also in the Admiralty Group—two thousand miles to the north-west of Samoa.

Here, however, is what Dr Stair remarks:

'One of the curiosities of Samoan natural history is le manu mea, or red bird of the natives, the tooth-billed pigeon (Didunculus strigirostris, Peale), which is peculiar to the Samoan Islands. This remarkable bird, so long a puzzle to the scientific world, is only found in Samoa, and even there it has become so scarce that it is rapidly becoming extinct, as it falls an easy prey to the numerous wild-cats ranging the forests. It was first described and made known to the scientific world by Sir William Jardine in 1845, under the name of

Gnathodon strigirostris, from a specimen purchased by Lady Hervey in Edinburgh, amongst a number of Australian skins. Its appearance excited great interest and curiosity; but its true habitat was unknown until some time after, when it was announced by Mr Strickland, before the British Association at York, that Mr Titian Peale, of the United States Exploring Expedition, had discovered a new bird allied to the dodo, which he proposed to name Didunculus strigirostris. From the specimen in Sir William Jardine's possession the bird was figured by Mr Gould in his Birds of Australia, and its distinctive characteristics shown; but nothing was known of its habitat. At that time the only specimens known to exist out of Samos were the two in the United States (taken there by Commodore Wilkes) and the one in the collection of Sir William Jardine in Edinburgh. The history of this last bird is singular, and may be alluded to here.

'To residents in Samoa the manu mea (or red bird) was well known by repute; but as far as I know no specimen had ever been obtained by any resident on the islands until the year 1843, when two fine birds, male and female, were brought to me by a native who had captured them on the nest. I was delighted with my prize, and kept them carefully, but could get no information whatever as to what class they belonged. After a time one was unfortunately killed; and, not being able to gain any knowledge respecting the bird, I sent the surviving one to Sydney by a friend in 1843, hoping it would be recognised and described. But nothing was known of it there, and my friend left it with a bird-dealer in Sydney, and returned to report his want of success. It died in Sydney, and the skin was subsequently sent to England with other skins for sale, including the skin of an apteryx from Samos Later on the skin of the manu mea was purchased by Lady Hervey, and subsequently it came into the possession of Sir William Jardine, by whom it was described. Still nothing was known of its habitat; but this bird, which I had originally sent to Sydney from Samoa, was the means of bringing it under the notice of the scientific world, and thus in some indirect manner of obtaining the object I had in view.

'After my return to England in 1846, the late Dr Gray, of the British Museum, showed me a drawing of the bird, which I at once recognised; as also a drawing of a species of apteryx which had been purchased in the same lot of skins. A native of Samoa who was with me at once recognised both birds. Dr Gray and Mr Mitchell (of the Zoological Gardens in London) were much interested in the description I gave them, and urged that strong efforts should be made to procure living specimens. But no steps were taken to obtain the bird until fourteen years after, when, having returned to Australia, I was surprised to see a notice in the Melbourne Argus of August 3, 1862, to the effect

that the then Governor of Victoria, Sir Henry Barkley, had received a communication from the Zoological Society, London, soliciting his co-operation in endeavouring to ascertain further particulars as to the habitat of a bird they were desirous of obtaining, forwarding drawings and particulars as far as known at the same time, and offering a large sum for living specimens or skins delivered in London. I at once recognised that the bird sought after was the manu mea, and gave the desired information and addresses of friends in Samoa, through whose instrumentality a living specimen was safely received in London, vid Sydney, on April 10, 1864, the Secretary of the Zoological Society subsequently writing to Dr Bennett of Sydney, saying, "The La Hogue arrived on April 10, and I am delighted to be able to tell you that the Didunculus is now alive and in good health in the Gardens, and, Mr Bartlett assures me, is likely to do well."

'In appearance the bird may be described as about the size of a large wood-pigeon, with similar legs and feet, but the form of its body more nearly resembles that of the partridge. The remarkable feature of the bird is that whilst its legs are those of a pigeon, the beak is that of the parrot family, the upper mandible being hooked like the parrot's, the under one being deeply serrated; hence the name tooth-billed pigeon. This peculiar formation of the beak very materially assists the bird in feeding on the potato-like root, or rather fruit, of the soi (or wild yam), of which it is fond. The bird holds the tuber firmly with its feet, and then rasps it upwards with its parrot-like beak, the lower mandible of which is deeply grooved. It is a very shy bird, being seldom found except in the retired parts of the forest, away from the coast settlements. It has great power of wing, and when flying makes a noise which, as heard in the distance, closely resembles distant thunder, for which I have on several occasions mistaken it. It both roosts and feeds on the ground, as also on stumps or low bushes, and hence becomes an easy prey to the wild-cats of the forest. These birds also build their nests on low bushes or stumps, and are thus easily captured. During the breeding season the male and female relieve each other with great regularity, and guard their nests so carefully that they fall an easy prey to the fowler; as in the case of one bird being taken its companion is sure to be found there shortly after. They were also captured with bird-lime or shot with arrows, the fowler concealing himself near an open space on which some soi, their favourite food, had been scattered.

'The plumage of the bird may be thus described: The head, neck, breast, and upper part of the back is of greenish black; the back, wings, tail, and under tail-coverts of a chocolate red. The legs and feet are of bright scarlet; the mandibles orange red, shaded off near the tips with bright yellow.'

Less than twenty years ago I was residing on the eastern end of Upolu (Samoa), and during my shooting excursions on the range of mountains that traverses the island from east to west saw several Didunculi, and, I regret to say, shot two; for I had no ornithological knowledge whatever, and although I knew that the Samoans regarded the manu mea as a rare bird, I had no idea that European savants and museums would be glad to obtain even a stuffed specimen. The late Earl of Pembroke, to whom I wrote on the subject from Australia after my return from Samoa, strongly urged me to endeavour to secure at least one living specimen; so also did Sir George Grey. But although I, like Mr Stair, wrote to many native friends in Samoa, offering a high price for a bird, I had no success; civil war had broken out, and the people had other matters to think of besides bird-catching. I was, however, told a year later that two fine specimens had been taken on the north-west coast of Upolu, but that one had been so injured in trapping that it died, and the other was liberated by a mischievous child.

I have never heard one of these birds sound a note; but a native teacher on Tutuila told me that in the mating season they utter a short, husky hoot, more like a cough than the cry of a bird. When flying, they make a very curious sound like that of the hornbill.

A full month after I first landed in Samoa I was shooting in the mountains at the back of the village of Tiavea, in Upolu, when a large, and to me unknown, bird rose from the leaf-strewn ground quite near me, making almost as much noise in its flight as a hornbill. A native who was with me fired at the same time as I did, and the bird fell. Scarcely had the native stooped to pick it up, exclaiming that it was a manu mea, when a second appeared, half-running, half-flying along the ground. This, alas! I also killed. They were male and female, and my companion and I made a search of an hour to discover their resting-place (it was not the breeding season); but the native said that the manu mea scooped out a retreat in a rotten tree or among loose stones covered with dry moss. We searched in vain, nor did we even see any wild yams growing about, so evidently the pair were some distance from their home, or were making a journey in search of food.

During one of my trips on foot across Upolu with a party of natives, we sat down to rest on the side of a steep mountain-path leading to the village of Siumu. Some hundreds of feet below us was a comparatively open patch of ground—an abandoned yam-plantation; and just as we were about to resume our journey we saw two manu mea appear. Keeping perfectly quiet, we watched them moving about, scratching up the leaves, and picking at the ground in an aimless, perfunctory sort of manner with their heavy, thick bills. The natives told me that they were searching, not for yams, but for a sweet berry called mass'oi, upon which the wild

pigeons feed. In a few minutes the birds must have become aware of our presence, for they suddenly vanished.

I have always regretted, in connection with the two birds I shot, that not only was I unaware of |

their value, even when dead, but that there was then living in Apia a Dr Forbes, medical officer to the staff of the German factory. Had I sent them to him he could have cured the skins at least, for he was, I believe, an ardent naturalist.

THE SALVING OF THE 'SERENA'

By BREW MOLOHAN.

HE sea-going tug Hercules was steadily making her way through a heavy smother in the direction of the Western Islands. The gale had nearly blown itself out, and Rattray was glad to see, over the horizon,

the first glint of light which spoke of settled weather. Ugly and squat the Hercules looked, but there were few better sea-boats afloat, and her powerful engines forced her through the water at a pace that many a mail-boat would not have despised.

Rattray turned to the mate, who was beside him

on the bridge.

'We can push her along at fourteen knots now, Jack,' he said; 'and as discipline is not such a necessity on the Hercules as on the Berwick Castle, if you will come down to my cabin I will explain the meaning of the wire I sent in answer to your note saying that Captain Williams had fired you.'

'There is no necessity for an explanation, captain,' returned Dalton. 'Eight pounds a month on the Hercules is better than six on the Berwick Castle, and the time will count when I go up for my extra master's ticket. However, I don't mind admitting that I'm a bit curious to know what this trip means.

'Go for'ard and tell the bo's'in to take your turn on the bridge, and then come below.'

Dalton found the captain sitting at the table with a big chart of the Atlantic Ocean in front

'Light a pipe and help yourself, and if you dare to interrupt me until I finish my yarn I'll throw the bottle at your head.'

'On the 2nd of November 1900,' began the skipper, 'the Black Star steamship Serena ran on an uncharted sandbank off the Bahamas. She was the biggest boat in the cotton-trade between New Orleans and Liverpool; and as on this particular trip she was carrying a full cargo, her total value was not much short of half a million. For two days they tried to get her off without success, and then a heavy gale blew up from the sou'-west. The seas repeatedly broke over the wreck, sweeping away half-a-dozen of the crew, and the remainder were taken off by an American vessel which luckily hove in sight.

'Salvage-tugs were sent out from New York on receipt of the intelligence; but when they arrived

at the sandbank no trace of the Serena could be found, and it was supposed that a very high tide or a subterranean eruption-which is a comparatively common occurrence in these latitudes-floated her Whatever the explanation may be, that she floated off is a certainty, because on the 6th of January the Royal Mail steamer Tocantins sighted her in 22:31 N., 59:45 W. It was heavy weather, and as the Tocantins had her contract time to fulfil, the captain did not attempt to get a hawser on board.

'When the news reached Liverpool, the Black Star people, in addition to sending out a tug, offered a reward of forty thousand pounds, to which the underwriters added a further sixty thousand pounds, to any vessel that would bring the Serena into port.

'The consequence of the reward was that every sea-going tug on both sides of the Atlantic went after the prize, and within six weeks an Americanthe Ulysses S. Grant-actually picked her up. A week later, however, she broke loose again one dirty night, and has not been reported since. Now, sir, that reward of one hundred thousand pounds is still open, and that reward I mean to have before I am

twelve months older.' 'But, captain' began Dalton.

Be quiet until I have finished. You do not know it; but for the past ten years the scientific study of ocean winds and currents has been my pet hobby; and without being egotistical I may say that at the present time I know more about them than any

'The loss of the Serena was a source of great man afloat. interest to me, and from time to time I have amused myself by working out her course. So accurate were my calculations that, chancing to work out her position on the date when she was picked up, I had actually placed her within a few miles of where the Ulysses S. Grant found her. The "picking up by the way, was a matter more of good luck than judgment, as the majority of the searchers were quartering the ocean two hundred miles to the north.'

'The searchers failed,' continued Rattray, unheed ing the interruption, 'because they did not allow for the effect of the trade-winds on a vessel standing twenty feet out of the water. They thought to find her in the centre of the Gulf Stream, whereas the trades were driving her south in the proportion of one mile to every ten and a third she travelled east. I have pricked out her course on this chart, and you will notice that, instead of being in the middle of the stream when the *Ulysses S. Grant* picked her up, she had drifted nearly two hundred miles to the sou'-east of where she should have been.

'This s'utherly drift may appear unimportant; but—and here is the vital point—it was sufficient to force her into the branch of the current which runs to the sou'-west of the Azores, and she thus avoided the fleet of tugs which were waiting for her in the main stream that runs to the nor'-east.

'After passing the Western Islands she met the full force of the trades, which gradually edged her out of the current into slack water. Here she was totally under the influence of the winds, and gradually drifted sou'-west until she came to a standstill here.'

Jack Dalton looked at the point indicated. Surprise for a moment held him speechless.

'Why, that is the edge of the Sargasso Sea!' he exclaimed.

'Exactly! That is the spot where the Serena is lying.'

'But—well—why, captain,' he ejaculated, 'no one has ever been there!'

'No,' replied the skipper calmly; 'but we are going. The Sargasso Sea,' he continued, 'lies roughly between the parallels 22 and 28 N. latitude, and 40 and 90 W. longitude. Being out of the track of both sailing-vessels and steamers, very little is known about it; but the Government surveying-ships have given us a fairly definite idea of its whereabouts.

'However, to continue my tale. Of course you know why I was fired by the Joint Castle Company?' he broke in suddenly.

Dalton nodded.

'Well, I suppose it was cheek on the part of a first officer to fall in love with the managing director's daughter when she was a passenger on his boat,' commented the skipper. 'Sir Girling Hathaway thought so, anyway. He had me carpeted in his private office, and gave me the alternative of quitting the company or giving up Mabel. I elected to quit, but reminded him that he was only a mate himself fifteen years before. His reply, as he showed me the door, was to the effect that when I had made as good a position as his I might apply for his daughter's hand, but not before.

'After leaving the Berwick Castle I realised my little property and went straight to Liverpool, where my friend Henry Thomson is head of the Holdfast Towing Company. From him I hired the Hercules for five hundred pounds a month and 5 per cent. of the salvage-money.

'I have made every preparation that I could think of to make this venture a success, Jack. I shipped iron bars for grapnels by the ton, and lime-juice by the hogshead; to guard against malaria from the rotting weed I ordered respirators by the gross, and even went so far as to have a steel spring six fathoms long spliced in the middle of a hawser to allow for the pitching of the tow.

'Tis all or nothing this time, Dalton, and I have staked every penny I possess on the venture. If it turns out a success it means a fortune to every man on board; if it doesn't—well, it won't be my fault.'

When the Hercules left St Michael's she looked like a floating coal-wharf. Not alone were her capacious bunkers filled to overflowing, but every part of the deck where there was an inch to spare carried its cargo. To economise as much as possible, she was leisurely taken along at nine knots, and it was not until ten days later that, by steady steaming, they approached the point where Rattray calculated to strike the drift.

The crew during this time had not been idle. Under the skipper's superintendence, the carpenter constructed a huge iron cage to fix over the screw when they got amongst the weeds, and the men were busy splicing lengths of rope and preparing grapnels for use. A crow's nest was fixed at the top of the stumpy mast; and the reward of ten pounds offered for the first sight of the derelict created a keen competition for the post of 'lookout.'

On the eleventh day they passed through the first loose patches of drift which, like a spider's web, surrounds that immense bank of weed known as the Sargasso Sea. The cage was slung over the stern and fixed rigidly in its place by an ingenious arrangement of hawsers; and Rattray himself at the wheel steered the tug through the clear lanes of water.

'I have purposely struck the weed at this point, Jack,' he said; 'and, if my theory be correct, as we travel east the loose weed will gradually disappear until we can get close up to the bank; but I do not look for the Serena until we arrive at the southern edge.'

His predictions were verified. The encircling patches of detached drift became fewer and fewer, and on the afternoon of the fourteenth day they ran close up to the dense brown mass which, like a floating field, stretched away to the south beyond the range of vision. The bank consisted principally of gulf-weed, interspersed here and there with huge trees inextricably matted together. The surface was, as a rule, about four feet out of the water, but huge hummocks, caused by the drift being piled upon itself by hurricanes, rose like miniature hills above the main body. Occasionally they passed small forests, where the trees stood upright as if growing in the water; and more than once great beams and timbers showed the end of ships which no doubt had been posted as missing many years before.

The heat as they steamed close to the edge of the bank was terrific, and a horrible stench of rotting

vegetation arose from the floating mass; but, thanks to the respirators that the skipper had provided, every man on board escaped scatheless.

Day after day they steamed slowly east, keeping close to the bank during daylight, but drawing off at night and bringing the tug to by means of a couple of sea-anchors, and it was not until the seventeenth day that the cry of 'Clear water to the s'uthard!' from aloft announced the approach of the eastern end. The crew gave a sympathetic cheer as the course of the Hercules was altered. They all knew the object of the search, and not a man but confidently looked forward to a good time on shore with plenty of prize-money in his pocket.

On the second day after rounding the bank the shout, 'Serena ahoy!' brought Rattray on deck with a run. In a moment he was in the crow's nest, where, with a heart beating painfully with excitement, he made out an indistinct shape looming away in front over the weed. Even through the glasses it was some time before he could convince himself that it was not one of the piled-up heaps of weeds which they had been passing lately in great numbers.

'Ring full steam ahead, Jack,' he shouted to the mate, who was excitedly watching him from the bridge.

The Hercules bounded forward, and in an hour there was no longer room for doubt. A steamer—a large cargo steamer—was fast in the weeds; and although the distance was too great to make out her name, by the black star indistinctly seen on the funnel Rattray was certain that she was the Serena.

He returned on deck with a face in which triumph and vexation struggled for mastery. The troubled glance he gave the mate was returned by a look equally troubled.

Well, captain, you've found her; but how the deuce are you going to get her out?'

It was true. He had found the Serena; but between the Serena and the Hercules stretched a mile of dense, impenetrable driftweed.

Rattray moodily bit his lips.

'I was right in my calculations, Jack,' he said, 'but quite forgot the distance a twelve thousand ton steamer, with perhaps a gale of wind astern, would force herself into the bank. I expected to find her near the edge.'

He went below, but returned in a few minutes with a smile on his face.

'I am an ass, Jack. When the Serena hit the weed, of course she forced a passage through, and this passage must still be comparatively clear. We will search until we find it.'

They ran along the edge of the mass for three or four miles, and then turned back. Every eye on board was eagerly looking for the tiniest break which would show where the Serena had hit the weed, but without success. The bank presented an unbroken outline, and to all appear-

ances had never been disturbed since the day it was formed.

Soon after starting the search they had passed an immense mass of trees matted together with gulfweed and lianas, and as they returned it occurred to Rattray that this might have floated into the opening she had made. The Hercules was brought close in, and he went off in the dingy to explore the miniature forest. The branches stood high out of the water, and it was only by clambering over them that he succeeded in obtaining an uninterrupted view of the Screna. There was not the clear lane of water he had looked for; but two well-defined banks running from where he stood right up to the derelict showed that he had found the object of his search.

'We have a big job in front of us, Jack,' he observed when he returned on board. 'The Screen went through there right enough; but the weed followed her in, and we will have to clear every bit of it out before we can get our hawsers abourd'

aboard.'
With the first glimpse of light on the following morning they were busy. The tug stood in for the trees, and Rattray himself hitched the hawsers to two of the largest trunks. Slowly the cables tightened as the Hercules forged ahead, and, with a terrific tearing and rending, a huge fragment of the drift was torn out and towed slowly away; the hawsers were cut as close to the tow as possible, and time after time the tug backed into the trees, where the operation was repeated and great fragments torn out of the bank.

The sun beat mercilessly on the toiling men. Not a breath of air was moving to temper the scorching heat, and poisonous exhalations hung round them in a mist; but, rendered immune by the respirators, and stimulated by the example of the officers and the great prize that lay before them, the crew worked like Trojans; and when the Herculs was drawn out for the night nearly half the trees had been cleared away.

It was well into the afternoon of the third day when the first great barrier which lay between them and the Serena was removed; and as the captain and mate were discussing the problem of dealing with the weed the engineer came on to the bridge.

'How long d'ye reckon it will take to reach her. cap'n?' he queried.

'With luck, Mac,' replied Rattray, 'I hope to have the Serena in tow in the inside of a month.'

'Hoots, mon!' returned Mackenzie excitedly, 'if ye will have a look at the bunkers ye will see that there is a big hole in the coal already, and by the end of a month there won't be enough left to take the tug back to St Michael's by hersel', to say nothing of towing a weight like yon.'

Dalton glared at the speaker with a face of thunder. He was just beginning to enjoy the prospect of a big lump of salvage-money in his pockets, when his hopes were shattered by the unlooked-for words of the engineer.

'You forget, Mac,' laughed the skipper, 'that the Serena will have a few thousand tons in her bunkers, and I am sure that the owners won't object to our using some of it.'

'Hoots, mon! ye are richt.'

Standing on the stern with a couple of grapnels, to which light hawsers were attached, Rattray slung them as far as he could into the channel; the *Hercules* was then started slowly, and they had the satisfaction of seeing a large morsel of the drift separate from the mass and float after them.

'That is all right as far as it goes,' remarked the skipper; 'but we must do something better, or we shall never reach her.'

He had a number of light planks slung over the side and laid, one in front of the other, along the soft bank of 'the canal,' as Dalton facetiously christened the track of the Serena. These, it was found, would bear a man's weight, and they were enabled to carry the grapnels three times as far as they could be thrown from the tug. A hopeful cheer arose as a patch of weed fully sixty feet long slowly followed the Hercules out to sea.

Day after day they kept persistently at the work. The broiling sun beat mercilessly on men who were burned almost black by its scorching rays, and the noisome exhalations forced them to wear the respirators continually; but in spite of every obstacle the Screna perceptibly drew nearer, and with the end of the work in sight the crew worked like veritable demons.

It was time, too! The iron bars were nearly all used up in the manufacture of grapnels, and the huge coils of two-inch rope were diminishing fast, whilst the engineer's face grew longer and longer as he returned from his daily examination of the bunkers.

As they approached the derelict Rattray could see that she had pushed the weed in front of her until it had stopped her way; then it had curled round her, stem and stern, so that she lay, as it were, in an almost landlocked bay of her own making. His mind was troubled as he saw the solidity of the drift that embraced the ship, for the great weight of the Serena had pressed the weed into an absolutely solid mass, and one which, from the circumstances, it would be impossible either to cut through or tow away.

At length the moment arrived when the Hercules backed up to the side of the derelict, and Rattray himself climbed on board to fasten the two six-inch manilla cables with which to tow her from her resting-place. She lay almost broadside on, and as he went forward to the stem he hurriedly glanced at her weather-worn decks.

The Serena had evidently passed through more than one stiff gale since the date, three years before, when she had set out on her long journey. Great pieces of the rail were washed away, and not a solitary boat was left on the davits, whilst her upper works were completely wrecked. So troubled was he, however, at the prospect of the weed which still enclosed her that he did not give more than one hurried glance around, and after fastening the cables he signalled to Dalton to go ahead.

As the Hercules slowly forged ahead the cables became taut as iron rods, and Rattray, standing by the rail of the derelict, saw the huge ropes contract to one-half of their size under the strain; but beyond a slight list, no movement on the part of the Serena was perceptible. For the first time in her career the Hercules had found her master; and although the roar of escaping steam and the heavy throb of the engines showed that she was straining her utmost, the tug might as well have sought to wrench an island from its moorings. For an hour the ineffectual struggle went on; and at length, satisfied that the Serena was too firmly held to be moved, the skipper signalled to Dalton to shut off steam, and with a clouded brow returned to the Hercules.

'Tell Mackenzie I want him in my cabin, and come along yourself,' he said to the mate.

The engineer barely waited to wipe his streaming face with a bit of waste before helping himself to a generous 'three-finger' from the bottle pushed towards him, and the others were not long in following suit.

'What do you think of it, Jack?' said the skipper.

Dalton groaned.

'You gave her all the steam she could carry, Mac?' he continued.

Mac nodded grimly as he mechanically helped himself to another nip and pushed the bottle towards Dalton. 'Mon,' he replied laconically, 'the safety-valve was six inches off the collar when the mate rang off.'

There was a long silence, broken at last by a fierce exclamation from the skipper. 'Have you no suggestions to offer, boys?' continued Rattray. 'In finding the Serena I have done what no other sailor afloat could do. I have staked my whole fortune and my future happiness on her salvage, and I shall win!'

He impatiently filled his glass and tossed the fiery spirit off at a gulp.

'Look here,' he said, 'I have a plan which stands as good a chance of sending us to the bottom as of shifting the Serena. The last thing I took aboard before leaving Liverpool was one hundred pounds of gun-cotton, and this I intend to use on her.' And he related the desperate project that had flashed through his brain.

The pair stared at him in speechless amazement for a moment, and then the engineer said slowly and quietly, 'Mon! ye are captain of this tug, and one death is as good as another. I'm satisfied.'

Dalton was white to the lips, but nodded when the skipper looked at him. Rattray divided the remainder of the whisky into the glasses. 'We need not tell the men,' he said, 'until everything is ready.'

Returning on deck, he had a number of light planks slung on board the derelict. These he and the mate threw over the opposite side, and by placing them end to end they were able to make their way out on the weed for about a hundred yards. The mate returned to the tug for a grapnel to which a light hawser was attached, and after this was firmly fixed in the weed the donkey-engine was started, and half-a-dozen fathoms hauled in. They then went below, and with infinite precautions Rattray got out the gun-cotton, which was made up in ten-pound boxes.

'We will get it to the hole in five journeys,' he said.

When they had completed their self-imposed task, Rattray weighted the explosive so that it would sink to fifty fathoms.

'I will let it have an hour's fuse, Jack,' he remarked; 'that will give us plenty of time to get ready.'

The crew were called aft, and the captain, standing on the bridge, addressed them.

'My lads,' said he, 'I have brought you to the Serena, but as she is at present we might as well have remained at home. There is only one possible way of getting her out, and that is by exploding a mine at the other side. The fuse has been lighted, and I will give you warning when the time comes to hang on. Open all the ports, and then every man come aft for a tot of rum.'

Ropes were stretched across the fo'c'sle; and down in the engine-room, Mackenzie, having started the engines, lashed himself to a post from which he could control the levers. Rattray looked at his watch.

'We have just time to get the hawser with the steel spring on board the wreck, Jack,' he said.—
'Now, my lads,' he continued when the cable had been made fast, 'into the fo'c'sle with you, and hang on as if Davy Jones were pulling at your heels. The mate and I will remain on the bridge.'

The seconds ticked slowly by; not a sound was heard but the incessant throb of the engines and the swirl of the water as the screw churned it. The clouds of smoke from the *Hercules* as she strained at her work overhung them like a pall, and, despite the intense heat, Dalton felt curious quivers of icy coldness in his bones.

Suddenly there was a terrific report as if the very walls of the world had caved in, and it seemed to the watchers as if the whole surface of the weed was hurled bodily into the air, falling again about a mile behind them. The shock stunned them for the moment, but they recovered in time to see, as they thought, the Serena heel right over into the huge hole the explosion had made. Over—over—over she careened, until they could see the barnacles clinging to her very keel; and, just as Rattray opened his mouth to order the cables to be cut, the

reflex rush of the water righted her with a roll, and carried her with tremendous force on to the stern of the *Hercules*.

It was fortunate for the people on the tug that Rattray had had the foresight to keep the engines working at their highest pressure. As the gigantic vessel rolled towards the Hercules, the latter, relieved of the immense weight for the first time, darted forward like an arrow, and escaped being crushed by a matter of inches. The derelict crashed through the solid weed as if it were so much liquid, and, as she dipped, the water rose in a great ware, driving the Hercules before it like a ball from a gun.

Crack! crack! went the manilla cables as the tug, hurtling forward at forty miles an hour, threw her weight into them; but the curious hawser that the skipper had invented saved the situation. The stell spring stretched until it was almost a straight line; but before it had time to snap, the wave had dashed ahead through the canal to the open sea.

'Ease her,' rang the skipper, and the Herculas slowed down sufficiently to allow the spring to resume its normal shape.

At a snail's pace the *Hercules* moved forward with the derelict in tow, and before darkness fell the *Serena* rolled lazily on the glassy sea a few miles off the bank. A close examination next morning showed that, beyond the fact that every inch of glass on board had been shattered, no further damage had resulted from the explosion; and when, after a fortnight's laborious work, her bunkers had been replenished, the *Hercules* commenced her long, heavy tow.

Extract from The Liverpool Maritime World:

'MARRIAGE OF THE SALVOR OF THE "SERENA"

'Yesterday, at St Michael's Church, Captain James Rattray, of the Black Star s.s. City of Liverpool, to Mabel, daughter of Sir Girling Hathaway, managing director of the Joint Castle Steamship Company.

'Our readers will remember the sensation a few months ago caused by the intelligence—first published in *The Liverpoot Maritime World*—that the steamship Serena, which had been posted as missing for over three years, had been towed into the Merse. This valuable steamer was abandoned in the West Indies in 1900. She was reported detelict some time afterwards; and although a reward of one hundred thousand pounds was offered for her salvage, it remained for a Liverpool tug, the Hercule, and her commander, James Rattray, to earn it.

Captain Rattray had made a hobby of the scientific study of ocean winds and currents, and by means of his knowledge was able to foreast accurately the course of the derelict and her final resting-place in that unexplored tract of the Atlantic known as the Sargasso Sea. After an infinity of danger and trouble, she was released from the weed and towed to Liverpool, where she met with a reception which, it is safe to say, has been unequalled in the history of the port.

'The Serena was found to be intact, and her valuable cargo practically undamaged; and for his services, in addition to receiving the largest salvage award ever known, Captain Rattray was invited to take command of the Black Star Company's new boat.

'We are glad also to chronicle that his courage and genius have met with appreciation in other quarters. He was invited to lecture on the Sargasso Sea before the Royal Geographical Society, and for his researches was presented with the society's gold medal.

'No better testimony of Captain Rattray's sterling worth can be given than the fact that the crew of the *Hercules*, who shared his dangers as well as his success, have joined his new ship to a man.

'In unison with our readers, we heartily wish Captain and Mrs Rattray a long and happy life.'

THE GENTLE ART OF JU-JU-TSU.

By G. G. CHATTERTON.

U-JU-TSU—translated literally, 'The Gentle Art'—the wonderful science deduced by patient study of the source of things, and unravelling of their reason, and consequent mastery of their knowledge, that

is so essentially Japanese. It has already been exploited with approbation by medical and other authorities on physical culture; but still, perhaps a few remarks, without claiming to be profound, after a visit to its school may prove not devoid of interest.

You need pass through but a couple of streets that lead directly off the seething thoroughfares of Regent Street and Piccadilly Circus to find yourself in Golden Square, one of the quiet, green oases which here and there in London take you by surprise, and in it the Japanese School of Self-Defence has now established its headquarters. And thither we went to watch the teaching of the science upon which years of a life may be spent with ever-growing interest, since it claims that there is always something to be learnt—a perfected science of self-defence, wherein brute-force takes a back seat, and size, weight, and strength surrender their importance. For the Japanese, having probed to the heart of things, can prove how the essence of self-defence is knowledge of how to overcome by yielding to an attack instead of resisting, by using the strength of your assailant in place of your own, and, getting him at an anatomical disadvantage, as they so admirably phrase it, by then applying the skilled leverage which so infallibly can maim and disable.

The school is under the supervision of its instructor-in-chief, Professor Raku Uyenishi, premier ju-ju-tsu exponent. But as he was professionally visiting Paris we were received with smiling welcome by Professor Koizumi, and courteously given advantageous seats; and, as he was engaged upon instruction on our arrival, we had an immediate opportunity of watching the science of the 'gentle art.'

Our first impressions were belying to the title. Fearful and wonderful were the resounding slapping noises as master and pupil fell upon the shining mats beneath them—mats made in Japan,

over two inches thick and stuffed with hay under a surface of woven rice-straw, which are spread over the entire floor; slap-slap striking the ear with unnerving effect upon spectator and would-be learner, until one saw the combatants leap up again with never hurt or jar, the Japanese laughing softly through his gambols. For to fall with immunity is the skill of ju-ju-tsu, and takes the beginner in its craft months to master.

The pupil upon whose lesson we happened to arrive was no novice, but had been over three years studying, and was as well clever at his game; and yet with what smiling ease did Koizumi, so much the smaller of the two, vanquish him! At times he tossed him right over his shoulder-a curious sensation this at first experience, we are told; on the floor he was ever the man uppermost, and whether recumbent or erect he kept scoring the points by establishing the 'lock.' A 'lock' or point is scored by rendering an adversary helpless, holding him in such a way that the least resistance can be responded to by a pressure which, if continued, would entail exquisite pain and possibly serious injury. In ju-ju-tsu a lock is acknowledged by a slap on the handiest substance, human or otherwise, and the combatants arise and start afresh.

The lesson finished, after many resounding falls and endless locks declared, the pupil retired to the enjoyment of a hot shower-bath, and Professor Koizumi kindly gave us a display of falls broken into harmlessness, throwing himself down backwards, forwards, sideways, as if flung with violence, to leap up easy and unshaken.

The pupil is first taught to break a fall on his back, and next to break one on his head, saving himself by learning to come down first on his hands outspread and relaxed—the hands which make the slapping noises on the mats. The gist of breaking falls in ju-ju-tsu is keeping all the muscles relaxed for them—nothing may be rigid, or as it were in protest; and the seat of balance—and knowledge of balance is a portion of its science—comes from the waist, not from the shoulders. Knees are kept always bent, the feet move quickly, and, as in boxing, the gaze is fixed on the opponent's eyes.

The pupil is provided with a costume identical with that of the instructors: a Japanese jacket with loose, short sleeves, which leaves bare the chest and wraps across in double-breasted fashion, and is girdled with a strong band round the waist; drawers like bathing-drawers, and legs and feet bare; and the English tyro will find that his toes catch in the fine straw-work of the mats, the unaccustomed big-toe sometimes catching with unpleasant effects.

Inflexible rules find no place in the 'gentle art,' etiquette typically Japanese alone governing its friendly practice. This etiquette ordains that combatants courteously shake hands before and after a contest, and prohibits the infliction of any unseemly indignity on an opponent, at the same time allowing ample scope for placing him at an

anatomical disadvantage.

So as to know how to inflict these anatomical disadvantages, bones and muscles are given careful study—where pressure exerted sideways can break or dislocate, and where lie sensitive parts pressure against which can force the assailant to desist. Prominently sensitive parts lie about the elbow—can one not imagine desistance enforced by skilled elaboration of 'funny-bone' tortures?— and in the back of the calf of the leg; and pressure beneath the chin, forcing backwards the opponent's head, lays him at your mercy for throttling.

Quickness and agility, resource, simultaneous thought and action, must be acquired by those who would master the science of ju-ju-tsu, in which even partial proficiency would form a valuable equipment; and the English aspirant must cast aside his stubborn English principles to conform to those discovered for him so excellently by the Japanese. Different they may be—for are not most Japanese principles diametrically different from English ones? In the simple craft of threading a needle there seems to lie a keynote suggestive of their whole scheme of opposition. The English girl is taught to pass her thread through the eye of her needle, the Japanese one to pass the eye of her needle over her thread.

Englishwomen learn ju-ju-tsu, and as the 'gentle art' unfolded its power before us we fell to wondering what might have been the end had the suffragettes mastered it before their great display in the House of Commons. When, with lamentable lack of manly chivalry, screams and kicks were set at nought and overborne, ju-ju-tsu would have aided the maltreated ladies. Instead of being ignobly carried out shricking, with arms round the policeman's neck, the baffled suffragette might still further have defied the law, and, grasping his chin to his anatomical disadvantage, have quietly throttled him in his brutal progress. Instead of being dragged down from her lofty position as she gained it, she might have broken or dislocated arms that thwarted her, and the whole lobby of the House might have been held up by

More pleasing was it to watch the merry little Japanese instructors chatting so gaily amongst themselves or with their pupils, and to exchange a few more words with Professor Koizuni, who, in an interlude before taking on another pupil, had appeared clad in a dark-blue kimono, with matting sandals on his feet and a Japanese book in his hand. Then we left him to his reading, and he took farewell of us with smiling courtesy.

IN HEREWARD'S LAND.

Here, where ye count the miles by scores,
And ye count the men by tens,
The sighing ghost of an old-time wind
Sings me the Song of the Fens.
It tells, as it sobs to the swing of the scythe
Where once the tide ran free,
Of the deeds of the men, the ancient men,
Who sailed on that ancient sea.

They came in long, black dragon-ships
From the Land of the Icy Belt,
Grim sons of Odin, to love and loot,
To rob and plunder the Celt.
They fought and they feasted, borrowed his home,
And never repaid the same;
But, sword in hand, they fought for his land,
In the days when the Romans came.

When Rome's all-powerful phalanx marched From Thanet to Hadrian's Wall, They crushed the tribes who barred their way. But the Fen-men laughed at them all. Safe and secure in their sedgy homes, Enjoying each casual fray, They were there before ever the Romans came, They were there when they went away.

The Normans made the land their own,
And sought to force the Fen;
Masterful men were the Norman knights,
But the Fen-men Masters of Men.
Then, harried and harassed and held at bay
By those whom they could not break,
They lowered their lances and sank their pride,
And made their peace with the Wake!

And so the Fen-men remained the lords,
Of sedge and heath and pine,
So long as Hereward's name endured,
With the Twisted Knot as their sign.
So sings the wind, to the swing of the scribe,
To those who can understand,
Of Hereward Wake, and the ancient men,
And the peace they gave to the land.
G. Basil Barham.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, October 21st.

NLY the other day we wrote on this page about the coming of the Kaiser, in the course of the long procession of foreign kings and potentates to the capital of England and the heart

of the Empire which is brought about as the result of the wise and pacific diplomacy of King Edward. Now we hear that the almost immediate future is to be richer in such visits than most people had imagined, for it comes to be tolerably certain several months in advance that a journey will be made to England soon by the heads of two other European states, these being the Czar of Russia and Queen Wilhelmina of Holland, both of them peculiarly interesting monarchs. Between the young Queen of Holland and the British people there is a strong bond of sympathy in that there is such a strong likeness between her position on the throne in the heyday of her girlish youth and that of the young Queen of England seventy years ago, who, while she lived, saw her country grow to an unexampled position of greatness and prosperity. And in some ways also there is something pathetic in the situation of this young Queen and her Consort. So far as the scheme has at present been arranged, it is not intended that the visit shall be anything but a semiprivate one, and it will be made chiefly to the Duchess of Albany at Claremont. However, a few days may probably be spent with the King and Queen at Windsor Castle, and quite likely some opportunities may be given to the general public of showing their good feeling. As for the other monarch who is coming, it has to be said that the visit of a Czar to this country, or to most others in these troublous times, must always be regarded as a more or less delicate and difficult matter; and though at present there is a slow increase of good understanding between the Government of this country and that of Russia, a long time must elapse and some great changes must take place before there can be anything like a full sympathy.

No. 517. - Vol. X. [All Rights Reserved.]

Russia in London is probably smaller and of much less consequence than any other leading European country in London, and yet the great Russians have had more to do with our metropolis than most people are aware. Everybody knows that Peter the Great spent some time in London, and he occupied that time very thoroughly. Walk a little way down Buckingham Street, near the western end of the Strand, and you may see the house that he lived in while he was here, a modest dwellinghouse with small and rather dark panelled rooms inside. And only two or three weeks ago they began to pull down in the High Street, Deptford, a quaint old building which used to be the chapel in which Peter worshipped during the period that he lived in Deptford while he was learning shipbuilding at the dockyard. Czars have been in London at various times since then. In the way of British visits to St Petersburg, nothing has ever been more magnificent than those of the special embassies on the occasion of the coronation of different Czars, first by the sixth Duke of Devonshire, and next by his kinsman the Earl Granville, in whose entourage there was included the present head of the House of Cavendish, then a very young man only just on the threshold of his public career. This, indeed, was virtually the introduction to public life of the man who was destined to play such a great part in the politics of his country afterwards, and, be it noted, one of very special importance when Russia was at war with Turkey, and many most delicate and important matters had to be considered with the utmost circumspection. That special mission to St Petersburg in which the young Lord Cavendish had a place was probably one of the most magnificent of its kind on record, for the old Duke of Devonshire, who had been at the head of the last one, took a personal pride in seeing to it that everything was done as well as it was To revert again to Russia possible to do it. in London, not many people realise what a large number of Russian officers have in one way or another spent some time in this country. We are OCTOBER 26, 1907.

now able to think of the Rojestvensky affair with a little more charity than was the case at the time. How many of the best-informed of the critics of that distinguished Russian naval officer realised that as a young man he had spent much time in England, fitting himself the better for the life that lay before You may meet many people to-day who remember him in London drawing-rooms at that time-a thoughtful and distinguished-looking young man, who had generally agreeable manners, and who was popular. It is generally known that King Edward and the Czar have been anxious to meet each other for some time past, but there have been many things to hinder the fulfilment of such a project. Some time since the Queen purchased a villa on the Danish coast near Copenhagen, and there was an idea that the two sovereigns might meet there; but then it was found that if this scheme that had been formulated were carried into effect the King would have to forgo his usual spring holiday in the south of France, from which he generally derives much benefit. His Majesty's medical advisers were strongly against any such change in his usual arrangements, and so the idea of a meeting in Denmark was abandoned. There are good reasons why the King cannot go to St Petersburg, and so the Czar has decided to come here. This will be a full State visit, with greater ceremony and display than has marked the visit of a foreign monarch to this country for a long time. Very likely the Czarina and one or two of their children will accompany the Czar.

* * *

The other morning when we awoke and drew back the curtains we saw, alas! that there was the first symptom of the autumn and winter fogs. After a poor summer in the matter of weather the mere sight of the thing struck a clammy chill into our bones; and we remembered how the bestinformed and the most discreet of the weatherprophets had boldly declared that there is a severe winter before us. When we see the first sign of fog we know that the days of sunshine and flowers, and even of golden, sapless leaves which are still happy reminders of the dead summer, are indeed over for the season, and that there is nought for it now but to get the furs out of the cold storage and consider engagements and schemes of work for one's winter programme. Fog! I think that, taking him all in all, the Londoner must be an unusually optimistic kind of person, for it is certain that after he has got over the first displeasure of reacquaintance he takes his fogs very cheerfully indeed, and there is a very prevalent fancy that they are good for the health of the townsman. It is a fancy born of the wish and the desire to make the best of everything, and if it is a worthless delusion, it is still something to the credit of the man. Delusion it certainly is. One of the greatest doctors of the day, Sir Frederick Treves, is a bitter enemy of the London fog and of the causes which chiefly bring

it about; and I remember him not so long ago saying that the lung of the smoke-breather in London was already compromised, and that this appalling combination of soot and sulphuric acid was a great irritant to it. Fog, he says, exaggerates to an intense degree all kinds of lung-trouble, and it kills Londoners not only by hundreds but by thousands. The death-rate always goes up as the result of a bad and enduring fog. In the week of the great fog of 1880 it rose from twenty-seven wthe amazing height of forty-eight per thousandthat is to say, that during that week nearly one person in every twenty who lived in London died. So let the Londoner have great credit for his cheerfulness in such circumstances, and let him be praised for the fact that his chief complaint is not against the fog but against the railway companies who find it impossible to run their trains within an hour of the proper time, and so throw the arrangements, business and domestic, of their customers completely out of gear.

It is known that many careful Britishers who have passed their first youth, and have got into the way of feeling that they have more or less serious or troublesome complaints ingrained in their systems, which have a way of making their presence most felt when the winter chills are prevalent, take any reasonable excuse of having a talk with their doctors at this time of the year. It is now that we begin most to think of the risks of life. The fall of the leaf and the darkening of the days somehow lead even the least emotional and contemplative among us to give a thought to the immutable workings of nature, to which the life of man must strictly conform. It is reasonable, then, that happy, if somewhat too nervously minded, people should yearn at such a time for good length of life; and how they do yearn, and of the practical result which they seek to give to their yearnings, was told to him the other evening when, as for some private talk, the present writer found himself in the consulting-room of one of the foremost physicians of the day. It was a sudden fancy that such a chance shot as 'Do we live as long as we ought or could?' might possibly achieve some result; and it was stated in reply that the same question had been askel of the doctor in a professional or semi-professional capacity about a dozen times a day lately, and that it had seemed to him that the question must be particularly topical at this time of the year. It was further said that we certainly do not live any thing like so long as we might do if we made long living a science, and left undone many of the things that we do daily, innocent enough in their way, but all of which tend to the exhaustion of the energies which yield the long life. But whether this scientific living would be as pleasant as the easy way is a question of disposition and tempers. ment. Every man has a fair chance of living to be a hundred, the writer was told; and thus he was

reminded of the dictum of Sir James Crichton-Browne, who declared some time back, in just these words, that every man was entitled to a century, and did not achieve it simply because the natural evolution of his nerve-centres is largely interfered with and too often arrested by unfavourable environment and deleterious habits of life or methods of work, and old age is thus prematurely induced, unduly abbreviated, or loaded with infirmities that do not necessarily belong to it. And Sir James had it that a man should be at his best, in the matter of the capacity of his mind, from forty-five to fiftyfive years of age. This is rather later than some people would be disposed to suggest as the best time for great work, and it is nearly the age which a famous professor caused an uneasy flutter by saying that all sorts and conditions of men who had reached it should have compulsory silence enjoined upon them. You remember that Lord Palmerston was once asked when he considered a man to be in the prime of life, and that he answered immediately, 'Seventy-nine;' adding, 'but as I have just entered my eightieth year, perhaps I am a little past it.'

* * *

The conversation to which allusion has been made turned on some of these points, and the suggestion that brain-work of a severe order was rather against long life was met by the physician with the answer that a good deal of circumstantial evidence to prove the contrary could be collected—as, for example, that Herbert Spencer died when he was in his eightyfourth year; that Darwin reached his seventythird, Carlyle his eighty-sixth, Sir George Stokes his eighty-fourth, Gladstone his eighty-ninth, Disraeli his seventy-seventh; that Newton lived to be eighty-five; and that Tyndall was accidentally poisoned when he was only seventy-three-almost young enough to be the son of some of these others! The modern doctor accepts the evident laws of nature and the vagaries of human nature, and he has long ceased to search for systems and specifics that will yield old age of themselves; but it is curious to be told that here and there in foreign countries there are medical men of indubitable cleverness and position who do not seem to abide by the generally accepted limitations of medicine and science. Thus, two very distinguished French doctors have for a long time past been engaged on a very remarkable line of research and experiment, and claim to have achieved excellent results. These men are Professor d'Arsonval, one of the most eminent members of the Academy of Sciences and a professor at the College of France, and Dr Montier, who has earned a considerable reputation for the valuable nature of his scientific investigations. The former has constructed during the past few years a number of alternating electrical machines of a hitherto unknown power, and by means of these wonderful machines he is enabled to bathe his patients in a torrent of electrical fluid, sparks a foot long being given off. The voltage is tremendous,

but it is not at all painful, and the patient sits in the middle of the electrical douche, smoking a cigarette if he feels that way, and being scarcely aware that he is undergoing any treatment at all. A few years ago a number of London doctors held a theory that a very similar kind of treatment would be effective in cases of tuberculosis, and it was tried for some time at the Brompton Hospital. Being well acquainted with one of them, the present writer had the privilege of the experience, though an uncomfortable one in some respects, of sitting in a chair and having a voltage passed through him such as, he was informed, would be sufficient to kill several horses if the character of the current were changed, and of seeing sparks fly from his body, as from a blacksmith's anvil, when it was touched by the operator. It was a case of saturation in electricity. This was the kind of thing evidently that Professor d'Arsonval did with his patients, and it is said that his treatment produced some extraordinary results in cases of what was called 'premature arterial sclerosis.' Life is prolonged in this way, so it is said, because in a large proportion of cases the progressive hardening of veins is the cause of death. Cerebral hæmorrhage, angina pectoris, lesions of the heart, of the loins, and of the liver, might be said to be due to sudden manifestations of the 'arterial sclerosis,' and the physiological characteristics of all patients afflicted with such, whether old or young, are similar. It has been found that their pulses beat too quickly, that the blood circulates in veins that are either too narrow or too hard, and that this excess of pressure leads to the graver trouble that terminates the life of the sufferer. The doctor's object, then, is to moderate this tension. All this is the statement of the learned French professor, who claims that by his electrical treatment he does moderate the pressure and prolongs life. It is an interesting idea, at all events, whatever other doctors may say about it. Then we have been told, or rather the medical informer who is responsible for the bulk of this information was told, of the curious researches and claims of Dr Weichardt of Berlin. Surely it must be a fine thing to carry a bottle or a tube of serum in one's pocket which, when properly administered, would prove an instant cure for fatigue! Never to feel tired! Or, perhaps better, to be always able to enjoy immediate recovery from tiredness, and that with no assistance from alcohol! This Weichardt boldly called his serum the serum of fatigue. It is extracted from the blood and tissue of other animals bled to death after first being subjected to great fatigue, the muscular tissues being acted upon at very high temperature. The resulting extract is injected into other animals also in a state of fatigue, and from the blood of these inoculated animals is obtained the serum which is supposed to destroy the toxins resulting from fatigue. These tales of researches and of claims will make pleasant fancies for optimists at the beginning of a winter season.

And when the long evenings come again it is curious to notice how in the columns of some newspapers there are published many consecutive advertisements of different people who ply a very strange sort of business. They are professors of bridge, and for a consideration they teach that game of cards, and they 'guarantee proficiency'-a remarkable guarantee in the case of people who are without what are generally called 'card memories.' They hold classes, and they whet the appetite of their pupil for an extra guinea's worth of knowledge by showing him on some occasion how he had come on to the extent of being able to win a matter of half-a-sovereign-in coloured counters-from the professor, reckoning at the rate of 'half-a-crown a hundred.' Of course in these days the game of bridge is not merely a craze, and not merely an institution; to a large section of society it is far too much of a necessity. So people go to classes to learn it because they feel that their social state is unhappy or impossible without it. But there can be little doubt that a certain small percentage set to work to learn this gambling game with the deliberate object of securing such skill as will enable them to make money at it and have a tolerably certain increase of income. It may be a crooked ambition and a dangerous one, but its possibilities of realisation are not always so slender as some people might suppose, thanks to the exceedingly large proportion of players who are really bad, and who are the natural prey of designing persons who are better. There can be no doubt that there is now an enormous class of people who look to the bridge-tables to yield them a considerable proportion, if not the whole, of their incomes, and it is the fact that there are now in different parts of London scores of clubs that exist for no other purpose whatever than to play this game. Even those who take what is called a very broad view of life cannot regard this as a wholly happy state of affairs, and lately a well-known London clergyman declared with much emphasis and pointed illustration that it led to grave results. Almost of

necessity gambling of this kind by young people who cannot afford it weakens their moral fibre and leads them to very devious ways. Generally, as might be supposed, the consequences are the worst where women are concerned, and this authority has it that the cases of kleptomania in the West End shops by ladies of good or fairly good social position have been remarkably on the increase during recent years. A connection is drawn between this curious habit and losses at bridge. Others have not hesitated to say that worse evils befall young women who fall victims to the bridge habit or craze and lose their money. All this is as it may be; but in any case it would surely be a happy thing if all people had the same rule in the matter of whom they played cards with as has the King. It is a rule with him that he will not play with any young lady who has not attained the age of twenty-one. Only once, it is believed, has His Majesty broken that rule, and that was a little while since when he was staying at the country house of some old friends of his. The daughter of the host was chosen as the King's partner, and in view of the understanding that she would be so honoured she had been practising for months past. But when the table was being made up the King said to her very kindly, 'Marjorie, you are not yet twenty-one, and on principle I never play with little girls under that age.' However, Miss Marjorie pleaded so earnestly and tearfully for the rule to be relaxed on this occasion that His Majesty gave way, but only for 'just this once.' It is a change from a serious subject to a very light side of it; but having mentioned the King's game of bridge, one cannot resist telling a story which may or may not be true. His Majesty was opposite the dealer, and the 'call' was passed to him by his partner. The King declared 'No trumps,' and, as was his duty, in dut course laid his cards on the table, revealing what players would call 'a very thin no trumper.' Where upon the dealer exclaimed, 'Well, sir, all I can say is, God save the King, and help Mrs Blank!' Of course Mrs Blank was the name of the speaker.

ECONOMY IN PARIS.

TERY one knows what a charming place Paris is to spend money in. How delightful to set aside a sum and to run over and enjoy the clear, smokeless air and the very real gaiety of the life of Paris, without

worrying about expenses, and just doing whatever you fancy at the moment, till nothing is left but your return ticket! You can indulge yourself thus reasonably at from two pounds to five pounds a day. You can do a little of all the correct things at the correct time, and see the world and his wife, not to speak of the half-world, and the latest creations of all sorts. You can ride or motor in the Bois;

you can lunch or dine at the most fashionable restaurants; you can shop in the Rue de la Paix; you can skate in the Palais de Glace; you can have at many charming courses near Paris; you can have a good seat at a theatre, and sup occasionally at Maxim's or the Rat Mort.

Every one knows all this, but how many people know that you can enjoy Paris quite as much, if not more, if you have to consider every sou you spend and must limit yourself to an average deight or ten francs a day? You can see most the more expensive, artificial life in a different way, and you will learn to understand the life of Paris and you will learn to understand the life of Paris and get some real knowledge of its many interest-

ing differences from the life in our own towns, as well as learn many useful lessons, if you keep your eyes and mind open—no easy thing for British travellers to do, as it takes long to make us realise how insular and how obstinately contemptuous we generally are of the ways of the foreigner.

I could easily write a book on how to spend a sightseeing holiday of from a fortnight to two or three months on such a sum very comfortably. But what has struck me most about Paris are the great advantages it offers for a longer stay if you have to economise and want cheap education for your daughters. As a householder you can live exceedingly well on six or seven francs a day each person, including rent, taxes, wages, food-in fact, all ordinary household expenses. This is possible owing to the all-pervading flat system and the glorious institution of the 'bonne a tout faire.' By possible I do not mean possible to live in a slummy way, but like gentlefolk. You can get flats all over Paris with three to five rooms or more, all taxes paid, for from thirty pounds to eighty pounds a year, unfurnished, with modern drainage, and prettily arranged. Naturally you have to pay more for a bathroom, electric light, a lift, and a telephone. If, however, you are content to do without these, you can find a charming flat, with often an open view of trees close to your windows, for a very moderate price.

You do not lose caste by living in this way, and you can confine your entertaining to 'five o'clocks' or card parties, &c., which do not cost much. Idle display and large establishments are not part of the ordinary French life, and many of the best people live in this sensible way. To do this you of course require at the outset to spend some time looking out for your flat and acquiring the necessary knowledge to enable you to manage it. Until then you can live in a hotel en pension at six to eight francs a day. If you have an expert friend who can tell you the thousand and one small things you ought to know, so much the better. It is little use going to house-agents for such flats. Choose your district, and wherever you see a white ticket, 'Appartement à louer,' on a house that might suit you, ask the concierge what the rent is, the amount of the extra taxes if any, and the number of rooms ('Combien de pièces?'), and about the drainage ('Est-il tout à l'égout?'). Then, if you like, see the flat and find out about the views, noise, smoky fires, damp, &c. Give half a franc to an obliging concierge for his trouble and he will be very grateful to you.

Here are some facts about one (on the fifth floor) out of many charming flats that I know. The rent, taxes, insurance, and concierge's fees and tips come to thirty-eight pounds. It contains a drawing-room, two bedrooms, a dining-room, a kitchen, a large cupboard for boxes, and a closet with modern sanitation. There is also a servant's room on the sixth floor and a large cellar downstairs. The present tenant rents an extra attic—a large room

with a fireplace—for about seven shillings and sixpence a month, which is included in the above rent. Other rooms can be rented if required for short or long periods.

There is a charming balcony off the sitting-rooms looking on to fine trees, where the birds are fed after the petit dejeuner. They become very tame and are quite friends. There is waste ground and garden round three sides of the flat, which lies east and west, with the kitchen window to the south, and the view is very extensive to the west. It is close to the rich American quarter, and from the bridge over the Seine close at hand from thirty to forty rows of fine trees branch off to the various boulevards and along the river-banks. The riverviews are splendid, and long lines of picturesque barges, which have come from great distances, are constantly passing up and down.

Your furniture can be put on board a vessel in London, and landed at the nearest quay. The riversteamers take you and your parcels or bicycle up the river for a penny on week-days to Charenton, near Vincennes, or for twopence down to Suresnes, beyond the Bois de Boulogne, passing Meudon, Sêvres, and St Cloud. The electric railway takes you to Versailles or connects you with the Ceinture Railway and St Lazare. Tramways of all sorts, and omnibuses, horsed generally with teams of three gallant grays, take you to every possible or impossible part of Paris for three-halfpence outside and threepence inside. If you dislike stairs-which are very easy wooden ones, -you can get the same accommodation on the lower floors by paying from eight pounds to ten pounds more, or at the same price on the ground-floor. There is no doubt, however, as statistics show, that illnesses, especially such varieties as typhoid and other fevers, become rarer the higher up you live in a town. You also escape your neighbours' dust, which the pattern bonne ought to shake from the windows between eight and ten o'clock every morning.

The flat is usually taken for three months, and three months' notice is required before giving up a flat. It is the rule rather than the exception that the rooms should be thoroughly cleaned and repapered to the reasonable taste of the tenant before entry. If it is standing empty you can get a month's extra use of the flat for nothing after the cleaning operations are completed. The letting terms are the 15th January, April, July, and October.

The concierge is apt to regard the foreigner as his special prey, but if you show him that you know the ropes and are always firm and civil, and deal directly with your landlord if any difficulty arises, you will generally find that he is a much-maligned individual who works very hard and has a great deal of responsibility.

The rooms of French flats can generally be made really pretty at a very small expenditure. The cornices are in good taste, and there is often suitable woodwork to set off tinted papers without patterns, unless you like to have a conventional fleur de lys design or something of that sort, which always looks

well. Furnishing is not expensive, and you can rely on getting half the cost price back if you wish to sell. It costs very little to get some furniture sent over from home, but this subject would have to be dealt with at greater length. It may merely be added that it is a great pleasure to pick up what you want gradually after getting beds and ordinary necessaries. The old shops and fairs of Paris are an everlasting joy to those who are fond of hunting for really good old furniture and books and pictures, and who know how to give their rooms that charm and comfort which can be felt but not described.

Once in your flat and provided with a good bonne, about whom much might usefully be written, your troubles are over if you will be content to manage your household on French lines. You will fare better than at home, and have much less to attend to, and more free time. The bonne will have lit the kitchen fire (and others in winter), swept out the sittingrooms, and prepared your bath before she brings your petit déjeuner to your bedroom or serves it in the salle à manger. The milk and bread and butter -all excellent-are left at your door in the morning or twice a day, and the butcher's boy will call for orders. The bonne will then attend to the bedrooms. About eleven o'clock she will probably go out for from half-an-hour to an hour with a big basket on her arm to buy vegetables, cheese, and any small things that may be wanted, and interview many gossips at great length. Coal for the kitchen and wood and fuel for the other fires arrive punctually in sealed bags if ordered by post-card. Potin, the universal provider of Paris, will deliver your groceries, petrol for lamps, the table water which you prefer, and everything else you require, and take away the empty cans, &c., at the same time. Most things are paid for on delivery or weekly, and your bonne's book is inspected every day. Most French bonnes cook really well within the limits of the old bourgeoise cookery, which is the best in the world. You taste the special flavour of each cours, served as it is straight from the fire, unspoilt by a chilling journey by stair or lift. Your treasme is interested in her cooking, as your food is her. Her weak point is probably a lack of variety in puddings, but she is willing to learn. For two pounds to two pounds ten shillings a month, with wine, you secure the services of this paragon, who often does some washing and even sewing if required. She expects to be talked to in a more or less friendly way, and not to be treated as an inferior being and to be free for a few hours on Sunday afternoon.

The average expenditure of such a householdnamely, four people, including the bonne-can be very comfortably limited to sixteen shillings a day in winter, and less in summer, when so much fuel and artificial light are not required. This is allowing four pounds a month for rent and taxes, and is on the supposition that the flat is unoccupied and unlet in your absence for two and a half months' change of air somewhere. An average of one guest a dar, generally at tea, is included. The excellent white or red wine of the country costs about twopened halfpenny a quart, and really good wine can be got at from one to five francs a bottle. Whisky and tea can be ordered from home at home prices. You can dine exceedingly well at hundreds of restaurants for three or four francs if you want a change.

It is difficult to give in a short article any adequate description of the pleasures of such an experiment in economy, but everything I have noted is the result of personal experience and investigation. Miss Betham-Edwards happily sums up the French system of housekeeping 'as the glorification of simplicity, a supreme economy of time, outlay, and worry.'

THE HERMIT OF CAPE MALEA.

THE STORY OF A HIDDEN TREASURE.

By J. L. HORNIBROOK.

N the lonely headland known as Cape Malea, in the south of Greece, there is a solitary habitation, a rude structure perched high among the rocks, pointed out to passengers on passing steamers as the Hermit's Hut.

Though the original occupant has long since passed away, a successor has taken his place, who lives in the same rigid seclusion. Steamships bound that way often blow their steam-whistles in an endeavour to attract his attention, but he refuses to be lured from his retreat. At night, however, a glimmer of light high up on the headland marks his solitary dwelling among the rocks.

It is now many years since the first hermit took up his abode in this lonely spot. Curious stories

were told of him. Though his identity was never revealed, it was said that he had occupied a high position in the Church; that, in the heat of passion, he had been guilty of a crime, on which account he had fled from Athens and sought refuge in the rocky seclusion of Cape Malea. It was said, mortover, that he was the sole possessor of an important secret—a secret relating to a vast treasure hidden away somewhere on one of the islands of the Greeian Archipelago. The truth of the latter report may be judged from the following story, related to the writer by an old Greek pilot intimately acquainted with these waters, as an experience of fact in the days of his youth.

When little more than a lad, Carlos—that #85 the pilot's name—sailed these seas in his father's

brig; his brother, Dimitri Carlos, being mate, and his father the skipper. Pedro himself (the pilot) acted as second mate; while an old retainer, Salome by name, was cook. The remainder of the crew consisted of five Greek sailors picked up at random.

On one occasion, a hot July day, the brig was becalmed in the vicinity of Cape Malea. The sea shone and glistened under the fierce rays of the sun, the heat rising from it as though from boiling oil, and there was little prospect of a breath of wind coming to their relief.

All day long old Carlos, the skipper, sat under the awning aft, combing his white beard with his hand and glancing thoughtfully towards the rocky slopes of Cape Malea. A strong current was drifting them shorewards, and at nightfall they had to drop anchor to save the vessel from bumping upon the rocks. Then old Carlos, calling his sons to him, announced his intention of landing and seeking the hermit in his hut. All three had heard much of the mysterious recluse, and of the secret he was supposed to possess.

The two young men rowed the old skipper on shore in the punt. On landing, he bade them await his return, and set out alone up the dark and lonely slope. The night was black and still, the ground-swell flopping heavily against the rocks, while not a breath of wind came from land or sea.

The two brothers waited a full hour, but as yet there was no sign of old Carlos. The delay caused them much speculation. They wondered what was taking place up there in the hermit's hut, and what was the nature of the interview between their father and the solitary tenant of the hill.

At last old Carlos came walking down with slow step and lowered head. They were struck at once by the change in him. His manner was grave and thoughtful, though there seemed to be some subdued emotion underlying it. He had the air of one who had been profoundly impressed by something he had seen or heard.

He took his seat in the punt without speaking, and was rowed back to the brig. Not a word did he utter on the way. Even on reaching the vessel he vouchsafed no information to his sons. He went straight down below, leaving them to question each other as to what he had brought away with him from the hut.

The following morning, while the brig still lay at anchor, old Carlos summoned them both to the cabin, bidding them bring Salome with them. When they were shut in there together and secure from interruption the old man unfolded to them his tale, which proved a truly surprising and remarkable one.

He said that after landing he had climbed the rocky slope and silently approached the hermit's hut. There was a feeble glimmer of light within. Looking through the little window, he saw the hermit lying on a rude couch, one bare arm hanging over the side. He was either asleep or in the last stages of illness—old Carlos could not tell which.

He crept noiselessly into the hut. The first thing that caught his eye was a paper lying on the floor, which had evidently dropped from the hermit's hand. He picked it up and glanced at it. The contents startled him. It was a written confession of the crime the hermit had committed—telling how in a fit of passion he slew a brother-priest.

While Carlos still held the paper in his hand the hermit awoke, raised his gaunt form on the couch, and glared at him with wild, half-crazed eyes. At sight of the paper, however, intelligence seemed to return to them at once.

'Have you read that?' he cried in a hoarse, rasping voice.

'Yes,' replied Carlos, 'I have.'

'You know my secret, then?'

'Swear that you will keep it. In return, I will put you in possession of another secret—a secret from which you will derive untold benefit.'

'The secret of the treasure?'

'Yes.'

The bargain was struck between them. Carlos returned the paper to the hermit; and he, on his part, gave him full particulars of the island upon which the treasure was hidden, and how to find the exact spot. The old skipper noted down these particulars before he left the hut; and now, in presence of his sons and Salome, he produced the scrap of paper on which they were written.

Before referring to it, however, he took down a chart of the Grecian Archipelago and spread it out on the table before him. The other three bent eagerly over it.

'Here,' said old Carlos, laying a finger on the chart, 'are two islands, Paros and Antiparos, lying close together. It is with Antiparos we have to do. There the treasure is hidden.'

'How are we to find it?' asked Dimitri.

'I am coming to that,' replied the old man. 'But first I must tell you that we may have great difficulty in landing on the island at all.'

'How is that?'

'For a long time this treasure has been known to exist, though no one was aware of the particular island on which it was hidden. Some years ago a shrewd old Turk heard of it. With a few wealthy friends he leased some of the islands, under the pretence that they intended to search for minerals. Their real object was to discover the treasure, and in that they failed. Now, to protect themselves and prevent others from landing, they induced the Government to send out a gunboat, which cruised about in the vicinity of the islands. The gunboat is there to this day, and takes it upon herself to stop and board any vessel suspected of treasure-Many have been turned back in this hunting. way.'

'And if we fall in with her?' asked Dimitri.

'Leave it to me,' replied old Carlos. 'I will spin them some plausible tale. If she allows us to pass and proceed on our way I will land you three on the south-west portion of the island, at a particular spot. The landing must take place at night-time, for it is only then that the directions can be followed and the treasure found.

'When you set foot on shore,' he resumed, referring to the scrap of paper, 'you must walk due east by compass for two hundred paces, then turn sharp to the left, and get the star Polaris bearing right ahead. Follow on for six hundred paces. This will bring you to a little conical-shaped mound. Ascend to the summit, and again take your bearings. Your course will now lie northeast. One hundred and fifty paces will bring you to a sunken patch of ground about thirty feet square. Right in the centre of this square you will begin to dig. About three feet below the surface you will come across a flat stone. This you must raise carefully, and wait for some time to allow the foul air to escape before you venture down.'

'Yes, yes,' said Dimitri, nodding his head. understand.'

'The stone,' proceeded old Carlos, 'covers the mouth of a shaft over one hundred feet in depth. You must descend by means of a rope. On reaching the bottom you will find a narrow tunnel running in a westerly direction. Crawl through this until you come to another opening on the right, into which you must turn. Do not be afraid if you hear terrible noises on all sides, noises as if a great flood of waters was about to break in on you.

'This second tunnel you will find even narrower than the first-so much so that there will be barely room to crawl through. It will bring you to an underground vault or chamber; and there, amidst sights that may shock and terrify you, you

will find the treasure.'

He said no more, but handed the paper containing the directions to Dimitri, who was to act as leader of the little party. A land-breeze springing up soon afterwards, they hastened to weigh anchor, and sailed away in quest of the hermit's treasure.

As old Carlos had anticipated, they were not allowed to approach the island without opposition. The following morning the watchful gunboat hove in sight, and ordered them to round to. An officer came on board, and proceeded to interview the skipper.

Old Carlos had his story ready. He displayed the ship's papers, which showed that they were bound from Patras to Syra in ballast. questioned as to why they were so far out of their course, he stated that they had run short of water owing to calms. He wished to land on Antiparos in order to obtain a fresh supply, as he knew of a good spring there.

The explanation, told in a simple and convincing manner, satisfied the officer. After searching the brig throughout and finding nothing suspicious, he accepted a cigarette from the old skipper and

took his departure.

The brig was again put on her course, old Carlos chuckling quietly to himself. The first difficulty

that lay in their way was overcome. The old man held anxious consultation with his sons during the day. All three were excited by their near approach to the island containing the treasure.

As the sun set that evening the brig slowly rounded a rocky point on the extreme south-west of Antiparos, and soon afterwards dropped anchor in a sheltered little bay. All preparations for the expedition were silently and quickly made. To the sailors, who were not in the secret, old Carlos gave out that he wished to land in order to obtain a particular kind of plant which grew on the island. Knowing that the brig was his own, and that he was at liberty to sail her where he chose, they were satisfied with the explanation.

An hour later Dimitri, Pedro, and the faithful old Salome landed. Each carried a coil of rope and a lantern, the latter not yet lighted. They were armed, moreover, with shovels and pickaxes, as well as a supply of water and provisions.

A curious-shaped rock standing high up on the beach marked their starting-point. Under shelter of this Dimitri lighted his lantern and took out his pocket-compass.

'Due east for two hundred paces,' he said. 'That is our first move.' And in silence, each following the other, the distance was slowly paced off.

'Now to the left,' continued Dimitri. 'Ah! there's Polaris bearing right ahead. On this course we must make six hundred paces.'

With his eyes on the star, which served them as a guide, he set forward again, the two others following in his footsteps as before. Presently he paused and looked round at them.

'Halt,' he said. 'We have covered the six hundred paces, and here is the mound right before us'

They climbed to the summit, where Dimitri care fully took his bearings again.

'Now for the last lap,' he said, beginning to grow excited. 'Only one hundred and fifty paces more and we are at the spot.'

He moved on ahead again, directing his course to the north-east, and soon reached the sunken patch of ground, which was almost an exact square.

'Here we are!' he cried, making for the centre. 'The treasure lies right beneath our feet.'

By careful measurement they fixed upon the right spot. Pedro and Salome now lighted their lanterns and placed them on the ground. Then they commenced to dig.

They worked with pick and shovel, throwing up the earth in a mound, until they had reached a depth of nearly three feet. Then Dimitri's pick rang upon something hard.

'The stone!' he cried eagerly, while the two

others were not less excited.

The stone, when uncovered, proved to be a great flat slab about three inches in thickness. With no little difficulty they succeeded in raising it and getting a rope round it. Then they set them selves the task of hauling it up out of the excaration, which was quite enough to tax their united strength. That done, they sat down to wait and give time for the foul air to escape, as old Carlos had directed.

Not until a full hour had elapsed did they dare to venture down. The stone now served them in good stead. One end of the rope by which they intended to descend was made fast to it; the other was allowed to dangle down into the dark depths of the shaft. Then Dimitri, with his lantern slung around his neck and his pick secured to his belt, made ready to lower himself into the black, gaping hole. As the three stood for a moment around the mouth of the shaft, they could hear a dull booming and roaring far below, but this did not deter them. The next moment Dimitri swung himself into the dark opening, and quickly disappeared from view.

He reached the bottom in safety, and signalled the others to follow. Pedro went next, then Salome, each armed with lantern and pick. They too arrived safely at the bottom of the deep shaft.

And now the first moment of hesitation came. For a time they stood there in a group, looking at each other with awed, questioning faces. The roaring noises were terrifying. It was exactly as old Carlos had described: just as if a great flood of waters was about to crash in upon them. They were chilled, too, with the cold, which was intense down here.

Dimitri at last raised his lantern, the light of which was reflected dimly from dark walls of rock on every side. He looked around him.

'See, there is the tunnel,' he said. 'Yes,' he continued, consulting his compass again, 'it leads in a westerly direction. Come along.'

He crawled into the dark opening, Pedro following, and Salome bringing up the rear. As they proceeded the roaring of waters seemed to grow louder and nearer. They felt sure that only a thin wall of rock separated them from some cavern into which the sea found entrance, and expected every moment a raging flood to break in upon them.

The second tunnel, into which they now turned, was so narrow and low that their backs almost touched the top. The roof here was not of solid rock, but seemed to be composed of earth and stones. Once, when near the end, Dimitri raised himself a little, so that his back actually brushed the roof. Immediately there was a warning shout from Pedro.

'What is it?' cried Dimitri, endeavouring to look round.

'Be careful,' shouted his brother. 'The earth is falling. You are bringing in the roof.'

Dimitri crouched down again. A few yards farther he emerged from the narrow tunnel, and was able to stand upright. He found himself in a kind of dark vault, almost circular in shape. In spite of the din and roar of waters close at hand, his heart beat high with exultation. They had reached their goal at last. This was the treasure-chamber! He waited until the two others had emerged from the tunnel and were at his side. Then they raised their lanterns and looked about them. As they did so a simultaneous cry broke from all three—a cry of surprise and horror.

All around the walls of the underground chamber were ranged figures, lifelike in size and shape, some with the most horrible and fiendish expressions. They seemed to glare and grin at the intruders, and it was some time before the latter could bring themselves to believe that they were not really human.

'Bah! They are only images,' cried Dimitri, who was the first to recover himself. 'They were placed there probably for the purpose of scaring away any one who penetrated so far. But they must not deter us. Come, let us look around for the treasure.'

They had not far to look. In the centre of the place was a mound of earth, to which they turned their attention. Clearing it away with their pick-axes, they came upon a great oaken chest, the lid of which was quickly prised open. It contained the treasure they had come to seek. It was filled with bags of gold, a quantity of gold plate, gold figures, and jewels of every description. In their wildest dreams they had not hoped to find so much wealth.

They had brought a stout canvas sack with them for the purpose of removing the treasure. They refrained, however, from attempting the task here. Apart from the fact that the sack would not hold the entire contents of the chest, they were little disposed to linger in this ghastly chamber. The influences of the place, the silent figures staring at them from all sides, the roar of waters, had an unnerving effect upon them. Salome, in particular, was trembling and quaking, casting frightened glances over one shoulder after another. Pedro also was unstrung, Dimitri alone retaining his self-possession.

They decided to haul the chest out to the foot of the shaft, where they could remove the contents at leisure. For this purpose they attached a rope to it, and, heavy as it was, dragged it across to the mouth of the tunnel. Dimitri and Pedro, each holding the rope, entered the opening one after the other; Salome pushing and guiding the great chest from behind.

It was slow and arduous work. They could only move the heavy chest a foot or two at a time, and even then they had to tug and strain desperately to drag it along. But what cared they for that? In time they would get it out; and then—then—vast riches would be theirs!

They had only proceeded a few yards along the tunnel when they were brought to a sudden stoppage. The great chest stuck fast. They tugged and strained, but could not move it. It had caught or was jammed somewhere.

'What is it, Salome?' shouted Pedro, raising his voice to the utmost, for the roar of waters around was deafening. 'Can you see where it is jammed?'

'Yes, yes, I see,' came the faint response. 'Wait a moment.'

They heard him striking with his pick against the rocky wall of the tunnel. Again and again he struck, knocking away portions of the rock in order to free the chest. And then, as they waited, they heard a terrible cry break from him drowned almost immediately by the rush and roar that followed. They knew what had happened. The water had broken in upon them!

Desperately, frantically, they strove to move the chest, to push it back or drag it forward. It was wedged fast. Their utmost efforts could not

stir it.

They could not, they dared not linger. The water was already making its way out upon them. In another few minutes it would flood the narrow tunnel. And so, with old Salome's piteous cries ringing in their ears, they turned and crawled away for their lives.

It was a race against death. The water gained upon them so rapidly that their lanterns were soon

extinguished. Fortunately they reached the wider tunnel in time, and made their way rapidly along it to the foot of the shaft.

'Up, up!' cried Dimitri to his brother. 'The

water is making upon us fast.'

One after another they hastened to climb the rope, and reached the top in safety. There, panting and exhausted, they flung themselves down. The same heavy thought was in the mind of each—the terrible fate which had overtaken poor old Salome.

At daybreak they made their way back to the brig, carrying their sad tale to old Carlos. Though the loss of the treasure vexed him sorely, he was far more moved by the death of the faithful Salome.

Later in the day they visited the spot again, and found that the water had risen almost to the mouth of the shaft. All efforts to pump it out were in vain. It rose as rapidly as it was discharged from the pumps, fed from below by the sea itself.

And so, to this day, the water holds the treasure

in its grip.

ENGLISH AND SCOTTISH INNS.

HE cosy inn of the coaching days—
which went out about the middle
of last century, and experienced a
revival lately through cyclist and
motorist—with smiling host and
hostess, blazing fires, and substantial

good cheer, has developed in some cases into the smart modern hotel, where one loses individuality and becomes a number, and where the telegraph and telephone and bustling ways of modern life have killed old-fashioned leisure. Mr Charles G. Harper, who has given us about a score of volumes already regarding English roads, coaching, and allied subjects, has scoured England on his bicycle, and quite naturally crystallised the knowledge gathered after five thousand miles of travel into two handsome, well-illustrated volumes, The Old Inns of Old England (Chapman & Hall). Mr Harper traces the history of inns, which he believes came in with the Romans, till our own time, and chats pleasantly about pilgrim inns, historic inns, inns of old romance, Pickwickian and other Dickensian inns, those frequented by highwaymen, those in Cheshire, the inns that have retired from business and are now private dwellings or farmhouses, with the rhymes, anecdotes, relics, ingle-nooks, signs, and all the lore that has gathered around them during the centuries. The oldest inn in London, he says, is 'Dick Whittington,' Cloth Fair, Smithfield; while the 'Seven Stars,' Manchester, claims to have been licensed for five hundred and sixty

There is a wide difference between the ordinary public-house and tavern of to-day and the place where a seat in a tavern-chair, according to Dr Johnson, was the height of human felicity. The eighteenth-century inns, where men like Addison, Goldsmith, or Johnson smoked and drank in public parlours, were the clubs of that age. While comfortably seated in the Shakespeare's Head In at Chapelhouse, on the road to Worcester and Lichfield, the great lexicographer delivered himself thus to Boswell: 'No, sir, there is nothing which as yet been contrived by man by which so much happiness is provided as by a good inn.' Falstaff, when his hostess tried to prick his conscience by the memory of an old debt, said, 'Shall I not take mine ease in mine inn?' And the poet Shenstone wrote this on the window of an inn at Henley:

Whoe'er has travelled life's dull round, Where'er his stages may have been, May sigh to think he still has found The warmest welcome at an inn.

Longfellow in Hyperion makes Flemming, as he ascended the tavern steps, say in his heart with the Italian Aretino, 'He who has not been at a tavern knows not what a paradise it is. O holy tavern! O miraculous tavern!—holy, because no carking cares are there, nor weariness, nor pain; and miraculous because of the spits, which of themselves turn round and round.'

The writer, who was lately in the Globe Room of the 'Reindeer' at Banbury, with its fine Jacobean ceiling and oak panelling, and traditions of Oliver Cromwell, can witness to the truthfulness of Mr Harper's description. Equally correct is the description of the Washington Irving Room in the 'Red Horse,' Stratford-on-Avon, kept now as a small private sitting-room, looking out on Bridge Street. The walls are hung with portraits, in-

cluding those of Irving and Longfellow, and a silhouette of Sally Garner, daughter of the landlord during Irving's visit. The clock has a brass plate with inscription; there is an inscription also on the poker known as Geoffrey Crayon's sceptre, which is kept rolled up in the office of the hotel. Irving's chair is kept in a cupboard with glass doors. Mr W. S. Brassington, of the Shakespeare Memorial Library here, has edited a dainty edition, with pictures, of the two famous essays written by Irving in this room, upon Stratford and Charlecote Park.

Next to visiting these quaint inns and recalling their associations is the pleasure of turning over Mr Harper's pages. Broadway, in Worcestershire, better known and appreciated by Americans than English folk, is a favourite haunt of artists. Here resides Madame de Navarro (Mary Anderson), amongst the apple-orchards of the vale of Evesham. The four-gabled stone front of the 'Lygon Arms' gives this inn the air of an ancient mansion-house. It has a reputed Cromwell Room, where the Protector is said to have slept before the battle of Worcester. The father of Thomas Lawrence, P.R.A., was landlord of the 'Bear' at Devizes. The young hopeful was petted by the ladies, painted portraits for half a guinea, and between whiles punched the heads of stable-boys. The elder Lawrence, who was a business failure, would sometimes introduce his son thus: 'Gentlemen, here's my son. Will you have him recite from the poets or take your portraits?' The 'Feathers' at Ludlow is a fine old timbered black-and-white house. 'There are,' says Mr Harper, 'many ancient and picturesque hostelries in England, but none finer than the "Feathers," and it is additionally remarkable for being as exquisite within as without,' with its oak-panelled rooms, decorated ceiling, and carved oak overmantel. There is a 'Saracen's Head' in the town of Lincoln as well as at Southwell, Notts, where Byron once stayed and wrote an epigram on the carrier; here also Charles I. was delivered up to the Scots. Southwell has memories of Cardinal Wolsey after his fall, and its fine cathedral of Norman architecture is worth a visit. The rosery of Messrs Merryweather is one of the finest in the kingdom, and is altogether a thing of beauty and joy when the roses are in bloom. Colour and fragrance alike make a walk here an unforgettable

Some of the Shakespearian inns were the 'Boar's Head' in Eastcheap (the scene of Falstaff's revels) and the 'Garter' at Windsor. Pepys mentions the 'Red Lion' at Guildford in 1661, where he had asparagus for supper, 'the best that I ate in my life.' Defoe wrote part of Robinson Crusoe at the 'Rose and Crown,' Halifax; and at the Royal Hotel, Bideford, Charles Kingsley wrote Westvard Ho! Kests composed Endymion at Burford Bridge Hotel, near Dorking; and there R. L. Stevenson imagined a highway romance in the tapping of

an outside shutter by the chance wayfarer at dead of night. On his way to London in 1802 De Quincey made the Lion Inn, Shrewsbury, the scene of one of his rhapsodies. The 'Old Angel,' Basingstoke, now a temperance hotel, had associations with Jane Austen's early days; while the 'Royal George' at Knutsford has associations with Mrs Gaskell's Cranford. In 1852 Miss Mulock thought of Tewkesbury as the background of a story, lunched at the Bell Inn close to the abbey gates, and decided to make that house part of her new tale, which proved to be the very popular John Halifax, Gentleman. At the 'Red Lion,' High Wycombe, Disraeli made his first speech. The present landlord is Mr Oliver Cromwell. John Hampden was borne mortally wounded to the 'Greyhound' at Thame. At Goring-on-Thames there is an inn-sign painted by Marcus Stone, while that of the 'George and Dragon,' Hayes Common, was painted by Millais. Dick Turpin was the son of the landlord of the Crown Inn, Hempstead, Essex. The 'Spaniards,' between Hampstead and Highgate, has traditions of him. In 1739 he was hanged at Knavesmire, York. Mr Harper says: 'Since then he has become very much of a hero, perhaps the sorriest, the most sordid and absolutely commonplace scoundrel that was ever raised on so undeserving a pedestal.' Black Bess is wholly a creature of Harrison Ainsworth's imagi-

Mr Harper recalls that Dickens, at twenty-five even, had an encyclopædic knowledge of inns, due to his reporting journeys for the Morning Chronicle; and in Pickwick some fifty-five inns and taverns are mentioned, of which twelve remain. This first successful book by Dickens is called the very Odyssey of inns, which are touched at from Rochester and Ipswich on the east to Bath and Bristol on the west, and as far as Birmingham and Coventry in the Midlands. We read of hospitable comfort, of a prodigious amount of eating and drinking, with great joints, heaped-up dishes, and many bottles and decanters. But Dickens's waiters are creations of the novelist; those of Thackeray are drawn from the life. Cattermole drew the 'Maypole' for Barnaby Rudge entirely from imagination. When an imaginary character is believed in he soon achieves a local habitation and a name. A visitor remarked to an innkeeper, 'So this is where Mr Pickwick is supposed to have slept.' landlord was ruffled. 'Supposed to have slept?' He did sleep there, sir.' The appreciation of Dickens for inns decreased as his method of storytelling changed in later life. 'Jack Straw's Castle' on Hampstead Heath, where the novelist and Forster used to have a red-hot chop and a glass of wine, is said to have somewhat changed its character.

There is a long list of inns closed by the railways, where the 'stable-yards grew silent, grass sprouted between the cobbles, spiders wreathed the windows in webs; the very rats, with tears in their eyes for the vanished days of plenteous corn and offal, were reduced to eating one another.' The 'Edinburgh Castle,' at Limehouse, London, is now a mission church, where, instead of advertising some one's fine ales, there is the text, 'No drunkard shall inherit the kingdom of God.' Marlborough College for boys was once the Castle Inn. The 'Falcon,' at Bidford, near Stratford-on-Avon, is now a private house.

Mr Harper has not turned his attention to Scotland. There, too, he might also have gleaned some entertaining matter. The reading of his book has suggested to us the following notes. Tennyson wrote his *Daisy* in an Edinburgh hotel, while

Here alone in this dark city, When ill and weary, alone and cold. . . .

And I forgot the clouded Forth,

The gloom that saddens heaven and earth,
The bitter east, the misty summer,
And Gray Metropolis of the North.

The White Horse Inn, where Johnson arrived in 1773, was once the first hostelry in Edinburgh, but suffered a gradual decline. The Doctor had a specimen of Scottish cleanliness here, just before Boswell called to conduct him to his house in the Lawnmarket. The waiter sweetened the lemonade with sugar lifted in his greasy fingers, whereat Johnson threw the beverage out of the window. Johnson's muttered exclamation as he passed up the High Street, 'I smell you in the dark,' is a commentary on the filthy state of the open sewers. It would be easy to give examples of the coarseness of many Scottish inns in the eighteenth century. Surely Topham (1775) is wrong in calling this the best inn in Edinburgh. In the Pleasance 'we were conducted by a poor devil of a girl, without shoes or stockings, and with only a single linseywoolsey petticoat, which just reached half-way to her ankles, into a room where about twenty Scotch drovers were regaling themselves with whisky and potatoes.' T. J. Hogg, who came on by coach from York to Edinburgh after his friend Shelley the poet, who had just married, spent a night in a wretched inn where the coach stopped. He thought it a disgusting place, and was attended by a stupid, red-haired, barenecked, barefooted, dirty girl. He observed impressions of naked and muddy feet, of bare toes and heels, on the hearth and on the floor, but no other traces of social elegance. The young wench was half-naked. The common room he called an uncommonly dirty, dingy hole. It is only fair to say that John Wesley, who crossed the Border into Scotland about twenty times, and lived in all kinds of inns, notes under Thornhill, Dumfriesshire, in 1753: 'What miserable accounts pass current in England of the inns in Scotland! Yet here, as well as wherever we called, in our whole journey, we had not only everything we wanted, but everything readily and in good order, and as clean as I desire.

Robert Chambers in his Walks in Edinburgh tells us that James Dun, an innkeeper at Blackshiels,

latterly of the Pleasance in Edinburgh, removed to Princes Street in 1776, where he erected the sign of 'Dun's Hotel.' The term 'stabler' was then the common word for innkeeper; and as the word hotel was new, many thought the place neither more nor less than a house of bad fame. Lord Provost Kincaid is said to have remonstrated with the proprietor upon the indecency of the sign. In 1825 Edinburgh had nineteen hotels; now, opposite where Dun's Hotel once flourished is the gigantic North British Railway Hotel. At the other end of Princes Street a noticeable feature is the Caledonian Railway Hotel.

Lord Cockburn in his Memorials recalls a scene at the beginning of the nineteenth century in an inn at Middleton, south from Edinburgh, whither the local aristocracy, to the number of over a dozen persons, including the Duke of Buccleuch, had gathered for a day of freedom and jollity. Young Cockburn heard them roaring and singing and laughing in a low-roofed room scarcely large enough to hold them, with wooden chairs and a sanded floor. When their own lackeys did not choose to attend, the masters were served by two women. There was plenty of wine, particularly claret, in rapid circulation, but young Cockburn specially noticed a huge bowl of whisky punch, the steam of which was almost dropping from the roof, 'while the odour was enough to perfume the whole parish.' The noise, heat, and uproarious mirth were remembered long afterwards. When Cockburn's father went out of the room, the son was stuck in the chair and toasted uproariously. Burns has painted scenes like these in lower life in Tam of Shanter and The Jolly Beggars. Cockburn in 1845 lamented, 'Why, amidst all the beauty that surrounds Edinburgh, have we never had a single hedge alchouse or English country inn? Whisky, no doubt, is a devil, but why has this devil so many worshippers? Chiefly because exclusion, with its horror of open, sunny recreation, will give the people no deity to follow.

Christopher North glorified the Crook Inn, on the upper reaches of the Tweed, in his Streams, as well as Clovenfords Inn lower down, above Galashiels, where William and Dora Wordsworth in 1803 found the name of Walter Scott a passport for everything, as he also had stayed there. The recollection of being so near Yarrow Vale, and passing it unvisited, caused the poet to pen Yarrow Unvisited. Dr John Brown records an anecdote of the poet Campbell, who had wandered as far as the 'Bield,' above the Crook Inn, and was snug in bed after his tumbler of toddy, when there came a knock at the door. Candle in hand entered the pretty maiden who had given him his supper. 'Please, sir, could ye tak' a neebour into your bed?' 'With all my heart,' said the poet, starting up gaily. 'Thank you, sir, for the Moffat carrier's come in a' wat, and there's no' a single other place. Up came the big, reeking man, and exit the little woman. Carlyle spent a sleepless night in Broughton Inn, where the coach had stuck during a snowstorm. Professor Jowett used to come to Tummel Bridge Inn, Perthshire, year after year.

Inn and hotel tips and charges are another story, and each visitor has some experience, good, bad, or indifferent, to relate. R. L. Stevenson, in his green youth, exclaimed of a Scottish inn at Dunblane, 'What wonderful things inns and waiters and bagmen are!' although a little later, in Germany, with an eye on a probable remittance from home, he wrote, 'This hotel-work makes money disappear like butter in a furnace.'

In the eyes of the law an inn or hotel is an establishment the proprietor of which undertakes to provide for the comfort of all comers, especially travellers. Dr Murray in his great dictionary

defines an inn as a public-house kept for the lodging and entertainment of travellers, or of any who wish to use its accommodation; sometimes erroneously called a tavern, which does not provide lodging. There is an interesting point of law in this connection which is worth noting, emphasised by a decree against an Edinburgh hotel proprietor for a sum of over one thousand seven hundred and ninety pounds, the value of the contents of a bag of jewellery stolen from the hotel by outside thieves. Both in England and Scotland innkeepers and hotelkeepers at common law are liable to restore all goods of their guests brought to the inn and lost, unless they can establish that these have been lost through the 'act of God' or of 'the king's enemies.'

THE MONTH: SCIENCE AND ARTS.

ARTIFICIAL SILK WALL-COVERING.

HE evolution of sanitary mediums for the covering of walls, either in the form of a fluid or a fabric such as wall-paper, has been a subject of great study during the past few years. One of the latest of these is

a new material to which the name 'metaxin' has been given, and which is the production of a German inventor. The feature of this substance is that externally it has the appearance of silken fabrics, the characteristic lustre being of great brilliancy, while any desired colour scheme or effect can be secured. The grain or thread of the textile substance is completely reproduced, and the imitation is so complete that its artificial nature can only be detected by minute inspection. The wall-covering is prepared by forcing dissolved wood-pulp through a series of fine openings, and then treating and drying it by a secret process to obtain the requisite silky appearance. Subsequently this product is deposited upon a firm foundation suitable for hanging upon walls, such as paper or cotton, in a sufficiently thick layer to prevent the material underneath being distinguished. The silken threads are caused to adhere so firmly to the base that they cannot be rubbed or scratched off by wear and tear, thereby giving the covering great stability and durability, while, moreover, it is completely resistant to the action of soda, acids, or alkalies, and absolutely damp-proof. The material will take any colour, is not affected by heat, and owing to its tightly closed surface offers no refuge for dust or disease, so that it is perfectly hygienic.

AUTOMATIC SYSTEM FOR THE LOCKING OF RAILWAY-CARRIAGE DOORS.

The perils incidental to the conventional system of locking railway-carriage doors have been forcibly brought to the front during the past few weeks by

the number of fatalities that have ensued through a door suddenly flying open and precipitating the passenger within on to the metals. An ingenious system has, however, been recently patented by four inventors of Workington, whereby such dangers are completely eliminated, the doors being locked securely by automatic agency from the engine. The device is of a simple character requiring no elaborate or additional fittings to the locomotive, the locking and unlocking action being applied in conjunction with the automatic brake. Although every carriage door throughout a train may be locked in this manner, such operation does not interfere with the working of the doors of the brake-vans, which must of course always be unlocked. The scope of the invention is as follows: Before the train leaves a station the doors become securely fastened, remaining so until it draws up again at the next stoppingplace, when the doors become automatically released. After the doors have been so locked, should the guard desire to unlock a door for any reason, such as to admit or release passengers, he can easily do so from the outside by means of his key in the usual manner. Furthermore, should a door be left partly open, directly it is slammed to it becomes locked like the others. Moreover, in the event of an accident, causing possibly the overturning of a coach, the doors thereof immediately unlock automatically. Although the system is operated in connection with the automatic brake, the operation of the latter is not interfered with in any way by the new device.

A NEW TYPE OF LIFE-BELT.

Despite the numerous appliances that have been contrived from time to time for the purpose of superseding the familiar type of life-belt, the latterstill retains its popularity. Yet, at the same time, it possesses numerous well-known disadvantages. It is with the object of overcoming the latter that a new device of this type has been evolved by an

inventor of Antwerp. The life-belt comprises two buoyant cushions which are designed to fit upon the chest and the upper part of the back respectively, connected by straps passing over the shoulders. The cushions are held firmly in the requisite positions by a belt which passes round the waist and fastens with a buckle. In this manner the wearer's head is kept well above water, and there is no possibility of his equilibrium being upset. The belt weighs from six and a half to seven pounds, and can be put on or taken off in a few seconds. Being of simple design, there is no part that can fail at a critical moment, while it has great strength and buoyancy, and even when damaged, such as by fouling wreckage or rocks, is still fully capable of sustaining the wearer for any length of time. The apparatus has been submitted to a prolonged series of severe trials both in the sea off Antwerp and in European harbours, and has fully demonstrated its efficiency.

HOW TO DETECT WHEAT-STARCH ADULTERATION.

Wheat-starch is one of those domestic commodities which is greatly subject to adulteration, the usual medium for such practices being ground rice. Iodine is a familiar and ready means of determining the purity of starch, which from the resultant chemical action turns blue. But with wheatstarch such a test is not satisfactory, since the substance consists of large and irregular masses of gluten intermingled with minute grains which the iodine does not affect. In rice-starch the proportion of gluten is much less, while similarly the grains are smaller than those of the wheat. The presence of the latter can be easily detected as follows: Take a small quantity of the starch, and, under a stream of water falling into a bottle, thin it until it attains the consistency of milk. Seal the bottle, and after subjecting it to a thorough shaking allow it to stand until the sediment has collected at the bottom. Suspected rice adulteration will then be easily verified, for in such a case the undissolved wheat and rice grains will resolve themselves into three distinct layers, the larger and smaller wheatgrains forming the bottom and topmost layers, while the rice will settle in the space between.

AN INGENIOUS BENCH-VICE.

Workers at the bench are fully aware of the delay caused when engaged upon an intricate operation by the continual movement of the work in opening and closing the vice in order to facilitate filing or cutting the work at awkward points. The universal vice which has recently been placed upon the market will be much appreciated, since it has been expressly designed to obviate such disadvantages. In reality it is an application of the ball-and-socket joint, the socket being bolted firmly to the bench, while the pedestal supporting the jaws carries at its lower end a ball working in this socket. In this manner the vice can be swung through any angle and the jaws containing the

work placed in any desired position. With this ingenious tool, once the work has been clamped up there is no necessity to remove it until the task has been completed, while at the same time the work is always placed in the position most advantageous to the workman.

BEETROOT-COAL BRIQUETTES.

This is the age of coal substitutes, a varied assortment of which have recently been placed on the market, and which more or less fulfil the claims advanced. Yet at the present time one of the greatest economic problems of the day is the commercial use of the vast amount of coal-dust which accumulates as the result of screening the mineral. The most popular means of utilising this residue is to combine it with sawdust and oil, fashioning and compressing the resultant product into rectangular blocks or briquettes. A new method of preparing such bricks for domestic consumption has been invented by an ingenious French chemist, in which incidentally use is made of the waste from another manufacturing industry-the beetroot-pulp resulting from the preparation of beet-sugar. This residue is practically useless; but now, by mixing it with coal-dust and resin in certain proportions, a new type of briquette is obtained which burns freely without crumbling (owing to the beetroot pulp fibres holding the combination together), and gives an intense heat with practically no smoke. In those countries where the coal-supply is an acute problem owing to the deficiency of native deposits, and where the manufacture of beet-sugar is a flourishing industry, these briquettes should command a wide sale.

PASSION-FRUIT.

An attempt has recently been made to extend the variety of the table dessert by the introduction of the Australian passion-fruit. In the Antipodes this dainty is highly appreciated, owing to the refreshing taste of its juice, which is particularly delectable in hot weather. In appearance the fruit resembles the dark-purple plum, and is the fruit of a creeping vine which is cultivated extensively on Australian homesteads for the adornment of verandas, porches, and so forth, in the same manner as the Virginia creeper over here, the flower being a pretty yellow. The fruit has a hard skin enclosing a mass of flesh which, when ripe, is rich in juice, while in the centre are the seeds. The juice is slightly acidulous, and the flavour is somewhat a combination of the favourite summer fruits of this clime. The Autralians serve up the fruit in a variety of dainty dishes, such as with cream and sugar à la straw berries, the fruit being pressed through strainers to separate the pulp from the seeds. The supplies in Australia are very abundant and obtainable all the year round, the price fluctuating from a penny to sixpence per dozen, according to season. In this country the fruit is almost unknown, the greatest difficulty hitherto experienced being in connection with its transportation; but the perfection of the chilling-chamber should enable this problem to be satisfactorily surmounted. Once the British palate has become accustomed to its luscious flavour there is no doubt but that a heavy demand will ensue for the fruit, and a repetition of the grape-fruit romance result. Such a fruit in the summer-time should be highly welcomed owing to the lack of any similar native dainty.

AN EFFICIENT MOTH-EXTERMINATOR.

There is one pest against which the careful housewife wages a relentless war more than any other in the preservation of articles of attire, and that is the moth. Clothing before being packed away is generally liberally treated with camphor, pieces of which are always retained in the drawer or other storing receptacles. A German chemist has, however, recently prepared a powder which is stated to be far more efficacious in exterminating this insect than the simple camphor; and although it is composed of various ingredients it is inexpensive to make up. The recipe is as follows: (1) Sawdust, finely sifted, 500 parts (by weight); powdered ammonium carbonate prepared with oil of lavender, 5 parts; mix thoroughly together; then add glacial acetic acid, 10 parts; water, 10 parts. (2) Sawdust, finely sifted, 500 parts (by weight); glacial acetic acid, 20 parts; water, 20 parts; spirits of wine, 15 parts; camphor, 5 parts; oil of turpentine, 10 parts. The camphor in (2) is first dissolved in the spirits of wine, then combined with the other liquids, and the whole mixed with the sawdust. Equal parts of (1) and (2) are then taken, the second being added to the first, and after thoroughly mixing add forty parts of ammonium carbonate prepared with oil of lavender. The mixture is then left to dry in a sealed vessel. The preparation is used by distributing the powder in rooms, cupboards, or drawers in which the articles are stored, and the latter may either be suspended over or laid in the powder. If preferred, however, the substance may be sprinkled over the attire, since it is perfectly harmless. The powder is certain in its action, and retains its protective qualities for a long time. Owing to the combination of the ammonium carbonate with the oil of lavender the preparation possesses a pleasant smell, which, however, is injurious to the moths.

THE 'NOTOGRAPH.'

An ingenious novelty which will be greatly appreciated by travellers has been devised by a London inventor for use at railway stations, whereby it will be possible for passengers to communicate or make appointments with friends. The absence of any facilities at the railway termini in any of our great commercial centres for leaving messages for incoming passengers has long been deplored, and it is in order to overcome this shortcoming that the 'notograph' has been devised. It is an automatic appliance upon which messages may be written and left for instant discernment by those whom they

concern. The messages are written upon revolving belts similar to a tape-machine, and the apparatus is so designed that ninety messages are visible at one time. By its aid great inconvenience will be averted to business men while travelling. For instance, Robinson in Glasgow, who has an appointment at a certain hour in London with Smith, who is coming to meet him, misses his train. He transmits a notification of the fact, together with intimation of the train by which he is travelling, to the 'notograph' at Euston. Smith, being disappointed at not meeting Robinson upon the arrival of the prearranged train, refers to the 'notograph' and ascertains the reason; but being unable to await the next Glasgow train, in turn leaves a message on the 'notograph' for Robinson relating his movements, and the spot at which he may be found by the time Robinson reaches the Metropolis. It will be realised that by means of this appliance great inconvenience and delays may be averted, and its utility will be as greatly appreciated by people travelling for pleasure as by business men, since the communication of any description of message or instruction is possible.

PETROL-OPERATED ROCK-DRILL.

One of the latest applications of the explosive power of petrol is to the boring of holes in rocks for the insertion of the blasting cartridges. The machine is ingeniously designed, and comprises a small motor in which the vapourised charge of petrol and air is fired by electricity. The motion thus imparted to the motor is then transmitted to a rapidly reciprocating spindle, to the end of which is fixed the steel drill or jumper for boring the holes in the rock. At the same time, in addition to its reciprocatory motion, the drill-spindle is automatically rotated, so that the drill strikes a fresh surface of rock at each blow. This tool is unique of its kind, and, being so compact and self-contained, is inexpensive to operate, extremely portable, and easily moved from one point to another as desired. For quarry work the appliance should be decidedly advantageous, especially as a further improved development upon the tool has recently been successfully accomplished, whereby a battery of drills may be operated simultaneously from a single motor, so that a large surface of rock can be bored at one time.

A REMARKABLE DISCOVERY IN RAMIE PRODUCTION.

Owing to the frequent shortages in the cottonsupply during the past few years, renewed efforts have been made towards the utilisation of ramie as a substitute for this textile fabric. Already this fibre has been brought into extensive application for the production of various articles, such as incandescent gas-mantles and so forth; but its supplanting of jute and cotton has not yet been very complete. This is due to the difficulty experienced in separating the abundant quantities of gum from the fibre. In order to carry out this decortication expensive machinery is requisite; and even then, despite the slow and laborious nature of the task, the result is not very satisfactory. Consequently it has not been possible to place the ramie-the character of which, however, is fully recognised by textile manufacturers-upon the market at a price to enable it to compete favourably with cotton or But it is now announced that an Indian resident has evolved a simple process by which the degumming can be carried out expeditiously and cheaply, and without the aid of any expensive machinery. The fibre is completely deprived of the gum in the operation, while its strength and character are not impaired in the slightest degree. Furthermore, by the application of this process the ramie can be spun upon any existing jute or flax machinery. The announcement of this discovery has resulted in a decided stimulus being imparted to the cultivation of ramie, which flourishes luxuriantly in India, a syndicate having been formed in the country for the exploitation of the new decorticating process, which can either be carried out upon the rhea-field or at centrally disposed factories, transport of the crude material to which will not be expensive. The textile markets of the world have always expressed their desire to develop the manufacture of the fibre once the degumming difficulty has been overcome, since the fibre is much stronger than either flax, jute, or cotton. In view of the facility with which the rhea can be grown, it is anticipated that its cultivation will now be extensively developed not only in India but in other parts of the world to which it is indigenous.

A HANDY FIRE-EXTINGUISHER.

The simple process of producing aerated water by the discharge of the small bulb containing carbonic acid gas in an ordinary siphon is well known to every household. Recently another application of this system has been perfected which will be widely appreciated, since it enables the siphon to be used as a first-aid chemical fireextinguisher. In this instance the bulb contains a charge of liquid CO2, which supplies the requisite pressure for the ejectment of the liquid from within the siphon. All that one has to do is to empty the bulb into the siphon in the usual manner, and by the depression of the lever a steady stream of the extinguishing liquid is thrown upon the burning object.

PARAFFIN-MOTOR CAR.

The advantages of an engine which will run by means of paraffin instead of petrol must have occurred to many owners of motor-cars; and according to The Engineer, Mr R. O. Allsop has designed a two-cylinder paraffin-motor which has demonstrated its capacity for car-driving. The objections which have hitherto curtailed the use of paraffin on the road include the difficulty of starting, the smell from the exhaust, and the fouling of the sparkingplugs and valves with a gummy deposit which must frequently be removed. These difficulties have

been apparently overcome by the inventor after several years of study and experimenting. The starting is effected by petrol until the carburetter is sufficiently heated to change over to paraffin, and the above-mentioned fouling is prevented by a special device for limiting the admission of oil to the combustion-chamber. If this motor is able to substantiate its claims by satisfactory work on the road the demand is likely to exceed the supply for some time to come.

NOVEL PUMP.

Amongst the 'new implements' exhibited at the Royal Agricultural Society's Lincoln Show was an invention called the 'lamp-pump' which is designed to replace hand-power for pumping small quantities of water. The apparatus is a very simple one, and will go on pumping without attention for several hours at a time. The motive-power is produced by a small steam boiler, which may be heated by any available means. What is known as a 'primus' oil-stove was used to heat the example shown, but a gas stove or a small fire of coal or coke would do the work equally well. Steam is used at atmospheric pressure, or slightly above-hence no danger of explosion exists; and as the pump is moved directly up and down by the steam without any cranks or wheels, a breakdown or stoppage is well-nigh impossible. The pump will raise four hundred gallons an hour to a height of forty feet, and should prove very useful for the supply of water to country houses where no public service is available.

A THOUGHT IN AUTUMN.

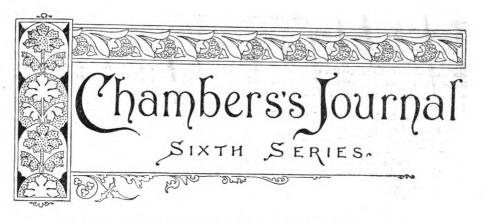

Thou art the same through all the dying years, Far moon, that lookest on the earth and sea. Now are the forests bare, the hoar-frost's tears Lie on the quiet breasts of lawn and lea, And nought but thorns the withered rose bower bear. I mind me of the grace that summer wears, The scented opulence of Arcady; Though here is snow where once spread flowers affame, Thou art the same.

Let us take comfort, since thy light will be, In nights to come, as pure as this which cheers Our youth, hope, love; for joy and tragedy Stir not the perfect splendour of the spheres:

Thou art the same. CONSTANCE FARMER

THE CALAMITY OF THE POLDER.

By C. EDWARDES.

IN THREE CHAPTERS .- CHAPTER I.

IET LEEVAN stepped out of the mill door, his Gouda pipe in his mouth, and glanced at the blue Zuyder Zee before him. A capital breeze had sprung out of the west; but near at hand the great shallow Zee was

scarcely ruffled by it. Its blueness stretched to the horizon.

Piet had proposed to release the sails of the mill and let them grind maize, as behoved them on such an afternoon; but, turning to the sound of clogs on the stones between the door and the house, he changed his mind.

'You may put that down, Klaas,' he said.

Klaas was the one man who helped him and his mill 'Well-and-Good' to grind corn for the commune. He was no beauty. 'Just an old dog that I can trust,' his master had said of him in one of his many recent sour moments. As touching the 'trust,' Piet did not overestimate him. Klaas had been born in the year of the mill. Above the mill's mouse-coloured thatch, on the roomy sky-blue pivot of its sails, the date 1845 showed in black letters. There was a white sun with golden rays beneath the date, and, let into the hinder woodwork, a panel inscribed 'Wel en Goed,' with 1845 underneath that also, and the name 'Erasmus Hendrik Leevan.'

It was Piet's grandfather, Erasmus Hendrik, who had built the mill and later taken Klaas into his service. Things had happened since then. Klaas had fought the Achinese in Batavia, and returned to his birthplace with a poisoned leg and no ears. The Achinese had captured him and begun to kill him in that horrible deductive way of theirs which might have kept him still alive, though limbless and without facial excrescence of any kind. They had started on his ears, but, happily for him, got no farther ere he was rescued. And he had been at the mill almost ever since—a warning to the ambitious who yearned to seek their fortune in

No. 518. - Vol. X.

foreign parts, and an encouragement to others to stay at home and mind their own business.

Klaas habitually wore a gray-green knitted turban to curtain most of the space formerly covered by his ears. 'I will set it going first, mynheer,' he said.

Piet simply took the pole from him. 'It will stand as it is,' he declared.

The old man looked down at his wooden shoes, and then wrinkled his brow at the mill, which was to him like a living creature which displayed proper animation only when it moved. 'It is a pity,' he said slowly. 'Why should you show such temper about a woman? Going, mynheer!' But he couldn't go yet, for Piet had him by the arm.

'Tell me this,' said Piet fiercely. 'Am I master here, or are you?'

'There is One only that is Master, mynheer,' said Klaas, 'here and everywhere. We are all little worms of His.'

Piet released him with a gesture of impatience. 'To the devil with your cant!' he exclaimed. 'Be off with you, and do not name her to me again, or you will be sorry.' He shouted the last words, red in the face, but otherwise a fine figure of a young man.

Klaas slipped down 'Well-and-Good's' gentle grass-slope. The mill and its outbuildings were perched on a hillock some fifteen feet higher than the land as far as the first dike, and that was a good third of a mile away north and south, and not much less towards the west. Between the mill and the curved dike it was rough plough-soil and this season even rougher grass, the whole veined with miles of gleaming straight ditches nearly bank-high with water. It had been a wet winter and spring, and much of the land itself was still bog. Once a day, an hour after half-tide, the opening of the Ruyter Sluice relieved the acres of some of their water, but the supply seemed infinite, and the ditches latterly soon swelled up anew.

NOVEMBER 2, 1907.

Throwing down the pole, Piet thrust his hands inside the bands of his trousers and went to the landward side of the mill. His cousin Betje was home again from Amsterdam. He stood and scowled at the immense red roof of the house which held her.

All the land in that segment of green dike was known as the Leevan Polder. His grandfather had begun the damming, draining, and cultivating; his father and Betje's had continued it; and now all the hundreds of acres belonged to Betje's father. Piet himself had care of the sluice on which so much depended. He possessed the mill and nothing else, barring a fishing-boat with two tawny sails in Cramby's little haven, an hour's walk to the south. It was one of the two gnawing discontents of his life that he had not very much more.

His father had disappointed him grievously. He had worked as hard and well as his father before him, yet there was nothing for Piet except the mill, with a bare living attached to it in these days. By all reckonings, there ought to have been tens of thousands of guilders for Piet somewhere. His father had sold his share of the polder to his brother (Betje's father) for sixty-five thousand guilders. and the amount had been paid gradually in hard cash. But at his death there was no trace of all this money, nor had he given Piet or his brother any intimation about it. The notary Visman, who had a certain insight into the old man's affairs, though not so much into his character, was as astonished as every one else, save Klaas. Only Klaas claimed to see an explanation of the wonder in the deceased's devotion to the Scriptures and scriptural teaching in his declining years. Klaas quoted the text about taking heed not to lay up treasure on earth where moth and rust do corrupt, and said those were his late master's sentiments to the last syllable. Furthermore, Klass declared that Piet's father had once talked to him of the curse that much money was likely to be to a young man of his son's volatile disposition. Piet was almost a gay youth at that time, now three years ago. He had loved Betje very hopefully then, and himself also. He still loved Betje, but without any hope.

Thus things stood with him as he eyed the red roof which had the blessedness of sheltering his brown-eyed little cousin. It was a house shaped like a long pie, the crust domed rather high above a shallow dish. Just a strip of white for its narrow body; all the rest of it roof as red as blood. Piet stared and glared as if he meant at all cost to his eyes to distinguish the very toes of the stork in its nest on the roof. The bird was perched on one leg, apparently admiring its other uplifted foot.

But a braver mood now came to the lad. 'I will go and see her,' he declared, 'whether I am wanted or not.' He knew he was not wanted inside that well-ordered house with the significant name 'Werk' on its gate. Certainly not by his aunt Mina, nor yet by her husband. As for Betje, he was not so

Betje had loved him openly enough in the old days, when he was regarded by all the country-side as a youth with a rich future. Just as open compassion had succeeded when the search for her uncle Piet's missing guilders was finally abandoned And then mefrouw her mother had abruptly taken her to a college of music in Amsterdam, and she had spent most of her time in Amsterdam ever since. The talents of several kinds which she had there acquired were so much fuel to Piet's despair. Her fine ways, besides, which were, as Klass had said, wasted on a rough polder. She still kept certain mysterious eye-twinklings for Piet when neither her mother nor her father was near; but Piet was no expert in the language of young ladies eyes trained in Amsterdam. He attributed them to ungenerous pride about herself, and recently also to the prospect of her eventual union in matrimony (by no means, in Piet's opinion, holy matrimony) with a rich Utrecht sugar-refiner named More, whom mefrouw her mother loved to throw, as it were, defiantly into Piet's face whenever they could not help meeting and he was indiscreet enough to inquire about his cousin.

Having descended the mill's little hill on the west, Piet paused to drive the chickens from the boards over the old well. There were two wells attached to the mill-this, the abandoned one, which after a few years had refused to supply water, and a newer one between the mill and the Zee. Piet's father had intended to fill up the old well; but a long course of meeting in the village had absorbed the energies he might usefully have shared with his property, and he had died leaving the task unfulfilled. Piet saw no reason why he should trouble himself about such a trifle.

From the well he followed one of the long ditch strips direct to a sod-bridge, with the gate labelled 'Werk' on its other side. He marched for his purpose like a soldier in a forlorn hope. Looking straight before him, with never a glance to the one hand or the other, he was determined to see Betje; just as determined not to be frightened off his design by any casual glimpse of her father or mother. And Fortune rewarded him for his valour.

At the bridge it was right turn, and from the gate he saw Betje herself. She was standing in something suspiciously like an attitude at the dairy-end of the farm, with a shining background of clean pans and pails set on their rims by the wall. Moreover, she was not dressed at all like a young lady of Amsterdam. Her skirts were drawn high, she wore wooden shoes, her plump arms were bare from the elbows, and it was as if she were biting a finger or thumb while she observed him. Also, unless the distance deceived him, she was smiling a welcome. But the moment their eyes met Betje gave up biting her finger or thumb Piet's heart bounded in him at that fond recall and beckoned instead.

of old times and ways. How often when they were both in their teens had Betje thus invited him to secret communion! They had had their dreams together as a result in all the few spots of privacy which life on a bare polder could yield—in the huge hayloft beneath the red roof of the farmhouse, on the other side of the dike, nestled among the cows in the stall, and even artfully screened by a rearrangement of the drying clothes on the line after a wash-day.

She pointed to the piggery, a new trim erection close under the dike. Thither Piet proceeded, with long strides and furtive glances now at the house windows. Only by a miracle could he have escaped notice already. But his aunt Mina and his uncle Erasmus would have to hurry like the chickens he had just scared if they meant to come between him and Betje before they could exchange words.

Betje received him with both hands extended and a smile that was seducingly like her smiles in the past. There was a difference, but even the difference was only a new charm in her. 'Goodmorning,' she said. 'How pleasant of you to come at last! Oh Piet, but you—hurt me!'

'My hands are hard,' said Piet stupidly, relaxing his grip.

'They always were. Papa and mamma are not yet back from Rampen. You are very lazy, I understand, of late, but may be aware it is the calf-market. They have gone for that.'

This took Piet's breath away, though he ought to have been sufficiently posted in local matters to guess it. 'You are alone, then?' he stammered, with hungering eyes.

'Yes; but there is Tante Louisa. She was to keep watch on me. She is ironing a lace collar. It must be almost finished. Piet, I want to tell you something.'

Piet shivered all over. There was wild love in the shiver as well as something of consternation. He had never seen Betje's eyes more beautifully bright, and not since that feverish hunt for his father's will, which was to mean so much to him and her, had she smiled on him with such cousinly confidence. Nevertheless, he had his doubts now about all women, even including Betje. Klass had hammered it into him, from the Bible and other good or merely wise books, that the weaker sex excels in guile. 'What is it you have to tell me?' he asked heavily.

'Oh,' said Betje, 'I sha'n't tell you if you look like an undertaker. Klaas is right. You are greatly changed. I don't think I shall tell you at all.'

'I am not changed,' said Piet. 'I wish to Heaven Almighty I'----

'Hush!' said Betje; 'the pigs will hear you, and perhaps tell Tante Louisa. Once she knows that you have used bad language to me'—

'Bad language to you, Bettikin!' groaned Piet.
'There's only you in all the world worth thinking

about. I wish I had changed; then I should perhaps try to love some other girl and forget you.'

Betje pursed her mouth. 'Thank you,' she said with an air of demureness. 'I have often puzzled to think why you don't. It must be so lonely at "Well-and-Good" with no one but poor old Klaas.'

'Lonely! It is much worse than lonely,' Piet retorted. 'I look at your bedroom window every day and inform myself that I am a fool to bear it.'

Still demure, though with the shadow of a dimple coming and going in her cheek, Betje drew her hands from her cousin's. She took him by surprise in the act. 'There!' she said. 'Now I can tell you without running risks. I also am lonely. That is why I am at home again. Mynheer Julius Mops has jilted me, Piet, and I am in the most terrible disgrace at home. I am going to advertise myself as a governess. That was my intention yesterday and this morning while mamma poured out the coffee and continued to discuss me as an undutiful daughter. Tante Louisa agrees with everything mamma says on the subject. She is so thankful she has no children of her own to rend her heart with their ingratitude. Papa is better; he only shakes his head at me. But that is quite as much as I want from papa. And now I must fly.'

'Wait!' cried Piet hoarsely.

'Well, mynheer?' said Betje, looking as if there could be nothing reasonable to wait for.

'He has given you up, you say, that sugarmerchant?' Piet spoke as if the thing were incredible.

'Suppose,' said Betje, 'I alter my way of putting it. I must not libel the dear man too grossly. Of course I never could love a forty-five-year-old Mr Mops, who is so fat that he cannot walk a mile; but papa and mamma assured me that that did not matter. They said I could not help respecting him-he keeps three carriages and seven servants, you must know. They said, besides, that respect in such circumstances nearly always grows into love. But I am much older since then, and, Piet, I don't believe it. A fortnight ago I told Mr Mops my opinion. I said I did not love even his money, much less himself; and when he had choked a little, in anger, not grief, he said I had better go home and talk it over with my parents. And here I am. I sent him back all his presents except those of them that I had eaten, and he has gone to the south of France for his health. Good-bye.'

Again Piet begged her not to go. 'Wait, Bettikin!' he implored.

This time, however, it was useless, for Betje was already almost in the arms of a yellow-faced little woman who had flown round the corner of the farmhouse just in time for her.

It was Tante Louisa, of course, in all the glory of her inherited gold skull-cap, with gold tendrils and little garnet grapes at the ears, and in all the wrath exacted by the situation.

'You wicked girl!' cried Tante Louisa, raising her hands as if to strike.

Piet's own inclination was to walk rapidly out of reach of Tante Louisa's tongue, but her uplifted hands kept him still by the piggery. Thus tarrying, he learnt something more about the beloved Betje of his boyhood, who was now ten times dearer to him than ever before.

Stopping in front of her aunt, Betje smoothed her hair with dainty finger-action. It was as if she only realised how the breeze had ruffled it now that she could see her reflection in Tante Louisa's burnished morion.

'Do you call me wicked, tante?' asked Betje calmly. 'Why, if it is not impolite to inquire?'

'How dare you,' screamed the little old woman, 'do such a thing? Do you wish to spoil the lives of two men in one week? Having broken the heart of that generous and noble-minded gentleman, Mynheer Mops'-

Betje looked round, and seemed pleased that Piet was still where she had left him, and even

listening.

'Having done this,' continued Tante Louisa, with ferocious nods, 'you seek to play with the affections of that unfortunate young man your cousin, who is already sufficiently a good-for-nothing without your idle help.'

'Come here, Piet!' called Betje.

Piet approached like one under a spell.

Was I playing with your affections, Cousin Piet?' she asked him.

He took time to consider both the question and his own answer. Tante Louisa was no aunt of his, and no more his friend than her sister, Betje's mother.

'Was I?' Betje insisted, with a stamp of one of her little clogs. But she smiled at him with the stamp, and that gave him courage.

'You were not,' he replied. 'I do not understand the game; but I am sure you were not playing with

me. At least, I think not.'

'There!' said Betje triumphantly. 'And, my dear aunt,' she added, taking the old woman's arm, 'do, if you will be so good, believe me when I tell you that it is very bad manners to talk to me like that. I am not accustomed to such vulgarity in Amsterdam. Come, dear.

Tante Louisa wrested her arm free. 'I shall move as I wish, miss,' she said, having flushed to the charge of vulgarity.—'And as for you, Piet Leevan'

'Run, Piet!' cried Betje, her eyes as radiant as her aunt's headpiece under the sun. 'Run, Piet dear!'

Again she tried to secure possession of her aunt, and again Tante Louisa would have none of her.

Instead of running, Piet did the bravest deed of his lifetime. He stepped a yard nearer Tante Louisa and confessed the truth. 'Mefrouw,' he

said, 'perhaps it is news to you, and perhaps it is not, but I love Betje better than all of you put together, and including Mynheer Mops. Fellows like that to love her, indeed! Yes, I love her, and, by Heaven! I shall marry her after all. I feel it' He raised his hand solemnly as he mentioned Heaven this time. Then, and then only, did he turn away. Betje whispered a word which he did not catch. No doubt it was a reproof of his impudence. He didn't care what it was. All the blood in his body seemed to applaud him for his audacity. He strode back to the mill and released its sails, and for three hours ground maize into flour with a light and bounding heart. Not for many a day had 'Well-and-Good' made such blithe music for

Klaas looked in once, and was sent away.

'I do not want you,' said Piet.

'You have your thoughts, mynheer?' suggested the old man, after a long look at his master's eager

'I don't know what I have, but I do not want you,' Piet replied. 'Take the key and attend to the sluice. And when you have done that bring me the key, and go where you will till bedtime.'

'You mean just that, mynheer?'

'Just that, Klaas. Why should I not mean it?'

'I suppose you have been talking to her. Ah, mynheer, it is a temptation your good father would have resisted. But, many thanks, I will go to the village, and, with permission, sleep there.

Wish to get drunk for once, eh, Klaas?' asked

Piet kindly.

'Drunk - yes, mynheer, with thanksgivings to the Lord for His many mercies. There is to be a

Piet tossed his head and laughed out. 'Go to your sermon, Klaas, he said, and much good may it do you.'

'That is what I hope, mynheer,' said Klaas.

It was dusk when Piet stopped the mill. The sky was still faintly crimson above the dunes in the west, and the criss-cross miles of ditch-water all still gleamed their silver between the hill of the mill and the farmstead of Werk. The lamp was lit in the house with the great red roof, which now looked like some misshapen dark monster, with its couple of yellow eyes set towards him, crouched as if for a spring. The breeze had latterly but just sufficed to turn 'Well-and-Good's' sails. Now there was no sound except that of the steady out gush of the polder's superfluous waters into the sombre Zee in the east. Piet stretched himself. gazed at those two unwinking yellow eyes of his uncle's farmhouse, and thought of Betje's brown eyes. He had thought of little else since their fascination had bewitched him afresh that after noon.

(To be continued.)

THE CAMPDEN HOUSE FIRE.

By HUGH CHILDERS.

HE burning of Campden House fortyfive years ago was a startling and sensational affair. Was it accident or arson? This was the issue submitted to a special jury of Surrey by a well-known insurance office,

which took the happily unusual course of charging their fashionable Kensington client with burning his house to the ground with a view of defrauding them. The status of the parties to the suit, and the reputation and money at stake, invested the affair with all the elements of romance.

Campden House was no ordinary London mansion, and I intend to give a few particulars of its history and associations. The various offices which insured it and its contents had and have a high commercial status, and if the man against whom they solemnly raised a charge of felony was of somewhat doubtful origin and superficial gentility, he at any rate had a good position in the world as a host and a collector, when collectors were more rare than nowadays, and had received royalty and numbers of people in good society at his house.

The magnificent house, which gave a name to the salubrious district of Campden Hill, was itself called after its founder, Sir Baptist Hicks, first Viscount Campden. It has become a kind of aphorism amongst the opponents of the peerage, as among the more classically severe of its supporters, that hereditary honours are to-day conferred more for commercial and less for military or political eminence than formerly was the case; it is therefore interesting to observe that Baptist Hicks, successively a knight, a baronet, member of Parliament for Tavistock, a baron, and a viscount, owed his honours and his fortune to the honourable but unromantic vocation of a mercer in Cheapside. He came of a good Gloucestershire stock, and indeed is the collateral ancestor both of the Gloucestershire viscount of the present day, who was so long known as Sir Michael Hicks-Beach, and of the Earls of Gainsborough. Hicks was fortunate in being privileged to supply the Court as well as the common people with silk from his house of the 'White Bear,' as he also was in having amassed sufficient capital to lend money, as we are told, to impecunious noblemen of Scotland; but the question whether his honours were partly due to Court favour obtained in this indirect manner does not concern us now. Having assumed the titles of Baron Hicks of Ilmington in the county of Warwick, and Viscount Campden of Campden in the county of Gloucester, he proceeded to build himself a lordly pleasurehouse in the parish of Kensington.

His peerage was a peculiar one. It was granted to him for life, with remainder to his son-in-law

and his heirs-male. As he had been married fortyfour years and had no son, it was not probable that he would have one; still, it was curious that the formality was not observed of giving any possible son a chance of succeeding in preference to the daughter's husband.

Externally, Campden House was a red brick building in the Elizabethan style, with tower, and turret, and parapet, and large bay windows, and gable-ends, and projecting porticoes-altogether a very picturesque pile; it was not unlike, on a smaller scale, its neighbour, Holland House, which was once regarded so completely as the end of London that Lamartine said, 'Après Holland House la forêt,' and Macaulay at Holly Lodge said that no one lived to the west of him except Lady Holland and the Duke of Argyll. For a time the Princess Anne and Prince George of Denmark lived at Campden House, and there is a volume, not very easy to obtain, describing the life of their son, the young Duke George of Gloucester, while there. The residence of this family at Campden House was effected that the little Duke might be near his aunt, Queen Mary, at Kensington Palace. The Prince and Princess came to Campden House in 1690, the year in which King William III. bought Nottingham House (now Kensington Palace) from the son of Lord Chancellor Nottingham, and employed Wren to add a story to it and build the present south front. The precocious little Duke, then the ultimate heir to the throne, with his 'charming countenance and the large head which betokens water on the brain, was the life of the Court.' His biographer tells many anecdotes of his childhood: 'of his regiment of little boys-his Horse Guards; how he made them seize his Welsh tailor who made his "stays" too tight, and force him to sit upon a wooden horse in the Presence Chamber for a pillory; of his gravely coming to promise King William his assistance and that of his little troop in the approaching Flemish war; of his curiously true presentiment of the day of his nurse's death; of his indocility with his mother's ladies, but his affection for Mrs Davis, an aged gentlewoman of the Court of Charles I., who first won his heart by giving him cherries, and then taught him prayers which he never failed to repeat night and morning, much to the surprise of the existing courtiers; of his constant whippings with a birch rod from his Danish father; of his proudly telling King William that he possessed one live horse and two dead ones (his Shetland pony and two little wooden horses), and of the King's saying that he had better bury his dead horses out of sight, and his consequently insisting on burying his playthings with funeral honours and composing their epitaph; and how at six years old the little Prince, with much state,

was taken to Kensington to receive the Order of the Garter from his uncle."*

I do not intend to trace the subsequent history of the house-it was a school for young ladies at one time, and there is a quaint picture of the prim scholars of sixty years ago imbibing wisdom from their stiff teacher; but after this glimpse of Campden House at the beginning of the eighteenth century I pass to events of one hundred and fifty years later. The occurrence which gives it importance in this narrative is its coming into the possession of a certain Mr Wolley in the middle of the nineteenth century. This gentleman had married a lady with an ample fortune of about thirty-five thousand pounds, and was thus enabled to buy the lease of Campden House for six thousand two hundred pounds; but earlier in life he had been in more humble circumstances. The last occupation he had before his marriage was that of clerk or translator to a French gentleman, at a salary of fifty pounds a year. At the age of twenty-one he had been in a nondescript capacity at Raggett's Hotel: he 'attended to the books or did anything to assist, but did not consider himself as a waiter; he stayed in the hotel, but had no payment.' At the time of his marriage (1847) he had no means of his own at all; indeed, being in want of money in the previous year to pay the rent of his lodgings, he had joined a company of provincial actors. There is no doubt, however, that he was a person of agreeable manners and social qualities; he sang and was musical, and had the accomplishments which attract and attach friends. People in good society flocked to his entertainments, as many as eight hundred having been present on one occasion. He bought Campden House in 1854; but two years later let it for a time to a Colonel Waugh, and retired to Tonbridge Castle in Kent, where he lost his wife, who was drowned in the Medway. In consequence of this event, and the loss of his only child, he became a good deal shaken in health.

A few sentences from his evidence in the trial to which the burning of Campden House gave rise

will be interesting to transcribe now.

'When I first took possession of the house,' he said, 'it was in a very dilapidated state. With the exception of one room, the dining-room, there were merely the bare walls. Many persons said I was mad to take it. From the time I took it I laid out very considerable sums of money upon it gradually. I was some years about it. A good deal was necessary to be done externally. I fitted it up according to my own taste. There were very few fittings in it. I took the grates out and fitted it up in the style of the original age of the house, with dogs for firewood, &c. I continued these restorations for a number of years. In fact, I was continually doing something to it. At the time I bought it it was greatly improved, and I then continued to improve

it, and was always doing something up to the time of the fire. I was always purchasing things, such as panels, and had them put together. I purchased them in all places, at home and abroad. I did not always pay ready money for them. I recollect purchasing a place in Essex called Fearing. It was an old house, and there were very remarkable carvings in it. I am almost afraid to say how much I gave for it; I think it was fifteen hundred or two thousand pounds. It was before my wife's death. I purchased it, not for the purpose of using it, but for the sake of the carvings, which were of the time of Henry VIL, very remarkable; indeed, there are casts of them in the Kensington Museum. They were removed to Campden House, and one room-the breakfast-room-was entirely fitted up with them, and furnished in keeping with the carvings.

'I was constantly purchasing pictures, both abroad and in England; very few modern ones, chiefly of the ancient school, little known in this country at that time. Italy was in a very disturbed state at that time, and things were often for sale. The panel pictures were principally in the room called the long-room or ballroom. Some time ago, I may state, I had an illness, and am almost blind sometimes, and can hardly see by day. There might be twenty or twenty-five pictures in the room of great value; several very fine Italian pictures. There was a portrait I bought at Brescia, of great value; that was one of the panel pictures There was a picture of Velasquez, I think. There were also a great many pictures in frames, and a good many that had not been framed or were taken out of frames, for I had a fancy for ebony frames, and would purchase pictures for the sake of such frames, and take them out; and this I liked generally to do by myself. Those that were not in frames were all over the house—a great many in the corridor, some in a cupboard in the library.

There were not very many looking glasses. There was one magnificent Florentine or Venetian glass at the end of the ballroom. It was in a ren magnificent frame—and that was its value—elabor rately carved, the early part of the sixteenth century. It was, I believe, the finest glass of the kind in England, and I had never seen one like it. My brother-in-law, who had a house in the Isle of Wight, was anxious for it, and said he would give four hundred pounds for it. There were a great many chandeliers procured from different places, many of them bought at Falckes Bond Street; but they were much added to site. wards, and crystals, &c., bought at various times put to them. There was a great deal of gilding in the house. From time to time, when I saw any thing in the style of the house, I bought it. I had no profession or occupation; my house and garden were my occupation, and I used to be always fitting up something. I gave one hundred and fifty pounds for the dining-room table, and furnished the room in accordance with it. The rooms were

^{*} See Hare's Walks in London, vol. ii. p. 460, referring to Lewis Jenkins's book.

richly furnished in various ancient styles—Louis Quatorze or Louis Quinze.'

One expert witness said that the articles of furniture were such as were only seen in palaces. It had cost him, he said, twenty-eight thousand pounds to fit up a smaller house in Hyde Park Gardens in a similar style.

Mr Wolley's counsel, too, in opening the case, spoke of the magnificence of the house. It was, indeed, as he said, no ordinary building, but more like a palace, a mass of quaint and curious carvings and gildings. The staircase ran up to the centre of the house, and at the top was a corridor of large size. One of the canopies took three months to execute, being taken from the ruins of York Minster,* from which it was purchased by Mr Wolley, and another from Westminster Abbey. The woodwork was gilded, and the whole was one mass of gilding. One of the arches in the interior was unique; it was taken by Mr Cottingham, the architect, from Westminster Abbey, and was decorated most gorgeously, looking like a golden arch. The rooms were hung with crimson and gold; there were oak carvings and heavy candelabra and chandeliers, and Venetian and Bohemian glasseverything, in fact, which was rich and rare. Mr Wolley was a collector (a much less everyday character then than now), and it was his hobby to amass curiosities. Old curiosity shops were ransacked for the purpose; and we have seen that such was his enthusiasm that he actually bought an estate in order to get at the carvings in the house on it. To keep up the character of the thing, there were servants in liveries of blue and silver, probably borrowed, which perhaps sounds rather tinselly. It must be borne in mind that the sixties were much more prosaic and less opulent than the closing years of the century. Early Victorianism still reigned unchallenged; Stuccovia was at its zenith, and the renaissance in furniture and china had not come. So that the ex-waiter, as he was stigmatised by his opponents, who dispensed a princely hospitality in the glorious old house of Queen Anne, was an unusual phenomenon. It would be nothing remarkable now; nobody knows or cares about the antecedents of their hosts, or whether they have been waiters, clowns, or jockeys.

This really was the gist of the attack on the unfortunate man, who had already lost his property; the actual circumstances of the fire were not of any particular interest, as far as can be gathered from the people who saw it. Suffice it to say that on a windy night in March 1862, after a proud existence of two hundred and fifty years, Campden House, with its priceless contents—amassed in the manner we have seen—was totally destroyed by fire. Nothing of all the treasures so zealously collected was saved. There was no large staff of servants in the house at the time, as after the death of his wife

Wolley seems to have lived rather a hugger-mugger existence; and though some of the inmates escaped with great difficulty, and according to the newspaper comments 'in a rather ludicrous manner, suggestive of a pantomime,' no one was killed.

There were insurances on the house and its contents amounting in all to twenty-nine thousand pounds, and the different insurance offices concerned resolved to resist the claims. Now, to do this on the ground of arson is to charge a crime punishable by penal servitude for life; still, this was the course determined on, and the battle was fought on the claim first in order, one on a particular policy for four thousand five hundred pounds, and the result of this trial was to be taken as decisive of the rest. The counsel for the insurance company in his speech to the jury went so far as to say that it would be ruinous for their office to set up such a defence unless they could sustain it; but the Judge said it would not be so, for if companies were to say, 'We will pay claims which we believe have originated in fraud and arson rather than discredit ourselves with the public,' the consequence would be that no one would be safe in bed for fear lest his neighbour, certain of impunity, should set fire to his house in order to defraud a company. There is, however, no doubt that Wolley's somewhat peculiar past made the defence more easy than if he had been a man of better birth and education. The claim looked suspicious; and it was suggested that, having lost money and being no longer able to live in the style he had been keeping up, he may have considered it the easiest line of retreat to appear to be obliged to drop out of society after a crushing and unmerited catastrophe. The trial, having been crowded out of the Middlesex list, took place at Croydon, where the Surrey Assizes were at one time held, and it was watched with intense interest. Baron Bramwell presided, and there was a great array of counsel on both sides, of whom three-Mr Bovill, Mr Lush, and Mr Denman-afterwards became Judges, and one is at the present time in political life as Lord James of Hereford. The feature of the case was the crossexamination of Wolley, on which everything turned; and although this lasted several hours, he preserved his self-possession throughout, and answered very quietly. His sister-in-law, who described the fittings of the house, in her evidence said she had an interest in some of the furniture, which had been bought with her money, to the extent of thirteen thousand pounds, and she had lent Wolley thousands more! She said that thirty thousand had been spent upon the house.

A perfect host of witnesses was called to try to prove that the house had been intentionally set on fire; but, as the Times said in its comment, 'nothing more was proved against Mr Wolley than might be made out in many cases by aid of spiteful tittle-tattle, jealous attorneys, and large funds;' the head and front of his offence being that he was 'an adventurer, a nobody, a strolling player, a

^{*}In 1829 a lunatic named Martin set fire to York Minster, and much damage was done to it; eleven years later it accidentally caught fire and narrowly escaped destruction.

waiter at a tavern who marries a rich wife and takes a great house. Mr Bovill, in replying on behalf of Mr Wolley, had no difficulty in demolishing the case made against his client; and the jury all but stopped him in the middle of his address. On the fifth day of the trial—a stuffy day at the end of August, the Croydon court crowded to suffocation—the Judge summed up strongly in favour of the plaintiff, and the jury instantly returned a verdict for him. His counsel, in a fine indignation, then claimed interest up to the very day, which was granted, judgment being given for a sum even running into halfpence.

What subsequently happened to the hero of this strange story I do not know. Campden House rose again like a phœnix from its ashes, a faint reflection of the old Elizabethan building, because it was necessary that the money recovered should be expended in reinstating it; as a matter of fact, the new building of 1864, unable to maintain itself against the inroads of surrounding flat, was pulled down about half-a-dozen years ago, though the small annexe of the original building, added by the Princess Anne, and known as Little Campden House, still remains, an object of artistic interest.

AN ELEPHANT COMEDY.

By Albert Dorrington, late of New South Wales, Australia.

E followed the baggage-coolie and his tiny bullock-cart along the narrow mountain-road where the closeplanted para-trees clung tenaciously to the storm-washed slopes. My business lay with one of the superin-

tendents of the large rubber-plantations at Newara, about fifty miles from Colombo.

I had left the crowded pilgrim-train at the siding, where the engine was still visible as it crawled round the bottle-shaped summit towards Kandy. The superintendent's bungalow overlooked the plantation and the company's vast jungle reserves—a densely wooded tract of country extending for several miles through valleys and roaring torrents. The coolie lines were in the valley below, a mere cluster of mud huts thatched with straw, and infested with yellow pariah dogs and squalling Tamil children.

I was met at the bungalow gate by Belton Dacey, the superintendent, and after the usual hospitable formalities was conducted over the estate to where a gang of labourers was at work clearing and burning off a patch of heavily timbered land.

While passing a thirty-acre field of newly planted trees we came upon a group of young para-plants uprooted and tossed aside as though a tornado had passed during the night.

Dacey turned to me almost apologetically. 'We've been pestered by a rogue elephant the last week or so. I don't know why the brute chooses our plantation night after night, while others in the district remain untouched.'

Lower down the valley, where the company had put in several thousand cocoa-nut trees, there was further evidence of the rogue's trunk and foot work. Many of the young palms had been twisted and wrenched to the ground and their top stems scattered broadcast. The brute's footmarks were plainly visible in the soft sandy soil.

Following the spoor leisurely, we halted in a hollow half-concealed by a clump of silver oaks,

and examined them more closely. A man's footprints joined the elephant's just here, then followed them for a short distance, and disappeared altogether. Sixteen years spent in Australia among the black police and aborigines had taught me something of the art of tracking. The dishshaped elephant-spoor grew faint and was lost, as far as Dacey was concerned, the moment we crossed the first gravel ridge.

'What do you make of it?' he asked, halting suddenly.

'Seems to me as though the brute had been brought here by its native keeper,' I answered. 'The man's footprints disappear near the clump of silver oaks, which seems to indicate that he rode the animal here, and waited until it had trampled and uprooted things to his satisfaction. I might go further and say that the unwieldy creature was thrashed or goaded into doing the mischief.'

The superintendent grew thoughtful for a moment; then his eyes glittered strangely, as though a sudden thought had fired his imagination. Returning to the bungalow, he summoned the head kangani hurriedly. A few moments later a grizzled giant of a man with black Tamil eyes and skin stood salaaming in the doorway.

'You did not tell me, kangani, that it is Musora who drives his beast across our fields at night. Have you quarrelled with the man? He has no grievance against the company,' said the superintendent of the man.

dent sternly.

'I know nothing of the matter, dorai, answered the kangani softly. 'Musoora is a drunkard and a bad man. I know not why he comes here with a bad man. I have dug pits, but the beast passes them by. The pea-rifle my brother brought from India is not much good for stopping elephants, oh master!'

Belton dismissed him sharply and turned to me. 'This fellow Musoora and his elephant were employed on the estate until quite recently. He is a bad lot, and his animal is no better. Like most Tamils, he goes amok when the taste of whisky is in his mouth. He has been convicted three times for driving his beast over cultivated land. One night, about two years ago, he brought a couple of full-grown bull-tuskers up to an overseer's bungalow and drove them at it under the goad until they wrecked it fore and aft. If he visits the estate again,' continued Dacey, 'I'll send the police after him and destroy his elephant.'

During the night I was awakened by the mournful barking of an elk as it wandered over the mountain-side. Later, my small fox terrier, which always accompanies me, scampered up and down the bungalow veranda as though in pursuit of several cats. Approaching the window, I perceived a score of black-faced monkeys peering down at the dog from the trellis-work overhead; they chattered and grimaced maliciously as it leaped and tried to gain the veranda rail.

'They come from the forest at night,' explained my bedroom coolie, entering hastily. 'They pick up scraps of bread and fruit, and they will not go away unless we reach them with a whip or shoot one of the mothers.'

I was not in favour of shooting one of the mothers, especially the one that sat on the trellisedge with the bald-faced, shiny-eyed baby in her arms.

'But the sinna dorai must not encourage them,' whispered the coolie, 'or they will come again and break the windows.'

About midnight we were awakened by a terrific din from the coolie lines. It seemed as though an army of women and children were wailing and calling to each other from different parts of the estate. Above all was heard the insistent throbbing of a death tom-tom.

Passing round the veranda, I met Dacey on the steps, his face whiter than usual. 'Some devil's work going on below,' he said bitterly. 'At daybreak they will come up here, six hundred strong, and ask me to remove their lines to a more suitable site. A man or a woman falls sick suddenly, and they believe that the devil is in their huts. No amount of argument will convince them that dirt is the only visible devil. The lines have to be shifted and rebuilt on another site—at the company's cost of course,' he added bitterly.

Dacey rarely interfered with the domestic troubles of his seven or eight hundred Tamils unless murder or violence justified his presence in the lines. The kangani or headman settled all disputes, and in the majority of cases he ruled justly and with a rod of iron.

The shouting continued below until the valley echoed with the screaming and wailing of Tamil children and women huddled together in groups near the factory door.

Dacey shrugged his shoulders and beckoned to me. 'Come and see the fun; come and see the big black kanganis thrashing a mob of stampeding coolies. To-morrow, if my luck is out,' he went on slowly, 'there won't be a single Tamil labourer on the estate.'

'Where will they go?'

'Anywhere. They'll disband and seek employment on other plantations.'

'But your coolies are bound over to serve the estate for a certain period. You can compel the bolters to return.'

'Yes, if other planters were honest and advised me of their whereabouts. But the other planters are always in want of a few extra coolies, and the bolters are sheltered and set to work with the others.'

Following the superintendent down the steep, boulder-strewn path, we arrived outside the lines, where two hundred Tamil girls and women lay crouching in the tall lemon-grass, spreading out their hands in the direction of the forest reserves.

The kangani, his eyes glinting savagely, strode from a mud-walled house, his big black fists clenched at his sides.

'Speak out, man!' thundered Dacey. 'What has happened? Who drove these women from their huts?'

The kangani pointed to the jungle reserves, where several lanterns flared as though a host of coolies were beating the scrub in quest of a hidden foe.

'The elephant, oh master! It has taken my little son.'

The kangant's head drooped slightly; his breath came in sharp expulsions. 'My wife came to me a minute ago crying that the elephant had lifted the babe from beside her. It was dark, the fires were out, and we could not see the black beast as it walked back to the forest. A curse on the marauder that enters the huts to steal our children!'

'You have not been drinking?' The superintendent eyed him frostily, his erect figure and flaming eyes. 'Have you been smoking opium?'

The kangani shrugged his shoulders and indicated the crowd of women huddled together outside the lines. 'Ask these people, oh master! It is the sick man and the cripple who take afim.'

The women now gathered around the superintendent, and each explained and dilated upon the elephant's iniquitous act. It had trampled into their lines without warning; it had trodden on two pariah dogs that obstructed its entrance. Without warning or noise it had lifted the kangant's babe from the mat, and had vanished in the darkness. They were sorry their headman had lost his little son. The elephant would carry it to the river and drown it for certain.

The superintendent's face grew dark and perplexed as he listened to the chatter of the Tamil women. He had worked in Southern India for several years, and he knew the ways of drunken mahouts and trained elephants too well to discredit certain parts of the story. We examined the kangani's house and the broken threshold where the huge beast had crushed and torn away the woodwork while effecting an entrance. In a far corner of the room lay a young Tamil woman, her small brown fingers dug into the earthen floor. Her face and shoulders were half-concealed by a scarlet sarong.

'She allows an elephant to steal my little son.' The kangani spoke behind us, and his voice was full of bitterness and suppressed wrath. 'She is no longer wife of mine. To-morrow I will thrash her before her people. The tom-toms shall follow her from the lines.'

'You will quit my service, then,' answered the superintendent coldly. 'There will be no thrashing either, kangani.'

The kangani lowered his head. 'The dorai knows I loved my little son. This beast of Musoora has stolen my life.'

The superintendent had given an order to a coolie some time before, and he now appeared carrying a heavy Mannlicher rifle on his shoulder. Dacey took it and walked from the lines past the sprawling Tamil women and gaping men.

A crowd of boys surrounded us as we moved towards the jungled slopes near the eastern corner of the plantation. Dacey turned sharply and snapped out a word to them. In an instant they vanished back towards the huts.

Faint streaks of dawn appeared in the distant sky. Banks of white mists surged over the deep valley, and the down-dripping moisture fell like heavy rain upon our garments. Far away came the ugly yelp of a jackal, and the pariahs in the coolie lines answered in dismal chorus.

'An Australian black tracker would have picked up the spoor long ago,' I began apologetically as the superintendent fretted in my wake, wolfing the end of his Burma cheroot.

'Go on,' he said huskily. 'Musoora has a hut on our boundary, also three wives, six children, and a rogue elephant. After I've disposed of his child-stealing beast I'll see whether his constitution is adaptable to a nice clean jail.'

The day broke with startling suddenness. A belt of saffron spread like a fiery cloud across the naked east; the sun-illumined peaks seemed to flower and redden in the yellow flares of light. Groups of tiny black apes watched us from the high-stemmed silver oaks as we plunged across the gully into the scrub where the spoor showed in the creek slime. Behind us stalked the kangani, his sheeted garments drawn tightly about his face and head. Again we crossed the man's footprints that joined the elephant's higher up the gully. We were soon panting along the edge of the gravel range, and here the spoor disappeared mysteriously. The hard, stone-like surface of the ground refused to retain the slightest impression of man or beast's footprint.

'Let us go to his hut,' said Dacey. 'He will come home sooner or later.'

The smoke of Musoora's household wound skyward in the clear morning air, and as we crossed the ridge overlooking the valley we beheld a squat, mud-walled house half-concealed in a tangle of lianas and scrub.

Three women who had been cooking rice inside appeared suddenly at the door. A couple of yellow pariahs yelped savagely from the evil-looking interior. At that moment a terrific thrashing of brushwood came up from the jungled hollow below; the rasping voice of a man broke the morning silence.

'Tull, tull, thou! Walk, beast, or the factory dogs will eat thy feet. Up, Binam, up!'

The head and tusks of a full-grown elephant appeared from the jungle-shadow; a moment afterwards beast and man swung into the open, glistering from head to heel with moisture from the overhanging forest. The man, turbaned like an Indian mahout, plied his thin iron goad on the head of his beast mercilessly. A sudden turn in the path brought him into line with the superintendent's rifle.

The elephant trumpeted hoarsely, then halted and remained stamping and rocking in front of us, its small intelligent eyes fixed on the immovable rife-

The driver raised his head suddenly, and his jaw hung at sight of the angry superintendent standing in the path.

'Get down!' commanded Dacey sharply. 'And if you address a single word to that—that meegra elephant, I'll shoot you without mercy, Musoora.'

Musoora made no movement; his slack mouth expanded until the fat creases under his chin seemed to fold over his greasy vestments.

The kangani, standing behind, called out in a quivering voice, his left hand indicating something tucked away between the tusks and trunk of the stamping elephant, 'My little son, oh master: Alive—by the gods! Let us talk reasonably with Musoora; no harm has yet been done.'

At first glance it was almost impossible to see the dusky infant rolled away so cunningly in the folds of the great trunk. Musoora held his goad aloft half-threateningly, as though intending to drive his beast over us.

The superintendent's rifle came suddenly into line with the elephant's blinking eyes. Deliver the child to its father, Musoora. We'll talk after wards concerning the trampling down of No. 9 field. No monkey-tricks,' he continued, 'or I'll present you with a dead elephant in ten seconds.

'Shoot, dorai! shoot!' laughed Musoora from above. 'Your bullet will not save the kangan's brat; the dying beast will crush it as it falls'

'There is something behind this foolery,' said the superintendent sharply. 'Speak out, Musoora. I will listen.'

The mahout leaned from the beast's shoulder and pointed with his goad at the stiff-limbed kangani standing in our rear.

'That headman of thine, oh dorai! has swindled me out of fifty rupees. I have waited a year for the money—money for lifting timber from the old lines, money the company paid him for my work and the work of my elephant. Let him pay me now, or there will be no son to take over his debts when he is dead.'

'It is a lie!' shouted the kangani. 'It was thirty rupees—no more. The dog lies, oh master! He shall not threaten my son's life for money owing. It is against the law.'

The superintendent's face grew dark as he glanced swiftly at the gesticulating headman. 'I will give you both sixty seconds to make up your minds.' He spoke slowly along the barrel of his rifle, his eyes fixed on the watchful mahout. 'The three of you shall suffer—the elephant first. Now'—

It seemed as though the uneasy brute understood the superintendent's threat. The great trunk swept up and down trumpeting shrilly, while its huge body rocked to and fro in fearful expectation.

'Shoot, oh master!' whispered the kangani.
'Let my brat take its chance. I will not pay Musoora fifty rupees. The elephant will fall on its side, not head first. Believe me, dorai, it will fall on its side. Let the child'——

Something wet and dripping flashed out of the jungle. A scarlet saring and a woman's burning eyes confronted us. It was the kangan's young wife, and her mouth was drawn, her cheeks sunken, as though the sharp misery she had endured had unhinged her mind. The mountain mists had matted the long black hair, and the wind had blown it mask-like about her low, broad forehead. She crouched forward under cover of the superintendent's rifle until she stood in front of the fear-stricken elephant.

'Back, Nourana!' screamed the kangani. 'The beast will strike thee dead!'

Without turning or heeding his words, she

gripped the near tusk with her left hand and smote the great blinking face above her.

'Thou beast! was there no other child but mine to steal? Was the trampled fruit of our garden not enough—the banyans and sweet herbs that thou takest the blood of my heart, thou evil one?'

The elephant seemed to relax, and its trunk unfolded suddenly; the brown brat slipped from its resting-place into the woman's arms. Pushing it across her broad hips, she took a stick from the ground and again darted forward.

The elephant retreated, its small red eyes watching her anxiously. Her lithe body quivered as she smote it fiercely on the lip and trunk, stooping in her fury to belabour the flinching brute on its soft round toes.

'Remember, thou eater of swine, not to enter my house again. The taste of thee will be on my child until it dies. Beast!'

The elephant nosed the air in its pain, and, with a sudden heave and shake of the head, crashed into the jungle on our left. Musoora turned and shook his goad at the trembling kangani as the elephant bore him unwillingly from the scene.

'The affair is settled for the present,' said the superintendent, shouldering his rifle. 'I must admit,' he added to me, 'that the woman's promptness saved the situation. These Indian mahouts are deucedly awkward fellows to deal with.'

The kangani hurried back to the lines, followed by the shrill-voiced Tamil woman carrying her child. We returned to the bungalow, feeling that our sleep had been unnecessarily disturbed.

A few weeks later I heard that the notorious Musoora had been arrested and put in jail. There were many charges against him, but the one preferred was for driving his animal full tilt at a motor-car on the outskirts of Colombo. East of Aden the inebriated chauffeur is never so dangerous as the drunken driver of an elephant.

SOME BARGAINS IN OLD OAK.

By R. A. GATTY.

HERE will always be collectors of old oak furniture, no matter how fashionable the Chippendale and other periods of exquisite taste and finish of workmanship may become. Oak was the material used by our

forefathers in their house-building and furnituremaking; and though the wood as a substance may not take the same fine polish and colour as mahogany, it has peculiar merits of its own. The graining of oak, called the flower, has often beautiful markings, and the wood acquires a peculiarly soft gray-brown colour as the centuries go by. It may be as well to correct one popular error: there is no such thing as black oak. If you come across a dark-stained piece of oak furniture you may be perfectly certain that it has been treated with some colouring dye, for the wood if left to itself never naturally goes black. It is true that this staining of the wood is often as old as the period when the furniture was made, but it nevertheless is not the real colour which the oak takes if left to itself.

It is to the interest of dealers and fabricators of old furniture to keep up this fiction of black oak, and they point to it as a sign of great antiquity, and the general public believes them. The dark stain covers a multitude of sins in the shape of new wood and patches of modern carving, especially when afterwards covered with a coat of shining varnish. I discussed this once with a dealer, who

freely acknowledged that he regularly stained his old furniture, for unless he did so no customer would buy it. This especially referred to the American market, for numbers of visitors from the United States came to his shop during the summer months. I may here remark that a genuine piece of oak furniture can be relieved of this stain by an application of hot water and potash, and the wood restored very nearly to its pristine condition. But the furniture must be genuine and not made up, otherwise all the defects will become at once apparent.

Although the cult of old oak is not likely to die out, it is by no means certain that the supply is not rapidly coming to an end. Most of the best pieces are in private hands, and rarely come into the market, and when they do they fetch very large prices. It was quite different thirty years ago, when it was possible to meet with fine specimens in the farmhouses and cottages in out-of-the-way districts. As an instance of this, I remember calling one day to see a farmer about his rent, and I found him thrashing wheat in his barn with a flail. He had portioned off a corner by placing a large oak table-top across the angle, and over it he threw his thrashed wheat. I inquired if the remainder of the table was still in existence, and he took me to another part of the barn, where I saw a magnificent table, with a carved frontal twelve feet in length, having grapes, vine-leaves, and parrotheads deeply carved upon it. The legs, six in number, were of elongated melon-shape, and connected by foot-rails. There were two long forms six feet each in length, and two oak joint-stools to fit the two ends of the table.

It was evident that the table had been intended to stand against the wall, and the guests dined with their backs to the rest of the room. It had never been made for a farmhouse, and it must have come from some superior residence. The farmer could not enlighten me on this point, and all I could gather from him was that it had been in the barn since the days of his grandfather. I afterwards ascertained that about a hundred years previously an old manor-house had been pulled down nearly a mile away, and in all probability this table, which was of great weight and solidity, had found its way into the farmer's barn, as it was far too large to be put inside the farmhouse. I need not say that the table became my property in lieu of some of the rent, and the farmer, to show his gratitude, offered to give me an old cupboard which, he said, was standing near the manure-heap, and used as a sort of fowl-house; for, as it had, as he described it, open church windows, it was easy to look inside and see whether the hens had laid any eggs. We went together to see this peculiar cupboard, and, to my astonishment, I saw a piece of Gothic furniture with three perforated church windows in the upper panels. The cupboard stood five feet four inches high, and, though covered with filth of all descriptions, was apparently in sound condition. The

cornice round the top was gone, and the lower door had been taken off to give freer access to the fowls, but it lay beside the manure and had not been destroyed. The centre window was a flamboyant rose-window, and the other two were of Perpedicular architecture. These were in a perfect state, and all the other panels were thoroughly sound. In fact, the workman who cleaned and scraped it told me the long exposure to weather had made the only like faceil wood.

oak like fossil wood. For many years I was quite at a loss to know what use the cupboard had been put to. I thought it must have come out of some old monastic establishment, and been used for keeping church vessels, and perhaps vestments in the lower part. A book on Old Oak Furniture by Mr Frederick Roe, recently published, throws quite another light upon the matter. Drawing a distinction between what are known as domestic credences and food-lockers, Mr Roe says: 'Food-lockers of a type quite dissimilar from the credence were in use during the Middle Ages. In nearly every case these may be known by the perforations, mostly in the shape of Gothic windows, which were introduced in their doors and sides. These perforations were generally backed with red cloth, which, while it excluded dust, admitted air. Traces of this cloth and its attachments may still be found on the inner side of these Gothic lockers.' This very probably is the explanation of the old cupboard I rescued from the hens; and if the style of architecture is to be taken as a guide for dating it, it was made about the year 1470.

There is a good deal of difference between what I may term manor-house old oak and that of the farmhouse. The former is much more florid in character, and to some tastes not so interesting as the simpler and severer style of the other. There was a time when the farms were full of chests, tables, cupboards, and beds all made in the village hard by, and all bearing evidence in the details of their shapes and carvings of the period at which they were made. It is possible to meet with such pieces now scattered about in cottages and home steads in out-of-the-way places; but the collector must be very wary when he enters villages which have come under the influence of the town dealer.

As an instance of this, not long ago a cyclist was pushing his bicycle up a steep village street not very far from London, and he saw an old woman knitting outside her cottage door, which was open. He glanced at the interior of the house, and caught sight of a fine-looking grandfather clock with a brass face, and he stopped and asked the old lady for a drink of water. This opened the way for a conversation, and he at once began to express his admiration of the carved, black, oak-cased clock It had belonged to her grandfather, the old lady told him, and she prized it more than anything she possessed. At length, feeling sure that he had struck upon a genuine article, the cyclist offered a good round sum for it, and after many protestations and some tears on the old lady's part, she consented to let him have it. The story might very well end here, and the cyclist remain for ever undeceived as to the genuineness of his bargain, only he happened the following year to be again passing through the same village street, when he recognised the same old lady knitting outside her cottage door, and another grandfather clock identical with his own in all particulars appearing through the open door! There is a process known as salting, and I believe it has been more than once practised successfully on those prospecting for gold and diamond mines. In this instance the old-oak dealer had this agent in the village to assist him to palm off oak furniture which was not so readily sold in his own shop.

The only defence against such cheating is for the collector to read up his subject and make himself an expert as far as he can. It is a very good plan to practise the fingers in detecting modern from old carving. In the case of old carving all harsh edges are worn down, and it presents a smoothness when you touch it which the modern stuff never really gets even by the help of sand-paper. Forgeries, again, may often be detected by the injudicious mixing up of periods in the carving which the forger often perpetrates. Shot-marks and punctures with a bradawl to feign worm-holes can easily be exposed by tapping the wood to see if the fine white dust which the worm makes is left in the holes.

There is a story of a rich American gentleman who, when travelling in Italy, saw a finely carved ceiling in an old palace which greatly took his fancy. So anxious was he to obtain this treasure that he offered to purchase the entire palace as it stood if he could not get the ceiling in any other way. The matter was left in the hands of a dealer, who promised to keep a lookout for this or any other ceiling likely to be sold. year or two went by, and the American was informed that a ceiling had been found exactly like the one in the old palace, and he could have it for a certain big sum. This was agreed upon, and straightway the American began to build a wing to his house with a room specially designed to fit the ceiling. When the house was ready a large party was invited to a ball in honour of the occasion, and the dancing took place in a room above that in which the ceiling had been placed. All went well until supper-time, when the guests eating in the room downstairs were conscious of tiny fragments of something falling from above, and found they were being bombarded with small shot which the ceiling was discharging owing to the vibration caused by the dancers' feet. The story does not go on to say what the feelings of the American were when he discovered he had been taken in.

People are very apt to disregard pieces of old cak because they are not well carved, and some of the oldest bits get overlooked. For many years a plain chest with a simple rose in each panel was put away by my orders where it was never seen,

and would have remained where it was had I not been told that roses with four petals only are a rare form of decoration, and the shape of this particular chest assigned it to a period far earlier than many elaborately carved. Mr F. Roe, in his book to which I have previously referred, gives a very interesting account of the rose pattern, and the variations given to it in Tudor times. The number of the petals sometimes coincides with the king's name, as, for instance, eight petals for Henry the Eighth; but this is not a reliable rule, and no doubt in country places the same style was repeated reign after reign.

The same authority, when dealing with Yorkshire chairs, draws attention to the fact that those made shortly after the death of Charles the First have that monarch's face introduced into the carving on the back. I heard one day of the existence of some of these chairs in a farmhouse on the moors, and I found there the remains of what must once have been a very fine collection, but treated in the most extraordinary way. The house had mullioned windows, and the rooms upstairs were partitioned with oak panelling. In one of the bedrooms was a magnificent oak bed, with four posts and a richly carved head, and the canopy above had a finely decorated centre. The farmer had this bed in use, but six Yorkshire chairs and a high-backed armchair profusely carved were relegated to a room in which lived the imbecile son of the farmer all by himself. The oak furniture was considered uncomfortable and practically of no value, and the half-witted man had been allowed to do what he liked with it. Strange to say, he respected the carving and never damaged it, but all down the sides of the chairs, and wherever there was a clear space, he had treated them with a hot skewer and written a kind of mad diary. There would be an entry, 'Our Tom married, Oct. 10;' another was, 'Our sow had a litter of pigs, June 3.' I rescued this store of fine chairs and the bed, and happily a few thin shavings of the plane removed the burnt entries, which were not deep. It was in vain I looked for Charles the First's head on the chairs, which were probably of a later date.

The low foot-rail in a chair is always indicative of its age, for people used to put their feet upon it at a time when they spread rushes on the floor. It is grievous to see the way the dealers treat the plain old chairs and chests by carving upon them styles of decoration quite out of place with the date of the furniture. If you ask them, 'Is this a genuinely old piece?' they are willing to swear it is, and so far they are right, but they do not say they have done the carving themselves. The collecting of old oak to be of any value at all consists in obtaining specimens of the various periods of furniture, and it matters very little whether an article is carved or not, except that it looks handsomer when it is. The Yorkshire settles of the Queen Anne period from farmhouses are quite plain, except for the moulding round the panels,

and very beautiful they are in their simplicity. To treat these with Tudor roses or Gothic windows is wanton absurdity, but they sell better nevertheless, and that is all the dealers care about.

It may seem greedy to go about farms and cottages buying here and there, but it must be remembered that at the time I speak of the old furniture was utterly disregarded. It is only of late, since the dealers have hunted around and the value has gone up, that the oak has come to be prized. I remember an old woman in a cottage, who had a very fine Yorkshire chair which she wished to sell, using the expression 'a powsy owd thing' to show her contempt for it. The principal reason was, I fancy, that it required a good deal of rubbing to keep it bright. But there were other reasons for parting with the old oak. Bad farmingtimes had brought trouble to agriculturists, and the farms, which were once freehold, were heavily mortgaged. On more than one occasion I was offered the oak, as the people said they would rather I bought it than have it dispersed at a sale. One farmer left it in his will that if ever his son sold his oak bed, more than three centuries old, I was to have the first offer; and, though I had left the district many years, a letter came one day offering me the opportunity to purchase the bed, and I accepted it.

On another occasion I was sent for to visit a widow who lived in a farm some distance away, which was one of the oldest in the parish. The old lady was ill in bed, and I found her in a weak state, but by no means seriously ill. It was late in the afternoon and turning dusk, and I could only see that the bed she was in was a four-poster, with carving at the head and a panelled canopy above. To change the conversation from her ailments, I began to admire the bed and a fine oak wardrobe beside it, when she requested me to strike a match and examine the carving, at the same time covering her own face over with the sheet. By the short light of a vesta match I hurriedly took in the splendid work on the bed-head. Two five-petaled Tudor roses graced each end of the upper frieze, with a band of strapwork between. Below were two circular arched recesses with incised panels. These two were divided by a sliding panel with a secret receptacle inside, above which was a marguerite flower. The pillars of the bed were of elongated melon-shape, fitting into square posts. The bed had never been touched with any stain, and was of a lovely gray-brown colour. The simplicity of this piece of furniture only added to its loveliness, and I could not resist expressing my strong admiration.

In the kitchen downstairs stood an oak table twelve feet in length, with forms to fit one side, while on the other side was a settle with plain panels built into the wall. To give more room for this long table either a recess had been let into the wall or the house was so built at the time, and in this was a mullioned window. The

table shone with brightness, and the old lady told me it was used every day by themselves and the farm-labourers, and they kept up this bright polish with hard rubbing. It is rarely the case that you see furniture of such an early date kept in daily use and in such fine preservation. The table could not be later than the reign of James the First, and it might be earlier. It had the usual six legs of elongated melon-shape, connected with low rails all very massive and strong. There was no carving upon it, and no doubt it had been made locally, and the bed also, and both were specimens of typical farmhouse oak. I am glad to say the old lady soon got well again, and some years afterwards she came to see me, and reminding me of my former admiration of her furniture, she asked me to purchase it, as she was giving up farming and did not wish to have her things sold at a sale. I paid her exactly the price she asked for them, and we were mutually satisfied; but I admit the value at that time was not what it is now in this generation.

It may be well to give a hint as to the best way of treating old oak when you have collected it. Avoid oils of all kinds and use nothing but beeswar and turpentine. If the worms have got in, soak the part well with paraffin, and it will soon kill them. Melt the beeswax, and then mix the turpentine, and you cannot rub the oak too much. By this means you get an exquisite polish, and the beeswax does not stain the wood.

The church of Bradfield was served in the fourteenth century by a priest from the Priory of Ecclesfield, which was originally dependent upon the great Abbey of Fontenelle in Normandy, founded in A.D. 654 by St Wandrille. The Sunday of must have been difficult in winter, for the distance of the church from the priory was quite six miles over hilly ground rising up to thirteen hundred feet above sea-level. There are only slight remains left of the early Norman church in the present Perpendicular building, but it is said that a large oak coffer in the church, hewn out of a solid trunk of an oak-tree, and bound with iron, is of that

It is always very difficult to introduce a reredos into one of these old buildings built of stone from the moorsides. They do not lend themselves to work in marble or any white stone, and after restoring the church I was anxious to see a reredos put in that would blend with the somewhat sombre stone work. I decided to take Parker's Glossary of Architecture as a guide on this matter, and under the head of 'Reredoes' he describes it as 'the wall or screen at the back of an altar. It was usually ornamented with panelling, and sometimes was enriched with a profusion of niches, buttresses, pinnacles, statues, and other decorations.' About this time, owing to difficulties arising with the French Government, many monastic establishments were closed in France, and I heard that at the town of Caen in Normandy a considerable amount of old ecclesiastical oak had been seen on sale. Alady

residing near Bradfield, and a munificent donor of stained glass windows and other gifts to the church restoration, commissioned me to go to Caen and bring back, if I could, some medieval oak panels to make into a reredos. I decided to go first to Havre by boat from Southampton, and from there to make my way to Caen. I found at Havre that a small steamer of very light draught plied between that town and Caen, and took a limited number of passengers. There was a short sea-passage, and then—after passing the rocks of Calvados, where the White Ship went down and King Henry the First's son perished —we entered a very narrow river called the Orne, and steaming past the memorable quarries from which the stone was formerly taken to build so many fine churches, we arrived at the quaint, historic town of Caen. A very imperfect knowledge of the French language handicapped me a good deal in my quest for oak; but under the guidance of a workman in a blouse, who took me to many out-ofthe-way shops in bystreets, I managed in two days to get together something like half a ton of oak panelling, which consisted principally of old chestfronts and doors. It was a matter of great interest to me to think that I was not many miles away from the abbey of St Wandrille, which formerly owned Bradfield church, for I felt it was quite possible that some of these fine Gothic panels might have come from that abbey itself, and were now most appropriately being taken for use in the Bradfield reredos. The return journey in the small steamer was an exciting one. In addition to my great pile of oak, we had on board a cargo of Normandy pigs, with immensely long ears, and they were placed in a pen in the centre of the deck. All went well till we reached the mouth of the river and got out to sea, when an equinoctial gale began to blow from the south-west, bringing in great waves from the Atlantic. As these waves descended with some considerable force on the backs of the pigs in the pen they opened their huge mouths and gave forth a chorus of fearful sounds both alarming and ludicrous. We had very great difficulty in making our way to Havre; and had

we started later we could not have crossed, for before night it was blowing a full gale. On my return to England the value of the old oak was readily appreciated. Plaster casts of the Gothic panels were taken for the School of Art, and these were of various architectural styles. There were flamboyant and decorated panels, and many fine linen-pattern panels; but the finest specimen was a buttressed chest-front which was set aside to form the frontal of the Communion Table. None of the oak had been painted or treated with any stain, and it was in excellent condition considering its great antiquity. The delicate tracery of the flamboyant panels so peculiarly French was hardly damaged at all; and these, with the decorated panels of church windows, made most fitting subjects for a reredos. The construction of the framework to hold these panels was put into the hands of a clever and experienced wood-carver, and the straight line of the top was broken by appropriate Gothic treatment in delicate carving. From the moment the oak was placed in position it harmonised with the surrounding stonework, for the tracery of the windows above and around it seemed to be reflected in the panels below. Then there was the sentiment of the oak coming from the Norman district in which the abbey of St Wandrille once flourished when it possessed Bradfield as an appanage of its own. Five hundred and more years have passed since then, for in 1381 the church of Bradfield was transferred to the Carthusian convent of St Anne at Coventry.

It is always difficult to get country people to understand history, but I hoped I had impressed this link with the Norman abbey well into the minds of my clerk and his wife. However, the latter, when one day taking some friends of mine round the church, gave the following explanation of the reredos. I must make this remark before going further. I had been out in the German ambulance during the war of 1870. She said, 'Our rector went out and fought with the Germans against the French, and conquered them, and brought back this oak out of France'!

A NEW INCANDESCENT LIGHT.

OME twenty years ago many people thought that with the introduction of electricity the death-knell of the gas industry had been sounded; but Dr Aur's incandescent mantle rescued it from the possibility of

such a catastrophe. And, with the cheapening of electricity, for some time it looked as if it would be a close race between the two illuminants; but the advent of the inverted form of incandescent burner some four years ago imparted to the gas industry an impetus that will to a great extent give it the lead for at least some time to come.

The development of the inverted burner, for the short time it has been in use, has been phenomenal, and during the past year at least a million of these burners must have been sold in the United Kingdom. Strange to say, it is this conservative country which has taken the lead of the nations in this matter; Germany is following us closely; but, stranger still, the acute American is only waking up to the advantages of this form of lighting.

The prejudice against the inverted burner was at first very great, but only proved in the end that when theory and fact disagree the latter is bound

to win, and that nature has still undiscovered laws or applications of existing laws of which we are

ignorant.

When the first inverted burner was introduced it was ridiculed and laughed at; the idea of gas burning upside down did not take on. The writer said to one of the first experimental inventors that there was no use in going on with his idea, as it would never work; and only a couple of years ago two gas engineers controlling two very large gasworks in this country refused to have anything to do with inverted burners, because they were 'not scientifically correct.' And this was the very general opinion of the 'professional' in the gas industry up till quite recently.

Happily this is changing, although in some important instances the old opinion prevails. The public, however, have not to thank the gas industry for introducing this new form of lighting, as it is practically the result of commercialism. The pioneer makers, especially the New Inverted Incandescent Gas-Lamp Company, saw what was in the inverted burner, and stuck nobly to the task of perfecting it and keeping it on the market at a reasonable price. The makers now are many, and the makes of the burner legion, one Birmingham manufacturer turning out forty different forms of it.

A great amount of trashy stuff has been put on the market, but this is unavoidable, as the demand for cheapness-irrespective of efficiency-is so rampant; but the fact that 'a good article is the best' is peculiarly applicable to the inverted incandescent burner, as the wear on it is ten times more severe than on the ordinary upright burner, and the adjustments, owing to the nature of the burner, must be more precise. Consequently a good burner, irrespective of cost, is the most economical in the end.

The weak feature in the inverted burner is that, the point of combustion being below the holes where the air enters the bunsen, the products of combustion are liable to get into the burner and

cause carbonisation. The usual type of inverted burner gives from fifty to sixty-five candle-power on a consumption of three cubic feet of gas, and various means have been tried to raise the candle-power without increasing the gas consumption. An Edinburgh firm, Messrs Wm. Anderson & Co., seem, however, to have overcome these difficulties to a very appreciable extent in a new burner which they have patented. With this burner they have been able to raise the candle-power per cubic foot of gas from twenty candles to thirty-three candles, enabling them in a single-burner lamp to produce one hundred and fifty candles, which is the highest candle-power yet obtained. This result is achieved by preheating the primary air which mixes with the gas in the bunsen tube, and this is done by making a heating chamber around the bunsen, and taking the air in at the bottom by tubes, thus obviating any chance of the products of consumption getting into the burner again, which is a source

of trouble in so many burners of this type, causing the carbonising of the mantle and burner.

The globe is held in position by a tempered steel wire spring instead of the usual screws, thus allowing for the expansion of the glass when heated and preventing the breaking of the globe, which, having no hole in the bottom, makes the burner suitable for draughty places.

Instead of the usual air-holes at the top of the bunsen, a perfectly free space is allowed, so that the heated air has no obstruction; but into the top of the bunsen tube is fitted a cone or tapered tube by which the gas and air in issuing through is caused to mix thoroughly.

The bunsen tube itself is of two diameters, the upper part being one-sixteenth less diameter than the under part. The latter is made of porcelain,

constricted at the exit-end.

There is also an anti-vibrator in connection with, or rather as part of, the burner, consisting of a loose cylinder with cap into which the burner-nipple is screwed. The burner is then suspended inside the cylinder for one-third of the way down by a spiral spring.

The contents of the heating chamber are preserved intact by a loose plate, which is kept in place by a light spiral spring.

The light obtained from a large cluster-lamp is equal to nearly seven hundred and fifty candles.

With this form of lighting the fullest value possible of the gas is obtained, and as there is no shadow to counteract, an efficiency of 331 per cent over the upright form of incandescence is obtained.

AN OUTPOST.

Last night in a dream I heard the song Of a lark that rose from a field of rye; And I sighed in sleep, for the days are long, And no birds sing 'neath a brazen sky.

There was never a breeze, the sun dipped down Into a barren stretch of sand; And night reached up for her starry crown, And set her foot on the wasted land.

'Twas just the time when the thrush sings best, And just the hour when the blackbird trills, When shadows steal from the purple west, And a rose light lies on the lonely hills.

I slept again, and in sleep I heard-Deep in a wooded, moonlit vale-The liquid notes of the nightingale, And my heart went out to the blithe brown bird

I woke to the beat of passing feet, To the blinding smile of the risen day; And over the desert danced the heat, And half in shadow the white town lay.

And all the glamour of Rastern skies-A charm as old as the world is old-Wakes when the wings of the night unfold, And, lo! when the day is born it dies. LAWRENCE B. JUPP.

MEMORIES OF HALF A CENTURY.

By R. C. LEHMANN, M.P.

PART VIII.

HAVE already given an account from my father's reminiscences of the unfortunate fracas between John Forster and Robert Browning. I have myself a very distinct memory

of the biographer of Goldsmith and Dickens. I recall him as a very big, square, beetle-browed, black-haired piece of solid humanity, with a voice that made the glasses jingle on the table, yet he could roar you (on paper) as gently as any sucking dove, for with all his arbitrariness and resolute roughness he had one of the kindest hearts that ever beat in the breast of a literary dictator. As a proof of that I may cite three letters written by him to my mother when she was recovering from a dangerous attack of inflammation of the lungs:

'PALACE GATE HOUSE, KENSINGTON, W., 19th March 1866.

'MY DEAR MRS LEHMANN,—It was a great grief to me last night to hear of your illness.

'I returned to town only a few days since, and, remembering our engagement before I left, was looking forward to the pleasure of an early meeting when this sad disappointment came.

'You are forbidden to see friends at all, I hear; but when the prohibition is removed you will, I hope, give me the privilege of coming to you. I feel that I deserve this by the pain the news has given me which I heard last night.

'Earnestly do I trust that better news will reach me soon. The weather lately has been such as to try us all; but we have no winter before us now; and you, with your youth on your side, and spring and summer coming on so fast, will soon again be merriest of us all.

'Of course this note is not to give any one the trouble of answering; for my wife (herself a prisoner to-day) will bring me word to-morrow how you are, after inquiring; and when I may see you, I

No. 519. - Vol. X.

[All Rights Reserved.]

know that Mr Lehmann will kindly send me a line to tell me so.

'With all kindest wishes, my dear Mrs Lehmann, very affectionately yours, John Forster.'

My mother must have answered this kindly letter very promptly, for on the following day Forster writes again:

'MY DEAR MRS LEHMANN,—I will not believe that any note from me gives you any pleasure if you trouble yourself again to send an answer to what I write. So now, you see, I shall test you. If I don't hear from you I'll write, and if I don't— Well, I cannot bring myself to say I won't write; but I certainly shall not write with half so much pleasure.

'My wife sends her best love to you. She has not been out of doors since we dined on Sunday at Southwick Place, or she would have gone to inquire after you. She has been saving herself up to be able to dine with the Dilkes to-night, and I fear won't be able to go after all.

'The fact is, everybody's ill with this weather, and whatever secret little ailment one has it fastens upon and exaggerates. It has discovered a little weakness in you, and the lesson it teaches is that you should guard that place with greater care when you are well. The secret of long life is to know where the enemy is always lying in wait to assail us, and to provide and fortify against him. You will do this more carefully in future—will you not? For your husband's and children's sake first, and for all our sakes afterwards.

'You have the best of doctors—a doctor to disarm a sick-room of not a little of its weariness and pain; and I am sure you will soon be well. Not only that; I am sure you will in future be more prudent, not defying, but temporising with east winds and savage airs, especially at night.

'Always, my dear Mrs Lehmann, very affectionately yours,

JOHN FORSTER.'

Reserved.]

NOVEMBER 9, 1907.

And then comes the third and last of this set of pretty messages of friendship:

'PALACE GATE HOUSE, KENSINGTON, 29th March 1866.

'With no common pleasure, my dear Mrs Lehmann, I have heard of your ability to take a drive the other day; and now I hope this fine weather which is really come will help the good De Mussy, and another doctor more potent even than De Mussy (we call him Youth), triumphantly to set you up again. And then with a little-no, I will say a great deal-of prudence, you will be able for the future to defy your enemy, and to save from infinite anxiety all your friends.

'As soon as I hear that I may call and see you I mean to inflict myself upon you for a few minutes, just to be satisfied upon my own seeing that what I hear is true.

'And so good-bye for the present, and ever believe me, my dear Mrs Lehmann, very affectionately JOHN FORSTER.

'I shall bear this myself, and learn how you really are.'

In the winter of 1869-70 my father, who was then in America, had sent John Forster some canvas-back ducks, of which he received the following pleasant acknowledgment:

'PALACE GATE HOUSE, KENSINGTON, 18th January 1870.

'My DEAR LEHMANN,—My thanks for your kind remembrance have been too long delayed, but you must not on that account think them less grateful and sincere.

'Both of us here were indeed much touched by your having thought of us at all that distance, and in such seasonable Christmas fashion. Nor was there a wish belonging to the season which your splendid present seemed to bring with it that we did not desire to return fiftyfold for all future happiness to you and yours.

'I call the present splendid, for how magnificent the birds were! I never saw such plumage. seemed a horrible sacrifice to the spit; but the result justified it, and the two brace we had here were a wonderful success. One brace only I could find in my heart to part with; and Coleridge (the Sol.-Gen.), to whom I sent it, told me his son, who is a bit of an ornithologist, would far rather have stuffed the birds than have let them stuff anybody else.

'We went to Torquay immediately after Xmas Day, and only returned on Friday last. We had horrible weather, and much of the pleasure of the visit was lost to me by a miserable cold.

'I shall rejoice to hear that health attends you everywhere in your wanderings, and that these will have, in every possible way that you can wish, a prosperous issue.

'With my wife's kindest regards, I am ever, my JOHN FORSTER.' dear L., very sincerely yours,

It was well said by the Times after Forster's death

that those who at first sight found him obstinate and overbearing were ready to confess that they had in reality found him to be one of the tenderest and most generous of men.

GEORGE ELIOT AND G. H. LEWES.

My father first met G. H. Lewes in 1853, and through him he and my mother became acquainted with George Eliot, and at one time saw a great deal of her. My father has described in his reminiscences (Cornhill Magazine, April 1892) the impression she made upon him. He speaks of her 'large head, the masculine and Dantesque features, and the soft, melodious voice which always cast a spell over me. One might almost have forgotten, he continues, 'that she was a woman, so profound was her insight; but I, at least, could never forget while in her company that I was with an exceptional being.' He relates how during the later months of 1866, while my mother and the family were in Pau, and he was alone in London, he used to go to her every Monday evening at her house in North Bank, Regent's Park, taking his violin with him, and how they played together every piano and violin sonata of Beethoven and Mozart. George Eliot, he says, was a very fair pianist, not gifted, but enthusiastic and extremely painstaking. The following undated letter * evidently refers to one of these visits: 'THE PRIORY,

NORTH BANK, REGENT'S PARK.

DEAR MR LEHMANN,-Friday the 16th will suit us perfectly.

'I will forgive you for disappointing me as to Wednesday, since I got the compensation of knowing that there still exist personages so romantic as Wandering Minstrels. †

George continues so far better as to be able to write a sheaf of philosophy every morning, and we feel that it will be very agreeable to listen to your violin in the evening.—Very truly yours, 'M. E. LEWES."

Here is another of an earlier date to my mother: 'THE PRIORY, April 30, '64.

'My DEAR MRS LEHMANN,-In Mr Lewes's absence I opened Mr Lehmann's letter, which is altogether a conjugal one, and can be answered by me to you.

'Yes, I do hope to be able to see you to morrow; but in my uncertainty as to my state of headache (that is the name sometimes for my head) I should be much easier if you would not send the carriage, but would simply leave us to find the way to you [to Southwood Lane, Highgate] for ourselves; and, if I am able to come to you, to allow the carriage to bring us home.

*I have to thank Mr J. W. Cross for permission to publish these letters from George Eliot. The letter from G. H. Lewes is printed by permission of Mr Edmund A.

† My father was a member of the well-known musical society of that name.

'Mr Lewes is sure—so far as one can be sure—of presenting himself to you between five and six.

'I wish I had been fortunate enough to see you yesterday. You are not one of those dreadfully healthy women who stare in utter scepticism at one's alleged miseries and inabilities. But I do mean to be at Highgate to-morrow if I can.—Ever yours truly,

M. E. Lewes.'

The following undated letter from that sprightly correspondent G. H. Lewes to my mother also, in all probability, belongs to 1864. There is another enclosed in an envelope addressed to 'The Mother of the Gracchi (in smalls as yet),' which was conveyed by my brother and myself on ponies, the same juvenile postmen having carried the note to which it was an answer:

'THE PRIORY, Wednesday.

'ADMIRABLE Woman,—The extremely youthful George will certainly break through his rule (for what are rules good for but to be broken?) and present himself arrayed in great splendour (i.e. a tail-coat and waxed whiskers) on Tuesday next. But oh! how little impression his pothooks and signature must have made on your insensible soul that you should have mistaken them for his better two-thirds'! I wrote to you—alone I did it!—Polly* having installed me in the office of general secretary, with directions to give her hearty love, and wish to see you, which of course I forgot. Come up on Sunday if you can; if not, any other afternoon after two.—Ever yours faithfully,

'G. H. LEWES.'

My mother spent the winter of 1866-67 in Pau, in order to restore her health after her attack of inflammation of the lungs. While she was there G. H. Lewes and George Eliot paid her a visit, of which she gives an account in two letters to my father. The first is undated, but must have been written, I think, on January 21, 1867:

'When I came home,' she says, 'I found the Lewes's card! † They had turned up at last, and both had called, and were at the Hôtel de France, so I wrote a note instantly and asked them to tea, and come they did, and a very sweet evening we had. There is such a gentle graciousness about Mrs Lewes one must love her, and she seems to adore him. He is worn out and thin and languid, has lost his old spirits, but they'll come back with change and rest. I made myself pretty in my gray silk and lace kragen, and they admired my dress so much. When I got up to play Mrs Lewes said, "I am inclined to quarrel, do you know, with Mr Rudolf Lehmann about a portrait of you I saw at his house. It does not do you justice." I told her she was the first person who said so, as it was usually thought, and I thought, it flattered. (Do you remember Aunt J----'s, "It's much too pretty -why, it's quite a handsome woman," before me,

the unhappy original?) I played to them, and wound up with "Adelaida" by particular request, Mr Lewes having told her that I played such a beautiful arrangement! Arrangement! Why, I never knew it was arranged, and if it is, it's certainly my own. They are coming to-day to break-fast at twelve. Then I have persuaded him to go and call on the Savages, poor things, whilst she will remain with me. Then they do what they like till six, when they dine with me. I felt I must make an effort, because they told me it was solely on my account they came to Pau. "We look upon you as a sort of heroine, dear Mrs Lehmann, parted so long from your husband and your home, and take a deep interest in you," for which I thanked her, and felt inexpressibly soothed in the idea that somebody at last had found out I was a heroine, which I had been suspecting all along myself. If people would only say such things and smooth my fur the right way, instead of lecturing me as they do, I would take a much more cheerful view of my position. I begin to think it's abominable the way my friends roar out when I meekly say I would like to come home, and write me severe philosophical, physiological treatises, and put me down, and when they've got me down keep me down. Mrs Lewes knows better, so please understand for the future I am a sort of heroine. . . . The Lewes's were enchanted with Chang. They say he is a real Maltese; they like Deutsch. † He is the brightest German (always excepting you, I trust and believe) they ever saw. That is a nice little word for his hop-sparrowishness, I dare say, but they like him. He likes De Mussy too, and she said she was so anxious to see him (I can't tell why) that she did a rude thing at the theatre and turned round and stared at him when he was with us once. I am sure he did not remark it, and if he had, would have been flattered. . . . Fancy, Lewes intended Goethe for Nina, having heard of her passion for Goethe from you, and in a vague way fancied she was a great big girl !-Heard afterwards she was five. However, he'll see her to-day at déjeuner.'

'PAU, 23rd [Jan.]. 'The Lewes's are gone after two delightful cosy days. I have got to know her as I never should have done in years in London, and I think she loves me-we are sworn friends. What a sweet, mild, womanly presence hers is-so soothing, too, and elevating above all. It is impossible to be with that noble creature without feeling better. I have never known any one like her-and then her modesty, her humility. A modesty, too, that never makes her or you awkward, as many modesties do. I am full of her. She makes a great impression on me, and I long to see more of her and be with her. She said, without my asking it, she would write me from Barcelona to tell me how it went with "George," and if they were going on as

^{* &#}x27;Polly' is, of course, George Eliot herself.

[†]G. H. Lewes and George Eliot.

[‡] Emanuel Deutsch, the distinguished Orientalist.

they now intend. They don't go to Madrid, but Seville, Cordova, Granada, &c. When she went away last night I said something of hoping she would like me, and we should be friends. said, "I do; I love you better every hour." She said it so sweetly, with her soft penetrating voice, it did not sound as such a compliment would from any other lips. How they like you! This was such a tie between us-and she thinks you so handsome. I can't remember the word she used for your head. I had to give her the "head-medallion" photo of yours, so send me another; she didn't like the one she had, and admired this so much. . . . I walked down to the station with them this lovely summer morning. The weather has been glorious these two days, and the old white mountains so grand; in fact, the little visit has been a complete success. She made me tell her the whole story of our courtship and marriage, which seemed to interest her intensely. In fact, she was like a dear, loving elder sister to me the whole time. I gave them a nice little dinner; first, a light lunch at twelvethen he went and rejoiced poor Mr Savage's heart by a visit, whilst I walked in the garden and told her my love-story. I wanted to take them a drive, the day was so perfect-not a voiture to be had of any kind, a chasse going on! Provoking, wasn't it?... Nina said her little poem of Goethe to them to-day, sweetly. My dear, she, Mrs L., was so sweet, so attentive to Matilda [our German governess]! She often brought her gently into our conversation by talking of Germany, and appealing in her charming, gentle way to the delighted Tilla. It was such a contrast to the way that upstart Miss P. treats her-hardly deigning to take notice of her, and that very day, in the Place, having in an insolent way held out a finger of her left hand as she passed to Tilla to shake, which Tilla did not take-bravo! She says this insolent baggage always gives her her left hand when she condescends to do it at all. So she was determined not to take it next time. . .

'What cold you have suffered! Here it is sirocco again to-day-like going into a hothouse when you go out. The valley was full of a seething mist over which the mountains towered clear and serene. George Eliot in looking at this mist said, "I love to see that mist-it is beautiful-it looks as if creation were going on underneath." . . . She asked me if there was anything characteristic here to take home. I said, "Hardly!" then went to my drawer and pulled out a beautiful large beaded rosary of the box-root, which perfectly enchanted her. She said it was strange: she had longed for a rosary, and had never seen anything more charming than those beads made of a root. I also gave her a knitted wool shawl, in which she much rejoiced. They are looking forward to having you again when they come home.'

George Eliot fulfilled her promise to write from Barcelona. The letter, a long, chatty, and delight ful one, has already appeared in the Combill. Later on in 1867, after both had returned to England, she wrote to my mother :

'MY DEAR FRIEND,—I shall say yes very gladly. for just now I want to see you of all dear people that I know, if there were not this insurmountable obstacle, that to-morrow morning we go to Niton. where we have taken a house for a fortnight.

· Poor George, after being so blooming that you would hardly have known him, has got all wrong again, has had headache for ten days, and begins to ask, "What good shall my life do me?" But he revives so quickly under favourable circumstance that I hope you will see him looking bright when we come back.

'Thus unkind Fate has willed it, else I should have felt as happy as a schoolgirl invited out to have gone to see you on Saturday in your pretty home, and I should have chosen to meet just the friends you mention-including Mr Deutsch. If I had not heard you cough too much! And you do not tell me that you have lost that old enemy who overtook you again in Paris.

'I wonder if I like you better because you are not well. I have a trick of caring more for any one who has a trouble than for those who seem quite scathless.

'We shall take care to advertise our return to friends whom we want to see, and therefore to you without any delay. George tells me to send his love with mine to you and your husband. You know already that he would have been delighted to see you all again. Always yours affectionately.

George Eliot's friendship for my mother continued to the last, and was extended to the younger members of the family. Once a little essay written by my sister was shown to her. She took it awas, and afterwards wrote to my mother:

'THE PRIORY, April 2, 1877.

DEAR FRIEND, -Nina's little paper is full of the best promise. It has the double strength of simples direct expression, and of observant lovingness

'You remember what old Ben Jonson wisher for his perfect woman. Besides "each soles." virtue" she was to have "a manly soul." And hope we shall see that grander feminine type-al once sweet, strong, large-thoughted-in your Nith

But don't let us tell her all the good we think

'I suppose the word "abrupt" is meant as an admonition by the teacher. But to me, the beginning to say at once what she has to say without the artificiality of an introduction is one of the good signs. - Yours affectionately,

THE CALAMITY OF THE POLDER.

CHAPTER II.

NOTHER hour passed and the polder was roofed with stars. Piet had eaten his supper in 'Well-and-Good's' parlour, and was now sipping his coffee with the ease and comfort of a baron in his moated castle. His

pipe lay on the table by his hand; over him the lamp burned neither too dim nor too bright; and, with his feet pushed towards the small hearth of clean old Delft tiles and its three or four glowing

sods, Piet sipped and sipped.

He had an absurd inclination to sing now and then. Instead of singing, he aired his thoughts freely out loud. They included rejoicings about the discomfiture of Mops, condemnation of all Betje's relatives at Werk, and wishes—uttered for the thousandth time—that his father had treated him with the fairness due to a son who had never given him a reasonably anxious hour while he lived.

Betje loved him, and always had loved him. This was the great gospel of the afternoon for him. If there was anything that he had to forgive her as touching Mr Mops, he forgave her over and over. But he never would, nor indeed could, forgive her father and mother. To think of it! Conspiring to sacrifice her innocence to a moneyed wretch like that, careless what happened to her dear mind and soul so that she might be in a position to drive out in her own carriage whenever she pleased, and—

A step outside checked his swelling indignation about the adults of Werk. He turned his head to the door, and there stood his uncle Erasmus.

'Fine night, nephew,' said Betje's father, with a matter-of-fact nod. 'Your aunt thinks I had better have a little talk with you.'

Piet's heart sank. 'Why not, uncle?' he replied gruffly, rising and drawing up a chair. 'It is long since we talked together. You will take coffee?'

'H'm!' Erasmus Leevan was a stalwart, broad man like Piet, but rendered grotesque by a wart on the end of his nose-a purple wart as big as a marble. This wart had been the prime affliction of his boyhood and youth, and even now his wife occasionally reminded him that it was a miracle she had married him in spite of it. He glanced about the room. It was stocked with memories for him. There, in a corner, was the old wooden cradle in which he and Piet's father-and, a generation later, Piet himself-had been rocked by a mother's foot. The prints on the walls were antiquities like the cradle-battle-scenes of Napoleonic times, wrecks of clippers and stiff little steamboats of fifty years ago, unbecoming enlarged family portraits, 'Moses in the Bulrushes,' and so forth. The walls were beset with such ornaments, and old blue-and-white plates (really valuable, some of these) were mounted by the dozen between the prints and everywhere else.

'Yes, I will take coffee and even a regalia,

'Right-o!' exclaimed Piet in English, with a strong effort to revive his spirits. The ejaculation had come into the district with the Hull cargo-boat which in the summer months called regularly at Cramby for calves, butter, and cheese. 'There are still some left, Uncle Rasmus.'

Piet's father had been an extravagant smoker before he became enthusiastically religious. At his death three boxes of very choice cigars were discovered; and until the quest for those missing guilders was given up his uncle had smoked one or two of the regalias every day at the mill.

'Miss Tenk tells me, Piet,' began Uncle Erasmus after his first pull at the cigar, 'that you were talking to Betje this afternoon.'

Betje's aunt Louisa was Miss Tenk to the general

Piet's head sank now, as well as his heart. That 'Right-o!' was a hollow fraud. 'It is true,' he said. 'Are we not cousins, Betje and I?'

'Cousins—yes. If it was only cousins, Piet'—— The influence of the regalia moved Betje's father. He put his hand on his nephew's arm. 'You may believe me or not, my boy, but that arrangement with Mynheer Mops was none of my desire. Your aunt is a clever woman. She and Miss Tenk—— I'm a cipher in my own house, Piet.'

'Just so,' said Piet. 'Is your coffee as you like it?'

'The coffee is very good. Your aunt says no man can make coffee. She is wrong. She would make a better earth than God Himself if she can be believed. But she can't—always.'

Piet pricked up. 'I don't know, uncle,' he said with a bitter smile. 'Klaas would not like to hear me say so, but I could suggest two or three improvements myself.'

'In your aunt, Piet?' Betje's father gave him a smile curiously like his own, for its bitterness.

'No. God forbid that I should be so bold. I meant in the earth—that is, in my own bit of interest in it.'

'Ah! H'm!' Uncle Erasmus seemed engrossed for a while with Piet's words. He puffed clouds of smoke. There were moments when his nose and the wart were for Piet the only visible features of his face. 'I want,' he then said sharply, 'to tell you about that infernal matter with Mynheer Mops. I never had a hand in it until it couldn't be helped. If I was on my deathbed, I could speak no greater truth than that to Betje herself.'

Piet stared. 'What does it matter?' he asked. 'It is all over.'

'Yes, yes. It is all over, as far as that gentleman is concerned, Piet,' continued the uncle; 'but there are others. Your aunt-I am here by her express request to tell you so. You understand, Plet ?'

Piet's fist crashed upon the table. 'I see!' he said with the voice of a hurricane.

Again there was silence, and Betje's father enveloped himself in more clouds. 'It is not a business I like, Piet,' he went on, with a distinctly apologetic note, 'selling girls in the best market like cheese and sheep. But I wish you to know that for my part there is no one I would sooner give my Betje to than yourself, Piet, if it were possible. But it is not possible.'

'No,' said Piet dismally.

'How should it be? You have nothing. This is a secret that I was not to tell you, but the fact is, my dear nephew, I am a broken and embarrassed man, and therefore, unless Betje can help us, the polder—all the polder, except just this mill, which is your own—must be sold. I have nothing left. I signed bills eighteen months ago for twenty thousand guilders, and again in July last year for another twenty thousand. They have been renewed several times, but it cannot be done again. Yes, I have been very unfortunate, Piet-no one more so perhaps; and that is how the land lies. Your aunt takes Betje back to Amsterdam in the morning to try again. The girl is much admired by several gentlemen of good standing, and now that ___ You are listening ?'

Piet had put his hands to his face. Now he jumped up, narrowly missing the lamp. 'Is a daughter nothing more to you than that?' he shouted. 'Are you not ashamed of yourself,

'Yes,' replied the uncle, with a shrug. 'There is no doubt about that. But the world is the We are not primroses and violets, we lruman creatures. As I was saying, Mynheer Mops holds those bills, and '-

'Mynheer 'Almighty Heaven!' cried Piet. Mops!

Of course, Piet. Who else? That was the bargain your aunt made.'

'And you are going to bargain again in the same way! She-she won't do it, sir.'

Betje's father thrust up his lips until they almost met the wart on his nose; shrugged his massive shoulders also. 'So she says,' he confessed. 'But her mother has been reasoning with her very patiently since our return from market. When your aunt says a thing is to be done, it generally is done.

Piet eddied about the little room on the other side of the table with the movements of a bear in a cage. He felt caged indeed-brutally caged by circumstances and his detested aunt Mina.

While he paced, his uncle explained how he had

been such a fool with his money. He had speculated and lost; speculated again and again, and nearly always lost. When his brother, Piet's father, had died he relied on Piet himself to pull him through with the money he had paid for the land in his more sober, earlier days. Neither he nor his wife would have desired a more convenient son-inlaw than Piet, with about fifty thousand guilders. But without the guilders the impossibility of such a pleasure had to be confronted. That was why Betje was packed off to Amsterdam in such haste Her mother had stayed with her there for five weeks. They had been a difficult five weeks, because Betje's nature even as a girl (and she was only seventeen then) was obstinate, like her mother's; but her mother was of course the stronger of the two, and in time forced her even to destroy the various little memorials of Piet which had accompanied her to Amsterdam, and to look at life through her own motherly spectacles.

Uncle Erasmus warmed to the story while Piet paced. He did not pay great attention to his scowling nephew, whose eyes might otherwise have frightened or at least arrested him. He flourished the stump of the regalia. And thus he drew towards the long-postponed logical outcome of his effort.

'Your aunt, Piet, will not be satisfied until you have sworn to me on the Bible that you will make no attempt to weaken our Betje in her good resolutions of obedience to her wishes. The girl shed tears this afternoon when her aunt Tenk told her mother about your being at the farm. Tears spoil a girl's eyes if they become a habit. And so, nephew, where is the old Bible with all our names in it—the one with the silver clasps?'

Scowling and mad with rage though he was Piet could not but wonder at his uncle in that moment. Had his brain softened in the last year or two? Perhaps so. Pecuniary trouble and Aunt Mina together might soften the hardest

Still, there were limits even to a crazy uncless impositions. Betje's father rose to approach the alcove by the hearth, where the old Bible lay on a small table, just as in the past. He stretched out his hand for it.

'No, no, my boy,' retorted Uncle Erasmus soothingly. 'It is no use fishing for the moon's reflection. You must not think of her.'

'I tell you, leave it alone,' said Piet, his role

The uncle lifted the Bible nevertheless, and placed it by the little porcelain coffee pot, beneath which the oil lamp was beginning to die out. promised your aunt, Piet'-

He was not allowed to continue. In two paces Piet was at the door, which he then flund

'If it was Aunt Mina herself,' he said, controlling wide. his passion very fairly on the whole, (I would behave to her just the same. You came to me for your own purposes, uncle; now go for mine. I don't want to commit a crime; but I—you ask me to swear—well then, I swear I can with difficulty keep from shooting you like a crow. Go, uncle, and I promise nothing.' His eyes blazed while he spoke. There was a gun neatly slung from the rafter next to the one which supported the lamp, and he pointed at it. Nor pointed only. Seeing that Betje's father was more disposed to argue than take him at his word, he gripped the stock of his gun.

That was enough for Uncle Erasmus. Bowing his head, he crossed the threshold hurriedly.

'Tell Aunt Mina I promise nothing—nothing!' cried Piet, and he slammed the door on Betje's father, the patch of stars visible over the Zuyder Zee, and the slumberous voice of the waters which still slid into the Zee at the Ruyter Sluice.

The next hour was quite the most critical in Piet's not very eventful life hitherto. He brooded about his wrongs, with his head bent over the table: first, his father and the missing guilders; then the removal of Betje, the cold heart-starving month after month; and now this brutal nipping in the bud of the new, though certainly rash, hopes which Betje's conduct that afternoon had planted in him. He cursed a little, and once, for a spell of seconds, he looked fixedly at the gun with which he had threatened his uncle.

Happily the sudden thought that his carcass was worth no more to him or any one than a crow's flickered out like the lamp under the coffee-pot. A braver notion came to him. His life on the polder was at an end. That was as obvious as his uncle's folly. He would sell the mill and be off to Canada as soon as possible. Only the other day he had been much ensnared by the latest booklet which the postman had brought him, full of pictures of rich virgin fields being ploughed by smiling young

farmers not a whit, he'd warrant, more capable than himself. He had mentioned the idea to Klaas; and, old as he was, Klaas had wished for nothing better than to go with him to such a country, which, it appeared, was quite free from the worry of drains and sluices. He was not serious about it then. Now he was absolutely serious.

'To bed, Piet Leevan,' he said at length, 'and in

the morning we will see the notary.'

He bolted the door and ascended the short ladder to his night's rest under the thatch. And it spoke well for his strength of mind, the last three years notwithstanding, that he neither peeped out of his hand's-breadth window for a beguiling 'good-night' glimpse of Betje's own nest in the distance, nor allowed any more vain regrets to keep him from the sleep which he had for once well earned. Five minutes after his head was on the pillow he lost consciousness of this distressing day. A little later and he snored.

For the poor polder's sake, it was unquestionably a pity that he had, for the first time in history, neglected his duty at the sluice. So it was, however. The tide had turned an hour or more before Betje's father's call. He might still have left the gate up for another hour without any risk; but with the Zee more than half towards high-water mark the trouble began in earnest. Little by little each narrow ditch swelled with the inflow of salt water. All was dark at the Werk farmstead as at the mill 'Well-and-Good' when the greater mischief set in. Brim-full, the ditches so laboriously dug by three generations of Leevans could do no more to protect the polder. By midnight there was water over all the land between the dikes, and the mill at one end and the farm at the other stood islanded in a lake. The stars winked at themselves in the polder as if they at any rate rejoiced in this new field for vanity. And still the waters rose.

(To be continued.)

THE PERSIAN SOLDIER OF TO-DAY.

NE must call him a soldier, because no other word exists to denominate the ragged pauper who is impressed into the ranks of the Persian army. All that we associate with the name of a soldier is absent from him.

His clothing in tatters, his rifle next to useless, his knowledge of military exercise and discipline practically nil, he is the victim of all his superiors, who have impressed him to make him a means to the dishonest acquisition of wealth by drawing his pay and allowances and appropriating them.

With the exception of two Cossack regiments—which, well trained and less irregularly paid, are efficient and useful—the whole army is composed of infantry. The spectacle of one of these regiments on

the march is not soon forgotten. Having no accoutrements such as we imagine to be necessary to the soldier en route, the Persian infantryman arranges his own marching kit; and as it is composed of pots and pans, water-jars, bedding, and other cumbrous objects, it is obvious that he cannot shoulder his burden, so, in partnership with two or three of his comrades, he invests a small sum in a donkey, and the squad put their loads on the back of the uncomplaining beast, which is even obliged to carry the rifles and ammunition. The tents are packed on mules—the least number that can be used, as the officers have to make their profit out of the estimates sent in to the Government for transport. Thus, having provided himself with a short stick and a new pair of thick-soled cotton shoes, the

Persian soldier is ready to start on his journey of maybe four or five hundred miles, to be accomplished by marches of from twenty-five to thirty miles daily.

No kind of order is kept on the march. He who is first ready and nearest the roadside after camp is struck leads the way, his companions taking the road at their own discretion. One would sooner imagine the procession to be a company of travelling tinkers than a regiment. Here and there among the throng one less penurious than his mates has hired or purchased a donkey for his own use; and as it is but lightly laden he takes occasional rides, or falling across the beast face downwards, one leg trailing on the ground, he sleeps calmly, oblivious of the cloud of dust like a fog around him, and of the fierce sun shining on the back of his neck. The sound that heralds the regiment's approach is not the synchronous beat which we associate with a body of soldiers in motion, but a complex shuffle broken by the clink of the animals' hoofs against stones, and the melancholy cries of 'Ai affliction!' 'May thy death be near!' 'Ai Misery!' with which a Persian urges his beast onward.

As to uniform-which the rank and file are supposed to receive new yearly, and usually do notit is composed of a tunic and trousers of cheap cotton, blue or red, seldom possessing a full complement of buttons or any pretensions to fit. The headgear is a black felt hat (something the shape of a top-hat without a brim), which bears-when not lost—a brass nishān or badge stamped with the device of the Lion and Sun. The amount necessary for the uniforms of the full regiment of a thousand men-in very few cases does any regiment number more than six or seven hundred-duly appears in the yearly bill sent in by the colonel to headquarters; but the clothing is only supplied when the officer can no longer delay its purchase, on such occasions as the Shah's birthday in a town ruled by a strict governor, who will insist upon the soldiers appearing less destitute than usual—an insistence the more emphatic that he does not have to pay for the uniforms himself. The result is that the soldier begs, borrows, and sometimes steals any kind of garment wherewith to cover his nakedness, his appearance being thereby often curious if seldom picturesque. Some years ago the complimentary guard of a business institution in Bushire, on the Persian Gulf, had visited in a body the shop of a Bombay slop-dealer, and the next morning two of its members turned out to salute the European directors in the cast-off tunics of a London policeman and a London and South-Western Railway guard-in which they subsequently appeared on parade before the Governor of Shiraz, whose indignation proved uncomfortable for the colonel.

It is the custom to provide at the doors of the houses of Europeans in remote cities a guard of from two to four soldiers, and on one occasion, when the newly arrived regiment at the town of Yezd, in Central Persia, sent two of its members to my door,

one was clad in a felt coat such as peasants wear, and the other had hung about him the remnants of three or four uniforms which, by excess of patches and dirt now somehow become welded into a mass, its wearer hardly dared remove from his body for fear of its disintegration in the process. I promptly made representations to the captain to the effect that some improvement be made in their garments; but that gentleman-after having in the course of a call imbibed many glasses of tea, smoked many pipes, and chatted in a mildly cynical manner of submarines and of the coming dissolution of Persia -announced that the men had sold their last uniforms, and consequently must wait till new ones were distributed. As winter was approaching, and the cold winds were reducing the guard to permanent shivering fits and a frost-bitten appearance generally, I caused two simple gray uniforms to be made, and had them bound with red braid Before allowing them to be worn, I sent the guard, under the escort of two servants, to the bath, with the uniforms to be donned after ablutions. They returned two hours later, cleaned and respectable; and, grateful for the improvement in their condition, exerted themselves to remember a few military phrases and exercises to such good effect that after a few days' practice they could present arms, and even made attempts to keep step on their journeys to and from the kitchen in search of charcoal and wood. A few days later the captain called again, and, more affable than ever, assured me that, having been on the former occasion attracted by my graces and overwhelmed by the excess of my kindness, he had deemed it no less than his most urgent duty to pay his respects so soon again. The object of his visit was, however, to protest against the new condition of the guard.

'To be perfectly frank with you,' he remarked, with the exaggerated amiability of the Persian caller, 'although it may seem presumptuous, I am bound to deliver to you a message which the colonel has made it my deplorably unpleasant duty to communicate. However, the vehicle, whether it bear fresh flowers or refuse, is but the same harmless servant, and I need not reassure you of my sincere affection for you, who derive so many soul-captivating graces from your noble father. In short, I must tell you that, having heard of these uniforms (which are but a sign of your kindness to all mankind), the colonel objected that by so clothing these men you have slighted the Persian Government in hinting thus obviously that it could not or would not clothe its soldiers; and, moreover, that you had employed red braid in the design, which is solely a Government prerogative. Looked at in this light -which is, I grant you, but the darkness of ignorance—it might appear that you had permitted generosity to overrun the bounds of discretion; but I regret to say that the colonel has further instructed me to request you to give up these—to himobnoxious garments, when he will supply new clothing of ing of the regulation pattern. As a matter of fact, I have no doubt that if you entrusted me with a small honorarium of, say, ten lomans [about thirty-five shillings] as a conciliatory present to this officious and grasping man, no more would be said. Moreover, you would acquire merit in that the service would be rendered indirectly to these happy objects of your generosity, while the colonel would look upon you as a sensible and kind-hearted man, a benefactor of great and small alike. I, of course, desire nothing for my pains in the matter; but if you were to give but a trifle to the sergeant who accompanies me—you may, to save trouble, entrust the sum to me—he would also praise you as a benefactor and support you in the presence of the colonel.'

To this lucid statement of affairs no answer could be given except that, having clothed the men, I did not propose to deprive them of their garments, or to insult the colonel by asking him to accept a bribe, which he would surely scorn. I did not think it necessary to indicate whether it was the small amount or the fact of accepting a bribe that he would scorn. Finally, as the captain had taken so much pains and shown himself so disinterested, perhaps he would allow his servants to accept a small present all round, and deign to receive himself some pounds of sugar-candy and some choice tobacco. This was as satisfactory a conclusion of the matter as he could have hoped for, and I heard no more of the colonel, who was probably unaware of the existence of the new clothing.

The arms of the two men were almost as effective as their Government uniforms. One was provided with a very long-barrelled flint-lock rifle. The operation of loading was tedious, but that of discharging the weapon fully compensated for the trouble by the exhilarating feeling of danger and uncertainty experienced by the marksman. The soldier having cocked the weapon, it was necessary to pull the trigger three times, the hammer descending a third of its travel at each pull. The completion of the third operation should have fired the gun, but not infrequently the expectation and nervousness of the shooter were dissipated by a misfire, and the process of priming, cocking, resting the weapon in the fork of a tree, aiming, and again missing fire was repeated. The usual procedure would be that, having become desperate, the soldier would take a careless aim, without the support of the tree, and the weapon would become impatient, miss the second jump of the hammer, and discharge with a fearful explosion and much smoke. Firing-tests having been taken, it was found that the record was made when two shots were fired in ten minutes.

The other soldier had a Werndl breech-loading rifle on his arrival; but the authorities, deeming it dangerous in conjunction with the enthusiasm aroused by the new uniforms, took it away and replaced it by a muzzle-loader which was quite harmless, for it had shed its hammer by the road-side during the journey to Yezd.

When not placed on guard, the soldier earns his living-his pay, nominally three shillings and fourpence a month, seldom reaches him-by engaging himself as a builder's labourer or by following one or other of the 'soldiers' trades'-egg-selling, copper-pot trading, head-shaving and hair-cutting, and (when he has a few silver pieces) moneylending. Living in a state of miserable poverty, he is not unnaturally dishonest, and after a short sojourn in a city becomes a rogue whose knavery has called forth the Persian saying, 'As poor and dishonest as a soldier.' Yet he is, if caught early and before demoralising influences have begun to work, an excellent outdoor servant, groom, or gardener. One regiment, the Feraidani, drawn from the district of Feraidan, near Ispahan, is composed of a particularly hard-working and simple class of peasants.

Recruits are drawn by a kind of conscription entirely from the centre and north of the country the Government could never press the wild southerners-and the sufferings of these poor fellows when sent to garrison the terribly hot Gulf - ports are intense. Bushire, Lingah, and Bandar-Abbas, three of the hottest places on earth, are garrisoned by these unfortunate men, who, coming from a cool mountain country, regard an exile to the Gulf as the most fearful time of their dreary lives. Not infrequently they are sent down the stupendous passes of the southern mountains to the Gulf during the hot weather, when even at midnight the temperature among the hills is cruelly trying; and no sooner do they arrive at Bushire than they may be shipped off to a small port lower down the Gulf, where the temperature is higher, the air damper, and the drinking-water salter. Occasionally, too, the local Governor, in order to gain a name for zeal, and incidentally fill his pockets with the pickings to be made out of exorbitant accounts, will send a hundred or two men to exact taxes from some remote mountain tribe, who, secure in their passes, and in the possession of modern arms and an ability to use them, defy the Government. The retributive force arrives at some little collection of huts, worn out with the sea-sickness a Persian always endures, and is sent ashore under the blazing sun to force a way into the gloomy red mountains showing dimly in the distance through their veil of dust. Ignorant of the way, and suffering terribly from the effects of their unaccustomed diet of salt-water and dates, the unfortunate men start at nightfall from their base, and arrive in the morning at the foothills, where there is no sign of the enemy. Catching a peasant or two, they kill them and take their goods, thereby foolishly increasing the animosity of the tribesmen, who watch them from above. An hour's march farther on, the Martinis begin to speak from the crags all around them, and one by one they fall as they scramble back along the road. Finally, they return to the seashore, sick, weary, nigh dead of heat, to undergo the terrors of a seavoyage back to more heat and weariness, while the Governor who sent them wires to Teheran the news of a victory and the amount necessary to reimburse him for what he has not expended on the expedition.

Truly the life of a Persian soldier is an unhappy one, and one's pity for these poor peasants is increased by the thought that under a good and just Government they would serve willingly and loyally for an infinitesimal pay if it were but regular.

GO. TOUCH AND

By ARCHIBALD DUNN.

HE sun had been blazing furiously all day, and the 'cool air of the evening' was as cool as the hot room of a Turkish bath.

Phe-ew !

Jack Carstairs extended his putteeencased legs to their full length, threw his arms back over his head, and, sinking more limply than ever upon the ground, exclaimed again, 'Phe-ew!'

Half-a-dozen throats endorsed the sentiment, and half-a-dozen pairs of legs stretched out in sympathy.

They belonged—these legs—to a party of junior officers having the honour to serve in Her Majesty's Royal Die-hard Fusiliers, and, having carried their owners the whole blessed day under an African sky, were feeling just now not quite so well as they looked. For the summer heat of Zululand is something to remember when you have marched in it for a period, and it takes the grit and backbone out of a Western race. Of course it does this rarely, because it rarely gets the chance. But on the present occasion there had been trouble upcountry. Ukimbo's tribe had been at their old tricks; and a detachment of the Die-hards which had gone forth to punish them were now (so the news had come in) in a very tight corner themselves. They could hold out for a couple of days, the messenger said-perhaps a little longer; but they were only fifty muskets, and Ukimbo meant business. Two thousand on the war-trail? Well, yes, two thousand-possibly three or four. Who could tell?

In such circumstances one does not wait for the sun, or, for that matter, for anything else; one simply goes ahead. And so the relief column had marched solemnly on till their backs and their arms and their legs ached all together, and till their faces felt shrivelled up like kippered herrings, and their mouths had grown drier than any limekiln.

'Gad! I'd like to be sitting in the Empirelet me see-third row of the stalls, with a great big whisky-and-soda in front of me, and a great, big, beautiful, white, round crystal lump of ice bobbing up and down in the middle.'

'Johnson,' said a growling voice, 'if I wasn't so dog-tired I'd get up and punch your beastly head!

'I will punch it,' said another voice, 'when this business is over.

'And I!' 'And I!' chimed in another and another

'All right, old chaps,' agreed the delinquent indifferently; and then the subject dropped.

Only one of the group had refrained from taking part in the discussion. He lay somewhat out of the circle, and while the others spoke he listened silently and at intervals glanced almost timidly from face to face. The light from some flickering lamp reached him now and then-when an intervening head chanced to move aside-and presently Jack Carstairs looked that way.

'Hallo, young un! thinking about that precious skin of yours and what's going to happen to it

to-morrow, eh?'

Carstairs was a man of some consequence among the subalterns-he had been in action. True, it was a tin-pot affair in which no one was hurt except a few savages who were incontinently shot before they had time to put up a fight; but that was hardly the point. The point was that Carstairs had been in action, and that none of the others had; and that, therefore, when Carstairs made a joke it was bound to be a good joke. For which reason the answering laugh was prompt and noisy.

'And I owe an apology,' said Johnson, 'for mentioning the Empire with ladies present."

In this wise did Johnson allude to the 'young un's' effeminate appearance, and to the fact that Francis Drake was known amongst the Royal Die-hards as 'Miss Frances' Drake; and another shout greeted this sally. A spasm of energy, too, stirred the listeners for the first time that evening It was always good fun drawing 'Miss Frances; and, however exhausted and tired the Die-hards might be, they were generally ready for a bit of fun. Therefore they changed their positions with a lazy effort and slanted their eyes towards the shaded corner.

The victim, however, responded slowly. As a rule it was not his habit to respond at all, diffidence being a marked feature in his character, and experience having taught him the wisdom of holding his tongue. But on this occasion he had raised himself to a sitting posture, and the expectant group were not a little startled by the angry look

'I wasn't thinking of my precious skin,' he said, flashing from his face. turning to Carstairs and ignoring Johnson, any more than you were thinking of yours. And, to tell the truth, I'm sick of you and your blather, Carstairs. You're always posing as a hero, but you don't seem to have done anything wonderful as yet, except talk, and—and.'——

Drake sank back, with the sentence unfinished. Never before in his life, perhaps, had he ventured on such an outburst; never before had the latent spirit of a man shown in him so openly; and now, with the effort made, the sense of anger suddenly dwindled, and in the reaction that followed he cowered abashed and afraid before his own temerity.

But the anger of a gentle nature is a powerful weapon because of its unexpectedness possibly, or because of its justice; and when it comes, it comes like a thunderbolt, creating the surest havoc and consternation. In this instance there was no one ready with a reply. The listeners gaped openmouthed at the speaker, and for a minute or more remained so, staring stupidly in astonishment; then, instinctively and of one accord, they turned to Carstairs. He had brought about the difficulty: he was the proper person to deal with it. Besides, they had not yet known him at fault in an emergency.

It was the more disappointing, therefore, to see that Carstairs was only laughing rather foolishly, and that he had nothing better to say than they had; and the disappointment deepened still further when the hero, having at last found his tongue, fell back tamely on a schoolboy retort.

'You'll sing another tune to-morrow, my lad,' he said. 'It's all jolly fine, you and your Dutch courage, when there isn't a nigger within ten miles, but—you'll sing another tune to-morrow, mark my words!'

Drake shrank farther back into the gloom and answered nothing; and the others, apart from a mild stare of astonishment, offered no comment.

Then Carstairs, stung suddenly to passion by a sense of his own ineffectiveness, blurted out afresh, 'Talk, indeed! That's like your infernal impudence! Talk! There'll be something else than talk tomorrow, I can tell you. And see to it, my fine fellow, that you don't disgrace the regiment. There'll be no quarter, mind you—these infernal niggers don't give quarter; it's sheer murder from start to finish, and the regiment can't afford funkers on its muster-roll. So see to it, my lad, that you keep that pretty face of yours turned the right way about when the time comes, when these howling brutes start hacking at the square with their knives, and when—

Talk, indeed! Why'—

"Mr Carstairs!"

A small, dapper man was standing in their midst. His iron-gray moustache seemed to bristle at them as he spoke, and his keen eyes flashed with indignation.

'Mr Carstairs,' he repeated in a sharp, incisive voice, 'I have told you before that I will not allow conversation of this sort among my officers. Don't let me hear any repetition of it;' and, without another word, he turned on his heel and walked away.

But as he presently passed along the line of

pickets, with a question here, an order there, scrutinising, considering, and instructing, the closeness of his attention wandered at times and an unmistakable frown of anxiety crossed his face. The incident of a minute before had started him on an unpleasant train of thought, and it was not easy to drive it from his mind. For, if Major Vesey was a veteran in experience, he had learned the veteran's lesson that nigger-fighting is a tougher business than it seems, and that silly talk among the youngsters does not help to lighten the task. These schoolboys, he reflected, came out there endowed for the most part with a natural courage which seldom failed them at a pinch; but that courage needed nursing -ay, and careful nursing, too. Like any other attribute of youth, it lay upon the surface, to be displayed instantly—at a word; and at another word to be as readily wiped out of sight and out of existence. It had not yet become part and parcel of their being; it had yet to be grafted there firmly and enduringly by the rough hand of hardship. Major Vesey knew this well enough; and he knew also that, as in a cricket-match, the most difficult thing on earth is 'to stop the rot' when it has once set in. It may not matter much on a cricket-fieldit means life or death in face of an assegai; and this little, dapper officer could remember dead men by the score who were dead only because the 'rot set in' and there was nobody to stop it. For that reason he said something under his breath about Carstairs, and that 'something' referred to Mr Carstairs's tongue.

And, in truth, that wagging tongue-just like most wagging tongues-had, as usual, managed to accomplish its evil work. Not, mind you, that Carstairs really meant it. Oh, dear me, no! For at bottom, as the regiment was quite ready to admit, Carstairs was not a bad sort. He had 'points'-a generous nature, for instance, and a kindly heart; but, as the regiment was equally ready to admit, 'the beggar was inflated.' A small vanity might be reckoned his weakest spot, and that weak spot had been rubbed up this evening very roughly indeed. The suggestion that, after all, he was not such a big man as he pretended to be, that his fighting 'record' was at best a poor affair, and that, seriously considered, he came remarkably near to being a sham-for such was the drift of Drake's sudden outburst-had nettled him beyond endurance; and, without pausing to think, his temper holding the upper hand, he had blurted out an angry and heedless reply.

On the listeners, taken collectively, the remark left little or no impression. Unimaginative, they hardly realised its full purport. Besides, they were too tired to-night to care. No quarter, indeed! Sheer murder! Well, it would be soon enough to think of that in the morning; and, having made up their minds to this, they rolled themselves in their blankets and presently fell asleep.

But the human disposition is not always cast in one mould—hardly ever, if the truth be told—and the differences engendered by nature are as a rule only emphasised by habit and made more marked through the strengthening force of time. A peculiarity, or a sensibility, grafted on us in that earliest start of life is all too apt to remain where it is, and it is but seldom that a man's environment will help him much to foster a virtue or to conquer a weakness. For the most part, it will help him whole-heartedly the other way; and this had been the case with Francis Drake.

Instinctively timid, it had not been his good fortune as yet to experience that rougher side of existence which goes to the making of a man. A too anxious mother had interfered in the first place; some trifling delicacy, a matter of really small account, had given its casting vote for a tutor instead of a public school; and, that Francis Drake's misfortune might be the more complete, it so happened that his sister Eileen, a girl some twelve months older than himself, was living at home. Now, God forbid that one should ever utter a single syllable against the chastening influence of a woman! God forbid that one should write down here even the shadow of a suggestion against that dearest place on earth-our home! And yet, in the soberest judgment, it is always clear that there are times when evil may spring from good, when the helping hand shall only hinder, and whenthrough the accident of inopportunity-the kindest effort shall lead to our undoing. At any rate, so far as Francis Drake was concerned, this had proved to be true. The timidity of his nature, his sensitiveness, his delicate, almost effeminate, spirit, had thriven in the hothouse in which it grew; and his sister's character, reacting on his own, had left it, like hers, gentle-indeed, lovable-but wholly destitute of that spontaneous pluck, that strenuous energy, which belongs of right to manhood. A public school, in its rough-and-ready fashion, could have cured all this with both comfort and satisfaction to itself, had the chance been afforded; and the regiment, who were willing enough to act as deputy, found themselves in similar predicament, for 'Miss Frances' had only joined three weeks before, and there had been no time to do anything with him. And thus it came about that now, whilst the outward evidence of slumber sounded aggressively all around him, he was still lying wide awake.

And yet Drake was far from being a coward. That distinction between timidity and cowardice, that broad division which separates the sense of fear from the weakness of yielding to it, stood for him, as it stands for most of us, a saving clause; and when marching orders had reached him three days before he had not been long in steadying himself. For an instant, it is true, his throat had tightened painfully; the fluttering of his heart had sounded in his ears like the beating of a drum, and he had looked round hurriedly lest the others too should have heard it. But that was impossible; they had drowned all else in their frenzied cheering, in their wild 'Hurrah!' and in that moment of shame

the hot blood had rushed back into the boy's face, and he had set his teeth and stiffened his courage.

Then, with the effort made, that first gripping of the resolution taken, there ensued an inevitable While the cheering lasted, while that rousing 'Hurrah!' still rang in his ears, it was well enough with Francis Drake. The exhilaration of the moment, the picture of the flushed, excited faces around him, the contagion of enthusiasm, struck a chord, and his whole nature responded instantly. But later on, in the calm of afterthought, the glamour of it melted away. A sense of despondency stole over him by degrees, a sense of unreality in the glory, a sense of vivid reality in the danger. And when the others left him one by one, some to see to the packing of their kit, some to write letters home, some to drink success to the regiment, the black cloud settled on him more surely, more persistently, than before. He could still hear them shouting—toasting each other, toasting the future. But the future! The future might mean death, and the life was gone out of the shout. Now, as it seemed to him, it was only the echo of a shout-no more than that; and in that period of loneliness, of overmastering depression, it was all a mockery of joy.

And during that three days' march bad grew steadily worse. The heat of the sun, the overfatigue, and more particularly the constant strain of watching had exacted their sure toll from nerves already tense to the breaking-point. As some one had hinted in an incautious moment, 'one never can tell where these black beggars may be—a hundred miles away or skulking in the grass at your elbow; one never can tell.' Which, as a matter of fact, is the truth, and a truth unfortunately over heard by Francis Drake. It had set him thinking again; it had started all the old fancies afresh—those fancies which could so readily picture the worst aspect of any horror; it had shaken a resolution already wavering, and it had left him weaker and more fearful than before.

At such a moment it is that the helpfulness of a stronger nature may change the whole current of affairs—a word perhaps, a look of encouragement, may suffice; the merest suggestion of personal confidence, any trifle indeed—so delicate is the balance of a man's mind between firmness and infirmity of purpose. And it is not always through his own merit or fault that he shall fail or succeed Toppling on the brink, he may go over with a crash, or through some happy fortune steady him self ere it be too late, and stand calmly facing the danger. This has come to most, on occasions; it had come now to Francis Drake. He was toppling on the brink, and as he stood there some one had given him a push from behind. No quarter, murder from start to finish, and howling demons hacking at the square with their knives! Carstairs had spoken heedlessly indeed; but he had upset the balance, and Francis Drake was writhing now in a very agony of torture. The others were asleep; there could be no sleep for him.

'Young un!'

Drake started at the sound. Outside all was still save for the hardly audible tread of the sentries, and within the tent not one of his companions stirred. Had he been dreaming? No; there it was again: 'Young un!'

And the boy raised himself on his elbow.

'Is that you, Carstairs?' he asked.

'Yes. I heard you tossing about, and I—I thought'—Carstairs spoke in a very low tone—'I thought that perhaps something that I said this evening might have fright—I mean disturbed you. You know, young un, I was only chaffing. The fact is that this business to-morrow is a regular oneman show, with Tommy Atkins playing the star part. There won't be any real fighting at all. We'll just sail through the beggars as a liner sails through a fishing-boat if they come in collision. I was only chaffing, young un.'

Drake gazed a moment at the recumbent figure; then suddenly a lump rose in his throat.

'I—I know that,' he said; then added simply, 'Thank you, Carstairs.'

'That's all right, old man; that's all right;' and with a sigh of relief, Carstairs turned over on the other side, his eyes slowly closed, and presently he had forgotten the 'young un' and the niggers and all else that belongs to the land of the living.

But it was the first wink of sleep he had had that night. A pricking conscience—that best and surest recipe for wakefulness-had worked on him with its usual effect, and had kept him restless and unsettled; those careless words, spoken vaingloriously but without any thought of evil intent, had recoiled with wondrous promptness on his own head. Strange to the terrors born of a too lively imagination, happily unconscious of the paralysing fear which in certain natures may underlie anticipation, he had recked little enough of his thoughtless remarks at the moment when they were uttered. They had burst from him unrestrained in a spasm of irritability. Then suddenly he had noticed the change which came over Francis Drake; suddenly he saw the boy shrink back again within the shadow; suddenly he realised the harm that he had done. Then would he have recalled it all; then, when it was too late, when the mischief was beyond repair. It was the old, old story of unavailing regret, of a futile repentance, and it kept him tossing about in a fever. However-and now he metaphorically patted himself on the back-it was all right again. He had managed to straighten things up a bit. The young un knew now that he had only been talking rot; and so, with a respite at last from that troublesome conscience, with a grateful sense of a good deed done, the just man fell into that calm and peaceful slumber which is by right of heritage the sleep of the just.

Yet it is not thus easily that the past is to be obliterated. The accomplished fact can never be

wiped out; its effect may be modified, that is all. In this case so much, and no more, had been achieved. The kindliness of Carstairs's action had touched the boy's heart, but it was powerless to erase from his mind that picture so firmly embedded there. Like the mark of a lead-pencil, it could fade beneath the rubber, and yet remain. The cheery encouragement had done something—indeed much—but it had not done enough. Something more was needed, some stronger touch than this, to make the weak man strong.

And so, when the day dawned at last, when the regiment fell in and the march began afresh, Francis Drake trudged alongside his company in limp and lifeless fashion. At starting he had straightened his back and squared his shoulders, for the timid are prone to some show of bravado; but the effort had been short-lived. He could not sustain it. His pale face spoke to that, and the heavy lines beneath his eyes.

'Ah, Drake!'—Major Vesey was passing along the column—'you look washed out, my boy. Had a bad night, eh?'

'Yes, sir. The-the heat, I think.'

'Humph!' And the Major's critical glance added its own emphasis. 'It is trying,' he said presently, 'but the morning air'll soon pull you together.' Then, as he moved forward, he grumbled again something about somebody's 'dashed infernal tongue.'

But now there were matters of greater moment to think of. The head of the column was passing out of the open and had just commenced defiling through a wood. Military formation was no longer possible. Entering in single file, beating down the undergrowth which lay thick across the track, the men followed one another into the shadow.

'Slowly, my lads,' said Major Vesey as he watched them disappearing one by one. 'Slowly, there! And—keep a good lookout in front.'

A good lookout! Ah, yes; but could it be done? When the trees stood studded so closely that in places a man could hardly squeeze between them, when the undergrowth clutched at one's leg and sometimes held it fast, and when the gloom around them was darker than the twilight, could it be done? Perhaps—perhaps not.

But they got along somehow, hacking a path as best they could, stumbling at times, struggling up again, and pantingly plodding onwards. And soon they were half-way through the wood.

'Call this nothink?' said one of the men. 'Blest if I can see a bloomin' thing.'

'Blest if I can either,' chimed in one of the others. 'Why, old Ukimbo hisself might be marchin' alongside.'

And Drake, who was close at hand, had been thinking the very same thing. To realise the full risk they ran needed no veteran's experience. The uncertain foothold; the impossibility of seeing a dozen yards away; the hopelessness of combining in case of attack, of even using their weapons at

all in the denseness of that foliage, were all apparent to the least-seasoned subaltern. A rat in a trap stood a better chance; at least he has room to turn about. And it was in just such a place as this, the boy remembered, that the Highlanders were cut to pieces two years ago. Not a man escaped; not one of them was left to tell the tale. Though there was evidence enough in all conscience, the clearest evidence in those horribly mangled bodies, in the cruel things that had been done to them, in the-

Crash! Bang! What was that?

The sound reverberated through the wood like a clap of thunder, and Drake stood rooted to the spot. So, then, it had come at last! It had come to them as it had come to the Highlanders, and ---- No; somebody was laughing-laughing and joking and helping to haul somebody else up from the ground. One of them had tripped and fallen, and exploded his rifle. Oh, was that all? He might have shot some one, of course, careless beggar. But never mind; they were only half-way through the wood. Push along.

This last injunction came from a sergeant.

'Push along, there!'

And the Die hards moved forward again-for an hour, maybe an hour and a half; and then a shout went up. The gloom had lightened unexpectedly, and the rays of sunshine were stealing in. Before them the trees were thinning and the path had turned less toilsome; a short three hundred yards ahead they could almost see the plain. There was good reason, then, for that cheery shout.

With a sigh of relief, Francis Drake gazed upon the welcome sight. During all this time the nervous strain had been growing more and more unbearable. It had mastered him with a slow and steady persistence; it had shaken him so that he was ready to start at the rattle of his own accoutrements, at the sound of a neighbour's cough, at the snapping of a twig beneath his feet; his own sigh, even, had struck his ear strangely and had filled him with a mortal fear.

But it was all right now. He could see the rays of sunshine; he could almost see the open space beyond. They were so nearly out of the wood—thank God for that! His breathing came more regularly as the thought was realised; his step trod more firmly, more elastically, on the turf; the colour crept back into his cheeks; and in a moment of renewed confidence he gazed around. In that moment his heart stood still! Peering at him through the bushes, not a dozen yards away, he saw two gleaming eyes-eyes set in a hideous black face -the eyes, the face that he had dreamt of so often! 'Look!'

He never knew that he had cried out. He was conscious that something had hurtled through the air, and that the man nearest him had fallen with a groan; but he was only conscious of this vaguely; his whole attention was fixed upon that hideous face; and as he looked a dozen others appeared beside it, and presently the bush was alive with men.

Drake stared at them an instant, stunned and stupefied. Then suddenly the truth came home to him, the recollection of the Highlanders who had gone before; and in a whirlwind of irresistible panic he turned to run.

'Mr Drake!' A hand lay upon his shoulder. 'Mr Drake, the enemy is -- in front!'

Checked by the words, the boy stopped, and, looking towards the speaker, met the firm gaze of Major Vesey.

'Come along,' said the elder man, taking the other by the arm and turning him round. 'Come along, and-we'll put the fear of God into these black fellows !-Steady there, lads! Steady there!

Major Vesey had watched the drama as a critic watches, played in a dozen seconds. He had noted the period of hesitation, the sudden wave of terror, the shameful climax to it all; yet, filled with that sympathy which is born of ripe experience, he had made allowances, he had held forth a helping hand. And in that instant he knew that he had not held it forth in vain.

'Come along!' he cried again, this time with rising enthusiasm. 'Come along!'

And there was no need for him to glance back over his shoulder. Already Drake was at his side. The enemy is in front! That was enough; that and the contagious example of a brave man. And together they rushed forward into a storm of flying assegais, into a crowd of shricking, naked savages, into a pandemonium upon earth.

'Where's the Major?'

The Die-hards, such as were left of them, had formed in the open. There were still sounds of movement rustling through the wood, but never the sign of a black figure to be seen. The bayonet had worked too busily for them during that last halfhour, and the game was up. But it was a sadly diminished square that stood facing the scene of battle, a set of worn, weary, panting men, labouring for their breath and thanking Heaven that they were alive.

Where's the Major?' Carstairs repeated the question, and glanced anxiously at the rest. But the answer came from the wood.

The war-cry had burst forth anew; the bush creaked and swayed before an oncoming mass; the assegais were flying once again; and in that moment a man carrying another man on his shoulders staggered through the trees. A race for life or death, and not a yard to spare!

'Quick, there, with the Maxims! Let 'em have

A steady rattle of the bullets, a sharp singing in it, boys! the air, a pattering amongst the trees, and that oncoming mass halted—rushed forward againhalted a second time—then wavered and fled; whilst the man with his burden had been drawing nearer, nearer, and nearer, till at last he stood within the square.

'Why, good heavens, it—it's the Major!' Tea-

derly they lifted him to the ground. 'Are you much hurt, sir?'

'No, no; only a broken leg. But if it hadn't been for Drake'----

Drake! In the excitement he had slipped aside unnoticed. Relieved of his burden, he had thrown himself upon the grass without a word, his legs still shaking from their effort and his heart thumping like a sledge-hammer. But it was to thump harder now—yes, much, much harder—hard enough

to crack his ribs, I tell you, when that rousing cheer went up upon the veldt. It rang from every throat in one great chorus—the testimony they paid him—and it carried far and wide. It reached the flying savages as they ran, and made them scurry for their lives as though the Evil One were behind; it reached the animals hiding in their lairs, and made them wonder what was coming next; it reached the Young Un's soul, and will remain there a memory, the sweetest memory, for ever.

THE HOME CULTIVATION OF TOBACCO.

By George Stronach, M.A.

AN the cultivation of tobacco in the British Isles be made successful and profitable? is not a new problem; and a further solution is about to be tried in the case of Ireland, on whose behalf a Bill passed through the Com-

mittee of the Lords last session, and 'was reported without alteration to the House.' This is another Irish 'grievance' rectified. The Bill, entitled 'Irish Tobacco,' 'presented to the Commons by Mr William Redmond, supported by Sir Thomas Esmonde, Mr Patrick O'Brien, Mr Joyce, Mr Hayden, Mr Vincent Kennedy, and Mr Charles Devlin,' is a very brief measure 'to repeal the law which prohibits the growing of tobacco in Ireland;' and it reads: 'Whereas, it is of the greatest importance that every attention and encouragement should be given to the produce and manufactures of Ireland; and whereas, by the Tobacco Cultivation Act, 1831, the cultivation of tobacco within the kingdom of Ireland and the exportation of the same from thence is prohibited: Be it therefore enacted by the King's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows: 1. From and after the passing of this Act, the Tobacco Cultivation Act, 1831, or any other Act made in this kingdom which prohibits or restrains the setting, planting, or improving to grow, making, or curing tobacco, either in seed, plant, or otherwise, in the kingdom of Ireland, shall be, and the same is, hereby repealed and made void. 2. This Act may be cited as the Irish Tobacco Act, 1906.

The history of tobacco cultivation in the British Isles is one of peculiar interest. By an Act of the twelfth year of Charles the Second's reign there was, for the protection of the British colonies and plantations in America, a prohibition placed upon 'the planting, cutting, or sowing of tobacco in England, Wales, Guernsey, or Jersey, or the town of Berwick-on-Tweed, or in the kingdom of Ireland, except in any physic garden of either university, or in any other private garden for physic or chirurgery only, so as the quantity planted exceed not one half of one pole in any one place or garden.' This was

partially repealed by 19 George III. so far as Ireland was concerned, the importation of Irish tobacco being allowed into Great Britain under the like duties and regulations as held with the British colonies in America. Then tobacco-growing began to flourish in Ireland, as it had done in the days of Raleigh, who in 1584 introduced into the country the potato and tobacco-plant from Virginia on his forty-two thousand acres of forfeited lands in Cork and Waterford.

The county Wexford, and the neighbourhood of Enniscorthy in particular, was the most favoured spot for the cultivation of the plant. A young man from Enniscorthy, who had visited Maryland, brought back with him some tobacco-seed, and encouraged his brother to venture on it, and from half an acre one hundred pounds profit was at once produced. Holding a farm of sixteen acres, this venturer made a profit of twelve hundred pounds in seven years. The tobacco sold well, because it was Irish. But in 1831 Lord North's Act was repealed; and from that year a fine of one hundred pounds was imposable on any person in Ireland growing more than one pound of tobacco in his garden. The Act did not pass through Parliament without much opposition, as valuable testimony was given as to the benefits accruing to the country from the cultivation of tobacco. In the article 'Tobacco-Growing in Ireland,' by Mary Gorges, in Chambers's Journal for 1905, the latest experiments are related of tobacco cultivation there.

The restriction has now been withdrawn, thanks to the energy of the Nationalist members, who have made a 'palpable hit' in obtaining for their country a privilege denied to England and Scotland, where, as in Ireland, it has been proved that tobacco can be grown with success and profit. It will be interesting to learn the arrangements made as to the exportation of Irish tobacco. Can the growers export the tobacco abroad as well as to Great Britain free of duty, or is the free-trade policy to be confined to the exports to England and Scotland?

Why should not England and Scotland agitate for similar benefits? In 1886 experiments were made in England which proved conclusively that the best of tobacco could be raised even in its variable climate.

The Government of the day granted permission for experiments, under certain stringent conditions. Several noblemen, landowners, and agriculturists obtained tobacco plants or seeds-amongst them Lord Walsingham in Norfolk, Mr Faunce de Laune in Kent, Sir Edward Birkbeck in East Norfolk, and Mr Bateman in Essex; and splendid crops were grown on their estates, although there had been no special cultivation of either plot for this particular plant, which had to take its chance in the kitchengarden with the vegetables for culinary use and in the field with the barley crop. But the land in each case was in 'good heart,' though not in such excellent condition as is considered by many necessary for tobacco cultivation.

The seeds were sown in a hotbed, where they grew rapidly, and then pricked out in shallow wooden boxes, to be kept for a time in a lower temperature. It was not till the middle of June, because of the cold nights, which would be fatal to them, that the plants could be set out in the open ground. By July the plants were in good trim, even under very ungenial atmospheric conditions. The following particulars mark the development of the crop, at the same time showing the anxious solicitude evinced by the Board of Inland Revenue:

July 8. Excise officer made first visit.

- " 17. Stormy. Plants growing very fast.
- " 19. Tobacco hoed the second time.

.. 20. Heavy rains.

- " 23. Stormy. Tobacco growing rapidly.
- " 27. Commenced 'earthing up' tobacco.
- " 29. Excise officer made second visit.
- Aug. 5. Finished 'earthing up' tobacco.

 " 9. Commenced 'topping' the tobacco.
 - " 11. Excise officer made third visit.
 - " 12. Tobacco hoed the fourth time.
 - , 20. Excise officer made fourth visit.
 - " 24. 'Suckering' the tobacco.
 - " 26. Found first caterpillars attacking plants. , 28. Closed an extremely hot week.
- Sept. 7. Excise officer made fifth visit.
- , 10. Tobacco beginning to ripen.
 - " 11. Slight frost at night.
 - 11 13. Excise officer made sixth visit.
 - " 17. Sharp frost. Dry east wind.
 - " 18. Another frost. Commenced cutting tobacco. " 27. Finished cutting and housing tobacco.

Assuming that the produce had been sold at fourpence per pound-of course the Excise officer took care that this was not possible-we find that the experiments worked out at a net profit, over the different estates, of from ten pounds to twentyfour pounds per acre.

So much for England; but has Scotland ever succeeded in the cultivation of the plant which, as King Jamie maintained, encourages 'smoking-a custom loathsome to the eye, hateful to the nose, harmful to the brain, dangerous to the lungs, and in the black, stinking fume thereof resembling the horrible Stygian smoke of the pit that is bottomless'?

By 22 George III. tobacco grown in Scotland was permitted to be imported into England for a limited time; although in 1782 the growth had been pro-

hibited, as doubts had arisen whether the prohibition applied to Scotland under the Act of Union.

During the American war tobacco became so dear that attempts were made in Scotland for its cultivation. The chief seat of the new culture was in the neighbourhood of Kelso, where it succeeded so well that sixteen and a half acres of Crailing tobacco brought one hundred and four pounds, or six pounds seven shillings and fourpence per acre, the produce being purchased by the Government at fourpence per pound. From the Agricultural Survey of the County of Roxburgh, it appears that tobacco was first grown at Newstead, and eventually many hundred acres of land were cropped with it. The profits were amazingly great, but the Act of 1782 put an entire

stop to its cultivation. As a remedy for agricultural depression Mr Gladstone recommended the cultivation of strawberries in Scotland. Mr Redmond goes one better by recommending the cultivation of tobacco in Ireland. By the removal of the prohibition on the growing of tobacco in Ireland he has got rid of a legitimate Irish grievance which has lain dormant for many years. It is to be hoped that the Scottish members will agitate for a like repeal Bill for their country, when a new and profitable industry will le reopened to the Scottish peasant. He needs it badly.

LINES FOR AN ALBUM.

So you'd have some dainty trifle Scribbled, lady, on this page; Shall I some old lyric rifle, Captured in a golden age From Elizabethan verses Sung by Lovelace long ago, Herrick, Carew ! Time rehearses Time confounds; yet each might do.

Lines that, on his war-horse prancing, Some Carolean cavalier-Backward to the castle glancing, Sees the most-bridge slowly rear; Shakes his silken scarf above him, Pricking onward to the war-Lilts to the bright eyes that love him: 'These I love, yet Honour more!'

Or a fancy carven quaintly, In a courtly Georgian line, Would you have—whose perfume faintly Dobson's urban notes enshrine! Pain I would have found aught fitting Delicately tinted page, All thy fairness e'en outwitting, Dared I in th' attempt engage.

But poor verses, random rhymings, Children of unhappy muse, Thine are inharmonious chimings, Not a 'symphony in blues.' Ye possess but evanescence, Yet unworthily must wend To the lady's gracious presence, Finding there perchance a friend. R. W. BUTTERS.

CHRISTMAS EVE IN CEUTA.

By A. FRANCIS STEUART.

EUTA, which is the chief of the Spanish possessions in Northern Africa, and has been for over five and a half centuries in the possession of European Powers, is singularly seldom visited by travellers. One

asks men who have for years lived in official positions, military or naval, opposite to it at Gibraltar if they have been there, and in the great majority of cases they answer that they have not, as 'it is so difficult to get at, though we often go over to Tangier;' or that they prefer the meagre dissipations of the Calpe hunt amid the prickly pita (aloes) in the neighbourhood of the Spanish township of San Roque.

Now, Ceuta is on a peninsula just across the sea, on the African side, from Gibraltar; and though no boat runs directly between the two colonies, English and Spanish, there is daily communication between Ceuta and Algeciras, and the latter is the Spanish town, facing Gibraltar, in which the Spaniards, expelled from the latter by the English in 1704, took refuge and formed a miniature rival fortress.

During a visit to good friends at Algeciras last year I formed a wish to visit Ceuta, which I could see across the sea, lying like a huge water-rat on the water, the isthmus connecting it with the mainland of Morocco forming the tail. I knew that it was once Carthaginian, then successively Roman, Moorish (the starting-place of the Moorish conquest of Spain), Portuguese, and now Spanish. I knew that it was garrisoned by the British in 1810, that it was a Spanish penal colony, and that it had nearly thirteen thousand inhabitants; and all this whetted my curiosity. I determined, therefore, that I must 'see Ceuta or die.' But (like the Gibraltar officials whom I had despised) I found it not so easy to accomplish what I had said in my haste.

In the first place, I had no passport. This I proposed to get over by borrowing that of my willing host, thereby rendering him liable to criminal

No. 520. - Vol. X.

[All Rights Reserved.]

prosecution! Luckily, I found in due time this would not work; then I was abandoned by another man who had an illusory idea also of going to Ceuta; and, lastly, I found that a passport from the Colonial Secretary at Gibraltar had to be got, and that visé by the Spanish Governor of Algeciras, the courteous General Espinosa de los Monteros, to admit me for a specified time to the Spanish penal colony.

When these preliminaries—which took time, for the Spanish catchword mañana (or 'to-morrow') means a good deal, and delays everything—were completed I found another difficulty awaited me, which was: 'When does the Ceuta mail-boat start?' Every one had a different hour and theory. One morning I tried 7.30 a.m. (the alleged time), only to see the ship steaming out of Algeciras harbour. Then, finding the real time of departure was 7 a.m., I went to the pier on the morning of the 24th of December (Christmas Eve) 1906, at 6.10, which I thought was 'punctual to time.' It was lucky I did so, as the steamer sailed at 6.50, but this time with me in it.

Accompanying me there was a railway magnate of a great English line, a Scot by birth, who, knowing that there was a certainty of a new Europe to Africa line of steamers being established in the near future when Morocco is developed, and that the line would run either from Tarifa to Tangier or from Algeciras to Ceuta, had (like Mr Micawber) come 'to see Ceuta' under the guidance of a native of Gibraltar. The rest of the passengers on the boat were Spanish soldiers and a very few of the bas peuple.

The day was perfect, the southern morning sun quickly warming the chilly air. The sea was calm, and Gibraltar lay behind us like a British lion couchant. William Littgow, the Scottish traveller, described the strait in 1621 as 'this narrow sea, on Affricke, or side of Fez, consisteth betweene Cap di Sprat and the Promontore of Sewty [Ceuta] and upon the coast of Spayne, betweene Cap de Trafolger

served.] NOVEMBER 16, 1907.

and the butting forehead-land of Gibelterre. . . . The passage being five leagues broad and nine in length.' And I cannot better the description. As we got across towards Africa we began to see the Spanish territory and neutral ground marked off by natural ravines and guarded by boundary forts, and, finally, in about two and a half hours reached Ceuta itself, where we were rowed ashore in a small boat by sturdy Spaniards—our military companions going off in another boat, pursued by the congratulatory shouts of the crew and received by no less a person than the Spanish General.

In spite of a good many Moors in the streets, the first glimpse of Ceuta shows the traveller that he is in a Spanish town. The fortifications of the old city are ancient and strong, but, though originally Moorish, have been strengthened by the Portuguese, who captured the town from the infidel in 1415, under Prince Henry the Navigator. On the incorporation of Portugal by Spain, Ceuta passed to the latter country; and as it possessed a Spanish garrison when Portugal threw off the Spanish yoke in 1640, under John of Braganza, it has remained Spanish, being now the chief Spanish convict prison, and a place of international interest since all European eyes are centred on Morocco. Unlike Gibraltar, the old town is not built on the side of the hilly 'promontore,' though the chief prisons now are, but on the isthmus or neck of land (divided by a fosse) connecting it with the African continent. The view of the various towers and walls reminded me most of the walls of Mazagan in Morocco, a town which was for some centuries (as was Tangier) Portuguese also.

My first desire was to see the cathedral dedicated to 'Our Lady of Africa,' so, leaving the other visitors, I proceeded to the older part of the town, threading my way in the little, narrow, ill-paved streets until I came to the chief square. There I found the church, a rambling building originally a mosque, with a little octagonal bell-tower surmounted with pointed battlements. A tablet on the wall says the present church was begun under King Charles II. of Spain, and finished in 1721 under King Philip V. The interior struck me as in no way interesting, save for the fine voices chanting in the choir and for a somewhat grotesque figure of a giant St Christopher painted on the wall. It contains, however, the olive-wood wand of Pedro de Menezes, the first Portuguese Governor, which is used as a symbol of investiture by his successors. Having looked round, I threaded my way back among narrow streets, elbowing Moors driving donkeys laden with charcoal; bakers' mules, with loaves of bread in skin panniers; Moorish women, who when they dropped their veils (and, being poor, they were not shamefaced) showed their tattooed faces; Jews, rare in Spain but common enough here, in black gabardines; and many convicts going unmanacled to work, clad in brown uniforms with round caps, white or brown according to their rank.

The next thing to be done was to admire the glorious view across the blue sea towards Tetuan on the African side of the isthmus, and in doing so one came upon the pescaria or fishing-place, where the brown corduroy clothes and yellow shirts of the pilchard-fishers gave magnificent notes of colour which did one good to see.

The newer and Spanish part of the town, built upon the undulating ground to the east, in turn claimed attention; and it was then that one realised that Ceuta was above all a convict settlement Convicts (unmistakable from their uniform) were everywhere, hastening brisk and busy through the streets to their work. There are some three thousand, I believe; but the greater offenders are in the walled prisons where (with luck!) one does not penetrate. My attention was drawn to one convict, an ex-lawyer of Madrid, who had blown up a recalcitrant client with an infernal machine; and the waiter at the fonda (a pleasant fellow with a twinkle in his Irish eyes) told me that he himself was from Malaga, but came there 'for theft.' I fear, in spite of his charming manners, this meant 'with violence.'

There are some handsome seventeenth and eighteenth century hospitals and public buildings and some ci-devant monasteries. In the upper part of the newer town the squares are lined with orange trees (the gardens with palms), and one of them has a bust of the patriot 'Ruy, 1808.' The Spanish shops boast gallant titles, though they are of small extent, and one can enter their doors under the specious signs of 'Africa Española,' 'La Española Ultramarina, or 'La Africana,' The Governor's residencia, on the sea-front, is less distinguished by its architecture and garden than by its sentry, one of the tiradores of the Riff regiment, which, recruited by the Spaniards among the Riff tribes of the hills, retains the pigtail by which Mohammed may, at an emergency, carry each one of them to heaven. The theatre, where Las Hijos Artificiales was being played, did not attract

The time allotted to travellers by the exigencies of the boat-service was five hours; but I had walked much, and the Governor—to whom it was necessary to show our passports, and (like a schoolboy) demand from him an exeat lest we should not be allowed to depart from the fortified town sternly forbade us to quit the walls except for the boat. As the Governor of Algeciras had told me this was the rule, I was not disappointed; but my railway-magnate friend was crestfallen. The reason of the rule was that the Moorish brigand El Valiente is rampant outside the walls; but, sa General Espinosa told me with qualified praise, 'he is a gentleman, and if he has to cut off a cap tive's head he will do it in a gentlemanly manner -though this emergency the Spaniards are auxious

to prevent.

Forbidden to drive into the neutral ground, and indeed beyond the town, and having seen most of

the city, the markets, and the prison depôts (where they sell pretty string cigar-cases and zapatillas or slippers), we took refuge in the most central café, and there listened to a young soldier—among many army men (majors, captains, and sergeants) who, after due salutations, met in all amity—who played 'La Valenciana' and other 'bull-fight' music until I relieved him by strumming Strauss waltzes, which were received by the audience with much rapturous stamping of feet.

Spanish boats having dubious hours of departure, I insisted, though the steamer was billed to leave Ceuta at 4 P.M., on being on the pier by 3; and this was lucky, as, after we were rowed on board, she left at 3.30! She returned with a larger crowd of emigrants than she had brought—some Jews (who

tried to escape the waterman's fare), some ladies. (who wept bitterly) 'changing garrison' for Algeciras, and some provision dealers returning to Gibraltar. Towards Spain-with Gibraltar, looking from the African coast exactly like a bishop's mitre, in front of us-we steamed, escorted by shoals of porpoises, and reached Algeciras in time to hear the firing of the cannon of the fort, which the day before had saluted the name-day of the young Queen of Spain, Victoria Eugénia of Battenberg, Queen Victoria's granddaughter. Not long after this the bells of the cathedral began to ring out that another Christmas was approaching, and that ecclesiastical ceremonials were soon to be enacted at which the presence of the whole of the devout inhabitants of Algeciras was expected.

THE CALAMITY OF THE POLDER.

CHAPTER III.

HE calamity of the night on the Leevan Polder was first realised by the inmates of the farm, led by Tante Louisa.

Betje's father and mother and the maids slept in rooms opening out of

the hay-loft. Their windows were cut in the slope of the great roof—four round, black-rimmed eyelets in the red.

Tante Louisa alone had a bed on the ground floor. Her health was not very good, and the ladder to the upper regions was considered a danger for her as well as a hardship. Waking in the middle of the night, for no reason that she could at once understand, Tante Louisa began to cough. She wondered why the air felt so damp, and then heard a sort of tapping in the next room, which was the Werk parlour. The sound was followed by another in her own room, as of china striking china. Troubled by the cough and increasingly interested in the unaccountable but intermittent noises, she sat up. There were peppermints on the dresser. She proposed to get one, and perhaps then investigate and see if the farm cats were up to frolicsome nonsense in the parlour. With this intention she put forth a leg, and screamed. If an assassin's hand had touched her throat she could not have screamed more vigorously. There were quite two feet of water in the room. She screamed until she heard movements overhead. Only then did she remember that there were matches under the pillow. Emboldened a little by the comforting knowledge that Betje's father was astir, she struck one and gazed at the alarming sight. Her bedroom slippers and at least two articles of crockery were floating between the bed and the window. This spectacle was too much for the old lady's sanity. She plunged recklessly out of bed into the pool, and, screaming louder than ever, floundered to the door. Here her brother-in-law came to her. Her shrieks were

tumultuous when the door resisted her efforts to open it. A stronger hand than hers was needed to push against the flood.

Betje's father on his part had not made the discovery without an accident which both irritated and hurt him. Descending the ladder staircase in the dark, he had slipped on one of the lower steps and thus reached the water in a sitting posture. He unwillingly swallowed a mouthful of it, and stumbled to his feet, feeling a concern which for the time was as keen almost as Tante Louisa's.

'What in the nation's name is the matter?' cried his wife from above.

Betje and one of the maids were with her, startled, like her, by the splash.

But Uncle Erasmus knew all about it now. He had not lived his life on the polder without occasionally conjecturing what might happen if some night the sluice were left open. It never had happened yet, for the reason that two minds at the mill were consecrated to his protection from such a peril. In his father's time that was the arrangement, and it had continued since. It was as much a matter of method for Piet and Klaas to make sure of the sluice at such times before going to bed as to undress for the same purpose. The one was a check upon the other. Klaas's question, 'Have you seen to the sluice, mynheer?' was as regular as Piet's own inquiry of Klaas in the like case. It was Piet's revenge upon him for his visit of the evening -this was Uncle Erasmus's instant conviction when he perceived the doleful situation.

'What, I say, is the matter?' cried the wife more peremptorily than before; and her husband now solemnly told her.

'Our evil-minded nephew has quite ruined us that is the matter,' he declared. This said, he clenched his teeth and proceeded to rescue his sister-in-law. It was not an easy adventure. The poor woman was unreasonably beset by terrors of drowning as she wrestled with the door, knee-deep in icy water. She was hysterical and helpless when he raised her in his arms. She screamed and struggled as he carried her up the staircase—this also was not easy—and only ceased when her sister's night-capped head and a cheerful though agitated candle assured her of safety.

Then, just as he was, in grim determination as well as despair, Uncle Erasmus went down again. 'The pigs will be drowned,' he explained. 'I must

go to them.'

Any less intelligent pigs would inevitably have been drowned. Those of Werk, however, had all their wits about them. When their master had waded out to them, he found them, complaining greatly indeed, but for the most part high and sufficiently dry on the roof of their sties. Two youngsters only were in a state of exhaustion and danger; and, with these under his arms, Uncle Erasmus returned to the house. He carried them upstairs as he had carried his sister-in-law, and, indifferent to Betje's protests, and their own, loosed them on that upper floor.

'We can do nothing more,' he then said, 'but

wait. The tide will soon ebb.'

It was a very distressing night for Werk.

Having fully found her tongue, after putting Tante Louisa into her own bed, Mefrouw Leevan denounced Piet as a monster untiringly. She shrilled about the inconceivable spoiling of her nether rooms one moment, blamed Betje for everything the next, and ordered the maids and Betje out of her sight and back to their beds as if they

were sinners of as inky a dye as Piet himself.

What could be done downstairs was left to Uncle
Erasmus to do. Dressed and in sea-boots to the
thigh, having lit the house-lamps, he was still rescuing articles of furniture from further harm when
the tide and the waters in the house began to fall.

The pallid dawn broke upon a scene of domestic desolation that would have infuriated a temper much less sweet than Betje's mother's. She it was who despatched her husband from the house to the mill to convey her maledictions to Piet at the earliest possible moment of safety. 'Go,' she said. 'You have your boots, and if you keep to the fields and observe the bridges very carefully there is no need for you to be drowned. Bring the young devil back with you to see the fruits of his devilry. Bring him and his clod of a man by the ears, which deserve to be snipped from their heads. And before I have done with him I will make him know that he must pay for all this mischief. If he has to sell the mill to do it, it shall be done.' From the top of the ladder Aunt Mina bellowed this stern injunction. All the household heard it as well as her husband.

Several times already Betje had tried to champion Piet against her mother's vituperations. She did not believe him capable of the baseness ascribed to him. Though obedient to her mother's orders, she had returned to speak up for Piet. That being of

no avail, she had shut herself in her own room-not, indeed, to stay in bed and try to sleep, as if the flooding of her home was none of her concern; she had more spirit than that. She lit her candle and placed it in the window. Piet would see the light; and, seeing it, if her thoughts could speed to him across the flood between the farmstead and the mill, he would know that he was still dear to her. Also, she dressed; and, thus dressed, she was seeking consolation in her Bible like the simplest of countrybred maidens, rather than an experienced young lady of Amsterdam, when she heard these brutal words of her mother about Piet as 'a young devil' and the dragging of him to Werk by the ears. Not that she deemed it possible for any man to take Piet by the ears with such facility. Nor did she think her father likely to attempt the task. But the unhappiness of it all! And the woeful lot that was to be hers if she consented to do her duty to the family as laid down to her the previous evening with such harshness by, of all persons, her own mother! By nature she was a sanguine and lighthearted girl. Mynheer Mops had appraised this charm in her as secondary only to her fresh young beauty. As a wife, he had calculated that she would be a lifelong tonic for him, to be taken, in one guise or another, as many times a day as it pleased him, like a harmless and agreeable exhilarant from 3 drug-store.

Her father grunted his acceptance of the nasty programme forced upon him by his wife; and Betje, with closed eyes, lay and waited for what should happen next. The grunting and gambolling of that pair of young porkers in the loft was no

amusement to her.

There was scarcely a foot of water in the house when Uncle Erasmus set forth for his nephew, but mud enough under the water. A pretty prospect this meant by-and-by, mused the poor man as he splashed out of the front door. Not a dry spot now between him and the Zuyder Zee's dike in front, except the mill on its modest mound. Above the dike a smear of crimson hinted of the coming sun, and this was the only cheerful colour in the scene.

It was with melancholy unutterable that Piet's uncle started upon his mission. He had had quite enough on his mind before this night. Now the burden was far heavier. As his eyes ranged dully over the great pool it seemed to him that the work of his life and his father's life was all undone. It was not really so bad as that, but thousands of guilders' damage to the polder had undoubtedly been wrought in the night. Nor in the polder alone. He could see the bodies of sheep and lambs here and there, just humped in the water. Of course. Had he not expected it? Some of the creatures, however, were safe enough. He had heard their cries ere daybreak, and there they were—those sager ones—lined and dotted about the green dike on all sides. Why couldn't the others have followed the sensible example of the majority, instead of staying where they were

until the Zee's flood first reached their mouths and then drowned them when they could swim no longer? Uncle Erasmus hurled the question at them. As for the young corn, it was inevitably washed out of the ground. And the land prepared so painfully this wet spring for the later roots was now likely to be useless for a year.

He was midway in the mess, sweating to the toil of lifting one foot after the other in the adhesive compost, when the sun slipped its rim above the Zee's banks and illumined the top of old 'Well-and-Good's' uppermost sail.

There was beauty enough in the scene now for eyes that had no personal interest in the surrounding spoliation. The sun's gold reached the polder, and never had the mile of trim dike looked so brightly green. On this side the mill had some coquettish streaks of scarlet to its black wooden hood, and, touching them obliquely, the sun did its best to draw attention to their distinction. An artist had once taken tea at the farmstead after painting the mill. Uncle Erasmus might have remembered the gentleman's words in praise of the value of those daring scarlet lines. He did not remember them, however. He just plodded and sweated on until he was over the last bridge and close to the mill.

Not a thing here had suffered from the deluge. Cow-house, piggery, and all the other outbuildings of the mill were handsomely out of reach of the flood which had devastated the farmstead. Trust the young rascal to have realised his complete immunity when he went to bed with such unchristian malice in his heart, and like enough his tongue in his cheek besides!

But, close to the mill though he was, Uncle Erasmus was not yet out of danger. It was the escape of his lifetime! So intent was he upon his dark thoughts and the mill itself that he all but stepped into the old well. There was only a skin of water round about now; and, toiling through that, he actually put one foot into the well. But he hopped to the left just in time, and, with one more muttered execration, stood still and stared at the round, dark pool into which, it seemed to him, he might have descended like a stone for all eternity.

And then, looking past it, he saw something that soon made him forgetful of his salvation. Stranded on the green margin of the mill's mound was a little yellow wooden box, with crude red and blue arabesques painted on its sides. Instantly it realled old times. It had been his brother Piet's treasure-chest in the days of their boyhood, and was the very article for which such a persistent search had been made all over the mill after his death. Young Piet, Klaas, and Erasmus himself had looked to that box, when found, for information about those desirable missing guilders. Legal and other documents which were also missing were known to have been kept in it, and why not the guilders, or their equivalent?

Uncle Erasmus picked the thing up, quivering already from his wart downwards. It was padlocked and moderately heavy. He stood for several seconds with it in his hands, shaking it and turning it about. The inscription in black paint, 'Pietje Leevan, Leevan, Holland,' was not necessary to kindle his interest in it. His brother had spent a long hour one boyhood's afternoon in painting his name thus, and Erasmus had subsequently rallied him about the absurdity of the 'Pietje.' It was 'Pietje' now as then.

The soft lowing of one of the cows in its stall roused him from his spell; and, deeply excited, Uncle Erasmus strode on up to the mill and beat at the door. He glanced back at his own house of Werk. The sun was embellishing that, as everything else, with fantastic morning splendour. Mefrouw his wife was probably rating the maids for not shovelling the mud off her parlour's parqueted floor as if they loved the labour; but to Uncle Erasmus, at this distance, the farmstead was like a small palace of ruby, topaz, and pearl. And little he cared what it was like.

'Get up, Piet! get up!' he shouted again and again. In the pauses he listened to the drowsy gliding of those accursed waters of the Zee as they returned to their source—listened without heeding, even as he heeded not the Aladdin-touch of the sun upon his home in the polder. His mind was extraordinarily alive to the possibilities thus hugged to his breast in the little yellow box.

'Piet, my dear boy! it is I, your uncle Erasmus. Do you not hear me?'

At length there was a response. The bedroom window to the right was unlatched, and Piet's rumpled head peered forth. 'Oh! It is you, then!' he said gruffly; and, having spoken, he yawned widely.

'Good-morning, Piet. Yes, it is I. Look! I am the bearer of good tidings, like a messenger in the Bible. Come down, and we will see what there is to see.'

Piet could not get more than his head through the little lattice. There was a glimpse of his seablue night-shirt at the shoulders; that and nothing more for Uncle Erasmus. But the sun in its virgin splendour was upon Piet as upon all else now in the polder; and his uncle thought he had never seen so noble a lad.

Piet's eyes enlarged as he looked down at the box. 'So!' he whispered, as if he were not much more than half-way yet to a perception of the blessing. And then his eyes roamed beyond his uncle towards the wet polder. 'What's wrong with the land?' he cried.

'Nothing, lad,' laughed his uncle—'nothing, that is, which this, with God's leave, will not put perfectly to rights. You forgot the sluice, Piet. Your aunt—— But your aunt is of no consequence.'

'By heaven,' exclaimed Piet, 'so I did!' He disappeared, and in another minute had slipped on some clothes, descended, and unlocked the

door. 'I was not myself when I went to bed, Uncle Erasmus,' he said at once; 'and Klaas being away --- But is there much loss? What of the

His uncle smiled to his very wart. 'A few sheep are nothing,' he said. 'Where are your poor father's

keys?'

They were hanging in the lock of the parlour cupboard. While Piet searched for the box's own particular key on the bunch, Uncle Erasmus made merry after a fashion about the events of the night. His eyes were fixed greedily upon the box, and his smile was not very sincere; but his account of Miss Tenk in the midst of the waters and afterwards was quite a creditable effort.

'She thought it was Noah's own flood come again, my boy, I'll warrant. Ach, but you should have seen her! For a bag of bones, though, she was not

so light to lift.'

'And Betje?' Piet glanced up to ask.

'She is as safe as the stork in its nest, Pietje. Yes; and you should have heard her speak up for you, lad. Her mother called you a few names. You will excuse her that, and expect no less, I'm sure; but our Betje vowed you were not that kind of boy. And, indeed, Piet, I thought much the same myself, though it was not easy to---- That one fits it?'

'Yes,' said Piet.

The key grated in the lock. Three years' accumulation of rust offered some resistance to its working and to the free movement also of the padlock's bar; and then the lid was open and piled papers sprang up like a released Jack-in-the-box.

Piet turned them all out upon the table in a spreading heap. Long linen-lined envelopes with writing on them, letters, some mildewed old photographs, many loose papers, and even a small battered doll, short of a leg.

'Ach, dear life!' gasped Uncle Erasmus as, with a well-feigned sigh of emotion, he fastened upon the doll. 'It was your little sister's-the angel who died.'

'Yes, that is so,' said Piet, pausing. 'But these green papers in the envelopes, what are they?'

Uncle Erasmus laid down the doll and took up

one of the green papers.

'Do you not know, lad?' he asked triumphantly. 'Five thousand!' He pointed to the sign in the corner. 'That is worth five thousand guilders. It is Government Stock-Rentes, some call them. Another, also for five thousand! It was with this paper your poor father was paid, by degrees, for his share of the land. Ah, Piet, how I worked in those days! And what sense I had in my work! Betje was a wee one then, and no trouble to any one; and your aunt's temper was more like what it was before I married her. Shall I count them?'

'Yes,' said Piet. 'I'll finish my dressing. I suppose it is what Klaas would call manna in the wilderness, Uncle Erasmus, eh?

Uncle and nephew contemplated each other across

the documents as eagerly as children at a school

'Just so, Piet-manna in the wilderness. What is a little mud in a house to all this?'

Piet nodded and stepped to the door, then returned and brought his hand down on his uncle's shoulder with a whack. 'Do you remember last night?' he thundered. 'I was going to shoot you At least I said so.'

'In your place, my boy, I should have done the same, declared the uncle stoutly. 'Six times five make thirty. Thirty thousand guilders already. And five more! Ah, here is one of ten!'

Piet chuckled. 'Pile it up, uncle,' he said; 'pile it up! I'll trust you with the lot while I put on my day-shirt. You know why, eh?' His laugh after the question echoed on in 'Well-and-Good's' old parlour as he climbed to his bedroom. Where did you find it?' he cried from above, midway in his toilet.

'Sixty-five thousand guilders, my boy, and more

to come,' replied the uncle.

'Sixty-five thousand !' Piet whispered the words And then, 'Oh, God in heaven, how good you are -sometimes!' While he spoke he turned to the window and looked across the glistening polder to the red roof of Werk. A sudden impulse to share his happiness, however absurdly, with Betje herself made him snatch up his handkerchief and wave it He waved for several seconds, and was then ready for commonplace joy again.

But there was an answer. From Betje's OWD little round window a flicker of white with the sun on it was discernible; and the next moment Piet's three years of solid striving to crush the hopes of his heart all broke up. With his hands above his head he danced as if he were at a bridal celebration. When his father was alive he had been a famous and welcome guest on such occasions in a radius of many miles from Leevan, and no more sprightly dancer was then known. His youth had suddenly come back to him.

The uncle's radiant face interrupted his capers. Betje's father had come up quietly, with a heart as elated almost as Piet's. His wart glowed like a carbuncle.

'Ninety-five thousand guilders, Piet!' said the uncle solemnly. 'And the deeds of the farm at Westwijk to show that your father did, after all, advance that money to Hensen. Many other little matters besides—the prize school-theme he wrote when he was thirteen, its subject "The Advisability of Perseverance and Hope." Piet, my dear boy, allow me to congratulate you on a fortune. It is nothing less-a fortune.'

'Right-o!' said Piet, wringing the hand his uncle proffered him. 'And now we will have some coffee. Klaas ought to be here directly. What will he say, the old chap? Oh, I know what he will say: "Mynheer, mynheer, how could you sleep in Peace with the sluice open? How could you, mynher?

They went down enjoying that joke together.

'How much do you owe, Uncle Erasmus?' asked Piet when his treasure was again before him.

'Ach, my boy! there are the two bills of twenty thousand each, with some interest.'

'That all?'

Piet went to the alcove by the hearth and brought out the old family Bible with the silver clasps. 'Seen this before?' he said, with sparkling eyes.

The uncle looked suitably remorseful. 'I was not myself any more than you were yesterday,' he protested. 'Trouble sometimes spreads a cloud over our better, our true nature, Piet.'

'Just so,' said Piet. 'Well, you wanted me to swear last night, you and Aunt Mina between you. Now it is your turn. Put your hands on it and swear you will both give me Betje.'

'I swear! I swear it with all my heart and with all my soul,' said Uncle Erasmus hastily, his hands on the Bible. 'But it would be just the same,' he added, with a pucker of the lips, 'if I did not swear. You were made for each other, my dear boy, and—I whisper this—not even for your aunt do I believe our Betje would a second time be civil to another Mynheer Mops. There! I am saying blasphemous things. If your aunt could hear me! But that reminds; I must return and proclaim the great news.'

'Coffee first,' said Piet.

The uncle, however, thought not. It would be kinder, he suggested, to all his household at Werk if he delayed not a moment longer as the bearer of such good tidings. 'Do you not see it?' he asked.

Put in this way, of course Piet saw it. He went out with his uncle and repeated his earlier question: How had the box come thus to be stranded like a little ark of blessing and safety on the Ararat of 'Well-and-Good'?

And Piet himself guessed it when they had puzzled for a minute or two. They were by the old well, still brimful, as never before until that night, and its boards gone. Piet gazed into it as if he thought he might see the truth mirrored in its placid depths, and suddenly clapped his hands. 'Father threw the box into the well,' he exclaimed. 'That is it. He threw it in when his mind got weak, and it seemed to him that money was all trash. And the water floated it up. Why, then—don't you see?—if I hadn't gone to bed in a rage and forgotten the sluice! And if you hadn't come last night and made me get into such a rage! And if Aunt Mina wasn't just exactly what she is—Ah! things are wonderful, Uncle Erasmus, the way they work out.'

The uncle nodded, looked his admiration of Piet's intelligent reasoning, and patted him on the back. 'It is so, without a doubt,' he said; 'and we shall see you presently.'

Piet waited only for Klaas.

The old man came in all agog about the state of the polder, and was bidden to look at the paper guilders instead of worrying over a trifle.

In few words Piet told him the tale of the flood and its outcome. Then he took his hat and marched for the farm.

Klaas was little moved by the sight of so much money, though willing to rejoice simply about his master's assurances as to Betje. He was more concerned about the mill and the new breeze of the morning.

'Shall I loose the sails, mynheer?' he asked when Piet was afoot.

'Ay, grind away, if you will,' Piet replied. 'Some of us like play and some work.'

'The Lord,' said Klaas, 'sent us into the world to work and pray.'

Piet shook his head at the old man. 'Maybe,' he said, with a laugh as hearty as the promise of the day; 'and for something even better still, or there would soon be none of us left to do it. I'll give her your respectful affection, Klaas.'

THE END.

PARALLELS BETWEEN SCOTT AND DICKENS.

By PERCY FITZGERALD.

COTT and Dickens were magical names both. They were the great lights of their century, and their joint reign stretched over three-quarters of that period—namely, from 1814 to 1870. Scott wrote his last page

of Castle Dangerous in 1832; the pen fell from his fingers a few weeks later, to be caught by a young and brilliant writer who fourteen months before had begun his career in a magazine. As Boz was a youth of spirit and enterprise, it is likely that he saw Scott in London on his returning from Italy to 'die at home at last.' I wish I had asked Boz this question, for I had many confidential opportunities of doing so. At a dinner-party I once

gave, an awkward guest—yet a distinguished man, who ought to have known better—said to him, 'You know, Mr Dickens, that we have no novelist that can be named with Scott!' Tableau! One would wish, however, that the noble pair had met. It would be like the fancied meeting of Nelson and Wellington at some public office. And yet there was really a kind of indistinct connection.

Reading through the melancholy squabbles and quarrels of Scott and the Ballantynes, our eyes rest with a sort of interest on the figure of a Writer to the Signet who, though called in as the friend of James Ballantyne, attracted the regard and respect of the great man. This was George Hogarth, then about forty, whose sister the im-

provident James had married. Her interests Hogarth sturdily protected, requiring a release of a certain charge from the great man himself, who had so high an opinion of the solicitor that he stipulated that the deed should be drawn up by him. Scott had him down to Abbotsford to go over his complicated accounts and draw up a settlement with Ballantyne. He gave him this high testimonial: 'I should be desirous that our mutual friend Mr Hogarth, your brother-in-law and a man of business and honour, should draw up a new coparcenary. He will be a better judge than either you or I of the terms, and, being your connection and relative, his intervention will give to all . . . the assurance that we have acted towards them on terms which are considered fair, just, and honour-And it was Hogarth who discovered that Scott had not power to raise more than ten thousand pounds on Abbotsford, though he was under a delusion that he could.

Hogarth was associated a good deal with jovial spirits-Lockhart, Wilson, and others-the latter celebrating him in the rather tedious Noctes (June 1826). This may have caused him to desert his profession and take to the precarious literary calling in London about 1831. He was burdened with no less than fourteen children, of whom only one survives.

It is interesting, therefore, that one so deep in Scott's secrets should have become the father-inlaw of Charles Dickens, Scott's legitimate successor. Being made editor of the Evening Chronicle-a new venture—he had his future son-in-law's assistance; while Boz in his turn, when editing Bentley, found room for him in that magazine. Oddly enough, he died in the same year as his son-in-law, of an accident, in January 1870, at the good age of eightysix. He had thus known intimately the two great story-tellers; to one he was adviser, to the other he gave his daughter Catherine Thomson. Failing an actual meeting, this is something in the way of connection.

But it would be interesting to 'tot up' the many other points of similarity that existed in these two great men. Both had training in the law, and Boz, though not 'called,' had taken the first steps to be a barrister. Scott was a poet; Boz wrote verses, some of which were popular. Boz wrote dramas, so did Scott; but the novels of each, dramatised over and again, had prodigious success on the stage. Both wrote essays, reviews, &c. In character both were much alike-in their geniality, love of their friends' society, love of walking and the beauty of nature. Both loved dogs and animals generally. Both aspired to set up as squires in the country and to have a territorial position. Scott's financial disaster is well known; while Dickens, not quite overtaken by such troubles, was compelled to resort to public reading as an addition to his resources. Finally, both overtaxed their brains by severe mental labour and thus precipitated their death. Both died comparatively young, or at least early.

In their later stories both exhibited the same exhaustion of invention and talent. Both, too, have permanently gained the hearts and affections of their countrymen to an extent that no other storytellers have done. There were the two Scotts: Scott the writer, brilliant, masterly, and gaining the suffrages of the world; and Scott the man as revealed in Lockhart's Life, whose doings, sayings, habits, engaging qualities, have gained love and respect. And so there are also two Dickenses: the writer and the man, both loved as much as admired.

Apropos of the general devotion to Sir Walter, at this moment in my study where I am writing these words, there is on my left hand, next the fire, three columns, as I may call them, of 'Scott Novels' all old and early editions-first, second, third, and fourth-all in the favourite half-calf-rubbed, faded, worn, and yet still respectable. I suppose there are some seventy or eighty volumes in these piles, and yet I would not have them disturbed or put on shelves for the world! It is a great privilege to have near one these original editions on which the eye of the author had rested before you; the story reads quite differently from what it does in the mean, starved, shabby modern versions. So there they lie by my side, and at times I take up a volume and read it through. It is remarkable that you can read and re-read Scott, and him alone, with out tedium. The reason is that, as in real life, a marked character can be encountered again and again, and always show variety. It is so with Scott. In every successive reading you notice something that has escaped you in former readings; he is so full-so stored. In real life, when you meet a really original and well-marked character he is always new-fresh! that is the word-and there is something that you never noticed before. But I do love that pile of old books, with the marbledpaper covers and their half-calf. I think that is a proof of sincere devotion. What a noble creature he was! Large, grand, spacious in his ideas. One of my best treasures is his pocket note-book, with its 'metallic pencil'—a dreadful implement which I remember well about the forties, and which never would write, but rather scratch. It is very precious to me, though merely made up of casual extracts reminders, &c. Poor, dear Scott; how he suffered at the close of his days! Admirable, lovable, brilliant as was 'Boz,' I am really afraid that one must admit that Scott was the greater man.

It may be 'fantastical' (Elia's word); but I was pleased to discover that Sir Walter had actually introduced a character called 'Dickens,' who was Bridgenorth's housekeeper—a Dame Dickens In St Ronan's Well, also, there is an odd, bizarre effect on the reader by meeting here and there with the word 'the Wellers'-Scott's nickname for the guests who frequented the well. And, per contra Box in troduced a Scott into The Old Curiority Shop, where he rather oddly thus dubs Quilp's strange boy. I don't think we can find this rather common name anywhere else in his works.

But there was one remarkable difference between the systems of the two writers. Dickens's stories are filled with moral and religious teachings, with pleadings for the poor, with exhortations to love and cherish our fellow-creatures, with expressions of devotion to our Saviour, and with extracts from the Scripture. None of these things do we find in Scott, for the simple reason that he considered his function was to tell a story and do nothing else.

It was natural that both these great writers, having been lawyers and bound to the law, should have exercised their acute observations on all the humours and incidents of professional life. Their stories abound in legal portraits of solicitors and barristers and judges, in some cases drawn from real life. Both give elaborate accounts of all the stages of a formal trial: the testimony, speeches of counsel, and judges' charges-Scott in the case of Effie Deans, and Boz in the memorable one of Bardell v. Pickwick. The former is conceived in a deeply tragic vein, the latter in the brightest spirit of fun and burlesque. Both furnish us copiously with sketches of the processes of the law -arrests, distraints, sponging-houses, imprisonment for debt, and the like. The brilliant picture of the Sanctuary in Alsatia, with its dreadful and degraded riff-raff company, can be put beside the gloomy pictures of the Fleet and the Marshalsea.

Both had a fancy for depicting inns, with their snug comforts and their innkeepers. But Boz, though he has drawn old Willet admirably, has nothing to compare with the inimitable and living Meg Dods. In St Ronan's Well Scott departed from his favourite themes of Scotch national life and character to essay a story of genteel manners and habits, just as Boz broke away from his favourite low life in Bleak House. Scott wrote many historical novels, Dickens only two. Scott celebrated old Edinburgh, with its ancient houses, wynds, and closes; but he had not the art-nor could he have, as Boz was the inventor of it-of taking an old house or an old city and investing it with a living, breathing vitality. They do not show you in Scotland the bedrooms of certain characters as they exhibit Mr Pickwick's rooms at county hotels. No one has done for any Scotch town what Boz has done for Rochester. On the other hand, Scott has with a rare zeal and love-described the fair landscapes, mountains, and lochs of his country. Scott's stories are full of brilliant military figuresofficers and soldiers—all admirably drawn. Boz has very little in this way. He had not, I think, much sympathy with the army, and knew little of it.

We find in Scott, Jane Austen, 'Boz,' and Thackeray a curious community of ideas. Many of the illustrious Jane's characters are shadowed forth in Dickens, while Thackeray, as I have shown elsewhere, copiously reproduced from Dickens both characters and situations. Yet all four are original after their kind. Dickens, who came, practically without any interval, after Scott, absolutely could not help being affected by that great personality

and his methods; Scott was in the air. It was, in truth, a wonder that he 'got away from him' so far as he did, and was able to devise methods of his own most original in their way.

In such cases it is common to speak of 'borrowings,' copying, not being original, and the rest. But in the case of really great writers such things cannot be said. The truth is, there is nothing 'original' or discoverable in any story, situation, or character; these are the common property lying in the public highway to be picked up by anybody. The true originality is found in the treatment. It is the treatment that makes everything new and original. Some French writer has calculated that there are little more than half-a-dozen entirely original situations or combinations of situations existing, and that these, altered and twisted, will be found in all the innumerable stories which are being daily discharged upon society.

With characters also it is the same—all depends on the treatment. Mr Pickwick is of the family of Don Quixote, as Sam Weller is of Sancho Panza's; yet no one would say that the modern characters were copied. The range of character is exceedingly limited. But where did the incomparable Wizard find his types? From life, from the crowd about him, materials cast into that wonderful melting-pot, his brain. Hardly any of his stories are 'original' in the vulgar sense, always following the lines of some tradition or legend or historical incident. He was, indeed, as much original as any one could be on this earth.

The plot of Nickleby seems to follow that of Guy Mannering. In both there is the lost heir-stolen by gipsies in one case, sold into school-slavery in the other. Ralph is the villain of one, Glossin of the other story. Squeers is the agent of Ralph, as Hatteraick is of Glossin. Colonel Mannering befriends the heir, as do the Cheerybles Nicholas and Smike. Glossin is murdered by Dirk Ralph hangs himself. The smuggler, when all hope is gone, fixes a support in the wall of the prison and hangs himself from it. Ralph goes up to his garret, feels for a hook, and there also hangs himself. Then we have John Browdie, a Yorkshire man-but the name is surely Scottish: Brodie-and he follows in his speeches and doings Dandie Dinmont. Nickleby visits him in the country just as Bertram does Dandie. In Pickwick also we find a touch of Pleydell in Guy Mannering, who is found at a carousing den. Mr Pickwick finds Lowten Perker's clerk at the 'Magpie and Stump.'

After his quarrel with John Browdie, Nicholas meets him on the road, when all is made up, and John lends him money to take him to London. In Woodstock, Roland Græme has a quarrel with Woodcock the keeper; and meeting him in the road, Woodcock gives him money to help him on his way. Gashford in Barnaby Rudge is like Ganlesse in Peveril. The scene at the well in Woodstock, where Tomkins besets Phœbe, who is rescued by her lover, is the same as that in Barnaby Rudge

where Dolly Varden is beset by Hugh and rescued by Joe Willet, her lover. In Pickwick, where Namby the sheriff's officer arrests Mr Pickwick, and Sam knocks Namby's hat off and prepares to assault him, the latter calls Mr Pickwick to witness that he had been assaulted in the execution of his 'dooty,' 'in bodily fear.' In The Antiquary Sir Arthur Wardour is arrested by the sheriff's officer, who is resisted by young Macintyre, and calls on Sir Arthur to witness that 'he has been deforced,' &c. Dodson & Fogg a little suggest Greenhorn and Grinderson in The Antiquary; they become obsequious on the change of fortune in their client after treating him infamously. In Woodstock the colonel sends the tattered Wildrake with a challenge to Rerneguy, and he bears himself in the same ludicrous fashion as does Folair the actor when bearing a challenge to Nickleby.

One very particular instance of this similarity of treatment will show how present to Boz were Scott's creations. This was of a grotesque nature and appealed to him. Touchwood in St Ronan's Well was a very quaint being, always making odd, unexpected remarks; but he had also a sincerity and good nature. "Why," said Mowbray, "your name is Touchwood—P. Touchwood—Paul, I suppose, or Peter. I read it so in the Subscription Book." "Peregrine, sir—Peregrine. . . . I don't like it, and I always write P. short; and you might have remarked an S. also before the surname I use at present—P. S. Touchwood. I had an old acquaintance in the City who loved his jest; he always called me Postscript Touchwood."

Every one will recall Mr Peter Magnus and his account of his name: "I like to know a man's name; it saves so much trouble. That's my card, sir. Magnus, you will perceive, sir-Magnus is my name. It's rather a good name, I think, sir." "A very good name indeed," said Mr Pickwick, wholly unable to repress a smile. "Yes, I think it is," resumed Mr Magnus. "In hasty notes to intimate acquaintances I sometimes sign myself 'Afternoon.' It amuses my friends very much, Mr Pickwick." "It is calculated to afford them the highest gratification, I should conceive," said Mr Pickwick, rather envying the ease with which Mr Magnus's friends were entertained.' There can be no doubt but that this truly humorous and grotesque passage is infinitely superior in treatment and originality to the one that suggested it. No matter how familiar, it can never fail to produce a smile. That Dickens had this scene in his mind cannot be disputed; but he has so transformed and enriched it that it has become a thing of his. Indeed, all Peter Magnus is admirable and delightful.

There is strong resemblance between the sad and gloomy tragedy of St Ronan's Well and that of Bleak House. The story of the latter is that of Lady Dedlock's mystery; for the Jarndyce Case is only incidental. Lady Penfeather in the same story is a sort of anticipation of Mrs Leo Hunter, and she is patroness of an al fresco fancy dress

fête given by the Mowbraya. She also recites poetry. The gaping curiosity of the restless crowd gathered to stare at the arriving guests and their dresses is described in both stories. The relation of Sir Mulberry Hawk to Lord Frederick is foreshadowed in that of Mowbray to Sir Bingo Binks. On the other hand, in his account of the duel, where Sir Bingo's courage has to be screwed to a sticking-place, Scott seems to have taken hints from Bob Acres and Sir Lucius.

Scott was fond of introducing queer small personages-dwarfs, dumb girls, Flibbertigibbets, and the like. Boz had also his La Creeveys and Miss Mowchers. If Scott had a Black Dwarf, with vicious, terrifying ways, but really good at heart, Boz had his in the odious Quilp. The dissipated, drinking barrister in The Tale of Two Cities somehow recalls Nanty Ewart, who was pathetically anxious to resist his fatal vice, but bewailed it as impossible. There is certainly a likeness between Sir Bingo Binks and John Thorpe, the sporting, bragging 'buckeen' in Jane Austen's Northanger Abbey. One passage in St Ronan's Well, when the Baronet makes his wager with Mowbray owing to a dispute, may be compared with Thorpe's boastings about his horse and gig; and this, again, may be placed beside Lord Mutanhed's description of his 'new-wed mailcart.'

Ramorney in The Fair Maid of Perth has his hand chopped off in a night brawl by the armourer; he lies agonising in bed, longing for revenge upon his assailant, while his leech artfully inflames his rage by telling him of the reports and remarks that are made about him. In Nickleby Sir Mulberry Hawk has a night affray with Nicholas, in which his face is frightfully beaten and disfigured, and he has to lie in bed nursing his revenge. Ralph Nickleby visits him, and finds a fiendish pleasure in repeating to him what people are saying of him, and thus goading him to fury and revenge. In Ivanhoe Isaac the Jew is immured in a dungeon by Front de Bœuf, and is described as sitting in a corner of his cell for three hours, ragged and dishevelled, and 'affording a study for Rembrandt' He is expecting execution or torture. There is a similar sketch in Oliver Twist, where Fagin is left for execution. Cruikshank's picture would do for either.

Pickwick was a perfect photograph of the times in which the author lived. It was really 'all-aire oh!' and contained portraits of living persons, satirical accounts of actual doings, and exhibited the influence of other living writers. The gobin story of Gabriel Grub is an adaptation of 'Rip Yan Winkle,' which story may have furnished the name of this famous 'follower.' The Dying Clown was a literal account of the wretched son of Grimaldi. The ludicrous Crumpet story was a variation of one of Boswell's. The striking incident of San Weller shutting himself up with his master in the Fleet, and getting himself arrested, is found in one of Smollett's novels. From The Antiquary,

where we find Monkbarns's fanciful discovery of an inscription A.D.L.L., and Edie's detection of the same, was drawn Mr Pickwick's find of the famous Cobham Stone with the 'Bill Stumps' inscription.

The subject of a protracted lawsuit which brought ruin to winners and losers was dealt with by Scott in Redgauntlet after a half-pathetic, half-humorous fashion. Boz had also his lawsuit story in Bleak House, where Miss Flite, a woman from Shropshire, answers to 'Poor' Peter Peebles.

It is not surprising that this heart-rending story of St Ronan's Well should have sunk into Dickens's very soul. It has been often said that it is an inferior work, but this is surely wrong. It has an overpowering interest, and the tragic scenes are blended with comedy. The ill-fated Clara Mowbray, with her dread secret, is another Lady Dedlock. Both are always contemplating a discovery. When this arrives both fly out into the night and wander about in their despair. Both call at a cottage to meet some lowly dependant. Mowbray pursues, following her track like Bucket, and as ineffectually. Finally both die in their despair.

When Mowbray discovers what he thinks is his sister's disgrace he is thrown into a fury, and rides home desperately, as if to destroy her. There is a strong likeness in this to Bill Sikes's discovery of Nancy's treachery, when he rushes home to take vengeance. All that follows is the same in both. His sister continued on the floor clasping him round the knees with all her strength, and begging piteously for life and for mercy. Mowbray strikes his sister. He is feeling for his knife. She clings to him, imploring him passionately not to kill her, which he is all but inclined to do. He looked at her with ferocity, grappled a moment in his pocket. Clara continued to exclaim, 'Brother, say you did not mean this! Oh, say you did not mean to strike me!' &c. Many passionate appeals are in this key. Mowbray's search for his sister is almost as exciting as that for Lady Dedlock. The locked door, the calling out, the finding the private issue to the garden, the summer-house where they find her glove, as Bucket did the handkerchief. 'We have no means,' says Scott, 'of exactly tracing the course of this unhappy young woman. It is probable she fled on hearing the arrival of Mr Touchwood's carriage. And thus she was contending with rain and darkness, the difficulties and dangers of the path. She must either have lain down exhausted or have been compelled to turn back. She had been to the bower, as was evident from her glove remaining there. It is probable that her spirits and strength began to fail her after she had proceeded a little way on the road, for she had stopped at the solitary cottage inhabited by the old female pauper. Here she had made some knocking. The owner said she had heard her moan bitterly as she entreated for admission. She was refused. It is conjectured that the repulsed wanderer made no other attempt to obtain shelter until she came to Mr Cargill's manse, in the upper room of which a light was still burning.'

How forcible and dramatic is all this, and how like the tone of the Dedlock flight! The sudden duel between Mowbray and Etherington, and the death of the latter, who sprang a yard from the ground and fell down a dead man, is like the sudden quarrel and duel between Sir Mulberry Hawk and Lord Frederick. In both cases the men had been 'pals' or friends. Mowbray despised and tried to pluck Etherington as his victim, just as Sir Mulberry treated his lord. Etherington was beginning to turn on his teacher, just as Lord Frederick did on his. The quarrel was at a shooting-match, just as the Hawk-Verisoft one arose in a gambling-den. 'Jekyll, you will have the kindness to stand by me in this matter?' So Lord Frederick invited Captain Adams. On the fatal catastrophe the victor's second said to him, taking him by the arm, that they must fly, or worse would come of it. 'I have a pony here, and you have your horse.-Captain Jekyll, I wish you good-morning. Will you have my umbrella sent back to the inn, for I surmise it is going to rain?'

Littimer, Steerforth's confidential valet in Copperfield—a quiet, reserved person, carrying out his master's villainies in a decorous, even gentlemanly style—was anticipated by Solmes, Lord Etherington's own man. He has exactly the same quiet reserve, and executes his master's directions to steal a letter as if he were merely to call for it. He understood exactly what was required, but would not give it an evil name or pretend to understand it

A curious thing in both writers is a fancy for alluding to some craft or trivial manufacture, to which they seem drawn by a personal partiality or association. Thus Boz, as we know, alluded to the subject of blacking-contrasting Warren and Day & Martin, and this was owing to the recollection of certain childish experiences of a distressing kind. In Scott we find several allusions to 'Burgess's sauce,' the proprietor of which still keeps on his old-fashioned shop in the Strand. Scott may have known the man or liked the sauce. In fact, he says boldly, 'Were you to eat your words with the best fish-sauce-and that is Burgess's.' I understand this preference has been found valuable as an advertisement, just as Boz's Double Diamond Port from the Cheeryble cellars is now largely advertised with a quotation from the story. Another trifle to which Boz often alludes is the Bramah locks and latchkeys. And we find Scott also noticing it. 'By your leave, Mr Bramah,' said the Earl, as he applied the key and opened his despatch-box.

'Were ye no' murdered, then?' said Meg Dods to Tyrrell when he returned to her after his disappearance. 'Are ye very sure ye werena murdered?' When Tupman was brought home after being 'peppered' by his friend Winkle, the spinster aunt hysterically calls out, 'Then you are not dead! Oh, say you are not dead!' 'Don't be a fool, Rachel,' said her

brother roughly. 'What the devil's the use of his saying he isn't dead?'

Scott makes Etherington say, 'I have known some women who have given up their virtue to preserve their character,' which is, of course, a familiar passage in The School for Scandal. The same nobleman also says, 'You are bolder than the boldest gipsy, for you not only steal my ideas and disfigure them, but they may pass for yours'which is another appropriated from the same play. In St Ronan's Well, Meredith, the comic man of the company, having passed some joke at the Wells Hotel on M'Turk, the bully of the company, was fain to go to a place at some ten miles' distance, and remain there in a sort of concealment until the affair should be made up; exactly what befell Winkle, in fear of Dowlen. A leading and sympathetic element in Bleak House is John Jarndyce's generous renunciation of Esther Summerson in favour of the doctor. Such renunciation is the clou of The Betrothed. Both ladies exhibited staunch loyalty to their antique fiancés. Dominie Sampson's raptures in the new library of books may be matched by Tom Pinch's delight at cataloguing the stranger's books. The Fair Maid of Perth's froward and pettish treatment of her valiant lover -now encouraging, now flouting him-is repeated in Dolly Varden's behaviour to the faithful Joe Willet. Both Scott and Boz have given good and true pictures of the faithful, genial valet in Richard Moniplies and Sam Weller. Scott, it must be said, rather limited himself in his portraits by drawing most of his characters as Scots with Scottish humour and peculiarities.

Old Monkbarns's impatience while waiting for the coach in Edinburgh, his threats and menace of taking a chaise and bringing an action, really anticipates Dowler's anger when waiting for the coach at the 'White Horse Cellar.'

Dickens has only ventured upon two autobiographical novels—namely, Great Expectations and Copperfield. In Bleak House he has, indeed, introduced a partial autobiography of Esther Summerson, but it is subsidiary. Scott has only one—Rob Roy.

In Quentin Durward we have Louis's favourite hangman, Olivier le Dain, with his assistant. This latter is in love with his profession, and resents the disinclination which a victim exhibits to submit to his treatment. He thinks he ought to enjoy it. So in Barnaby we have Dennis the hangman, who revels in 'working off' people, and who is also astounded at their want of taste when they wish to escape his handling.

In Nigel the incident of the old Jew's hunger for money—his stealing into Nigel's room at night to recover a gold piece—is like the old man in The Curiosity Shop who steals into Nell's room by night to carry off her money to gamble. Miss Trotwood in Copperfield, with her combative and autocratic ways, has an original in Meg Dods at St Ronan's. The latter, with all her roughness, had a fond corner for Tyrrell, just as Miss Trotwood had for

David. The topic of an old man married to a young wife, with an attendant admirer, which Box has so well treated in the case of Dr Strong, has also been dealt with by Scott in Kenilworth and in The Abbot.

In Kenilworth the villainous Varney holds a special relation to the Earl and his wife, inflaming the suspicions of the first and working against her interests, while at the same time he controls her and forces her to give him her confidence, on the pretext of keeping the husband's affections for her. He himself is in love with her. Now, in Dombey we have this situation repeated, Carker having just the same attitude to husband and wife, and making both his puppets. Scott in Waverley has a sort of half-witted creature, David Gellatly, who sings songs and wanders about. Dickens has his Barnaby—a similar sort of being.

The prefatory notices to the profitable forty-eight volume edition, giving an account of how the stories came to be written and what they are founded upon, are singularly interesting and even brilliant. It was a clever and original idea, admirably carried out. Dickens, when he came to issue his magnum opus, was compelled to follow the example, and his accounts are truly sparkling and vivacious.

There was, however, a most striking contrast between the methods of these great writers, which affected their productions. The one issued his work in portions or parts-twenty in numberthus taking over a year and a half to complete his task. The other delivered his book complete, writing it off at a heat, as it were. In Boz's case this really amounted to the supplying of some twenty separate stories or episodes; for each had to be self-contained and 'written up' so as to satisfy and stay the greed of the impatient public. But with what result? The complete work became a series of fragments. The author rested after each monthly effort, and had to begin again for the next. On his side, Scott went straight on with a gathering force without intermission, the excitement never flagging, his pen never relaxing. The effect on the reader was, of course, proportionate; he felt the enthusiasm of the writer. With Boz the part-system became a confirmed habit. He could not do without it, and when he attempted to fit himself to the orthodox three volumes he found himself relaxing This, too, accounts for the weakness in his conceiving or knitting together a story.

The two writers were also alike in this: they reproduced the dialect of their countries with great success and effect. Scott, it need not be said, gave the local language of his native land with infinite humour and variety, and seems to have invented a sort of patois that was quite intelligible to English readers, thus contrasting with his modern successor who have furnished uncouth and unintelligible sentences. Scott also supplied the Border language and that of northern England with very fair success. But his dramatic instinct carried him through all difficulties. If incorrect, it is very plausible and

natural. The language, too, he allots to foreigners is also very natural and specious, as in the case of Hatteraick; and Dickens also attempted various dialects—that of cockney London and Yorkshire. But his reproduction of American talk is truly admirable and amusing, if we consider the short time he spent in the country. Not so commendable

is his dealing with the French or Italian tongue, which he treated after a system of his own—namely, by literally translating the French idioms and phrases, such as 'Holy Blue!'—which seems forced.

It is pleasant to find that these two eminent men had so many points of resemblance.

A DIGGER'S YARN.

HE sun was just setting in a genuine West Australian sky, clear, blue, and cloudless, when a break in the interminable dreary scrub of diminutive trees resembling magnified gooseberry-bushes, through which I

had been riding since daylight, showed me a ridge of red granite, lightly sprinkled with vegetation and some fifty feet high, a short distance ahead. 'Water at last!' I muttered, relieved to think that the scanty supply left in the small water-bags that dangled from the necks of my three weary horses would soon be replenished, and that my poor companions themselves would soon be able to quench their thirst. Water in the arid districts of the interior of West Australia is obtainable from three sources only: shallow wells (sunk here and there where the country is occupied by pastoralists, each provided with bucket and trough for the use of sheep), 'soaks,' and native wells. Generally the water in the first mentioned is more or less saline -more rather than less-and sometimes highly charged with magnesia and other minerals whose effects are distinctly medicinal. Where the country has been abandoned by the squatter, and the low stone wall built round the well to prevent the sheep from using it-involuntarily-as a 'dip' has been broken down, the contents are sometimes flavoured with additional ingredients, such as essence of decomposing kangaroo, emu, or iguana, for these animals frequently fall in while attempting to reach the enticing liquid only a few feet below. Their unhappy fate is sincerely, though not lovingly, lamented by the unfortunate traveller who has later to drink a solution of their remains. At or near the base of any eminence may be sometimes found a patch of green grass, indicating the presence of a 'soak' or spring. A small excavation made at such a spot speedily fills with water, which percolates through crevices in the rock from the higher ground. This water is usually of the best quality, clear, cool, and pure. Failing the discovery of a 'soak,' the wayfarer, if skilled in Westralian bushcraft, will climb the ridge and carefully examine the sheets of bare red granite, sometimes covering nearly an acre in extent, which pave the summit. Very likely he will there find one or more native wells or pot-holes from a few inches to seven or eight feet deep, seldom more than a foot or eighteen inches in diameter, and so perfectly shaped as to appear to have been artificially drilled by the use of some instrument. These curious natural receptacles catch much of the water that falls on the granite pavement whenever a rare thunderstorm occurs, and keep it cool and fresh for months. Unhappily, though, the native well is an effective trap for insects and the smaller forms of animal life. Too often the thirsty explorer recoils with disgust from a green and highly aromatic liquid which might suggest ox-tail soup a year old. One, however, soon ceases to be over-fastidious in a land where it is not unusual for the traveller in the western districts of Queensland and New South Wales to be obliged in times of drought to dip his billy between the rotting carcasses of a couple of bogged bullocks in order to obtain sufficient 'beef-tea'-as the jocose bushman describes the savoury liquid-to quench his thirst, after due boiling and flavouring. These incidents of travel in Australia have to be taken as a matter of course. Water containing 10 per cent. of mud with an additional 5 per cent. of salt or animal essence he considers quite a suitable beverage, when duly purified by boiling and disguised by the admixture of a liberal proportion of tannin and brown sugar.

On this particular occasion I was fortunate enough to find a deep hole filled with perfectly clear, undefiled water, the gift of a recent shower. Thanks to the latter, too, luxuriant tussocks of wind-grass sprinkled the lower slopes of the ridge. Nothing but naked, red sandy soil was to be found below the bushy heads of the uninviting scrub-trees that surrounded this rocky oasis, so my horses did not require hobbling to limit their wanderings. Saddles and packs were quickly removed, and after each of my patient retainers had received a wellearned drink from a large billy they were turned loose to enjoy their supper. The camp was an ideal one-plenty of grass, wood, and water-and the cool breeze that blows incessantly throughout the night over the West Australian wastes played freely and refreshingly over the ground above the level of the scrub. A fire was quickly lit, and I prepared to enjoy my first substantial meal since daybreak, to be followed by starlight ruminations and tranquil slumber.

Just as the billy boiled the sound of a distant bell reached my ears, and presently a stranger leading a pack-horse rode up. He was an elderly man, whose appearance was that of a typical digger,

qualified by a certain air of refinement. Very possibly, like many men of his occupation, he had a 'history.' What it was beyond the mere fragment presently to be recorded I am not aware; nor when we parted the next day did either of us know even his late companion's name. A solitary life breeds reticence.

The visitor did not wait for an invitation to join my camp. That, according to bush etiquette, was to be taken as a matter of course. After watering his horses and placing his billy by the fire for a supplementary supply of tea, he seated himself on his roll of blankets, helped himself to a johnnycake and salt mutton, and commenced a series of cautious questions with a view apparently to ascertain what manner of man he had fallen in with. Finding that my errand was as harmless as his own -we were, it seemed, bound for two different goldfields lying nearly in opposite directions—he became more communicative, and proved to be an educated and well-informed man, conversant with topics quite unfamiliar to the ordinary roving digger. Our conversation happening to turn on the relations of whites and blacks, he told me a tale which later investigation has convinced me was, as he asserted, the absolute truth, and one which—for the benefit, and it is to be hoped edification, of the modern sentimentalist-I will now relate. Except that the names of persons and places mentioned by the narrator are altered, the yarn ran somewhat as follows:

'It was early in '85 that I and my mate reached the Kimberley diggings, having travelled overland from Queensland. Hundreds of men had arrived there before us, mostly from Victoria; but we could not raise the cash to pay our steamer fees, so tramped it, with one pack-horse to carry our swag. We had to keep our eyes open during the last part of the journey, for niggers were plentiful; but luckily we were among the first overlanders, and the blacks were too shy to come near us. Later they became a little too familiar, and many poor fellows who started after us never turned up-knocked on the head, no doubt, unless they went too far south and got into the dry country. No one had time to look for them, and a man or two missing did not then count for much.

'Hearing that good gold was being got at a place called Fossicker's Gully, we made up our minds to try there first. Quite a little town had sprung up on the field within a month or two. There was the warden's office, a bank, three or four stores, and about a dozen drink-shops, all doing a roaring business. Architecture was varied: iron, canvas, calico, mud, packing-cases, tarpaulins, and bushes constituted the principal building materials. Each camp had a big hedge of bushes round it for shade. Hot? I guess so—one hundred and twenty degrees or thereabouts. The water was pretty good for this God-forsaken country at first; but the diggers soon spoiled the holes, and typhoid broke out. For some weeks we buried three men a day.

'My mate and I got a claim about a mile from the township, and did fairly well for a month or two. We averaged about five ounces of gold each a week. But tucker was awfully dear: flour and meat one shilling a pound, sugar two shillings, tea five shillings, and sometimes none to be had at all when the teams stuck on the road. There were no camels in the country then. There had been good rains shortly before we arrived, though, and grass was plentiful for the horses.

'There were lots of blacks about, as we could see by the smoke over the hills; but for a mouth or two they kept away. Likely they had never seen white men before, and wanted to prospect us a bit first. But when they found we didn't bite-for diggers are most peaceable folk if let alone-they began to favour us with their attentions. One man's horse was speared; others disappeared, bons and all. The myalls evidently relished roast-horse, for soon no man's horse was safe out of his sight Then they began to take a fancy to bread and sugar as well. Men returning to their camps in the evening from their claims would find their tents burnt and everything gone, and niggers tracks all about. Naturally there was a good bit of grumbling, and indignation meetings were

'You know what the cussed law was then about the blacks. Good folk at home, no doubt, thought it quite right and proper; but they find it more convenient to sit at home in comfortable arm-chairs and preach morality than to go into the bush and practise it. Any man who shot a blackfellow, except in self-defence, might be tried for murder, even though he caught the nigger spearing his cattle or sheep. If a blackfellow was found to be shot in the back, it was taken for granted that the man who killed him had done so without lawful reason, and no further evidence was required. Consequently a nigger who knew the law might shy a spear or nulla at a white man, and then, if he missed, run away without fearing a bullet. A squatter might have half his cattle or sheep killed; but all he could do was to "arrest" the blacks and walk them off to jail, perhaps three hundred miles away. Very agreeable exercise that meant for, say, a couple of men on a station when about fifty blacks had to be caught and marched off. Sometimes the police might lend a hand; but they were generally a hundred miles away from the place where they were wanted. Had we any police about? Yes; there were two mounted constables. Their district was a little larger than France, so they had to be pretty active, and didn't spend much time at home. There were also half-a-dozen black trackers, but they were not allowed to carry guns. These might go off by accident and hurt a wild blackfellow-in the back.

'Well, as I said, the men began to grumble when the myalls took to borrowing their horses, rations, and tools. Nobody could feel safe. If a man were working on his claim his horse might be

speared or his tent robbed. If he sat in his tent watching his horse he didn't get much gold, and somebody might jump his claim. Nor did it pay for one man to keep another to shepherd his belongings when wages were five pounds a week. My mate and I were pretty wild, for our horse vanished one night, and we lost two days looking for it in vain. We were quite sure where it had gone.

'Soon the niggers became even more familiar. They hadn't at first condescended to show themselves; but one evening when a man was returning to his camp a spear just shaved his whiskers, and a darky bolted out of the tent with a bundle of clothes and a lump of beef. It was said that the digger's revolver went off; but perhaps that was by accident, for a man would naturally feel surprised to see his Sunday trousers running away in that fashion. Unluckily the bullet went wide, so the blackfellow told his friends that the white man could only make a noise, and matters grew worse instead of better.

'The following Saturday there was a great commotion in the township. News had just arrived that a man who had been to see old Joe Thompson had found his camp burnt, and no sign of Joe himself. Now, Joe was a thorough good sort, liked by everybody; and as he had had a turn at doctoring when a young man, he used to physic any one on the field who was ill gratis. We would sooner have spared any man than Joe. A search-party was sent out on Sunday, and returned in the evening carrying what was left of Joe, which was not much; for the niggers, after spearing him, had tried cremation on him in a patch of scrub about a mile from the camp. The poor old fellow had probably caught the blacks in the act of robbing his camp, and while remonstrating with them received a knock-down argument.

'This was the last straw. We thought it quite time to show the niggers we were not going to be treated like kangaroos even to please our friends at home. Robbery was bad enough, but murder was worse, and the blackfellow who had once tasted blood was, we knew, a regular maneater. The time was come to give them a lesson which would teach them better manners.

'All work on the field stopped next day. The diggers came into the township to discuss their grievances, and that evening a public meeting was held in the large room of the Do-Drop Inn, the leading hotel in the place. The room was crowded, and about fifty had to take outside seats, and I guess the barman inside was kept pretty busy. There were no rows, however; matters were too serious for differences of opinion. On one thing all were entirely agreed: either the blacks or the whites must leave Fossicker's Gully.

'After a deal of talk it was unanimously decided that a deputation of ten should wait on the warden, and respectfully demand protection for life and property on the field. If the Government

would not let us protect ourselves, we thought it only reasonable that it should protect us.

'Next morning, accordingly, the ten of us-I was one of the lot-waited on the warden and explained our difficulties. Old Bendigo, the chairman of the meeting, did most of the talking on our side, and put the matter pretty straight. The law, he said, forbade a man shooting a blackfellow unless the latter had first attacked him. Now, a man with a spear through his back could not generally take very straight aim, even if he could see through a three-foot gum-tree; and it would take a very active runner to catch a single blackfellow in the bush, let alone a score or two. We asked that the police should do the running for us, or that we should be allowed to do the shooting. If the next nigger caught robbing a camp were shot the rest would probably keep off.

'The warden was a man of discretion. We could see perfectly well that he agreed with our views, though he could not say so outright. After listening attentively to our complaints, he replied: "Look here, men, I have every sympathy for you, but I cannot give you authority to break the law. The latter only permits the arrest of blacks for theft, and firearms must only be used in selfdefence. But this is what I will do. As you know, there is only one constable stationed here, and it would be no use sending him out alone, so if you will select twenty-five men to serve as special constables, I will supply them with arms and rations, and pay them eight shillings apiece a day while on service. They can take a couple of trackers and follow up the blacks and arrest all who are believed to be implicated in the recent outrages." We thanked the warden, and after a short consultation accepted his offer. It didn't take long to raise the twenty-five. Every man on the field wanted to go; but only those who were good bushmen and who knew how to shoot were chosen. Bendigo was appointed the leader, and I had the luck to be selected also.

'You bet we were not long preparing to start, and that afternoon we were off. The trackers, according to their amiable custom, were only too eager to introduce us to their wild brothers, and when put on the trail at old Joe's camp, started off up the creek at a great pace. The mob being a large one, it wasn't hard to follow their tracks, and as the blacks had never been followed up before they evidently did not fear pursuit. Late the next afternoon we were close to them, and a couple of scouts sent out with the trackers ahead reported that the whole tribe had camped in a valley about a mile farther up.

No place could have better suited our purpose. The valley was narrow and bounded on both sides by high cliffs which closed in above and below, leaving only two gaps, each some twenty yards wide, through which ran the creek we had been following. In the wet season no one could have got in at all; but the bed of the creek was now dry, except for a

small hole here and there, where a little water remained, and the soft sand made it easy to crawl up without making a sound. A fine, large water-hole we found later, lying in the middle of the valley, and evidently its banks had been a favourite camping-ground for the myalls for hundreds of years. On each side to the foot of the cliffs the ground was open and free from scrub, with only a few big gums dotted about. It was far too pretty a place, though, for the job we had in hand.

'On hearing the report of the scouts Bendigo immediately formed a plan of campaign. Ten men, including himself, with one of the trackers, were to start at once on foot, and make a wide circuit round the valley so as to strike the creek at its upper end, where they were to stop for the night; the rest were to camp at the lower entrance, so that both gates should be closed. At daybreak the party above was to surprise the blacks' camp and secure as many as possible, while we were to deal with the runaways. Of course, if the blacks showed fight, it was permissible to shoot. On this understanding we separated. The stars were still shining brightly when I gently nudged my companions one by one as a signal to rise, and we stole softly up the bed of the creek. Our horses had been previously left in the charge of the second tracker a mile or so farther down, so that they might not give the alarm. We posted ourselves among the rocks at the base of the cliffs, where they approached each other most closely, and awaited developments.

'We had not long to wait. Suddenly, crack, crack rang out two rifle-shots about half a mile away, and then followed a regular volley. Our fellows grinned; this way of "arresting" niggers seemed to strike their fancy. We all kept our eyes fixed on the strip of sand, only some fifty yards in length, that we could see between our place of concealment and the bend of the creek. We expected soon to see some visitors—in a hurry.

'In less than five minutes the first appeared, followed by a whole string. They seemed badly scared, and ran as I never saw blacks run before. Bendigo and his men had evidently given them a shock, and we had a worse one in store for them. When the first was not twenty yards off I stepped out and called on him to surrender. Perhaps he didn't quite understand my meaning. At any rate he threw his spear by way of answer. He was too frightened to take a very straight aim, however; and, as we had been attacked, we were justified in shooting. In a couple of minutes we wiped the lot out. Then we waited for more, and treated them in the same manner.

'The business was pretty lively while it lasted, but it was soon over. When the rush ceased we advanced cautiously up the valley, knocking over a stray nigger here and there, and joined our mates at the blacks' camp. We found that they, like ourselves, had been compelled to use their rifles—in self-defence; but though fully four spears had been thrown, not one of our fellows had been hurt.

Five very old blacks who were found hiding in the camp had been arrested, and these, tied together by a stout rope, were taken away with us for trial. How many had resisted arrest and had therefore been lawfully shot we did not stop to count; but I should guess about a hundred—perhaps more. You see, to get away, the niggers had to run close by us, and we all knew how to use the rifle. We also had old scores to wipe out, and while about it determined to do the job thoroughly.

'Two days later we got back, and reported to the warden that we had, with great difficulty, owing to the roughness of the country, captured five prisoners, whom we solemnly handed over. He, perhaps, guessed that something else had happened, but wisely asked no questions. Not a blackfellow after that troubled the diggers about Fossicker's Gully.

Such was the grim story, fraught with a wholesome moral for the sentimental legislator, told me by the glowing camp-fire in the heart of the great lone land of Australia. Some months afterwards, while staying in Perth, it occurred to me to rummage among back files of the papers published during the year when, according to my informant, the tragedy took place; and after a long search I was rewarded by lighting upon a paragraph whose contents ran as follows: 'In a recently received official report the warden of the that, owing to the weakness of the local police force, he was obliged last February to send out a body of twenty-five volunteers to arrest certain natives in the neighbourhood, who had shortly before murdered a digger and committed serious depredations on the field. The party, after an absence of about a week, returned with five natives in custody. Their leader stated that more could not be arrested owing to the roughness of the country and the difficulty of following up the offending tribe. It is hoped, however, that the lesson will be sufficient to check the commission of other outrages. The prisoners have been sent to W--- for trial.'

MOONRISE.

THE night came down; over the shrouded fields
With sad and solitary steps I trod.
How, in one breathless moment, Nature yields
The living heart of God!

For there, behind the dim and darkling trees, Kastward, the silent heavens flamed to fire: Glowed, as with rapture of a soul that sees The birth of long desire.

And slowly, o'er the sullen, cloudy bars
Imprisoning her sure, victorious light,
The full moon rose among the wond'ring stars
And gave herself to night.

And swift, borne upwards on that shining flood,
My soul, a winged strength, shook out her flight
'Let there be light.' It was the voice of God
Again, and there was light.

Aga Rarrelek Baker.

MEMORIES OF HALF A CENTURY.

By R. C. LEHMANN, M.P.

PART IX.

BARRY CORNWALL AND MRS PROCTER.

REMEMBER on a certain afternoon many years ago—it must have been somewhere about the year 1864—my mother took me out with her in the carriage, and impressed upon my mind the fact that I was about to see

and to shake hands with a poet. I did see him, and I did shake hands with him, a very old and a very amiable and pathetic-looking gentleman. Did he wear a silk skull-cap? No, I think not; but he was reclining in an easy-chair or on a sofa, and he spoke in a high and rather quavering voice. This was Barry Cornwall, otherwise Bryan Waller Procter, who was born in 1787, had been at Harrow with Byron and Peel, had enjoyed the intimate friendship of Charles Lamb-Procter's name was one of the last that Lamb murmured before he died-and was to become (in 1866) his biographer. Dyer, too, he had known - George Dyer, the friendly, short-sighted, would-be poet of whom Lamb relates that he saw him, 'upon taking leave, instead of turning down the right-hand path by which he had entered-with staff in hand and at noonday-deliberately march right forwards into the midst of the stream that runs by us, and totally disappear.' Mr E. V. Lucas, in his delightful Life of Charles Lamb (i. 377), says: 'In that year [1817, when Procter first met Lamb at Leigh Hunt's] the author of Charles Lamb: a Memoir, to which all who write of Lamb are so much indebted, was thirty. He was in business as a solicitor, was living a very gay life as a man about town, keeping his hunter and taking lessons in boxing from Tom Cribb, and contributing to the Literary Gazette. There is no doubt but that intercourse with Lamb, who seems to have liked him extremely, led to his thinking more seriously of poetry, and we may attribute the composition of his Dramatic Scenes largely to Lamb's influence. Lamb admired No. 521. - Vol. X.

from this paternal association; he said that they were worthy of a place in his Specimens. It was not, however, until Marcian Colonna (1820) and A Sicilian Story (1821) were published that Procter took his place as one of the poets of the day.'

Certainly, when I saw Barry Cornwall nearly

them a little, perhaps beyond their deserts, possibly

Certainly, when I saw Barry Cornwall nearly fifty years later, there was nothing in his appearance to suggest a former association with Tom Cribb. No man could have looked, as I remember him, less pugnacious. Still, in his devotion to the noble art he did not stand alone among the writers of that earlier day. Byron boxed for purposes of slimness; Hazlitt has left us a description of a prize-fight which is one of the finest pieces of prose in the language; and the friend of Keats (himself a fighter), John Hamilton Reynolds, has celebrated the Fancy in stirring lines.

As for the sea (cf. 'The sea, the sea, the open sea,' &c.), of which Barry Cornwall wrote with an enthusiasm so infectious and seemingly so sincere, it is well known that he was himself one of the worst sailors in existence—I speak in relation to colour and health, not to nautical skill. A Channel crossing was a dread to him. I do not say that all marine singers have this vice; but I remember that Dıbdin, the laureate of poor Jack, never managed to get beyond Gravesend in his actual investigations of the ocean.

Lamb at Lamb: a was even happier in his wife. In 1823, at the age of thirty-six, he married Anne Benson Skepper, the charming and beautiful daughter of Basil Montagu's third wife. Born in the last year of the eighteenth century, this delightful lady lived until 1888, an example to later generations of the sprightly humour, the vivacious and indefatigable intelligence, and the genuine friendship that ruled amongst the heroes of the past. I am thankful to say that I knew her well. She loved my mother, and was one of her best correspondents. For her November 23, 1907.

benefit she employed the untiring activity of her pen, and for us, the representatives of a later race, she brought forth from the store of her experience treasures of memory and conversation. She could hold her own, and more than her own, with the youngest and liveliest, for she herself was the very embodiment of perennial life and youth. It was to her that James Russell Lowell addressed some lines beginning, 'I know a girl: she's eighty-two.' She had seen Charles Lamb in a state of exaltation in 1830. Mr E. V. Lucas tells the story (Life of Charles Lamb, ii. 223): 'A glimpse of Lamb in his cups,' he says, 'is given by Mrs Procter in a letter to Mrs Jameson in 1830 or thereabouts. "Charles Lamb," she writes (from 25 Bedford Square), "dined here on Monday at five, and by seven he was so tipsy he could not stand. Martin Burney carried him from one room to the other like a sack of coals. He insisted on saying, 'Diddle, diddle, dumpty, my son John.' He slept until ten, and then woke more tipsy than before; and between his fits of bantering Martin Burney kept saying, 'Please God, I'll never enter this cursed house again.' He wrote a note next day begging pardon, and asking when he might come again."

'The late Mr Dykes Campbell,' continues Mr Lucas, 'sent Mrs Procter, fifty-six years later, a copy of this letter, when it was sold at Christie's, and drew from that wise and witty lady a pleasant reply, in which she remarked: "I could not help laughing when I read your extract. I have entirely forgotten the dinner. If people will dine at five what can be expected? We have no time to get tipsy now, and that is our excuse."

Let those read on who are attracted by the prospect of some minutes of intimate conversation with Barry Cornwall and his wife, and let them, if they like, imagine they are listening in a room peopled with the great shades of Wordsworth, Coleridge, Keats, Landor, Tennyson, Walter Scott, Browning, Hazlitt, Carlyle, Dickens, and Thackeray; for to all these, as to Lamb and many others, Mr and Mrs Procter were friends.

The first letter is from Barry Cornwall to my mother, who had just established herself at Pau for the autumn and winter:

'Essington's Hotel, Malvern Wells, England, Sunday, September 1866.

'MY DEAR MRS LEHMANN,—My wife says, "I am writing to Mrs Lehmann. Won't you write a few lines?"

Old as I am, for ladies' love unfit, The power of Nina I remember yet.

So, although I have nothing to say, and if I had cannot say it, "I take up my pen," as young ladies at boarding-schools say, to tell you that I hope you are getting better—much better—quite well. You have, I know, been attended lately by that great musician, Mr F. L.; and I trust that he has left you determined to be prudent and to get well enough to return to England. People may talk of Biarritz

and Paris and other places of fiction; but be assured that no place is like Old England—except Scotland.

'My wife has monopolised all the news, I know; from the latest discovery in astronomy to the delicate appetite of our dog Prinny (Prince) all is before you. I know nothing except about myself. I have been writing a book,* which has attracted the kind words of several of my friends on the side of the Malvern Hills. The flowers are all gone—even our three great national prodigies have disappeared. These were three enormous this langlorious emblems of our N.B., Scotland, seven or eight feet high, and, I imagine, descendants from William Wallace or Robert Bruce.

'You have found the road to my wile's heart-dress. She fancies herself already in her cloat Pyrennean. I have taken to scarlet—with blue trousers—and a sweet green waistcoat. I rather think that when I return to London some of the ladies will salute me—I mean with their handsor curtsey, &c. When my friends return from foreign travel I cannot divine what they will do. Something extraordinary. Nothing so startling has come across human observation since the discovery of the Nyanza—what is the name? I mean the source or basin of the Nile.

'We have lately had—here amongst the residents in this Hotel—a Doctor Thompson, the Chief Sage or King of Cambridge, the Master of Trinity. Lest his elevation to this pinnacle should have daunted all his contemporaries, he has married a widow and come to pass the honeymoon amongst us unlearned Thebans.

'Kiss your children for me, and believe me, very truly yours,

B. W. PROCTER.

The next letter was also written to Pau; and with it, as a gift, or soon after it, went The Mysic ries of Udolpho, Mrs Ann Radcliffe's blood-curdling romance. The book arrived safely, and is referred to in a letter from my mother to my father (12th March 1867): 'Ernie [aged seven] has just been in a solemn manner to fetch himself a book to read. He has chosen the Mysteries of Udolpho, which Rudie has persuaded him to read aloud. Rudie and Freddie during the performance sit exploding at Ernie's mistakes-actually rolling on the floor in convulsions at passages. I just hear at this moment that somebody has been mixing in the "gay and buzzy skanes"—in consequence of which Rudie and Freddie are both kicking on the ground, whilst E calmly continues his reading without deigning to notice these unseemly proceedings.'

*27th January 1867, 32 Weymouth Street, Portland Plack

'MY DEAR MRS LEHMANN,—I like to return good for evil—soft words in return for neglect. It is the Weymouthian philosophy, which is peculiar to this district, and does not extend to Pau.

^{*} Charles Lamb: a Memoir, was published in 1866.

'My wife received (through Mr Lehmann, whom his familiars call "Fred") a message from you; but there was none for me. N'importe. Madame von Ousterhein, whom I am now rapidly attaching myself to, transmits many messages—jars of honey, to speak figuratively—invisible, untranslatable, and which I alone understand and feel. What is the French for kisses? I suppose they, the Robespierrians and Dantonistes and Marats, have no word for it in their vocabulary.

'I am ashamed to say, after the foregoing natural emotion (indignation is the word), I was glad to hear that you and the children were well. By "well" I mean that you were mounting the steep hill on which the Temple of the Goddess of Health is built so firmly.

'In order that you may not relapse on account of want of medicine, I have sent you some in the shape of a book. You recollect probably, from your historical researches, the name of a celebrated English physician, Dr Ratcliffe?* He bequeathed a great library to the University of Oxford, which indeed is there still. Well, one book escaped and came into my possession. It bears a very unassuming name, and does not profess to expound (what, however, it really does) all the abstruse mysteries of the Stoics. It is called, in modern phrase, The Mysteries of Udolpho, and is in the shape of a mere story.

'This piece of old crabbed philosophy (in two vols.), printed in the type of Walker or Dove or Suby—for I forget which—I have sent to you. With, I confess, some misgivings as to its security, I have entrusted it to "Fred," who says that he will forward it. I hope you will read the book and make a quick march up the Hill of Health and reach the top.

'(I can scarcely write—and I cannot walk or talk.)

'My wife will no doubt send you what news she has. I confine myself to Ratcliffian philosophy. The domesticities are hers.

'You will be glad to hear that Mr F. Lehmann has become an accomplished singer of the old song, "The girl I leave behind me."

'With all good wishes, I am, your sincere and injured B. W. P.'

The following stanzas are printed on a separate sheet of paper. At the top is written the date, 1872, and then in my mother's handwriting follow the words, 'Sent to me last New Year but one:'

VERSES IN MY OLD AGE.
By Barry Cornwall.

Come from the ends of the world, Wind of the air or sky, Wherever the Thunder is hurled, Wherever the Lightnings fly! Come, with the bird on your bosom (Linnet or lark that soars), Come with the sweet Spring blossom, And the Sun from Southern shores.

I hate the snake Winter that creepeth, And poisons the buds of May; I shout to the Sun who sleepeth, And pray him awake to-day. For the world is in want of his power To vanquish the rebel storm; All wait for his golden hour, Man, and beast, and worm.

Not only the seasons, failing,
Forsake their natural tone,
But Age droops onward, sailing,
And is lost in the seas unknown.
No wisdom redeemeth his sorrow,
For thought and strength are fled;
No hope enlightens to-morrow,
And the Past (so loved) is dead!
Dead! Dead!

Enter, now, Mrs Procter, who thus writes to my mother:

'August 15th, 1866, Essington's Hotel, Malvern Wells.

"Upon what pleasant slope or sunny field, sweet, unforgotten Girl, are you delaying?" So wrote Barry Cornwall forty years ago, not to your humble correspondent, but to a lady, Miss Jane ———,† with whom he was desperately in love, and now so writes his wife to Nina Lehmann.

. 'I have news of you from Mrs Benzon, who writes to me from the neighbourhood of Dunkeld—where I once was. I well remember the Inn where, upon my asking the Waiter what caused the disagreeable smell in the sitting-room, he quietly replied, "Dead mice"! I sat up the whole night to watch by my Adelaide, who was so nervous about mice that unless I had done so she would have had no sleep. We afterwards went to Glenfeschie, and remained at Kinrara for weeks.

'And are you quite well, my dear, and happy away from home? We left London in a great hurry. Dr Quain said Edith must go, so we threw medicine to the dogs and came here. We were joined in a fortnight by my husband, and have now been here since the 23rd June. We have had some pleasant people in the Hotel, and have gossiped away the hours in a lovely garden under some cherry-trees. Of course we had a nice young man, an Hussar officer, who certainly would have died of ennui had he not made our acquaintance. We sit in the garden all the morning, dine at half-past two, read and write a very little, and at five Edith on a donkey and I on foot ascend the Hills. I am good for six or seven miles, ‡ and we come home at eight, very glad of our tea. One day is so like another

^{*} His name, however, was Radcliffe.

[†]The missing name is Gape, as will be seen from a subsequent letter.

[‡] Mrs Procter was very nearly sixty-six years old.

that I begin to understand how prison life passes so quickly. I have a charming note from Mr Chorley. He has been across the water to Boulogne, and is now at Gad's Hill. I have also a letter from Mr Dickens, who really seems to like my husband's book, which was to have been dedicated to Mr Forster, but Payne the bookseller has supprest it; he having had a dispute with Mr Forster. Bryan has remonstrated with him, and he replies, "I have a right to do what I like with my own"! Of course my husband and Mr Forster are equally angry. At present Mr Forster is staying with Lord Lytton of Knebworth. I have a note from Mr Sullivan, who has set Adelaide's words "Hush!" to music for Madame Dolby. We are expecting Mr Kinglake here for a few days, and Mr Collins promises, but I have no faith in his ever coming. It is a pleasant dream. We hope to go to Fryston this autumn, and to visit the Goldsmids; as usual they have taken a place for a year belonging to Lord Digby, I think, called Newnham Paddox, near Rugby. Of course, Rencome Will it ever be? And now enough is not done. of ourselves.

'My dear, I do not want you to write to me-I only wanted to tell you I had not forgotten you nor your husband, nor how good you both have always been to me.

'And the Highgate home: is it finished? We have no books—the second volume of My Nord is at present my intellectual food, and very good food it is; only I should like the first.

'I read the marriage of your sister in the Pall Mall. . . . Browning is in Normandy . . . with his sister, who is going to live with him.

'I wish I could write you a letter—a mixture of Horace Walpole—as far as scandal goes, and ... as far as love; you must fill up that blank as you like.

'My love to your husband.—Your affectionate friend,

ANNE B. PROCTER.

32 Weymouth Street will always find me.
Edith and my husband send their love.

The Chorley referred to in this and the next letter was Henry Fothergill Chorley, the musical critic of the Athenœum. Fryston was then Lord Houghton's place in Yorkshire.

A COMPACT AND ITS CONSEQUENCES.

By ARTHUR H. HENDERSON.

CHAPTER I.

HE sole information we possess at present, gentlemen, is contained in the following telegram: "Steam yacht Carita reported wrecked in Santa Calda Bay. Fate of crew unknown." We therefore wired to

Lloyd's agent at Havana, asking him to try to ascertain further details, and in reply his telegram states: "Cable communication with Calda suddenly interrupted." Now, what do you wish us to do—if anything?'

The speaker looked inquiringly round the little circle of faces gathered about the long table in the meeting-room of the British Salvage Association. None of the assembled marine underwriters appeared to have an immediate suggestion, though the dissatisfaction with the intelligence was general.

'As you are aware, gentlemen,' went on the Salvage Association secretary, sorting the papers before him, 'the Carita is insured with you at Lloyd's and in Glasgow for twenty thousand pounds. This was effected through a firm of West End brokers. The name of the actual owner of the yacht has not so far been disclosed, nor is it clear what she is doing on the coast of Cuba.'

The silence of painful retrospection on the part of the underwriters was too deep to last.

'I suggest we send out a man to investigate,' proposed the chairman of the meeting. 'Will any one second that?'

The lead once given, two or three of his listeness

agreed simultaneously.

'Whomever we send may have to deal with on-shore Cuban residents whose characters are not openly commended in a census of the blest, observed a grizzled old underwriter dryly.

'I should recommend Captain Drummond, who has often been employed on your behalf before encouraged the official. 'He is just the man for the job—straightforward, resolute, and keen.'

At this juncture a clerk handed in a note. The secretary read it without comment. The envelope bore the name of the West Indian Telegraph Company. He did not, however, communicate its contents to the meeting, which was engaged in voting on the motion. It was resolved that Captain Drummond should go. Two hours later that expert received his instructions.

York. Thence you will get a Gulf Line boat across to Havana. It is a bad coast round Calda, according to the Sailing Directions. But of course the yacht must be salved if possible. What she's doing there Providence alone can tell, if it's anyhow a fit thing for Providence to take note of.

Drummond nodded comprehension. He was a sturdily built sailor. There was in him a quict grimness which in moments of peril would mean action swift and resourceful. He was one of the best of the Salvage Association men.

'The queer part about the business,' added his chief after a pondering moment, 'is that the local cable from Calda is apparently cut—not broken—so the company say. There may be some hanky-panky going on. Trust no one but your own perception out there. It's a mystery for you to solve. Good-bye, and good luck.'

Drummond was not of a temperament easily hustled. But when at Euston Station he found himself and his luggage conveyed, regardless of protest, to a first-class compartment and locked therein, he showed a tendency towards exchanging civilities with the railway officials of an explosive kind. They even ignored his announcement that he was travelling third.

The other occupant of the carriage regarded the performance of the guard with satisfied contemplation, and gave a distinct sigh of relief when the train moved off, as at the first step in a difficult task completed.

'Hope I haven't inconvenienced you'—the stranger looked apologetic—'but I desired your company above all things. Have a cigar?'

Drummond accepted, and mentally registered the fact that the cigar was one of the best. This—and first-class—was mollifying.

'Going to Liverpool?' he inquired.

The other met his gaze with thoughtful gravity. 'Yes,' he acquiesced. 'Then—to Havana!'

The train slid out of the station. Drummond puffed tobacco smoke concealingly about his face. His companion was a slight, aristocratic-looking fellow, handsome and bright-faced. His clothes and baggage were quietly smart. There was a portentous pause.

'Not much of a place Havana,' opined the sailor at length. The circumstances demanded a guarded remark of some sort.

'How about Santa Calda?' was the next query.

This time Drummond was conscious that he fairly started, 'Never was there,' he grunted stonily.

'My yacht is reported ashore in the bay,' said the young man calmly.

'Your-yacht!'

'Yes, the Carita. I'm afraid I've taken you by surprise.'

He had.

'I'm her owner. My name is Eastleigh—Earl of Eastleigh, you know.'

Drummond did not know. He stared, bewildered and incredulous.

'Good sort, that Salvage Association secretary,' went on the Earl. 'Saw him this afternoon after you left. He described you to me exactly; told me I should find you in this train. Said you'd lend me a hand.'

Drummond ruminated over a situation suddenly grown complex.

'There is a lady aboard the yacht,' observed the Earl of Eastleigh with some embarrassment. 'Are you a married man, Captain Drummond?'

'No,' said that individual firmly.

'Ever been engaged?' There was cordial interest in the question.

'Never,' denied the sailor with emphasis. His expression lent solemnity to the negation.

The Earl regarded him diffidently. 'I am,' he resumed after a moment. 'At least—I think so,' he qualified hurriedly. 'And Alice—Miss Denton, that is—borrowed the yacht for a month while I came over to Europe. Her home is in the States.'

Drummond cleared his throat; then he adjusted his hat. His eyes were very wide open. The Earl thrust his hands into his pockets and whistled.

'I expect the lady will be all right,' consoled Drummond after some reflection.

'But what has she cut the cable for?' mused her fiancé in a speculative undertone. He eyed his companion furtively for a second, and then a queer smile broke round the corners of his mouth. 'She is a most extraordinary girl,' pursued the Earl confidentially; 'absolutely adorable, but apt to have—whims. She is too much for that thick-headed old snorter, her father. She asked me to lend her the yacht. I can't think why I did it,' admitted the owner with candour. 'Then she said she wanted some adventures before she married. All rot! Anyhow, she seems to have struck one now.'

Drummond indicated modestly that he concurred. 'Look here,' said the young Earl with boyish camaraderie, 'you want to learn what has become of the yacht; I want to know what has happened to my girl. Let's make a compact to see each other through.'

'We'll do it mutual, sir,' agreed the burly sailor promptly. And the bargain was sealed with a hearty handshake.

This was the second conclusion concerning the Carita reached that day.

Consequences followed that compact.

CHAPTER II.

FF the north coast of Cuba, six miles from where the lighthouse blinks on the dark extremity of Cape Negra, lies Santa Calda Facing its vertical cliffs the Island. coast trends eastward till it ends in the long, low point, over which the sea breaks heavily with the swell of the wide Atlantic. The main body of the island is rudely circular, but on its southern side a tongue of land projects in the headland which curves to form the shelter of Santa Calda Bay. Between the island and the mainland the current surges, swift and uncertain in strength and direction, through a channel skirted by dangerous broken reefs and ledges just awash in the waves. Once inside the bay there is excellent holdingground, a protected anchorage, and a landing-place on firm, smooth beach. A few scattered dwellings of fishermen line the Cuban shore.

In one of these Captain Drummond was endeavouring to shave. It was an early morning of blue sky and brilliant dancing sunlight. Suddenly a distant shout was borne in upon the stillness.

Up the rough road leading from the shore sped a tall, lanky individual in extreme haste. He was untidily dressed, minus a hat, and his hair was wild and straggling. Two following shots rang out in quick succession. The new-comer sprawled earthwards and covered some considerable territory before alighting in a woeful heap on his head at the shanty doorway. Drummond rushed to the rescue, and hauled the man into shelter by the coat-collar.

'Gosh!' ejaculated the capsized one, sitting up and rubbing himself tenderly, 'came to a middlin' sudden stop over that blasted root, I did. Quit yer philanderin' round me, mister, an' get me a drink. I'm heated.'

Restoratives were administered-in copious sips. Recovery occurred under their beneficent influence.

'I'm a bit shook up, natural-like. Mighty real close thing that last popgun effort. Could hear my locks fair fizzle. Mean ain't fittin' language for the dastardy of these heathen. But I'm pretty tough.'

Drummond grunted polite concern.

'They've never made me half as mad, though, with them as I'll fix them up with me yet,' pursued the American malignantly. 'There'll be a good few burials when I start rifle practice, I reckon; an' it'll be an example of plantin' the accidentcases with their boots on for speed's sake with the mourners.' The inference was dark with vindictive spirit.

Drummond sneezed loudly from mingled dust, sunshine, shaving-soap, and emotion. But why

should they pot at you?' he inquired.

'I'm allowin' things have hummed a bit thick,' the stranger conceded. 'I represent'-he produced a large card from his pocket and thrust it on the Englishman-'the Caleb P. Denton Sugar and Estates Industrial Development Syndicate of Santa Calda. I'm Caleb Phineas Denton myself; Cincinnati's my state.

The amusement in Drummond's eyes suddenly

gave place to amazement.

'There is a wealth of unusual productiveness in that island's luxurious soil,' continued the Developer with enthusiasm. 'The economic potentialities of its wastin' plantations are immense, sir-immense. Do not, however, misunderstand the objects of the syndicate. Its broad and benevolent interests are philanthropic as well as financial; its aim is to lift the ignorant toilers and to teach them the value of a boom in real estate in Santa Calda. Meanwhile, we acquire the properties and prepare to import machinery for handlin' cane and extractin' the juice. Can't you see the radiant prospect of the picture in your eye?'

What Drummond was actually observing at the moment through the shimmering heat was the white triangular sail of a canoe-like craft beating out to sea.

'Unfortunately a contretemps has arisen. An opposition syndicate-Spanish too-has jest pizened the

guileless souls of those labourers of promise. It was that opposition which was shootin' at me, air. Jest a lot of wasters puttin' their dollars together to do me out of mine.

'So you are Mr Denton,' Drummond got in at last, when this definition and defiance of the rival syndicate had left its enunciator breathless.

'That's me, mister.'

'Is-is Miss Denton here?' queried Drummond with some hesitation.

'Thereabouts.' The speaker's arm waved vaguely coastwards.

'And the wreck of the Carita?' asked the other eagerly.

Mr Caleb P. Denton closed one eye with slow significance and shook his head. 'The Lord knows,'

he opined with irritating piety.

Drummond desired human knowledge. But beyond an enigmatic remark that yachts were apt to cause political complications which were exceedingly disturbing to syndicate promoters, Mr Denton would proffer no enlightenment. Drummond began to understand the cause of that strange lack of enthusiasm on the part of the Earl of Eastleigh when any chance reference had been made in the past to his future father-in-law. He stared out musingly across the rolling hillsides. The sky was one wide expanse of glowing blue. The palm-forests stretched away to the darker shading at the foot of the far mountains inland. The profound hush of tropical calm hung over the silent scene.

And what on earth had become of the Earl! For he was now nowhere to be found.

An aged negro was unearthed with difficulty from a backyard, and, as a concession to much ill-timed insistence from his interrogator, gave it as his solution that 'Mebbe the massa gone fer walk in the sun.' This sounded improbable to Drummond, who knew that young gentleman's disinclination to early efforts. However, he was unaccountably missing. Drummond began to grow uneasy.

A distant curl of smoke was drifting lazily from a house half-hidden by the sugar-cane. The tall chimney of a 'central,' or mill machine-shop, towered

in the background.

'My daughter's there,' volunteered Mr Denton after some reflection. 'Likely your friend's made tracks that way.'

This appeared a most possible explanation Drummond decided to visit the lady forthwith. A conscientious life involves the discharge of disturbing duties.

A tall, strong girl, with large clear eyes and a wealth of fair hair coiled deftly round an erect little head, rose in some alarm at his unceremonious entry. She was strikingly beautiful, and exquisite in a cool white frock which fitted loosely with dainty abandon round her slender form. A supple grace of figure added to the charm of her every movement. She did not resemble her father.

'My name is Drummond, miss,' said the sailor bluntly. 'Is the Earl of Eastleigh here?'

Her breathing quickened with a sudden gasp. 'No,' she answered swiftly.

'Have you seen him to-day?'

'No.'

'Did you know he was in Cuba?'

'No.' She spoke with a faint air of being on her defence.

Drummond watched her keenly, standing waiting. As she moved there came to him a faint wave of some scent she wore. His alert eyes never swerved from the girl's mobile face; it had crimsoned into a sudden beauty of colour.

'Where is the wreck of the yacht?'

The look of defiance about the lady's lips increased.

'I don't see what the Carita has got to do with you,' she said stormily.

Drummond did. But he forbore to explain at the moment.

'Lord Eastleigh was with me last night. This morning he is not to be found.' The captain reverted to his former topic.

She turned her face away from him till he could see nothing but one close-set ear.

'I did not know his welfare was nothing to you,' reflected Drummond aloud and astutely.

'I expect there are lots of things you don't know.' Miss Alice flashed round upon him in attempted scorn. But her eyes were dilated with dismay.

Drummond decided that it was exceedingly difficult to arrive at a correct estimate of contemporary history. The ways of women were absurd—always.

'Stranger'—Mr Denton's voice broke in, strident with excitement—'the opposition syndicate has annexed your chum. I reckon he was in yon boat under the thwarts, with a sack over his head to keep him innocuous.'

'But it is Lord Eastleigh, father!' cried the girl, with a fear suddenly awakened and sharp.

'Jeehosephat!' ejaculated Mr Denton, his eyes growing bigger. 'Now we've done it clean!' The news evidently gnawed at his peace of mind.

'We must go after him at once,' said Alice Denton after a minute of steely consideration. Her small oval face was pale with consternation.

'Them blamed Santa Calda gentry are a cage of cats,' her parent muttered in blank condemna-

tion. 'Guess they calculate to freeze on to him too.'

'It's all your fault for meddling with them,' declared his daughter passionately.

She towered above him to her full height of slender fairness, a maiden such as for whose sake men will commit great follies or achieve high deeds according as she leads. Denton chewed the straw in his mouth and eyed her furtively.

In its prosperous days, before the Spanish war, the sugar factory had evidently owned a small private wharf. For there, moored to the rotting planks of the pier, was a smart steam-launch. The name Carita adorned its bows. The sailor in charge was an American, and resolutely uncommunicative. Drummond asked him at once point-blank where the yacht was, but could get nothing out of him.

Indeed, taciturnity of a dismal character wrapped the whole party during the late afternoon run across to Santa Calda Island. The man in the launch attended to the engines and Alice Denton steered. She was more waywardly winsome than ever in a dark sailor coat and soft straw hat which shaded the perfect modelling of her mouth and chin. She managed the helm with a dexterity which Drummond admired.

As they approached the island the girl put the tiller hard over, and, instead of making for Santa Calda Bay, headed westwards along the winding channel of blue water. Cruel jagged rocks lined the shore. Suddenly she twisted the launch straight inwards. Next moment, through an opening in the reef, they swung into a little cove whose beach was fringed with cocoa-nut trees. The rich colouring of the tropical sunset outlined the stretches of coral sand and bright-hued flowers in the heavy air. A grass-covered valley led inwards to the upland plateau beyond.

A weird and wailing blast on the launch's whistle produced a tall mulatto, who came hastily to meet the launch-party. Much confabulation followed in Spanish, which Drummond did not understand. Then Mr Caleb Denton rose from his perch on the bulwark with a bound. He snorted a blighting translation with such stoicism as he could command.

(To be continued.)

A BALLOON TRIP FROM THE CRYSTAL PALACE.

P in a balloon, suspended in mid-air thousands of feet above the solid earth, all that you have to depend on being a large, thin bag filled with gas, a cord net, a few ropes, and a wicker basket! How many

would go for the first time if they had the chance? Certainly not every one; perhaps not one in a hundred. The majority of men might perhaps say yes, the majority of ladies no. Some of the

latter have even declared to me, with an expression of horror, that they certainly would not allow their husbands to go. Yet ladies will go without hesitation in motor-cars and in boats, in which the risk of accident is even greater than in a balloon; unless, indeed, you take exceptional risks by going up in very rough weather or by adventuring a cross-Channel trip. These exceptional risks, however, need not be attempted unless you are a professional aeronaut; in which case you must

make your advertised ascent at all hazards, or run the alternative of being mobbed by a disappointed public.

Many persons, however, would not venture in a balloon at all under any circumstances; and there is doubtless a certain fearsomeness in the very idea of finding one's self committed to a journey in such an invisible and impalpable element as the air; while some people have a constitutional dread of looking down from a height. We are perfectly familiar with terra-firma, and even on the water one may have a fair amount of confidence. But in the air, three, six, ten thousand feet up! Best not go in a balloon, or a motor-car, or a boat, or a perambulator if you allow your imagination to run riot as to what might happen. No doubt it is the greater feeling of familiarity with land and water which enables so many to accept risks thereon which are even greater than those involved in an aerial voyage under favourable conditions.

A balloon trip, however, is an experience really worth having, if you are of the necessary temperament to enjoy it; and a first ascent is a never-to-beforgotten event, especially if, as in my case, there is a little added spice of adventure.

I received an invitation some time ago to accompany a friend - a well-known amateur balloonist and member of the Aero Club of the United Kingdom-in one of his ascents, which are tolerably frequent. Two previous attempts to bring this off had failed, owing to weather and other unfavourable circumstances; but on a recent Saturday afternoon the much-anticipated opportunity arrived. The weather conditions were all that could be desired, and the ascent was to be made from the Crystal Palace at 2:30 P.M.; being, in fact, one of the regular ascents made almost every Saturday in the summer-time by some one or other of the members of the Aero Club.

It is not perhaps generally known how much ballooning is now indulged in as a sport. A balloon ascent is always an attraction as a side-show; but before the formation of the Aero Club in 1901 ballooning was almost entirely in the hands of professional aeronauts. There are now, however, a very considerable number of amateurs who are fully qualified to take charge of a balloon under any conditions, and many members of the club own their own balloons. The friend with whom I had the pleasure of taking the trip I am about to describe had made no fewer than fifty-four previous ascents, including a cross-Channel journey.

The construction of balloons has been greatly improved of late. A better knowledge of materials renders them more gas-tight; their shape and lifting capacity have also been improved; and an appliance known as the 'ripping-panel,' recently introduced, enables the final landing to be made with comparative ease, even in rough weather-

when it works.

I say when it works, because on my trip it did not work; with the consequence that we had a very

rough landing indeed. It is not often, however, that such an occurrence takes place, and the best appliances will sometimes fail.

The 'ripping-panel' is simply a contrivance for opening a large slit in the balloon so as to let out a great quantity of gas very quickly. This is done by simply pulling a cord called the 'rip-cord.' If this is not done when the car reaches the ground there is apt to be a rebound, another fall, and another rebound; and, if the wind is strong and the balloon travelling at a good pace, the car is pulled over on its side, and you may be dragged and bumped about for a very considerable distance However, I shall come to that presently.

I have said that the weather was favourable, for it was a lovely, bright afternoon after a somewhat doubtful morning; what clouds there were were very high, and the beautiful view from the terrace of the Palace could be enjoyed to full advantage. Nevertheless the wind was strong and rather gusty, and our start proved to be not altogether an easy

matter. Reaching the Palace at one o'clock, we found the balloon already half-inflated; and, having made our preliminary arrangements, we adjourned to the Palace grill-room to discuss a substantial lunch and the prospects of our trip.

Besides my friend, who was to act as pilot, and myself, we were also to have a lady passenger, who duly turned up a little later on. We should thus be three in the car, which, however, was capable of carrying four. But in a rough wind three is certainly better than four; and we had reason to congratulate ourselves afterwards that we were only three.

I rather fancy that an aeronaut is generally a little reluctant to take a lady passenger; but on this occasion at least any hesitation would not have been justified. Our lady friend had made one previous ascent, and she assured us that she did not mind where or how we came down. If the balloon would go as far as Russia so much the better, and if we came down in the sea she could make a swim for it. This was by no means bluff, as subsequent events proved that she could keep cool under somewhat trying circumstances.

Now all is ready for the start; the sand-bags, which have been moved gradually down the net as the balloon became inflated, are hanging round the outside of the car; and the balloon is also held down by a rope passed through a ring fixed in the ground.

We climb rapidly into the car, for the balloon is swaying about in the wind, and the car is by 110

means steady.

The sand bags are unhooked, and their place taken by a dozen men, who cling to the ropes to keep the balloon from rising and to steady it as much as possible. Their efforts in this respect, however, are not altogether successful, and afford great amusement to the spectators, for it is a sort of wild struggle between the balloon and the men,

whilst we in the car are having a somewhat rough time of it, and once or twice are very nearly upset altogether.

Now there is a lull in the wind, the balloon steadies, and 'Hands off!' is called. We rise from the ground, and are held only by the rope.

'Let go the rope!' and we are off, with a rousing cheer from the crowd, then a roar of laughter. What is it? I look over, and see a dog running after the end of the rope. A good thing for him that he did not succeed in getting hold of it, or in another moment he would have been swinging in

We wave our hats to the sea of upturned faces, and get another cheer in return. We are rising quickly, and objects down below are rapidly beginning to look very small indeed. Almost before one can realise it we are hundreds of feet above the Palace, with its two flanking towers two hundred and fifty feet high. This novel aspect of the Palace and grounds is most fascinating, and at first claims almost one's whole attention.

But we are being carried rapidly to the east, for the wind is almost due west, with just a point of south in it, and very soon we are attracted by the larger panorama opening out on all sides. What a panorama it is! Nothing obstructs our view north, south, east, and west. Beneath us like a map we see hundreds of square miles of our fair English land. To the north lies the whole of London, with its city and suburbs only partially obscured by smoke. The course of the Thames is clearly marked by a silver streak dividing the vast city fairly in two, and its broadening and sinuous course can be traced right down to Gravesend.

To the south and west lies the beautiful county of Surrey, and to the south and east the even more beautiful Kent. Towns and villages we see by the score, with fields and gardens and parks, like a rich-coloured mosaic. The railways are easily distinguished like ruled lines on a map, with the smallest of small toy engines and trains running

along them.

Being Saturday afternoon, the villages are en fête; cricket-matches are everywhere in evidence, brass bands are playing, and flags are flying. We hear cheering, but whether for ourselves or not we cannot tell. We are three thousand feet up in the air, and though we can hear sounds very distinctly it is difficult to locate them.

Notwithstanding the rate at which we are travelling, which is some twenty-five to thirty miles per hour, we are apparently in a perfect calm. Not a motion of any kind is to be felt. There is no wind, for we are going at the same rate as the wind; it is simply perfect, ideal, motionless motion. Looking down, however, we can see the shadow of our balloon passing rapidly across fields, hedges, and roads; and can form therefrom a rough idea of the rate at which we are travelling.

We put overboard a small toy parachute, with a wooden doll hanging to the string. It floats away a little in advance of us, and begins to fall. Presently, however, we discover it a little behind us, and higher than ourselves. Our balloon has fallen about five hundred feet owing to a cloud obscuring the sun; the gas has cooled and contracted, and so lost some of its sustaining power. We throw out a little ballast and check the descent.

We have now been in the air nearly half-an-hour, and cannot remain up much longer, for we are rapidly nearing the mouth of the Thames. Our course, almost due east, has taken us over Sidcup and Bexley, and we are now approaching Dartford. If we do not descend just beyond this latter town we shall quickly find ourselves at Gravesend and sailing down Gravesend Reach, over the river itself, with only a small piece of marsh land (Cliffe Marshes) between ourselves and the sea.

Beyond Dartford is the village of Stone, and on the farther side of the village a favourable piece of land for a descent-a grass field with a small orchard beyond, and beyond that again a large cultivated field. That is where we must come down, if possible.

In the meanwhile we have paid out our trail-rope, a strong rope about one hundred feet long. By trailing on the ground this rope will help to check and steady our progress.

Now begins the exciting time for us-and for others.

We pass over the village at the height of about fifty feet, trailing our rope right across everything -house-tops and gardens, and diagonally through the main village street. The whole population is out of doors, and the excitement is intense. It is probably the event of a lifetime for many of them; and men, women, and children set off in pursuit of us, some even attempting to catch hold of our trailrope.

This long trail-rope fascinates one; it looks almost like a living thing, wriggling across the village, and threatening destruction every moment.

Ah! there goes a chimney-pot. What next? Doubtless a certain amount of damage is done to tiles and gardens, but we heard nothing of it subsequently.

Now we have cleared the village, but the rope is slipping across the telegraph wires on the main road. Will it clear them ? Yes !-no! The pace at which we are travelling causes the end to curl up just as it reaches a pole, and there is a sudden check, which gives us a tremendous jerk; but in another moment some of the wires have snapped, and we are free.

Now we are over the field, and beyond is the orchard. We come down lightly, and then rise again to clear the latter. This we succeed in doing; but at the far side is a somewhat tall clump of elder-trees, and into this our car goes with a crash.

For a moment it looks as if we should stay there. The balloon itself is, of course, quite clear, being high above the car, and almost in less time than it takes to describe we have gone right through the elders and into the field of vetches beyond. We have suffered no damage, with the exception of a few scratches; our lady friend has lost the comb out of her back hair, and her hat is somewhat awry. Perhaps she is fortunate in not losing that also, for my own hat is considerably dented.

We come down into the field with a big bump as soon as we clear the trees, and the moment we touch the ground the rip-cord is pulled, but fails to act; the cord has broken. Had it worked properly we should not have risen again; though we should probably have been dragged along some distance. As it is, our progress has been checked somewhat, for the grapnel has been thrown out, and the balloon is rapidly losing gas through the top valve, for our pilot is holding on to the valve-cord for all he is worth. Nevertheless we are still travelling at a good pace, perhaps ten or twelve miles per hour, and as we come bump down on the ground the car is dragged over on its side, and we find ourselves somewhat mixed up, though we cling grimly to the side-ropes.

Relieved temporarily of the weight of the grapnel, the balloon goes up again as much as twenty or thirty feet, and then comes down more heavily than before. 'Bend your knees,' shouts our pilot. Ah, that time we did bump! With knees flexed, however, and our weight principally supported on the ropes, we sustain the shock without damage.

Once more we are dragged along on our side, once more we go up, and once more we come down bump; but this time not so heavily. As I have always been accustomed to active athletics, the situation does not present much difficulty to me; indeed, I am enjoying it immensely. Our pilot, I know, has had many a rougher experience; but I am wondering how the lady is feeling. There is no time to ask questions, and little enough time to make observations; but I can see that after each bump she still retains her hold, though I have also a vision of her in anything but a perpendicular position alongside of me when the car is turned on its side and dragged along.

We have not finished bumping yet, but the worst is over. Our grapnel is ploughing up the field, but helping much to check our pace. The balloon is rapidly collapsing, and after five or six bumps it fails to lift the car, and simply drags it along.

Some of the foremost men who are running after us now manage to get hold of the trail-rope. They had made several previous attempts, but could not hold it, as we were going too fast. In a few moments others have reached the car itself; we are safely held, and our adventures are at an end.

Willing hands are stretched out to clear the ropes and help us to climb out, the lady first. Is she all right! Yes. Are we all all right? Yes, thanks; but will some one please get some drinkingwater?

Every one wants to help. Men, women, and children gather round us by the score; the whole village population must be there. Some of them

have surely never run so fast or so far in their lives before. They breathe hard, and in the middle of that crowd there is a considerable want of air. I am glad to extricate myself.

No one says anything about damage to chimnerpots or gardens; we are objects of the greatest
possible interest and wonder—especially the lady.
She has come out of it fresh and smiling, and many
are the exclamations of admiration at her pluck in
adventuring such an exploit. Some one presently
presents her with a beautiful bouquet of carnations.
'Wouldn't you like to go up in a balloon, Mary
Ann?' some one says jokingly to a country girl in
the crowd. 'Not ma,' says Mary Ann so emphatically
as to raise a general laugh.

Many are the questions asked and answered. Where do we come from? Were we going anywhere in particular? When did we start? How high had we been? What did it feel like to be up there? and so forth.

Meanwhile we turn our attention to deflating and packing the balloon. There seems to be something almost pathetic about it as it lies on its side, slowly collapsing into a shapeless heap. It has looked so trim and symmetrical, and has carried as with such a stately grace through the air, that it almost looks as if one were letting the life out of something animate and conscious. We might even imagine its final manœuvres to be a protest against our bringing it to earth again.

A score of villagers help us to pack; a cart is sent for, and also a carriage; and with the balloon safely hoisted into the one and ourselves in the other, we are ready to set off for the station at Greenhithe.

Many of the willing hands have doubtless had a gratuity in view from the very first, and their expectations are now plainly evident. But every one has helped, and it must be a matter of diplomacy to satisfy so many claims. We select the three most prominent and assiduous workers, divide our gratuity between them, and tell them in the hearing of all that they must share it with the others. One man presses a claim for a lost hat, which might have been a Lincoln Bennett from his own description of it. He has a red handkerchief tied round his head; and though it is by no means clear how he could have lost his hat in our service, and we mightily suspect him to be an outrageous fraud, we give him a shilling, which fully satisfies him. A handful of coppers for the children to scramble for, and we quickly leave the crowd behind us as we drive off to the station.

Some of our helpers come along with the cart containing the balloon, but stop at the first public house, and we have to send a message back to hurry up the cart.

On reaching the station, however, we find that we have half-an-hour to wait for a train; so we refresh ourselves with tea and rolls, and send of telegrams to announce our whereabouts. By 6.30 P.M. we are back at Charing Cross, where the

three adventurers must part company for their individual destinations. We have all enjoyed it immensely, and would be delighted to repeat the performance at any future time.

What does it feel like to be up in a balloon? I suppose that, like every other experience, it must vary somewhat, or perhaps a good deal, with the individual temperament.

What does it feel like to come down again?

That would appear to depend very considerably upon how you come down.

There are doubtless some adventures, even in ballooning, which no one would care to repeat; but certainly any one whose temperament will enable him to enjoy such a first trip as I have described will be keen enough on going up again at the first opportunity, even if the coming down is likely to be a little hazardous.

ENGINEERING NOTES.

By W. O. HORSNAILL, A.M.I.E.E., A.M.I.Mech.E.

ELECTRIC FARMING.

HE reluctance evinced by the British farmer to adopt new machinery and methods leads us to the conclusion that agriculture will be one of the last industries to call in the aid of electrical appliances; and in view

of the economy and reliability of the small oilengine, it is difficult to see how any saving can be effected by generating electric current and distributing it to motors in outlying positions. When, however, the mains from some large electric power company pass within reach of a farm or estate the conditions are much more favourable, and this state of things must already exist in a measure which will be largely extended in future. A recent number of Electrical Engineering contains an interesting account of the application of electricity to a group of farms in Saxony. Current is brought from an adjacent town by overhead wires carried upon wooden poles. Two receiving stations are arranged, from which the electricity is distributed to the farm-buildings and to convenient positions in the fields for the purpose of driving threshing and other machinery. Sixteen fixed electric motors are installed for chaff and root cutting, oat-crushing, pumping, and for operating machinery used in the manufacture of potato spirit. In addition to this power equipment, six portable motors are provided, which may be used for driving pumps, circular saws, threshing machinery, &c., at any point where their services are required. The houses and buildings on the farms are all lit by electricity, nine arclamps and about one thousand glow-lamps being used for this purpose. This example can only be compared to a large estate or group of farms in this country, and it is doubtful if such a scheme could be a commercial success for the operation of farming machinery pure and simple. It would appear that wood-sawing, pumping, and other operations requiring power must be included if the results are to compare favourably with those at present obtained by the use of oil or steam engines.

NOVEL OIL PIPE-LINE.

Thick oil will not pass easily through a pipe;

hence, if it be desired to convey it to any considerable distance by this means powerful pumping machinery is required. This difficulty has been recently overcome in a most ingenious manner. It was desired to carry large quantities of thick, sticky oil from the Kern River oilfields in California to the seaboard, a distance of two hundred and eighty-five miles. Experiments proved that if a small quantity of water were added to the oil, and the mixture caused to rotate in the pipe, the water, being the heavier liquid, was separated from the oil by centrifugal force, and spread itself round the inside of the pipe. On the strength of these experiments, the tubes forming the pipe-line were grooved after the manner of a rifle barrel, thus imparting a rotary motion to any liquid passing through them. A small proportion of water is added before the oil passes into the line, with the result that it never comes in contact with the pipe-surface. The friction is thus vastly reduced, and little more power is required than would be necessary to convey the same quantity of water.

A FLOATING DOCKYARD.

A vessel has recently been constructed on the north-east coast for His Majesty's Navy, named the Cyclops. This remarkable ship is fully equipped for effecting all kinds of repairs which are usually carried out in a dockyard. A complete foundry which can produce iron and brass castings of considerable size is situated on the lowest deck, where is also a forge with all the necessary appliances. Carpenters', armourers', and blacksmiths' shops are provided, together with machines and appliances for turning out finished engine or gun parts, copperwork, and electrical apparatus. Boiler and shiprepair work is dealt with on another deck, all the usual shipyard tools being installed. Heavy parts to be repaired can be lifted out of vessels lying alongside by a powerful crane, which can be moved about to any point where its services are required. Further equipment includes refrigerating machinery and condensing plant capable of supplying freshwater to a whole fleet. All the machines are driven by electric motors, large steam-engines and dynamos being installed to provide the necessary current. The Cyclops, which measures four hundred and sixty feet in length by fifty-five feet in breadth, will require a large staff of men to utilise her equipment fully.

FAMINE IN PETROL.

A committee of the Motor Union of Great Britain and Ireland has lately been inquiring into the shortage of the supply of petrol and the consequent advance in price. It has also considered the possibility of using other oils or spirits in motorcar engines. Eminent authorities are quoted by the committee in its report to confirm its view that the supply of petrol must fail in the near future to be equal to the demand. Moreover, the sources of supply are admitted to be entirely controlled by two financial combinations. The conclusion unanimously arrived at is that alcohol, or some similar spirit which can be produced from vegetable matter, is by far the best substitute for petrol. Moreover, instead of depending upon foreign countries for our supplies of motor fuel, the entire demand could be met by our own manufacturers if alcohol were adopted, as it can be made from all kinds of vegetation, including peat. Practically, the only obstacle which stands in the way of this spirit being used for the production of power is the high duty on its manufacture at present imposed by the Excise authorities. The revenue from this source amounts to about thirty million pounds per annum, and there would appear to be great difficulty in allowing the manufacture of alcohol duty free for industrial purposes without leading to its illicit use for the preparation of potable spirits. Even if it were feasible to make industrial spirit undrinkable, strict supervision on the part of the Excise authorities would be necessary, whereby the cost of manufacture would be materially increased. Turning to other possible alternatives, the Automobile Club are recommended to carry out complete and thorough trials of motors using paraffin instead of petrol. Further, tar benzol produced from the distillation of coal is suggested, as large quantities of this material are available, and the supply would be greatly increased if the demand should arise. Lastly, gas-engines with their own gas-producers are mentioned as a feasible means of driving heavy commercial vehicles with greater economy than can be obtained by the use of a steam or petrol engine.

TRAIN FERRY STEAMER.

The steamer Lucia Carbo, built for the Entre Rios Railway, and recently described in Engineering, is of special interest from the fact that it is designed for the conveyance of complete railway trains over a distance of fifty miles. Three lines of rails are laid along the main deck from end to end of the vessel, and passenger accommodation is provided on a superstructure deck which is carried at a sufficient height to clear the tops of the railway carriages. Engines of over two thousand horse-power are capable of maintaining a speed of fourteen and a

half knots, and the vessel is lit by electricity throughout. The railway termini between which the trains have to be ferried are situated on the River Plate.

NOVEL WIRE-ROPE TESTER.

Wire-ropes are used exclusively for drawing up coal and other minerals from mines, what is known as a cage being hung on the end of the rope to receive the loaded wagons as they arrive at the bottom of the shaft. Usually the miners are brought up from their work by the same means; hence it is exceedingly important that the wireropes used for this purpose should be perfectly sound and good throughout. Wear must of course occur, and eventually the rope is replaced by a new one. The difficulty is to know how far the rope has become weakened by use, and hitherto no convenient and certain means of testing has been available; hence ropes have been laid aside before their useful life has ended rather than that any risk of failure should exist. Electricity seems to be capable of almost any application, and a device depending upon an induced electric current has been recently invented for the purpose of testing wire-ropes. The latter are made to pass through a coil of copper wire which is traversed by an alternating electric current. It has been found that the current is exactly proportional to the thickness of the rope; consequently, if any parts are dangerously worn or the separate wires broken, indication is at once given by a measuring instrument which forms part of the apparatus.

REMARKABLE RACING-LAUNCH.

According to The Engineer for September 6, a new departure in ship propulsion has been embodied in a motor-boat designed by M. André Gambin and built at Nantes. When afloat it appears to differ little from the ordinary motor boat; but the propelling arrangements below the water line are of a very unusual nature. Instead of a screw, the inventor uses what he calls a 'typhonoide' This contrivance is similar in appearance to a ventilating fan, and it is mounted under the bow of the ship at the end of a large cylinder which is continued aft to the stern. When the typhonoide is revolved by the engines it sucks up water and expels it along the sides of the hull, the boat being thus drawn forward. It is also contended that the action of the contrivance tends to reduce the resistance in front of the boat by, as it were, cutting an opening in the water for the hull to pass through, The inventor is stated to have guaranteed a speed of 54.5 knots, the power taken being very much less than for the ordinary boat fitted with a screw.

NOVEL TRACTION-ENGINE.

The forests in the north-western states of America provide large quantities of timber which have to be hauled down to the rivers for the purpose of being floated to the sawmills. No roads are available for this traffic, but the heavy snow which remains for many months of the year in these regions is made to serve as a track for sledges. Horses, which until recently were used to haul the logs over the snow, are now giving place to a unique form of traction-engine. The boiler and engines of this snow-locomotive are similar in principle to those used with ordinary steam-tractors in this country; but the customary wheels for carrying the locomotive along the track are entirely dispensed with. The reason for this departure is not far to seek, as wheels would sink into the snow instead of passing over the surface. It has been necessary, therefore, to provide the engine with what are practically snow-shoes. The front of the locomotive is carried upon a pair of runners which can be turned about by the steering-wheel in exactly the same manner as the front wheels of an ordinary traction-engine. The back and heaviest portion of the engine is supported on two wheels at each side, which are placed at some distance apart. A wide chain formed of strong steel links passes round each pair of wheels and forms as good a support as a long, broad siedge-runner. When the wheels are revolved by the engine, the chain, which has spikes on it for gripping the snow, moves along, taking the locomotive with it. The logs are carried upon a train of massive sledges, a number of which are drawn behind the engine.

NEW FLOATING DOCK.

Most of us are accustomed to think of a dock as an enclosed piece of water where ships are unloaded; but in addition to this useful type we have graving and floating docks which are needed for the cleaning and repair of large vessels. Small ships such as fishing-smacks and yachts are hauled bodily out of the water when important repairs become necessary; but if the bottom of a large vessel wants attention the above order is reversed, and the water is taken from under the ship. For this purpose what may be called a masonry trough is built, closed at one end and provided with watertight gates at the other. The vessel is floated in at hightide, and the gates are closed, the final operation being to remove the water by means of powerful steam-pumps. These graving docks are very costly to construct, an immense amount of dredging and excavation being often necessary; hence the invention more than half a century ago of the floating dock. One of these appliances has just been built for Trinidad by Messrs Swan, Hunter, & Wigham Richardson of Newcastle-on-Tyne. The dock is in the form of a trough open at each end; but, instead of being solid, the bottom and sides consist of huge steel watertight tanks, consequently the trough floats on the top of the water. When a ship has to be docked, water is let into the tanks until the dock has sunk deep enough to allow the vessel to float into it; powerful steam-pumps are then started, and the tanks are gradually emptied, causing the dock to rise and lift the ship completely out of the

water. Vessels weighing as much as four thousand tons can be raised by this dock, which may be lowered until there is a depth of eighteen feet of water over the keel-blocks. One unique feature of this dock is its capacity for lifting itself in sections when painting or repairs become necessary; for this purpose the dock is built in three lengths, two of which can be used to raise the third portion when desired. There are three separate pumping-plants, which together are capable of raising a vessel weighing four thousand tons in two and a half hours.

ELECTRICAL ACCIDENTS.

The use of electrical appliances has now become so general that we are all of us more or less interested in the risk of sustaining personal injuries from electric shock. In the annual report of the Chief Inspector of Factories, which has lately been issued, is embodied a report by H.M. Electrical Inspector of Factories, Mr G. Scott Ram, which contains some very instructive data regarding electrical accidents which occurred during 1906. We are accustomed to think that fittings carrying electric current at a pressure below two hundred and fifty volts may be handled with impunity, and fatal results from such low pressures have been deemed well-nigh impossible. This view is shown by Mr Ram's report to be entirely erroneous, and very considerable danger exists with faulty fittings even at such low voltages. One man was killed by a shock from a portable lamp, the pressure being only two hundred and thirty volts. He was standing on iron floor-plates when his hand came in contact with the leaky fitting, and he was unable to release his hold until the current was cut off. All efforts to restore animation were unavailing, death taking place almost immediately. Another fatality occurred under very similar conditions, a portable fan being responsible in this instance. The fan was placed on a shelf in a cellar in which pork was pickled, and the floor was in a very damp state. A youth attempted to start the fan by taking hold of the pedestal with one hand and turning on the switch with the other. The fan proved to be leaky, with the result that current at a pressure of two hundred volts passed through his body to the ground. Here, again, the victim was unable to let go the apparatus until the supply of electricity was interrupted, when he fell to the ground and died, in spite of medical assistance, which was quickly forthcoming. An electrician was killed by deliberately taking hold of an exposed joint in a cable which was carrying current at the same pressure, evidently thinking that no danger existed with such a low voltage. Two more fatal accidents are reported from circuits having a pressure of two hundred volts: one from the terminals of a motor which were only temporarily exposed; the second from an arc lamp, caused by a faulty switch. All the accidents above mentioned were caused by alternating currents, which have the peculiarity of making the muscles rigid until the supply

of electricity is cut off. Hence a person who has grasped an object carrying electricity of this nature cannot release his hold until assistance is forthcoming, by which time fatal injury has often occurred. Continuous current is not open to this objection, and the injuries reported during the year consist mainly of burns caused by flashing over of the current owing to faulty fittings and arrange-

ments, no fatal accident from low-pressure circuits being recorded. Mr Ram's report clearly indicates that all accidents to consumers may be prevented by the adoption of high-class apparatus properly installed and reasonably used. Even carelessness is guarded against in the best fittings, and shocks can only be obtained by deliberately exposing the parts carrying current.

WILD IRELAND.

By HELEN PORTER.

HE tourist who hurries through Ireland may form some idea of the beauty of her scenery, but can hardly gain much knowledge of the people. For one thing, the country men and women he meets

are an artificial product, manufactured by himself. Everywhere on the tourist-track we find beggars, touts, hangers-on, a demoralised population, trading on the easy generosity or credulity of the stranger. Often, when one is pestered with importunity, a certain way to get rid of the annoyance is to turn to the tormentor and ask with such scorn as one can, 'Is it for an Englishwoman ye take me?' and the method is generally effectual. At Killarney one blushes for one's country; and, though things are not so bad in Connemara, they are bad enough. A residence of five summers in this picturesque district has confirmed the belief that there is nowhere a more charming or engaging peasantry, but we must seek them off, and not on, the beaten track.

I once met an American journalist in Venice. He was full of Irish anecdote, and I asked him how he had gathered so much in the very brief time he spent in the Emerald Isle. 'It was easy enough,' he explained. 'I just said to my cardriver, "Tell me some stories," and slipped a shilling into his hand. When he stopped telling them I slipped another shilling into his palm. "Tell me some more." I was no longer surprised at the variety or strangeness of his information. Much of it, I have no doubt, came straight from the fertile imagination of the jarvey.

There is a story commonly related in Connemara of a tourist who met a woman carrying a fowl. Entering into conversation with her, he asked how much she expected to sell it for. 'Sixpence, or, wid any luck, eightpence, yer honour.' Whereupon he began to expatiate on the smallness of the price and the starvation wages the market offered, and ended by saying, 'If you had that chicken in London, my good woman, you'd get at least halfacrown for it.' The woman looked him up and down, and obviously decided that he was a born fool, or perhaps resented the implied slight to her country. Pointing to the lake—and lakes are always at hand in Connemara—'D'ye see that wather?

Well, thin, an' if I had a bucket av it in hell, maybe it's a pound a dhrop I'd be gettin' fer it!' she said, and continued her way.

Off the tourist-track the peasants are still very primitive, few of the old people speak anything but Irish, and it is common to meet even fairly young people who 'haven't the English.' It is awkward at times, as we once found when on a cycling expedition into an unfrequented region, where the very few inhabitants we met were unable to understand or to direct us. Hospitality is an Irish characteristic. On this occasion we were a party of three ladies, and twice in the course of one day we enjoyed free refreshment: tea with bread and jam at a wayside schoolhouse, and tumblers of milk all round at a public-house. No payment was accepted, and to insist would have been the worst of manners and hurt the feelings of people to whom we were total strangers, and whom we have never since seen.

In one district of the west it is the fashion to 'return' a present. 'Thank God, we are not so poor as we can't return a present!' was the exact phrase used by an old dame as she presented me with a lobster after I had given her a box of homocea to apply to a rheumatic knee. This is quite a custom in the neighbourhood, eggs being the favourite form of gift. Indeed, eggs are used in this part of the world very much as money is elsewhere. The countryfolk take them to the local grocer, and he gives them value in tea or other goods. The most acceptable presents to give are tea and tobacco. I had an old friend to whom I sometimes gave a few pence-worth of strong black plug. Once in the village shop I asked for tobacco, to be told, 'We've none, miss' Disappointed—for I had walked some distance to get it-'Oh, surely you have some?' I said. 'I'm afraid we've none you'd care to use, miss;' but when I explained to the young man the purpose for which I wanted it, he fetched it at once, and seemed much relieved. What garbled version of the 'smart set's' love for cigarettes had reached the village of Ballyconneely to make him imagine it was for my personal use?

A residence of over three months in this out-ofthe-way spot taught us that as a rule the people do not beg. My sister and I were in a wretched hore, without a chimney, without a window, a place in which one would hardly stable an animal, and one of the first things the goodwife said was, 'Thank God, miss, there's no poverty here!' There is no actual starvation, it is true, because, as the district is on the coast, there are 'pickings' to be had. The seaweed is a valuable manure, and all the country from Slyne Head to Gorumna Island is a centre of the kelp-burning industry. At first one rather dislikes the curious smell from which the district is never free in the season; but after a bit one gets to like it, and it is supposed to be excellent for the lungs. One of our party, a sufferer from sathma, had perfect health during her sojourn there.

Catering was a difficulty, laundry another; the fine things had to be sent away, but there remained a large family-washing. My sister went to interview the local washerwoman, who lived in a little cabin on the edge of the lake. She couldn't undertake it at all. 'Himself was away in Ameriky.' He had gone out on some mysterious business, never fully explained, on a job to try to earn enough to pay off arrears of rent. With the want of enterprise common to the Irish peasantry, she would have refused the work because 'himself' used to be right-hand man at this trade! My sister suggested that she should hire a girl to helpan idea which was new to her. She told us at the end of the season that she had made more than enough to pay all their debts by following this advice.

At one time there must have been a French, or rather Norman, settlement in this part of Ireland, for De Courcy is one of the commonest of names to be found here. It is a little surprising to have a charwoman of this high-sounding appellation, and I remember her anger on my saying her name was of foreign origin. It was obviously a deadly insult. She was a young woman with two children, and her husband had been drowned. There is a superstition among the people that it is unlucky to save any one from a watery grave or to take a drowning man into a boat. 'The sea will have its life,' they say; and if you take away its prey you will surely fall a victim yourself. It is a dreadful creed, and unfortunately firmly believed, there being many authenticated cases where lives have been lost for lack of a trifling effort to save them. Like most seashore folk, they have an awe, almost a horror, of the element to which they owe so much. We used to bathe every day, keeping our dresses and towels in one of the cottages, the owner of which was very anxious for us to bathe her daughter Mary, a fine girl of about fifteen, who always ran away at our approach, having an objection to a project as new as it was disagreeable.

A large establishment was a novelty in these parts, and it was rather amusing to see that the coachman in his important livery received all the curtsies and all the attention if we stopped anywhere on the road. We were very small folk indeed compared to him. An old man told one of my brothers, who was dressed in spotless white flannels, that the country-people thought it very humble of us to dress so plain. I think the old fellow's expression was, 'Just like one av our own gossoons;' for all the country lads wear white homespun, and the little boys wear petticoats till they are promoted at about ten years of age to the dignity of trousers.

The grooming of the horses excited much interest; there was nearly always a row of spectators on the top of the wall watching operations. 'The quarest now that iver was in it, shinin' their horses like lookin'-glasses.'

On Sunday afternoons a sort of stump-cricket was started in a stony field near the house. It was done to amuse our own servants; but gradually various small boys came to field balls and join in the game. Before we left at least fifty strangers used to assemble: bigger boys and young menstrange, uncouth-looking figures in their white homespun clothes, with long black beards and shy, startled manners; mountainy fellows-who tramped miles over the bog to this game, which soon became entirely their own as our party thinned out. The bat and ball were always left on the stable window-sill, not becoming their property till we left. It was a pity such an innocent and harmless amusement could not be kept up; but our English friends who rented the place next year told us it was quite discontinued.

We are often told that the Irish are very emotional. The day we left we had experience of this in the rows of weeping people lining the boreen as we went away. One woman threw both arms round one of the party and kissed her; and we had done nothing special for these folk; they were not our tenants; we had merely lived amongst them for a few months, treating them with civility and consideration, and giving such employment as a large household usually brings. The people are, however, very quarrelsome amongst them-selves, and their fights are cruel and bitter. They lie in wait for each other returning from fairs, and seize a favourable opportunity to revenge their grievances. An outrage of this kind had happened some years before our arrival. - had a grudge against a neighbour, One Micky for whom he lay in wait. The attacked one, however, was not too drunk to make a fight for it; his friends came to his help, the constable (for a wonder) was at hand, and Micky was soon hors de combat. He made a struggle, however, and inflicted great damage, biting a bit out of one assailant's ear, the top of another's nose, and a small piece out of the policeman's thumb. Next Sunday, after mass, the priest thought it his duty to refer to the matter. He asked his congregation if they had ever heard of cannibals, and then proceeded to draw a lurid picture of their abominations, closing something like this: 'Well, now, you all know

how wicked these black savages are; but there's one in this country worse than they, a Christian man who behaves worse than the cannibals, for they at least kill outright and eat for food, but as for Micky ——, he goes round tastin' the whole parish!'

Everything in this district is congested. The congregation of the chapel overflows every Sunday into the yard; the houses lie thick together, each with its tiny 'garden,' for so they call a potato or a cabbage patch. The scenery might not appeal to a casual visitor; there are no trees, no cultivation, just great stretches of sea on the one side, great stretches of bog on the other, extending to where the horizon is bounded by a distant view of the Twelve Bens. Long sandy plains lead to Slyne Head, a low-lying promontory. To appreciate the beauties of the spot you would need to live there, to notice how the bare brown bog turns gradually warmer in tone, till it becomes a bright orange, a pale red, and then in October a vivid crimson as the scutch-grass and the bog-plants turn scarlet. There is not a more glorious sight anywhere than a sunset over a red bog, the whole sky and earth on fire, and the pools and lakes glowing like molten gold. And then it fades into the softest of lilac and g ay, and the purple shadows chase each other over the bare hills. The seaboard is very dry, and on a stormy day one can see the rain-clouds rising very black and menacing, to be hurried inland before the gale and discharged on the peaks of the mountains, or else lying in thick white swathes on their summits. The effect is beautiful, and one enjoys it the more for the fact that one can lie on a knoll and pity the tourists in the Kylemore and Lough Innagh valleys.

To everything there is a drawback. In our case it was that we had hoped to get some fishing; but the river was dried up for want of rain, so some of us watched the behaviour of the clouds with disfavour. This is not a common experience in Connemara, where 'saft' days are frequent and rain a drug in the market. Perhaps it is that we like to do nothing by halves over here; when it is wet it is very wet indeed, but when it is fine it is fine. The remark made by a countryman about the language may apply to the climate: 'Tis a grand language, specially for cursin' or blessin'.'

The recent erection of a Marconi apparatus near Slyne Head must have considerably astonished the natives. The first motor-car that passed through Connemara was a great puzzle to them till they found a solution: 'It was a carriage which had broken loose from the railway'! The gramophone, imported by a summer visitor, occasioned more awe than amusement. He had 'the divil in a box,' they said, and as he was a clergyman it did not seem à propos!

'It's not right' is the expression used to denote anything uncanny. Mushrooms are not eaten for this reason; they are associated with fairy rings.

Rabbits are not used either; why, I could never understand, because hares are poached and eaten, and there are many superstitions connected with them.

1

If you want to see Ireland—real Ireland, not the Ireland of the tourist or the stage—you must avoid the new and convenient road, and take the old disused track across the bog and down a side-lane till you reach the 'Back av Beyant.'

THE SPIRIT OF UNREST.

When on the lawn the moonbeams lie,
And little breezes whisper by,
And shadows creeping o'er the sky
Have hid the glowing west;
When all is still, and I alone
Watch the stars twinkling, one by one,
He comes unseen, unheard, unknown—
The Spirit of Unrest.

When all is calm and hot and still,
And silence rests on vale and hill,
He creeps in o'er the window sill
Upon his wicked quest.
I seem to breathe him in the air,
I seem to feel him stir my hair,
I seem to see him everywhere—
The Spirit of Unrest.

And when the pine-trees creak and strain,
The wind is howling, and the rain
Comes tapping at the window-pane,
A knocking half-suppress d,
Then, in the pattering of the sleet,

Then, in the pattering of the settle I seem to hear his hurrying feet
As he roves moaning up the street—
The Spirit of Unrest.

And then I long to cry or shout,
I long to toss the clothes about,
To rise from bed and scamper out—
Escape my goblin guest;

Do anything to make some sound Instead of cowering, spell-bound, Feeling him creeping all around— The Spirit of Uniest.

There is one star—a little one—
That seems to be my very own;
Of all the stars in Midnight's crown
I love this one the best.
The pines are very straight and tall,

But it shines out above them all.

Its very peace seems to enthrall

The Spirit of Unrest.

And when I think how, in the sky, Its little light will never die, But twinkle through eternity—

A beacon ever bless'd—
Sleep creeps around me, misty, gray,
And with a sigh of balf-dismay
He spreads his wings and flies away—

The Spirit of Unrest. DOROTHY ROWS

HEART OFTHINGS. THE

By HENRY LEACH.

LONDON, Nov. 20.

IE new Lord Mayor has been elected, and the City winter season—a season of feasting and function-has got well started. It will be a busy season, and it should be a great and eventful Lord Mayoralty that will endure

until next November; but whatever is before us in this century, it is certain that that mayoralty which has just closed will always take high rank among all. There are signs that in these days it is becoming a more and more expensive thing to be Lord Mayor, and it has never been a cheap ambition to gratify. In the very olden days some Lord Mayors had a way of doing things in a very costly style, for an example of which we need cite a no less distinguished chief magistrate of the City than Sir Richard Whittington, of whom it is said that on one occasion, when he entertained Henry V. and his Queen at a Guildhall banquet, he took the King's bond for sixty thousand pounds, owing to himself, and threw it on the fire 'for spicewood.' Those were the great days when kings were really at home at the City headquarters, and when things were perhaps a little less cut and dried than they are in these days of stricter formality and of a Press Who in the that needs a report on everything. City has not heard of that wonderful story of how Sir Robert Vyner entertained King Charles II.? The King was fond of going to the City, and on some nine or ten occasions went there for feasting. On one of them Sir Robert, being then Lord Mayor, was a trifle indiscreet in his libations; and when the King rose to take his departure, up got the Lord Mayor, and, seizing him by the arm, hiccuped, 'Sir, you shall stay and finish t'other bottle.' His Majesty looked at him and smiled; and then he took his seat again, remarking, 'He that is drunk is as great as a king!' And with such a very friendly and sociable understanding did they finish 'the other bottle.' But, to the point of our note, it might not unfairly be suggested that there was a touch of rather less colour and rather less expense about some of the Victorian Lord Mayoralties; and there is a reaction now which is going to cost some of our future Whittingtons a pretty penny, the numerous visits of foreign royalties adding greatly to the financial burden that the Lord Mayor must bear. It may not be generally realised that in the very best of circumstances-meaning a minimum of extra expenses-his year of office must cost at the very least twenty-five thousand pounds, and generally he would regard himself as very well let off if his little bill ran to no more than thirty thousand pounds. Usually the 'show' and the banquet on the evening of his installation cost from four thousand to five thousand pounds; but the expenses in this case are defrayed, not by the Lord Mayor alone, but by him with the help of the two Sheriffs, the former paying half and the two others each a quarter. Thereafter the causes of great expense are multitudinous. The big banquets that are given by every occupant of the civic chair to the Judges, the Elder Brethren of Trinity House, and so on are chief among them. The total cost of official attendances of one kind and another, on an average perhaps two or three days a week, is very heavy, and each Lord Mayor has to make handsome subscriptions to all the charitable institutions that come within his purview. The increasing custom of fraternising with municipal authorities abroad, particularly in France, is adding considerably to the Lord Mayor's expenditure. Moreover, there are many peculiar little customs of which the public hears next to nothing, but which the Lord Mayor is expected to perpetuate at an appreciable expense to himself. Thus it is a tradition that each Lord Mayor should supplement the handsome stock of plate at the Mansion House by a fresh five hundred pounds' worth as a gift from himself. Obviously, from the pecuniary point of view, it is a very serious thing to be Lord Mayor, and the City demands that the most convincing proof of the candidate's financial position shall be supplied to it. The fact that he has become otherwise eligible in the long process of years is some indication that he is rich enough, for he

NOVEMBER 30, 1907.

must have been an alderman for about ten years, and some time previously must have fulfilled the office of Sheriff at a cost of from two thousand to three thousand five hundred pounds. But it might happen, nevertheless, that the man who in order of seniority was most eligible for the office felt himself ill prepared to bear such a burden; and if that were the case he would ask for his name to be passed over, very likely giving ill-health or business ties as the reason for his inability to accept the great honour which were otherwise in his grasp. But if he would go forward to the consummation of his civic greatness he must attend a secret sitting of the Court of Aldermen, and there almost lay bare to his brethren his financial position, producing proof that he is in possession of means which will warrant him in spending ten thousand pounds over and above his allowance, 'without impoverishing his family.' This is 'giving bond,' and the secrets thus disclosed, it is needless to say, are never in any circumstances divulged. Parsimony in a Lord Mayor is an unforgivable sin. So far back as 1832 a City poet set forth in eleven quatrains what he conceived to be the qualities of a good Lord Mayor, and one of them ran thus:

A good Lord Mayor is one who will not strain, Like some of old, to save and gripe and gain; And, all forgetful of his festive state, Let the cat kitten in the kitchen grate.

The last line of this verse was not simply metaphor. It is one of the traditions of the Mansion House that the event thus suggested actually took place during the year of office of a Lord Mayor whose prevailing characteristic was this hateful parsimony.

* * *

We were speaking of this as a festive season, and the menus of City banquets are still things for simple-living folk to wonder much at; but one may doubt after all whether in the variety of viands and dishes these feasts are quite so rich as those of fifty or sixty years ago, although in pure magnificence the moderns no doubt have it easily. One is brought to this thought by the perusal of an old menu of a public dinner that was provided at the Albion Tavern in Aldersgate Street in 1844, on the occasion of the opening of the Royal Exchange by Queen Victoria. On this menu there were no fewer than forty-six items, including four different kinds of soups, four entrées chaudes, and ten entrées froides. This old Albion Tavern, which was closed only a few weeks ago, was a very celebrated place in its day, and had a history of which few City taverns could boast the like. Most of the Corporation banquets, the Sheriffs' inauguration dinners, and the occasional feastings of civic companies and committees used to take place here, as well as the farewell dinners that were given by the East India Company to the Governors-General of India. The old trade sales of the leading London publishers, reminding the participators of the olden printing and book glories of Aldersgate and Little Britain,

used to take place after dinner here. Sir William Curtis, famous as a gourmand, once, so it is said, organised a dinner at this tavern which cost the party between thirty and forty pounds each, things being done in such a very thorough way that a special messenger was despatched to Westphalia in order to choose a ham. Lord Southampton also once gave a dinner here the cost of which ran to ten guineas a head. In those days the 'Albion' and the 'York House' at Bath were at the head of affairs, and had an almost equal reputation, with the result that there was much rivalry between them. This came to a head when a bet was made as to their comparative merits, which it was settled should be decided by a dinner of unparalleled magnificence, and as nearly as possible equal cost at each. The 'Albion' won the first course, and the Bath establishment the second, and eventually the result was declared to be a draw. Up to the time of its closing, one societythe Lowtonian-had dined regularly at the 'Albion' for one hundred and five years, and the Shakespeare Lodge of Freemasons ever since 1823. No foreigner was ever allowed in the 'Albion' kitchens, not withstanding an occasional French menu, such as that mentioned; and its most famous specialities were its turtle soup, its special ham cured by a special process of its own in wine, its lark-and partridge puddings, and its beef marrow-bones.

* * *

It is seldom indeed that a new work is published in such circumstances of active royal interest as The Letters of Queen Victoria, which saw the light last month, and which constitutes the serious book not merely of the season but of many seasons. Of the interesting and remarkable character of its contents there may be more to say in another issue of this Journal, and it is sufficient for the moment to observe that in these letters of hers from 1837 to 1861 the late Queen is shown to have been a woman of strong individuality and decided preferences even prejudices, which certainly had no little influence on the political history of her time. The editors of the work, which appears in three volumes, have endeavoured, and with much success, to show the personality of Queen Victoria, her methods of approaching and deciding great questions, her outlook, sympathies, shrewdness, perseverance, and diligence; indeed, the character of the Queen is shown in these pages of her own writing as it could hardly have been more plainly by an independent and well-informed historian. In these days of much writing and much book publishing it is only fitting that the authentic political history of the Victorian period should be far completer than that of any other, and yet it is a little remarkable that so soon after that period has closed the library should be so rich in such works as to leave, now that these letters have been given to us, very little to be desired. There is Mr John Morley's great Life of Gladstone as a basis for many considerations, and then there are many other official biographies published in recent times, such as the Life of Lord Granville by Lord Edmund Fitzmaurice, the Life of Lord Randolph Churchill by his son, and others, which fill up many of the blanks. In due course we shall no doubt have an authentic Life of the late Marquis of Salisbury; and we have not yet given up hope that perhaps the chief biography of them all, that of Lord Beaconsfield, will eventually be issued. In due course, but not until many figures who are still upon the stage have passed from it to the shades beyond, the remaining letters of the Queen, covering the period from 1861 to her death, will be published. It goes without saying that this period, after all, was in many respects the most momentous, and that during which her queenship counted for the most. But the point of this note is as to the intimate royal interest that has been taken in the publication of this latest volume. One hears that the King himself nominated Mr John Morley to be virtually the censor of the letters suggested for publication—that is, the supreme authority above the editors to decide what should be given to the public, and what, in the interests of the State or of particular persons, This was a very signal should be suppressed. honour for the statesman, and it is whispered that, excellent as the choice must be admitted to be, it gave a little surprise to at least one gentleman who was not unconnected with the book. We cannot judge how well Mr Morley has done his work without knowing the contents of the letters that he has held back; but one can see from those which appear in the light that the censor has let pass all that was consistent with the preservation of a comfortable safety. And the King himself read through all the proofs of the three volumes, making such alterations and corrections as he considered desirable, and personally chose from the collections at Buckingham Palace, Windsor, and elsewhere forty-one illustrations for the pictorial embellishment of the book. Then His Majesty selected the design of the cover, and made general suggestions as to the finish of the In this detail he was very likely reminded of the custom of his august mother, who always took the greatest interest in the choice of bindings for her books, and ordered the publisher to send the volumes to her unbound, so that she might herself choose a binding suitable to them. This is one reason why the collection of books at Buckingham Palace has among it some of the most beautiful modern bindings in the world. King's interest did not by any means end with the binding of the book and His Majesty's perusal of it when completed and delivered to him some time before its publication to the world. He took a strong attitude on the question of review copies -that is, as to what journals they should be issued to. He finally approved of a particular list, and it was impossible for the publishers to send copies to any others in any circumstances. One hears that even one of the foremost evening newspapers in London, a journal of great circulation and known

everywhere, was not on this list, and on its making application for a copy of the book for the purposes of review, had to be told that in the special circumstances of the case it was impossible. Such a circumstance is almost unique.

* * *

Even thus early there is a sense of Christmas. insinuating itself into the social atmosphere, and by the time these lines have appeared it will have become more appreciable. Foggy mornings, thick fur coats and ulsters, touches of frost, hot whiskies with slices of lemon as an elementary punch, the Christmas numbers, and hoardings on which are displayed coloured representations of scenes from the forthcoming pantomimes-with all this about them, the people hurry along with their work, assume beforehand a Yuletide complacency of mind, and say to each other that they will not mind how soon the festive season arrives. And they are asking now whether, apart from the inevitable merriment which nothing short of a national disaster would diminish, this coming Christmas will mark any abundant signs of prosperity of the nation as the last one seemed to do. There have been so many departments of business in which strong complaints have been made of very bad times lately that many usually optimistic folks are a little doubtful. It was said afterwards, with some logical display of facts and figures, that last Christmas constituted a record—that is to say, that at no other had so much money been spent by the people at large or had there been such abundant signs of prosperity. There was plenty of money everywhere and for everybody, so it was said, at the end of last year, and it must be confessed that, apart from the statistics of the bulk, even private persons in their walks about and their intercourse among their friends seemed to see evidences of a general abundance and contentment. London tradesmen, at all events, agreed that during the week preceding Christmas the volume of business done was absolutely a record, and it was declared in many quarters that people had not been able to buy or shopkeepers to sell fast enough. For this state of affairs there can be no doubt that the excellent weather prevailing was at least partly responsible. It was some sign of business done that the number of parcels despatched from the London railway stations during the few days before Christmas, up to Christmas Eve, reached the astonishing total of over six hundred thousand, a hundred and twenty thousand being despatched from Liverpool Street, the terminus of the Great Eastern route, and a hundred thousand each from Waterloo and Paddington. There are, as has been suggested, plenty of Christmas topics in the conversational air already. Two or three weeks ago the shareholders of the Drury Lane Theatre held their annual meeting, and they were rather inclined to grumble because the profits were not still at their highest, and some cantankerous persons seemed to think

there was something wrong in the principle of a theatrical manager's salary being as much as that of a prime minister, said theatrical manager being playwright also. But they have been bidden to look forward to the great pantomime this Christmas season, in the assurance that it will mark a vast success. It was stated in conversation with an authority the other day that the pantomime at Drury Lane costs twenty-five thousand pounds to produce, and that the weekly salary-list cannot be far, if anything, short of four thousand pounds. The same authority observed that a careful calculation showed that, taking London and the provinces together, not less than a million pounds a year is spent in producing pantomimes of all sorts and sizes, this sum providing for the production of about a hundred and twenty of them. There are probably about twenty produced in the provinces the cost of which is about four thousand pounds each, seventy others that cost about half the sum to bring out, and many others of the travelling variety that can be started on an expenditure of less than a thousand pounds. In this way a total of about three hundred thousand pounds is accounted for, and then there are the salaries and the general upkeep after production. Pantomime salaries, it is said, in the bulk run away with a little matter of seventy thousand pounds weekly, and the average run of a pantomime is about ten weeks, so the rest of the million pounds spoken of is thus accounted for.

* * *

Probably the Christmas spirit of socialism-the nearest we ever get or probably ever shall get to the ideal-will always prevail; but one wonders whether such an estrangement is not growing up between the classes in consequence of the trend of political events during the last year or two as may militate against the constant perfection of this spirit. Daily now do we hear murmurings against the aggressiveness of the Socialist party, generally cloaking itself under the name of the Labour party, and people of easy ways and thoughts, who have not been wont to bother themselves much about anything in particular, are evidently becoming disturbed at the state of things, and the danger that seems to be menacing. Previously this Socialism was tolerated, even patronised — considered as a pretty idea that need not be much thought about. And it has taken advantage of this indifference towards it to make a great advance, so that the middle classes now awake to find that all this magnificent municipalisation of things, and other like matters of which so much has been heard of late years, have been not at all for them, but in essence marks chiefly an advance of the Socialists. And now we hear much talk of the apathy of the middle classes, the classes that have generally been and must be regarded as being the backbone of the nation. Attempts are being made to stir them up, and we hear of various organisations being formed amongst

them for the better protection of their own interests and for their retaliation against the Socialism which threatens them. It is only too true that in the constant vicissitudes of political change there is but little thought ever given to the middle classes. It has always been an understood thing with statesmen that though they would grumble much when their interests were being threatened, they would more or less sullenly acquiesce in whatever any Government proposed. They have always been so good-natured! And thus it has come about that in the regulation of legislation they have been but lightly considered, while it has always of recent years been regarded as a question of paramount importance as to what the class below would think, and above all what it would do. And the further result has been that while each of the two great parties in the State in turn has more or less pandered to that class below, each has been indifferent to the middle class; and while the class below has two parties that it may threaten or cajole, two parties that take an interest in it, the middle class has none. There is no party for the middle class, and a wave of feeling seems to be rolling along towards the establishment or encouragement of a party that will be middle class. The tendency of affairs in these days is such that political seers who look far forward believe that the present arrangement of parties cannot endure much longer. There will have to be some great upheaval It was said a few years ago that there would be such an upheaval soon, and there were certain talks of coalition and the forming of a new Imperialistic party. But however important the Empire may be to the nation, you could not divide your national opinion for the purposes of legislation on party lines into Imperialistic and that which was opposed to it. Besides, Imperialistic fervour on a grand scale is, after all, a thing for special occasions, and so we hear little or nothing in these days of Imperialistic politicians, and quite nothing of an Imperialist party or section of a party. How, then, shall a middle-class party arise? It is a difficult question for anybody to answer, and it may not be for some time that any such party, developed on broad yet definite lines, for the upholding of institutions and the maintenance of the interests of the middle classes, will be established; but it is noticeable that the thoughts of many wise men in these days turn towards the principles and practices of the old Whigs. Little enough was thought of those old Whigs in the days of their decay as a party; but their virtues were great, and above all they seem now to be the men who would have been of use to a middle-class party. In these times when these 'vile Whigs,' as Dr Johnson liked to call them, are almost all things of the past, it is noticeable that no statesman has commanded greater national respect and trust—not of parties or sections but of the solid masses of the people irrespective of party—than the great Duke who has been commonly referred to as 'the last of the Whigs.'

A COMPACT AND ITS CONSEQUENCES.

CHAPTER III.

HE Earl had been landed. He had been very pugnacious—here the mulatto rolled his eyes in expressive confirmation—and had been conveyed with difficulty to a village not far away. He would be a valuable

hostage to his captors.

'Now I guess we'll proceed to small-arm drill,' vociferated the American with zest. He busily produced various weapons from the launch's locker. Drummond gathered that a rescue expedition was to set forth without delay.

'The boldest course is always the safest, because it's the least suspected by these Spanish niggers,' encouraged Mr Denton oracularly—he had gleams of sense at times. 'Here's your shooter, cap'n.' He thrust a rifle into Drummond's unwilling hands.

The latter drew back. For Drummond had come on a yacht-salvage job, and not to hunt the kidnappers of earls through the darkness of Cuban forests. He was about to protest this with modesty, when the girl laid a small hand on his arm.

'You will come too?' Alice Denton asked him through compressed lips. Once again man might propose, but woman disposed.

'I'll stop here,' grunted the sailor brusquely, 'and you'd best do the same.'

'Why?'

'Because you're a female, an' no good in a scrimmage. You'll only scream an' get hurt.'

She took her hand off his arm and looked at him earnestly with those grave eyes of hers under the shadowing hat.

'You are not very polite. I suppose you have not been accustomed to American girls.'

Drummond was not sure that he much desired such acquaintance.

'Lord Eastleigh and I were engaged to be married. I-I broke it off.'

Her voice sank to a whisper, and there was a short silence. A pretty red was mantling in her cheeks.

'I was—very foolish. I think I am wiser—than I used to be,' she added rather forlornly. Her expression was no longer unreadable. 'It is my doing that he is in danger here at all. So you will help me to find him now?' she pleaded with a new timidity in her voice; and as anything but assent was impossible, Drummond perforce assented—without enthusiasm.

The darkness was falling as the mulatto started to lead the way, armed with a blunderbuss which Drummond distrusted as likely to be equally fatal at both ends if fired. Mr Denton followed, bristling with weapons, and the sailor from the launch tramped stolidly behind. Drummond and the girl brought up the rear.

The mist was rising white from the hollows

of the ridges amid the high, moss-covered rocks. The faint moonlight shed queer shadows through the giant ferns and palm-trees. The footsteps of the travellers alone broke the ominous hush of the nightfall.

Once they halted for a moment while Mr Denton opened a large flask. He advised that it was sensible treatment on such an occasion to keep up the general physical tone by a judicious use of stimulants. His followers concurred.

More floundering through the forest brought the leader at length to an abrupt pause. The surrounding silence was no longer the same. A far-away murmur of voices drifted dully through the air.

Mr Denton tiptoed elaborately to the forest to reconnoitre; the others took the cover of precaution. It is by such strategical dispositions that victories are won.

In moments of tense expectancy the mind is extraordinarily open to impressions. Drummond will never forget the picture of Alice Denton's slender form silhouetted in the moon-rays. She was crouching warily behind a tree-trunk, white and beautiful. Dauntless courage, which more than matched his own, was stamped on her clear, colourless face and firm, red lips. Strain his eyes as he might, Drummond could see nothing.

A man's figure emerged, scudding furiously along the tangled forest-path. A frenzied yell of anger broke the stillness. A bullet spattered viciously among the leaves overhead. But, heedless of consequences, the girl sprang forward to meet the newcomer with a little, smothered cry.

'Alice!' cried the escaping Earl, dishevelled and astounded. 'You, dear, here!'

Her hands were outstretched towards him. She caught him to her fiercely, shook him as one shakes a naughty much-loved child, and then clung to him, solbing long, deep, breathless sobs.

A clamour arose, approaching surgingly. A little mob of men came through the trees in pursuit. Mr Denton fired carefully into the brown of them, and the uproar increased both in volume and blood-curdling noise. The mulatto discharged the blunderbuss with a fearsome boom. Both shot and targets scattered.

Denton thrust a revolver into the Earl's hand and bade him use it for his life. Its barrel at level glistened threateningly in the pale light.

'Hump it back to the shore,' shouted the American fiercely. 'I'll cover ye both.'

But with one arm in that of his girl the Earl turned to bay. 'We'll fight a rear-guard action,' he called grimly. He had once served in the local militia at York, and this was a reminiscence of training.

Another bullet came silently up out of the dark-

ness, and the sailor from the launch fell down with a flop and gurgled. Spits of flame were spurting through the bushes. With savage maledictions on all Cubans, Denton was loading and firing with rapidity and skill. The attack drew off. The pursued made a good use of the respite, and crashed eagerly through the undergrowth towards the wholesome sea.

The soul of the shindy was Caleb P. Denton. Drummond realised that under his finicking exterior was a bold and resolute man, full now of a steady, mad purpose to extricate his party from disaster. 'There's no foolin' with me when I am roused,' he remarked once in belligerent commentary on a particularly well-aimed shot at a lurking shape which dodged vainly in the distance; and as the acream of mingled pain and fury from the enemy echoed confirmation, the speaker smiled with sour vengeance.

"Tain't no time for half-measures. Spare 'em an' the glass-eyed devils will come on again thick as wipers. Reckon, though, this'll be the end of the syndicate I was for bossin',' he said.

Just as Drummond was aniffing delightedly the sweet smell of the shore the pursuers made a wild dash from an unexpected flank. Rifle and revolver cracked simultaneously. Drummond struck desperately at a man's springing form, but slipped on a patch of green slime amid the trees. He was conscious of a wild blow, of a shock of sudden sensation, and then he saw and felt no more.

'Feelin' better in that swelled knob of yours?' queried a voice at his side.

Drummond had come to himself with a jerk. He stared wonderingly at his surroundings. He was lying in a luxurious little cabin. The swish of water plashing outside against the porthole and the patter of feet on deck were evidence that he was on shipboard.

'I'm all right-I think.' Drummond sat up. His head ached dizzily.

'Nasty crack you got. Made me itch stampin' mad to see you go down. Fine healthy weight you were, too, liftin' 'board the launch,' pursued Mr Denton meditatively.

'Where am I?' demanded the invalid briefly.

'You're on the Carita. She ain't ashore; she's afloat safe enough,' Denton informed him with the air of a man resolved at length to relate the whole truth or die. A slight heave of the yacht confirmed the assertion.

'That's the ground-swell; there's dirty weather brewin'. And we're in a rare tight hole,' drawled the American, tilting his cigar to an acute angle with his nose. 'Have you a master's certificate for navigation, cap'n ?

'Yes.'

'Then you'd best take a pull at that champagne, an' get on the bridge an' take us out clear,' said the other. 'Engineer, steward, an' three hands is all we've aboard. Moorings are slipped, an' they're gettin' up steam. But the chart is plaguy difficult to understand.'

'I can steer if Captain Drummond will set the course and help me to keep on it,' said Alice Denton's quiet tones at the doorway. 'I am quite unfeminine enough, I know; I ought to have been a boy.'

'I'm glad you're not, sweetheart,' said Lord Eastleigh auddenly behind her. He kissed her unblushingly, and left a smudge of coal-dust on her smooth cheek. He was exceedingly grimy, and appeared to have risen from among the boilers.

Alice sat down on the edge of a locker in a tense attitude of protest against delay.

'So you're not hurt, miss?' queried Drummond irrelevantly.

'No; only scared-and scratched by the bushes,' she added in afterthought.

'What's the hurry?' inquired Drummond next, feeling himself tentatively all over and in no haste to bestir himself.

Mr Denton answered him with terseness: 'The weather, for one thing. An' there's a gunboat round t' other side of Santa Calda lookin' for us particular.'

This suddenly sounded serious. The events of the night-it was now morning-might be difficult to justify with ease.

'Sich of the native population of that village as weren't drilled through with bullets were roostiu' in the trees time we embarked you,' remarked Mr Denton dryly. "Twas the most heroical fight I've ever seen put up. But 'twill be a pretty tough proposition to explain to those aliens in that Federal warship. They're so blamed political in their notions. We reckoned that to steam for Jamaica was best.'

Drummond was also thinking, and his thoughts offered no encouragement to a rosy point of view. Explanation would be easier on British soil. The Earl of Eastleigh waxed impatient.

'We'll talk afterwards; let's clear now,' he cried. 'You do skipper, Drummond, like a good fellow. Alice will take the wheel for a spell; we'll stoke.'

'Has your bump of comprehension soaked that in?' asked Mr Denton anxiously. 'We want to run right out to sea.'

'All right!' said Drummond shortly. He steadied himself on his legs with an effort.

'Come on and shovel, then,' grinned his lordship to his future father-in-law. He laid a greasy hand on Mr Denton with enticing ferocity. That gentleman ground his teeth somewhat and departed with profanity to the stokehole. The way of the explorer is often very hard.

The cool, damp air on deck cleared Drummond's brain. The yacht was lying in Santa Calda Bay. A swift glance at the weather startled all his sea-

man's instincts into activity.

Seawards was a gray void out of which all light and life were being quenched by a queer haze which was rapidly thickening. The sun hung a fiery disc in the east, its rays sick and weakly. Long belts of lowering cloud were gathering in ominous density, while from the main mass jagged fringes were outstretched in sinister fantasies of shape. A sluggish swell was rolling oilily into the little bay and breaking with sullen booms on the shore-line. The Carita wallowed lifelessly to the waves. It was three bells in the forenoon watch.

The first thing was to get to sea. For a minute Drummond studied the chart closely. Alice Denton followed him into the wheelhouse, deftly connected the steam steering-gear, and grasped the spokes with firm, small fingers. She looked to the captain for orders.

'Sure you understand?' he queried bluntly.

'Yes,' she answered simply.

'Put her N.E. half E. soon as we're under way.'
He stepped out on to the bridge and rang up
'Half Speed.' The regular beat of the engines was

music in his ears.

He whistled down the speaking-tube, 'We shall need every ounce of steam-pressure you can give us directly. There's a hurricane brewing. Make all fast below, for heaven's sake! and stand by the throttle when she races.'

'Ay, ay, skipper,' came Lord Eastleigh's cheery shout of reply. 'We'll manage below here. But look after my girl on deck.'

Drummond smiled grimly. It was going to be

touch-and-go for them all.

As they rounded the headland and met the open ocean a lean, gray hull slid into view on their port beam. A long smudge of smoke seared the sky. A string of signalling-flags fluttered out impatiently from her masthead.

'If that chap thinks we are going to heave to for him now, he's mistaken,' Drummond muttered surlily.

A gun echoed distantly.

Drummond's face hardened into stern pugnacity.

He shoved the telegraph handle down to 'Full Speed'. They be runmaged in the flag locker.

Speed.' Then he rummaged in the flag locker.

Crack—shriek—splash! This time it was a shell which hurtled into the water astern, whipping the

wake of the yacht into foam.

The Carita was steaming splendidly, lurching through the welter of cross-seas. Drummond held on unwaveringly. The American gunboat was old, and foul with long cruising in the Caribbean. She was very angry.

Another projectile hooted menacingly overhead. Drummond swung himself down the bridge-ladder, along the sloppy deck, and hoisted the red ensign aft. The sharp spray was stinging in jets; the sky was blackening. Mr Denton, from the engineroom, clung to a protective ash-shoot, and beamed approval.

What are you doing there?' roared the captain.

'Guess it's as good a jumpin'-off place as any,'
was the bawled reply. 'That blamed domestic

The speaker's abuse was lost in the howl of the hurricane.

Drummond had just time to regain the bridge as the scream of the squall burst over the Carita. He darted into the wheelhouse, grasped the spokes over Alice Denton's straining hands, and side by side they faced the death that threatened.

A flash of vividest blue lightning tore through the riven clouds, and the thunder pealed with a ringing, metallic bang. Sky and sea seemed to meet in a whirl of seething darkness. A solid green wall of water roared like a cataract over the bows and swept hissing deckwards. A mighty wind whistled through the rigging. The yacht staggered in the madness of motion, buckled, squealed like a living, wounded thing in the smoking sea, and canted almost on to her beam-ends. Every loose article aboard was carried away with one ear-splitting crash. A pitiless blast of hail tore through the inky blackness, flicked on the streaming glass panes of the wheelhouse front, and swirled patteringly on the heeling steel of the deck combings. How the minutes passed Drummond never knew.

Clenched hands held the wheel steady; wild eyes peered through the driving scud. The lightning blazed incessantly, blue, green, and orange. Again and again the *Carita* shivered under the repeated blows of the gale.

Amid the screech of the storm the girl was speaking: 'Will he—Lord Eastleigh—be quite safe —below?'

'As much there as anywhere aboard,' grunted Drummond through tightened lips.

Her eyes questioned his face searchingly. 'He is —my love,' she breathed in uttermost confession.

'The twain o' ye will stick together all the closer when you're through with this,' Drummond told her with stout assurance. 'Don't talk. I'm fair busy with the helm.'

She bent over the shifting compass-card contritely.

The Carita bit her way onwards bravely. She was a handy craft, Clyde-built.

Insensibly at length the weather was moderating. The squalls were moaning less hoarsely over the dancing, white-capped waves. Drummond began to breathe more freely. They were past with the thick of it, and the sea went down with the rain, which sluiced over the yacht in angry torrents. Suddenly a blue patch widened on the far horizon, and heaven's own sunlight struggled out over the sombre gloom.

Where now was the warship? Gone!

'Twas a fair sneezer; but 'tis fizzlin' out now,' opined Mr Denton, popping up unexpectedly. He departed again in search of sustaining liquids for the engine-room staff.

Next evening the Carita sighted the friendly lighthouse on Point Morant, Jamaica. Her boats were smashed, her decks were swept, and on her smoke-stack the salt was glistening white and dry. As the glow of the sunset reddened over the sparkle of the sea, Drummond sought for the explanations he deemed his right.

'The Carita has never been ashore at all,' he observed with judicial severity.

'Not at all,' echoed her owner cheerfully.

'What am I to say to the underwriters at Lloyd's?' demanded the salvage expert with coldness. He glanced at the girl, who was leaning contentedly against the bridge-rail.

Her small brows began to pucker as if her

thoughts were painful.

'You had better tell him yourself, Alice,' suggested the Earl with magnanimity.

The lady pouted pensively. There was a

pause.

'You are not as clever as I thought, Captain Drummond,' she began. 'You haven't an idea of what is going on in other people's heads.'

This was undeniable, but not explanatory.

'Oh, I'll be open with you!' she cried, with a change to vehemence. 'I had broken off my engagement—just in a pet, you know; but I couldn't confess that outright—no girl would. I wanted to bring Lord Eastleigh back to me, and I did not know how to do it.'

'So you thought if he heard the yacht was wrecked he would come to see,' finished Drummond in sudden enlightenment. Girls were the strangest

things

'Yes; and it proved most successful,' beamed Miss Alice, unrepentant and irresistible.—'Though the first kiss you gave me, in the forest'—she swung round on the embarrassed Earl—'was a horrid scrubby one.'

The accused individual stroked his chin reflectively. Drummond recovered scent of the matter

in hand.

'To Lloyd's it was—misleading,' said the representative of that great corporation with asperity. Candour would have employed a less ambiguous word.

'Then Lloyd's is stupid!' The delinquent vindicated herself hotly.

She was hopeless, Drummond decided, half-aghas, half-annused, wholly perplexed.

'We left the yacht's captain in hospital in Havana with fever. Most of the crew deserted, and '---

'Who cut the cable?'

"Twas only a local land-line," Mr Denton interposed here; "Spanish property."

'You've no excuse,' stormed Drummond at this glad of a man on whom to vent his annoyance.

'Men fell originally by woman, and man falls by woman still,' quoted the unruffled syndicatepromotor in extenuation.

'Look here, Drummond,' chimed in the Eul 'Do you remember that compact of ours in the train at Euston?'

'Well?'

'Things must be hushed up. I will pay all the expenses incurred in sending you out here. I shall not make any claim on the insurance for the damage the yacht has sustained'—his gaze rovel regretfully over the sea-swept deck-structure. 'The consequences of your compact with me will be'—

'That the underwriters will have no liability to meet in the matter,' Drummond affirmed.

'We shall be married next month,' announced Miss Alice softly.

'I'm blind-sick of Cuban company promotin.

concluded her parent.

And therefore a telegram on the notice-board at

And therefore a telegram on the notice out a Lloyd's next day stated: 'Yacht Carita arrival at Kingston undamaged. Previous report of her stranding at Santa Calda erroneous'

'Smart chap Drummond—so reliable!' chuckled the secretary of the Salvage Association on receipt of the news. 'I should like to hear the whole story, though,' he mused.

He was a welcome guest at the wedding reception of the Earl and Countess of Eastleigh at Claridge's. But he never did hear quite all.

THE END.

WHY BOYS SHUN THE SEA-CAREER.

HAT there are weighty reasons for the decreasing supply of British merchant service officers is commencing to be generally recognised. The insufficient financial inducement a seacareer offers, and the inconsiderate

treatment received by officers and apprentices, have been made the subjects of many articles and letters which have recently appeared in the press. Yet another reason why parents who know what the life is endeavour to prevent their boys from following this profession has, however, generally been overlooked. The ordinary risks of a sea-life are, indeed, such as no high-spirited English boy would shirk; such dangers are 'all in the game.' Fathers, however, hesitate before embarking their

sons in a calling which may at any time take them to a port where yellow-fever, malaria, or smallpox is raging. It is true that business men can always be found when wanted to go to such death holds as Rio, Santos, or Guayaquil; but their employers have to pay them for the risks they take. An apprentice on a sailing-ship not only is not paid, but often has actually to pay for the privilege of being a combination of domestic, errand-boy, and outside jobber. He never knows where he may be ordered, and when he takes the risks of disgusting and loathsome diseases, does so under the same conditions as he would were he making a voyage to Australia or any other healthy country. Should he lose his health no compensation follows Small wonder, then, that parents endeavour to dissuade their boys from going to sea in the merchant service; small wonder that the supply of British-born officers is on the decrease. That these risks to health and life are not small I hope to prove by a brief account of one voyage to a pestilence-ridden hole to which many sailing-ships trade.

Some few years ago a fine little bark left Liverpool for Wellington and Dunedin. She was well manned, for it appeared probable that she would load wool for home, thus making an ideal voyage. However, from Dunedin she was ordered to Newcastle, N.S.W., to load coal for Guayaquil, in Ecuador. The voyage up till our arrival at the latter port passed as such voyages usually do. The usual modicum of gales, the inevitable shortage of food, the expected abuse of the apprentices-none were wanting. There was consequently much rejoicing when the Guayaquil pilot was received on board the day before Christmas, presaging as it did a Christmas spent in peace and quiet at anchor or beside a quay. The heat was very great; but as the little vessel glided quietly up the river the luxuriant tropical vegetation on either bank gave promise of shade and coolness when its destination was reached. Huge trees, with a foliage of a green so brilliant that the inhabitants of our more moderate climate can hardly imagine it, and a wealth of varicoloured flowers lined the river on either side. One longed to bathe in the cool-looking water, until such desire was abruptly quelled by the lazy movement of what had appeared to be a large log, sometimes followed by the opening of an immense, cruel mouth furnished with glistening teeth. The river was literally alive with alligators!

Guayaquil is situated some thirty-six miles up a river which, ten miles from its mouth, is quite fresh, and flows continuously towards the sea. It is also rich in long-extending sandbanks, which make it a matter of some difficulty to sail a ship up to the town. This, combined with the ignorance of a semi-civilised pilot, soon dispelled the dreams of a quiet Christmas in which the crew had indulged. Just before nightfall the ship grounded on a shoal, of the existence of which the pilot appeared to be totally ignorant. The evening brought some little relief from the intense heat, a thin mist rising from the marshy land and gradually enveloping the river. The refreshing coolness was delightful to every one, while the danger of the tropical evening mist was not even guessed. All Christmas was spent in endeavouring to kedge off; by evening, all efforts having failed, and the pilot, after announcing ' No puedo nada,' having gone to bed, a boat was despatched to the town for men and barges to lighten the ship. Three days after Christmas the wharf was reached. Of the sufferings from heat and the attacks of swarms of the most venomous gnats and mosquitoes in the world little need be said, for they were 'all in the game.'

The country about the city is beautiful, apparently a veritable Garden of Eden, but in reality

the home of swamps and fever. The town itself, in which fifty thousand people wallow in filth and an utter disregard of the laws of sanitation and decency, is the best possible proof of the inability of the South American to govern himself or to cultivate and develop properly the wonderful country which is his.

We found on arriving that we were not only to discharge our cargo of coal, but were to load a full cargo of ivory nuts for Hamburg. Incidentally we also learned that, as the natives would not work in the heat of the day, the crew were to discharge and load the ship, working from 6 A.M. to 6 P.M., with the usual breaks of one hour for breakfast and one for dinner.

The first part of our undertaking was safely accomplished, and the health of the crew was good in spite of the heat and indifferent food. Then came the second and more trying operation. The nuts which we were to load, being almost round, shift very easily, and it was deemed necessary to build a bulkhead or wall the length of the ship to divide the cargo into two equal portions. No material for this purpose was so inexpensive as bamboo; no bamboos were so cheap as those which could be picked out of the water. What matter that they had been there for months? What matter if they were rotten, and if their smell literally invited fever? They cost next to nothing, and they were used.

Three days after the loading commenced an able seaman complained of violent pains in the head, and was taken on shore to the hospital. One of the apprentices was told off to visit him each day. While so doing he incidentally learned that cleanliness was not part of the curriculum advocated by the medical authorities of the free and enlightened republic of Ecuador. In a very few days the youngster came sadly back from his daily visit and hoisted the ensign at half-mast; the first victim of a shipowner's parsimony had gone to bear witness where there is justice for all. By this time the second officer and another man were lying in their beds in the hospital ward, praying God to spare them for the sake of their loved ones at home, whose only support they were. Yet another twentyfour hours and the officer was beyond all earthly help, while his fellow-sufferer had charged the apprentice boy with his last messages for his family in the England that he knew he would see no more. And still the remainder of the crew were working in the hold amongst the rotting and fever-giving bamboos.

The youngster had at first been rowed ashore by two men; after a few days only one man went with him to bring back the boat; finally, he sculled himself on shore, for there was no one to go with him. All hands, save the captain and the one apprentice, were down with either yellow-fever or malaria. It was not until things had reached this pass that the captain allowed the boy to cease working with the natives who had now been

engaged to finish the loading of the ship. At length the captain (who, to do him justice, had not spared himself) was taken to the hospital, and the boy was left with one man who had returned on board half-convalescent. Of seventeen men who formed the crew, eight died in the Guayaquil hospital, and two were broken wrecks who lived but a few months after reaching England. The writer was the only member of the ship's company who came through that awful time without a day's illness.

For such risks as these neither officers nor seamen are paid. Similar dangers are encoun-

tered every day by apprentice boys who can claim nothing for loss of health, who are paid nothing for their fearless, loyally given services. Is it, then, any wonder that parents who know what the profession has to offer do all in their power to dissuade their sons from going to sea? Is it any wonder that the advice of every seaman is, 'Send your boys into the army or into the Church, into the law or into business; but, as you love them, don't allow them to swell the ranks of the underpaid and shamefully treated British mercantile marine.'

MEMORIES OF HALF A CENTURY.

By R. C. LEHMANN, M.P.

PART IX .- continued.

'Feb. 24th, 1867.

DEAR NINA,—You no doubt picture to yourself your friends looking all handsome, well dressed, and engaged in a continual round of delight, poets at our feet, painters longing to paint us. Nothing of

the sort. Half the people have colds and some influenza; and altho' the prospect of Lent has given us some parties, they have not been worth much. I went on Valentine's Day to Mr Chorley's. Only Peeresses dined, with a few men to do the agreeable. I found only the women and Chorley. Lady Molesworth in a red velvet jacket. Each of the ladies, six in number, found a Valentine upon her plate-a poem written by Chorley. He never treated me in that way. Sullivan played, and there was a whist-table. I shall always go, but people will not go to see others play at whist. About six people came in the evening. People are not easy to get; for instance, eighty folks came to me last Wednesday. They had only the free use of their tongues, and they were content. On Wednesday, 27th, I am again at home. Mrs Benzon was poorly, and Mr Frederick Lehmann writes me a note about a white tie! If he had come he would have made the acquaintance of Matthew Arnold. Dante Rossetti came early, and we had a nice long talk together. My husband was as bright as possible, and chirped about amongst the young ladies. Charles Collins is no better. He still keeps his bed. Wilkie, of course, did not come. He had dined out, and had smoked; so, altho' some men who had dined at the same house came, he did not. Saturday, 23rd, he was off to Paris. I tried to frighten him about Charles Collins, but in vain. . . . Your admirer, Mr Forster, is away at present. Macready and his wife have been at Queen's Gate House for a week, and a great bore they have been. He is grown old, fat, and stupid. Have you read Swinburne's poems? They are charming; a very few, perhaps six, not readable. One, a Ballad of

Burdens, is perhaps the finest, and a Hymn to Proserpine beyond my powers of praise.

'Yesterday was like summer; we wanted parasols, and sat without fires. To-day it rains, and is cold and dull. . . . I am sorry you do not send your two boys to some boarding-school. You make such a great sacrifice in leaving England that it is a pity to let anything interfere with your recovery. I am so nervous myself that I cannot bear the noise and restlessness of children beyond a certain time. We have had all our dresses sloped away and look like extinguishers; but I have had a short dress made. Petticoat and sleeves and upper part of body blue corded silk, then over it a short black satin skirt, the whole trimmed with black lace and bugle trimming. I assure you it looks very well indeed. I have copied out for you a list of the people who were here at my first party, and will also send you a list of the second. For small people should not attempt anything after Easter. I had the front drawing-room door taken off and a piece of net nailed across. It looked pretty and made it cool. The C.-J.* had dined at Chorley's. Millais tells me he has several pictures that will be ready for the R.A. Wilkie tells me his play Armadale will be in five acts-last a whole evening. If it is a success in Paris it will be played here in England, and how badly! How rich you and Mr Lehmann will be-you, who have always your house full, and where the wine flows like a river, must be

saving a fortune.

'I shall stop now; perhaps Browning will tell me some news. None. He talked only of what the maids call his-self... What an affair Cole, C.B., has made of the French Exhibition! You will have heard what Bismarck said, speaking of the various advantages countries had had—Russia one thing. Prussia another. He gave France the Exhibition. Mrs Cole and the Miss Coles have lodging and food provided for them by us, in fact.

^{*} Sir Alexander Cockburn.

'Your sister looked so pretty at our house!

'I am ashamed of my stupid letter, but I have done my best.—Yours aff., ANNE B. PROCTER.

'B. C. sends his love.'

'32 WEYMOUTH STREET, PORTLAND PLACE, W., Sept. 17th, 1869.

'MY DEAR NINA,—My mind is wonderfully relieved by hearing so good a report of the great Darling. I am now thinking of her hair.

'Yesterday I saw Hullah'; he has been at the Festival, Worcester, and says that it is impossible to speak too highly of A. Sullivan's Prodigal Son. It is so fresh and so full of the deepest feeling. Sims Reeves sang to perfection. It is an excellent subject. It is sure to be given in London, so let us go and hear it.

'I am reading The Vicar of Bulhampton. It is excellent, but one has read it all before. Edith and B. C. have both got very bad colds. B. C. has had a Seidlitz Powder at nine; tea, egg, and buttered toast at ten!...

'We have had such droll letters about the harmonium. Here is one. It was offered for three

pounds ten shillings:

"The Rev. Wm. Allport Leighton will be obliged by being informed whether the harmonium is in good condition, and how long has it been used? What is the very lowest price? Would a large musical box playing four tunes (in mahogany)—viz. "Here's a health," "Mad Jem," "Pray Goody," and "Rondo Italien," be taken in exchange? And who is to pay the carriage?"

'I have copied his letter exactly. No wonder my three darlings joined the Catholic Church. This is the first time anything he ever wrote was copied.

It ought to play "Foolish William."

'Yesterday we had a young friend of my girls to spend the day. She is French, and when they were children came for two shillings an hour to speak French with them. They have always looked after her a little. She is now married to an actor -has two children. He is hired at Drury Lane. They have a lodging in Alfred Place, two pair of stairs. You know what that means in London. Without meaning to complain, she gives one such dismal insights into life. The husband's health is very delicate. She said, "He is not strong. When he carries my eldest girl, two years old, the large drops pour down his face! We have such poor Cooking! He's very good, only cares for potatoes, and they never boil them enough." If it were you, you would boil them, and if it was me I would try; but what I call the half-gentlewoman is such a failure. . . .

'My love to your Frederick, and never forget that I love you. Our house looks so fresh and clean; only, tradespeople will call and lean their backs against the clean paint.—Your affectionate old admirer,

A. B. PROCTER.

'I only put A.; perhaps it is Adolphus who writes, or Arthur. Nourish the fond delusion that it is a coat without the petti.'

Here follows a letter to my father:

ESSINGTON'S HOTEL, MALVERN WELLS, August 2nd, 1870.

'MY DEAR MR LEHMANN,-I have a way of thinking of you and your dear Wife, and now in this beautiful quiet place you are more than usually in my thoughts. I know that you must be anxious about this war in which many of those you love must be engaged. I think of little else. I suppose that being so far away from the business of life fighting seems like murder. Tell me what you think about this quarrel. You perhaps do not know that my forefathers were German-I trace my descent from Scheffer the Painter, and bear his Crest, a greyhound. At the time when foreigners were persecuted in England we altered our name to Skepper. I proved my relation to the great man to the satisfaction of Watts of the British Museum. After this piece of family history you will see that I must be for Germany. How far my love for the family Lehmann completes this we will not inquire. And Nina-where is she? I pass a very quiet life here, being almost entirely out of doors. Edith is carried up on a Donkey, and the old lady is still good for six or eight miles. We have a pretty garden half-way up one of these hills, where we sit and work or read under some Cherry-trees. We rise at seven and go to bed at ten. Edith is wonderfully well, and we are counting the days that are left with great care. The Hills are beautiful and the gorse is in full bloom. The Hotel is a quiet little place; we can only receive four sets of people. We are mainly clergymen and Doctors-not your fashionable London Doctor who makes love to his patients, but the old one, who only took your money-not your heart.

'And Wilkie? No, I will not speak to you of him, because you will then revenge yourself by

writing about some wretched woman.

'On the 12th we go home. My husband is very dull; altho' he likes quiet, still he misses the small excitement my presence gives his home.

'The people here are very simple. Some complaint was made at Grt. Malvern about the small quantity of water furnished to each house, one man saying that the water cost as much as beer would. A member of the Council said what he advised was—not to dig for wells or bring some water into the town, but put your trust in Providence!

'The Princess Christian is here, and went to a Flower Show. They wished to fire some cannon or guns, but having neither, borrowed the blacksmith's anvil and beat a welcome on it.

'I shall be so much pleased if you will write me a few lines, telling me about yourself, your wife, and your children. I have been thinking of Mamie [Dickens] so much; she wrote me word they would leave Gad's Hill on the 1st.* That making a new home is dismal work. I don't think I ever can

^{*} Charles Dickens died on June 9th of this year.

make you believe how much I like my shawl. I have made many friends (enemies) unhappy and jealous.-Your grateful and affec. old friend,

'ANNE B. PROCTER.'

In the summer of 1872 the Procters rented the Vicarage at Highgate. Our own house in Southwood Lane, from which we were, however, temporarily absent, was little more than a mile away. Barry Cornwall was now eighty-five.

' August 14th, 1872. THE VICARAGE, HIGHGATE, N.W.

'MY DEAREST NINA,-I want to have a little talk with you, and altho' I have wanted that for a long while I must write to-day, because yesterday I walked to Woodlands and sat for nearly two hours in that lovely garden. As in all charming homes, "My Lady is in Scotland, Ma'am; she required a change. And my Lord is taking some German baths." It seemed to me as I sat there that life could offer nothing better than to live there. Fluff [the cat] in Edith's lap was so happy. She occasionally opened her eyes, took a look, and went off to sleep again. Edith had a large flat hat on, and it seemed as if Fluff thought it was you. Your garden is a blaze of colour. I felt sad as I sat there. It seems to me always melancholy being in a place without the friends who have made it warm and bright. Martin was most polite, and showed me round the Kitchen Garden. We looked at the Bees and the Pigs. It is a great treat to us to sit in your garden, and we shall go there very often. We took three white roses, but no beast appeared. Perhaps no beauty either. Martin showed me the young gentlemen's sitting-room-Princes' room-and yet I am wrong, for our Queen has no taste.

'My poor husband enjoys himself greatly here. He is taken out every day in a chair drawn by a Donkey, and he also sits in the garden. I forget whether you know this house. It is very comfortable, but we have frightful green papers in each room, and felt carpets—all patched! The price is eight guineas a week! We go back to Weymouth St. on the 12th Septr., and then Edith and I are going for a holiday somewhere.

'I have already had a short one—at Knebworth; but the society was not very congenial-first six women-and three men.-There was a Miss very common; all her discourse was about inferior people and things. It is curious how one vulgar person drags conversation down. Lord Lytton and Mr Forster both tried in vain to raise us, but after a little light we dropped down into dull, stupid, degrading gossip. My only happy moment was when - told Lord Lytton that people thought he ought to put clothing on the statues in the grounds ! - has given Ld. L. a lovely old white satin quilt. He had better pay for it, and not pay through his friends. I had some quiet talk with Ld. L.; but as he is deaf and wished to discuss the question of what truth there was in the report that Mr X. was a lover of Miss Y., I was nervous and afraid of being overheard.

'I have since I was here had many letters to write-one to my husband's oldest friend, a Mr Kelsall. He listened to and advised B. C. when he first published his Dramatic Scenes, the best thing I think B. C. ever did. Kelsall is now blind, and his wife wrote to beg for something to cheer his darkness. Lately has died B. C.'s first love-Jane Gape. He has dedicated his 2nd book to her, A Sicilian Story.* He had forgotten her, and would have denied the fact, only the dedication remains. I think we are more faithful. Mr Hayward has been at Lord Lytton's, and was polite enough to write and express his regrets to me for not meeting me there. Lady Molesworth came to see me to have some talk about poor Courtenay's death, but I had left Weymouth St. for this rural retreat. This garden is very pretty-we have a strong atmosphere of divinity. Bishops face you and learned D.D.'s look at your back. There is an excellent Library-all the new poets, Jean Ingelow, Trench,

'Write to me, my dear, and for once follow my example and tell me all about yourself. My best love to Frederick. - Your affect. old friend,

'ANNE B. PROCTER.

In 1874 Barry Cornwall died, at the age of eightyseven.

· October 4th, 1874.

'DEAREST NINA,-My dear husband died at a quarter past four, very quietly—in fact, he lell asleep.—Yours affectionately, ANNE B. PROCTER.'

'QUREN ANNE'S MANSIONS, S.W., February 11th, 1880.

'MY DEAREST NINA,-I had no good of you yesterday, and my cold and cough are so much worse to-day that there is no hope of my getting to Berkeley Square. I wanted to talk to you about Lady Churlotte Elliot. My husband once had some correspondence with her. She sent him her writings, and he was charmed with them. There was a notice of her in the Athenœum, and by that I learns she was Stella. I had forgotten this, but soon rubbed up my memory.

'And the dear old friends . . . one never replaces them. There is nothing like "Do you remember . . ?" As we grow older the doors close over old memories, and one has no one to talk to of those we loved.

'Did I tell you I had seen Mr Sartoris twice? We sit and talk of Byron, Shelley, and Trelawney, and we are both thinking of Her. † One feels with a man more restraint than with a woman. I have not courage enough to bring up the subject of his wife.

[†] Adelaide Kemble, the younger daughter of Charles Kemble, married Edward John Sartoris in 1843. her marriage she had gained great fame as a singer. Her delightful book, A Week in a French Country House, first appeared in the Cornhill, and was reprinted as a volume in 1867. She died in 1879.

'It was such a relief when Lady Goldsmid said to me, after some feeble efforts about the weather, "Now let us talk of Frank." . . .

'It is a curious way we live. There are people whom I hardly care for, and we meet three or four times a week, and you whom I love so dearly I so seldom see!—Yours affectionately,

'ANNE B. PROCTER.'

In 1882 we had taken Dunnichen, near Forfar, for the shooting season. My father, however, was abroad, and Mrs Procter, who was on a visit to us, thus writes to him:

DUNNICHEN, September 7th, 1882.

'MY DEAR MR LEHMANN,—It was a great disappointment to me to find that you are not coming here. I had some idea of commencing an action for "breach of promise;" but having taken Counsel's opinion, R. Lehmann, Esq., I find I have no case such as a Court would recognise, although morally I have one.

'As I have not given any fee, perhaps the said opinion is not of any value.

'It is ungrateful in me to make any complaint, for we are so happy here, and every one is so kind to us. Still, "Man never is but always to be blest."

'The weather is perfect. We sit in the garden or drive about in the Brake. I and the dear wife have long talks of "Those days that are no more," and your children look and listen to me as if I were some Antediluvian animal.

'I have many faults, but I am not ungrateful. I do not forget all you have done for me—kind welcomes, happy days, beautiful gifts—the most precious things I have I owe to you.—Your affectionate old friend,

Anne B. Procter.

'Since writing the above I have been out. Truth compels me to add the Wind is cold. It would have been nice had you come here on Monday the 11th. A. B. Procter, aged 82! I do not confess this generally.'

Mrs Procter was to live six years more, enjoying life and friendship and all her delightful memories to the last.

(To be continued.)

THE MONTH: SCIENCE AND ARTS.

OPERA AND DRAMA FOR THE DEAF.

EVERAL theatres in New York have adopted an innovation which might very advantageously be copied in other countries, since by its means the pleasures of the opera and the drama are brought to a section of

the community whose enjoyment thereof would otherwise be seriously curtailed. This is the provision of 'deaf stalls' equipped with the ingenious 'acousticon,' by means of which the deaf are enabled to hear every sound uttered on the stage. The appliance is similar in design to an ordinary telephone receiver which is held to the ear, only it is equipped with a sound magnifier which collects the sound-waves and intensifies them to such a degree as to enable them to penetrate the disabled auditory nerves. The apparatus is very neat and compact in design, the two receivers-one for each ear - being carried in a handle similar to the lorgnette, than which it is no more conspicuous. Attached to the seat is the requisite small dry battery. It must be pointed out, however, that the contrivance is only applicable to those cases of deafness in which there is no paralysis of the nerves of the ear, which malady no scientific development has yet succeeded in surmounting. A notable later application of this device is the 'dictograph,' which we described at page 700, and by means of which, strange to say, people whose deafness prevents them from listening to ordinary conversation can hear quite distinctly and easily. The 'deaf stalls' are precisely the same price as the other similar seats in the theatre, the expense of the instruments being defrayed by the management.

A COIN-COUNTING MACHINE.

Large commercial establishments and banks which have necessarily to handle a considerable number of coins per day fully realise the labour involved in counting and wrapping the various denominations in paper. Several ingenious mechanical contrivances for accomplishing this work have from time to time been evolved, but have not proved sufficiently accurate to become practically applicable. An ingenious inventor, after some five years' dogged perseverance, has at last devised a machine which will count any type of coin-gold, silver, or copper, and of any size-in consignments of fifty, and will, moreover, wrap up the same with perfect accuracy and security with the speed of five or six cashiers. It is only about the size of a typewriter, and is driven by a small electric motor of one-sixteenth horse-power. The coins are fed into a chute, and at the opposite end resolve themselves into a continuous edgewise line or roll, each coin as it falls into line recording the fact upon a dial. When the fiftieth coin has been registered the whole roll is automatically gripped, carried under a roll of paper, and strongly wrapped up, with the edges beaded over. When discharged in the wrapper the complete roll resembles a cartridge, and falls into a box, where, if desired, the name and address of the firm is imprinted upon the outside of the wrapper. Owing to the novel means of wrapping, it is impossible for a single coin to be extracted from a roll without evidence of the fact being betrayed by injury to the packing. The amount of electricity consumed in the operation of the motor amounts to about twopence or threepence per day; and as the only manual labour involved is simply the feeding of the coins into the receiving-chute, it can be manipulated by a boy or girl, while the coins are counted and wrapped and addressed at the rate of four hundred or more per minute. As a time and labour saver it is distinctly advantageous, especially in view of the fact that it works with infallible accuracy.

HARNESSING VOLCANOES.

The engineer has succeeded in harnessing the waterfall, and thus utilises for the generation of electricity the enormous horse-power formerly running to waste; but the harnessing of volcanoes for the same purpose, controlling the latent steam-energy, is a new departure. However, an engineer of Tuscany proposes to make the attempt on a large scale. He has made a close observation of the temperature of the steam issuing from the soffioni, and has found that during the past ten years or so the temperature has scarcely altered, nor has the amount of steam varied much in quantity. The steam rises thirty and occasionally ninety feet, the temperature ranging upon its emission from two hundred and fifty degrees to two hundred and eighty degrees Fahrenheit. He has successfully harnessed the energy for the operation of a small steam-engine, to which a dynamo was connected, and is confident of far greater achievements. He is now making endeavours to drive a turbine with the steam issuing from three large soffioni, representing an aggregate of some four thousand horse-power. It would thus seem that in the near future a new unit of energy will be created-volcanic-power.

THE SCIENTIFIC SAFE-BREAKER.

The battle for supremacy between the safe-builder and the safe-breaker continues unabated. Just as the former requisitions every latest scientific discovery in the design and construction of an absolutely burglar-proof safe by the utilisation of high steel which resists the ordinary drill, the insertion of explosives, &c., so does the astute robber press science into service for overcoming the obstacles that confront him. In Germany the security of the safe, even of the latest and most up-to-date construction, has been rudely shaken by the depredations of a scientific criminal, who is no more baffled by the latest achievements of metallurgical scientific application and the finest and hardest grades of steel than by the ordinary tin deed-box. In a recent burglary at a money-changer's office, after rigging up an improvised tent with blankets around the safe, he brought into play two cylinders of compressed oxygen and an acetylene generator charged with calcium carbide and water. With the combination of these two gases he obtained a blow-pipe flame of such intensity that the steel of which the safe was built, and which the finest drills failed to scratch, was melted as if it were lead. Considering that with the oxy-acetylene flame a temperature of some six thousand degrees

Fahrenheit is secured, the test which the steel had to resist was supreme, and naturally it collapsed. In the space of a few minutes a large hole had been cut into the safe-wall, through which the daring and ingenious burglar was able to withdraw the contents, and retreating through the hole he had made in the ceiling to effect an entry, he escaped scot-free with his booty. It is thus apparent that in order to circumvent the safe-breaker who has acquired at least a smattering of scientific knowledge some more efficacious means of safety other than mere steel will now have to be requisitioned.

TABLOID REFRIGERATING AGENTS.

The present is essentially an age of tabloids, by means of which nearly everything, from medicaments to edibles, is obtainable in small concentrated sweet-like form. But possibly the strangest application of this modern development is the production of a refrigerating agent à la tabloid. The refrigerant, the composition of which is secret, is prepared in small pastilles which emit a freezing or sterilising vapour in an airtight chamber. By this means all descriptions of perishable articlessuch as fruit, poultry, eggs, milk, meat, and so forth-may be preserved for any desired length of time as if stored in a natural ice or mechanical freezing-chamber without any deterioration or alteration of flavour. Every household can thus be equipped with an excellent means of preservation, dispensing with the necessity of ice-than which, however, it is much cheaper, while at the same time it enables sterilised preservation to be carried out in those places and climes where ice is not available. Not only is it applicable to small household requirements, but it can be employed for the largest installations where expensive and bulky refrigerating machinery is now employed. It is anticipated that this invention will work a complete revolution in the present methods of refrigention both in transport and storage.

AN AUTOMATIC BOOT-CLEANER.

The latest development of automatic devices to supersede manual labour is the mechanical shoecleaning machine. At present the amount of time, labour, and energy wasted in such establishments as hotels, boarding houses, and schools in cleaning the boots by hand is considerable, and could be far more advantageously devoted to other purposes A German firm has recently placed a machine on the market whereby the covering to our pedal extremities can be cleaned far more expeditionsly, efficiently, and cheaply than by the usual methods, while, moreover, it merely requires the attention of a boy or girl. The only manual labour necessary is to fix the boot or shoe to be cleaned, irrespective of size or shape, upon a frame. The article is then carried by an endless chain past six pairs of resilient brushes, which are continually revolving. The dirt or dust is first removed, then the cleaning medium

applied, and a brilliant shine finally imparted. With this mechanical appliance from fifty to ninety pairs of boots per hour can be cleaned. A later application of the apparatus will seriously threaten the existence of the shoeblack so familiar at the street corners in our large towns. This is an automatic machine where, by the insertion of twopence, you place your foot upon a rest and have your boots mechanically cleaned and polished in the space of about a minute. In Berlin arrangements have been completed for the installation of these machines in the principal thoroughfares throughout the city.

THE DECADENCE OF PORRIDGE.

According to a recent Scottish authority, the demand for oatmeal in a pure state—that is, as marketed from Scotland-is on the decline, and this condition of affairs is attributed to the invasion of similar articles of food in flaked, crushed, ground, or some other form from foreign countries. But the cause for this predilection is not far to seek. Scotch oatmeal, in the first place, requires very careful cooking, while the foreign cereal food facilitates this operation, a factor greatly appreciated by the housewife. Moreover, the latter is placed on the market in convenient cardboard packages, which constitute admirable receptacles from the domestic point of view both for transport and storage, while at the same time it appeals to the dealer, who finds it much more convenient to stock the article in strong sealed packages than loose in bulk, in which state it is liable to severe deterioration unless quickly disposed of. The fact has been stated by more than one medical authority, especially by the advocates of the Scottish product, that the foreign breakfast food sold in such attractive packets is an ill-defined composition. Investigation, however, shows that such is not the case, for numerous analyses have been made of these manufactured cereal breakfast foods, and for the most part they are entirely free from adulteration, and in some cases distinctly improved by the treatment to which they have been At any rate, no harmful ingredients submitted. enter into the composition. Some are made from the coarser milling products, while other brands contain certain proportions of molasses, glucose, and similar substances, which, however, are not of an injurious character. The percentage of mineral ash is sometimes found to be abnormally high; but

this result is due to the addition of salt for the improvement of the flavour, and can in no way be construed as an adulterant. To revive the interest in Scottish oatmeal the native producers should not be above taking a leaf from the practices of their foreign competitors in rendering the product more attractive to the housewife.

A NEW RAT-EXTERMINATOR.

The rat is an agricultural pest common to all countries, for it is one of the most voracious and destructive vermin known. Exterminators without fail have been devised, but none has hitherto demonstrated its capacity to accomplish the purpose for which it was evolved. A greater measure of success, however, appears to have attended the bacteriological preparation emanating from the Ratin Laboratory of London, if recent experiments afford any reliable criterion. Although the exterminating quality of this substance consists of a microbe which when ingested by the rodent sets up a virulent and contagious infection, it exercises no deleterious effect upon the larger animals. This claim is similar to that which was advanced by Dr Danysz of Paris for his method of dealing with the rabbit pest of Australia. but which apparently resulted in failure when submitted to practice. Still, the Ratin remedy appears to be attended with greater success. The substance, stored in an airtight tin, is mixed with a certain quantity of milk into a thick paste, and then small doses are wrapped in paper and distributed about the animals' runs. It is evidently very attractive to the rodents from the palatable point of view, for they eat it greedily; but the fact that they ultimately perish in their holes and crevices and yet leave no objectionable stench is one that should obviously be fully investigated before being accepted as a logical conclusion. In order to substantiate this claim incontrovertibly, a prolonged severe test should be undertaken by the Government upon similar lines to that followed in Australia in connection with the rabbit-exterminating virus. In this manner it would be possible to determine precisely whether the decomposing bodies of the dead animals exercise a deleterious influence upon mankind, as obviously they would. Should the substance prove harmless in this direction, then indeed a remarkable and efficient weapon will be available to the farmer with which to maintain his warfare against his most destructive enemy.

Volume X. of the Sixth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.

A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.

A cloth case for binding the whole of the numbers for 1907 is also ready.

Back numbers to complete sets may be had at all times.

Annual subscription, including postage to any address, either at home or abroad, 9s. 6d.

END OF THE TENTH VOLUME.

SEVENTY-FIVE YEARS OF 'CHAMBERS'S JOURNAL

EVENTY-FIVE years of Chambers's Journal. These words are easily written, and it might be possible to be wilder the reader by suggesting the array of literature circulated by the Journal in all parts of the habitable globe, with the tons of paper used, and the thousands of contributions on every conceivable subject of interest. Rather would we recognise in it a living stream of instruction and entertainment which has flowed for threquarters of a century; has refreshed, stimulated, and inspired its millions of readers; and is still flowing with scarcely diminished volume. Only one surviving periodical has an equal record.

Chambers's Journal was established on 4th February 1832, a year of political ferment, when the great Reform Bill became law. Sir Walter Scott passed away at Abbotsford in the autumn of the same year, and amongst the ten or twelve persons from Edinburgh who attended his funeral were William and Robert Chambers. To the thirty-fifth number Robert Chambers contributed, by way of supplement, the fullest account of Scott's life issued up till that time. This had a circulation of over one hundred and eighty thousand copies. Newspapers were then taxed, and to those who proposed taxing Chambers's the conductors pointed out the unfairness of checking a movement by which general knowledge was disseminated among the people to an extent never before imagined; Chambers's Journal itself 'finding at the least computation two hundred thousand readers, and circulating a great deal more paper yearly than the whole newspaper press of Scotland' at that time. As A. K. H. B. once said, the Journal was read in Scotland by everybody who read anything at all.

A vast army of writers has assisted in maintaining the best traditions of Chambers's, in preserving that continuity of purpose, variety, freshness, and breadth of interest so essential in a periodical intended not merely to afford passing amusement, but to instruct and to elevate. This has been accomplished under the fostering care or active editorship of the founders, William and Robert Chambers, and their associates and successors: Mr Leitch Ritchie, Mr James Payn, and Mr Robert Chambers, junior, who was succeeded by his son, the present Editor, and grandson of Dr Robert Chambers.

In the exercise of what William Chambers has called the 'winnowing machine' much golden grain has been separated from the vast amount of chaff which inevitably floats towards every editorial sanctum. In this process it is a gratifying fact that early work of afterwards distinguished writers has been retained, such as George Meredith's 'Chillianwallah,' printed July 7, 1849; Thomas Hardy's 'How I Built Myself a House,' March 18, 1865; and Sir A. Conan Doyle's Mystery of Sassasa Valley' in 1879. It is also pleasant to think that Hugh Miller, Mary Russell Mitford, David Masson, the Author of John Halifax, Gentleman, G. Manville Fenn, T. W. Speight, W. W. Jacobs, Stanley Weyman, and Sir T. Wemyss Reid were contributors, amongst thousands of others. Amongst the novelists have been James Payn, Mayne Reid, Christie Murray, Baring-Gould, Sir Walter Besant, Mrs Oliphant, Grant Allen, E. W. Hornung, Mary Stuart Boyd, John Buchan, and John Oxenham.

The Editor believes that 'Black Flame,' by Mr Samuel Gordon, and 'The Calamity of the Polder,' by Mr Charles Edwardes, in the current issue, are no unworthy successors to the hundreds of short stories which have previously appeared; and there has seldom been a more interesting series of literary papers than Mr Lehmann's 'Memories,' bringing in as they do letters and anecdotes of Dickens, Browning, Thackeray, and others. A new serial by W. H. Fitchett, I.L.D., entitled 'A Pawn in the Game,' will commence in the part for January 1908. This writer has made this mark as editor and journalist as well as novelist. He has made the history of the eighteenth and early nineteenth centuries peculiarly his own, and the great historical figures and incidents and early nineteenth centuries peculiarly his own, and the great historical figures and incidents that 'instinct of Empire' which the Earl of Lytton complained was dying out. 'The Mouth: Science and Arts' has been strengthened, and care is taken to present what is fresh, original, so and important. The best traditions which have recommended Chambers's Journal to a host of readers will be maintained in the future as in the past. An indication of the programme for 1908 is given on a leaflet in the present issue.

'BLACK FLAME.'

BY SAMUEL GORDON,

AUTHOR OF 'A HANDFUL OF EXOTICS,' 'UNTO EACH MAN HIS OWN,' 'THE FERRY OF FATE,' &C.

CHAPTER I.

HE morose face of old Zelig Kamnitzer grew less wrinkled and sullen as he listened to his interlocutor, and the lines of the severe mouth seemed to soften into something like an Calman air of benevolence. Schwartz saw it and took

heart, and his words came out swifter than ever. When he had quite finished, Zelig Kamnitzer drew a few heavy puffs from his pipe, and looked hard at him for some seconds.

'So you want to marry my Gnendel?' he at last summed up the young man's request.

'You have known it for a long time,' was

the eager reply.

Zelig nodded. 'And do you know what it will mean to marry my Gnendel?' he asked

'That I shall be the happiest man in the

world, Zelig.'

The old man rose with a harsh, disagreeable laugh, and strode up and down the chamber.

Calman watched him with renewed apprehension. Was Zelig going to refuse him after all? 'Perhaps I ought to impress upon you again that I can afford to marry, Zelig,' he said, a because'-

slight tremor in his voice. 'My business is growing. This week I was offered another two hundred gulden credit if I wanted it. I am thinking—I have mentioned it to you before—in a few months perhaps I shall move from Kurnick to a larger town-to Tarnow or Pschemischel . . .'

Zelig turned to him with the same disagreeable laugh as before. 'Quite right, my boy! Unpack all your greatness; dazzle me with your riches. I tell you, it doesn't want much to dazzle a pauper like me. Look'-he swept his arm round fiercely to indicate the contents of the miserable apartment—'all my worldly belongings wouldn't fetch two hundred kreutzers by auction. And my credit— I went the other night to get a tallow candle on tick, and the chandler wouldn't let me have it. What do you say to that, my boy?'
'I say that all that does not concern me,

Zelig, replied Calman. 'All I want is Gnendel -and you. You must come and live with us when we are married. You have worked enough in your time.'

Zelig's mouth was hard-set as he answered, 'Calman, you can't marry my Gnendel,

'Yes-because?'

'Because she is no fit wife for you.'

'Zelig!'

'Because she is no fit wife for any good man,' continued Zelig, watching the other, outwardly unperturbed. 'Listen, Calman! Do you know my Gnendel?'

'Of course I do,' was the vehement reply. 'Haven't I known her almost from the day I came to Kurnick? Certainly she is a little

wild and headstrong . . .'
Again Zelig's gruff, disagreeable laugh inter-

rupted him.

'A little wild and headstrong! Hark at him! You think that meets the case, my boy, do you? Well, then, let me tell you that you do not know my Gnendel. But I know herto my sorrow be it said. I say to you, Calman, that my Gnendel is not a woman but a devil. I have kept it locked up in my breast all these years, and it has made me a man of few words. I was afraid that if I made a habit of talking I might blurt it all out one day, and make myself an object of ridicule-or even pity-to all who know me. But to you I must speak, Calman, because I am an honest man, though poor. And, greatly as I would love to call you my son, I must step in between you and your evil destiny. Calman, let be. Not you! not you! Perhaps some great big brute of a man, with an iron heart and a heavy hand, who will frighten her and break her to his will; but not you, Calman. Let be, I tell you! Find some other girl for whom you are more of a match. I won't let you fall a victim to my daughter unwarned. I am an honest man, though poor.'

A deep breath, that was half apprehension and half relief, broke from Calman. He even 'Come, Zelig,' he said, essayed a laugh. 'don't make me out a poorer specimen than I

am. I shall know how to handle her.'

Zelig ignored him and continued to pace the chamber, wrapt in his own thoughts. 'Why does God take the full ears of corn from the field and leave the tares?' he said, half to himself. 'All the others have gone, and she remains. First there was Leika, so happy in her marriage. Then there was Shimmon—he went the second year he served with the soldiers. Faithful old Mindel was the last one to go. And now I have to thank God for leaving me Gnendel. But mark you, Calman!' -he turned on the other almost threateningly-'since she was left to me I mean to keep her. I won't let her go from me to spread havoc Calman, it need not have been elsewhere. like this with me. I might have been living in comfort if she had only helped me in my business. But she won't. She is idle and prodigal, and forgetful of all that beseems a Jewish daughter to be and to do. Listen! Last week I went to look for her, and where and how did I find her? Outside the town, on

the back of a colt, sitting astride like a man, with all the farm-hands making rude jests to her, and she jesting back at them. Oh, if one of the congregation had seen her then as I saw her I should have died!'

Calman paused a few moments in thought, and then he stepped resolutely up to Zelig. 'Tell me what you like, Zelig, my mind remains the same,' he said. 'No; if anything, my resolve becomes stronger. If, as you say, Gnendel is given so much to habits of wayward ness and perversity, what better than that she should be steadied down and brought to anchor by the solemn bonds of wedlock? Let her learn as soon as possible the sacred duties of Jewish matronhood. I will teach them to her. Trust me, I shall make her a good teacher, Zelig. Not by force or brute strength shall I bring these things home to her; I shall make no attempt to break her with an iron hand, but I shall bend her by infinite patience and kindliness. Believe me, Zelig, now that I know the worst of her, I shall be able to do the best for her. Leave her to me.'

Zelig blinked violently, as though he were trying to crush something between those thick eyelids of his. Then he came and laid his hand gently on the other's shoulder.

'Well, Calman, in God's name, then. With the Almighty's help all may be right. I did my duty, Calman, and warned you; but I did it with a breaking heart. After all, she is my child, and I want to see her happy; I want to see you also happy—you, Calman, whom I have always loved as a son. Yes, here's my hand on it.

The two men stood silently for a few moments, looking hard into each other's eyes. 'Where-where is Gnendel?' Calman asked

at last.

'I don't know. She went out some hours ago. But no doubt she will be here soon.

You may wait if you like.'

Calman nodded contentedly, and was about to seat himself on a chair, when his ears caught in the distance a confused noise, in which human shouts were blurred with the sound of musical instruments. The noise came nearer and nearer, until it struck even on Zelig's blunter hearing. The two of them stepped to the window.

'What can it be?' asked Zelig, puzzled. 'I think it must be the gipsy circus which the people in the town have been expecting for

the past few days,' replied Calman.
'Oh, a circus!' echoed Zelig indifferently. What were these foibles and vanities of the world to him? He was about to move away, when he stopped, held by a sudden thought

A few minutes later the van of the procession hove in sight. Swarthy men and women, tawdrily attired in make-believe splendour and hung with pinchbeck trinkets, came riding [Christmas Number.

along on gaily caparisoned horses, keeping step to the blare of unmelodious trumpets and the thud of kettle-drums. The cavalcade was flanked on either side by clowns in motley, who ran along turning grotesque somersaults. In the rear there followed a huzzaing mob of boys and girls, sprinkled with a few adults, and at the The red head of them all was-Gnendel. kerchief that had covered her head had fallen back over her shoulders; her coal-black hair had broken loose from the confining ribbon and was fluttering in the breeze like sable pennons. The gaudy sash round her waist; the bright, joyous, provocative eyes; the crimson lips, parted in a laugh and showing alabaster teeth, gave her the look of a Bacchante. Of course that was not the comparison old Zelig applied to her; he could not compare her to anything for the moment. All he could do was to ask himself, with a feeling of impotent anger, why this bold-faced hoyden had been given him for So that was why she had been a daughter. away from home all these hours! She had gone forth with the riff-raff of the town to meet these mountebanks, to join this guard of dishonour that gave them escort! And she was seventeen last birthday!

But, great as was his anger, it was yet tempered by fear. What was Calman thinking? For, despite everything, she was his child, and he wanted to see her happy, as he had saidhappy and safe in the keeping of a man who would not crush her heart with an iron hand.

And just then Calman, who had also been thinking, turned to him and made a straight answer to the other's unspoken thought: 'Zelig

yes, I am willing to take the risk.

The procession had come to a halt in front of their window. Zelig leant out and beckoned to Gnendel as soon as he caught her gaze. She seemed to hesitate an instant, and a mutinous pout puckered her mouth; but in the end she detached herself from the throng and entered the house. Zelig listened, and when he had assured himself of her approach he sat down at the table, his manner curiously firm and determined, took a sheet of parchment and pen and ink, and began to write busily. Presently Gnendel entered, shutting the door behind her, but remaining with her back close to it, without stepping farther into the room. So she stood, the rebellious pout still on her lips, without a word of greeting to either of the men, letting her glance shift composedly from her father to Calman. The latter was nervously toying with a book; Zelig continued at his parchment without looking up. So the constrained silence kept on, broken only by the scratching of Zelig's quill, until at length a huge flourish, accompanied by much spluttering of ink, signified that he had come to the end. Ponderously he rose from his chair, and, smiling somewhat awkwardly, came towards Gnendel.

1907.]

'Do you know what I have here?' he asked her, pointing to the document in his hand.

She tossed her head and shrugged her shoulders as she replied, 'How should I know,

The answer and the gesture that went with it evidently did not please Zelig, but his voice was still strangely gentle as he proceeded: 'I have here written out your engagement-contract, Gnendel. Calman has asked me to let you become his wife, and I have consented. In fact, it will please me very much. He will make you a good husband.'

'How much have you promised him for my dowry?' asked Gnendel, on whom the informa-

tion had produced no visible effect.

'Nothing. He says he does not require

any.'
'Well, then, what has he promised you?' continued Gnendel with a laugh.

'He says I may come and live with you when you are married,' replied Zelig, his fore-

head becoming clouded.

'Oh, I see! Is that what he bribed you with?' said Gnendel lightly. 'Well, tell him, father, that I can't be bought and sold like one of his earthenware pots. Luckily, I have a mouth that can say no or yes as it suits me, and this time it's no!'

'Gnendel!' exclaimed Zelig, white with

anger.
'Oh, hush, father! it's not worth while making such a noise about. It was hardly worth while calling me in for. I could as well have given my answer another time. It would have been quite the same answer, though, mind I don't want to get married. besides, just now I am very hungry.

She was moving off in the direction of the wooden larder opposite, when Zelig, with a strangled shout, sprang upon her, gripped her by the hair with one hand, and with the other, tight clenched, rained blow on blow down upon

her head and shoulders.

Gnendel stood perfectly still, offering no resistance, not even lifting an arm to protect her face against her father's violence.

'Zelig, you are mad! For God's sake let her go!' she next heard Calman cry brokenly.

And a moment later she was free, and saw Calman drag her father away and deposit him in the chair farthest from her. With blazing eyes and heaving chest she watched them. Her lips had resumed their mocking pout. But she did not go from the room. deliberate step she walked over to a corner and there huddled herself down in a heap, crouching uncannily, her face pressed into her folded arms, and her thick black mane, disordered by her father's rude handling, enveloping her like a cloak to her feet. Force of habit was too strong for her. That was how she had sulked hour after hour when she had been beaten as a child, and the days of her childhood were, after all, not so very far behind her.

The room was becoming draped in evening shadows. Gnendel, still crouching, had heard the door open and shut. That was, she presumed, when Calman took his departure. Some time afterwards-she could not tell whether it was minutes or hours-her father had got up from his chair, wheezing and groaning brokenly, and had shuffled off to the apartment in which he slept, leaving her all alone. Gnendel still made no move. She was only just beginning to be comfortable in her corner. Her father's presence had insensibly clogged her thoughts, but now they rushed on with the force and swiftness of mill-flails when the dam has been set swirling. She knew that the happenings of that day had put the climax on the long period of discontent and vague, unsatisfied longings which had crowded the brief years of her girlhood. For the first time she made a deliberate attempt to find out what had come between her and her father. For three years now this tacit hostility had been the order of the day-tacit except for the not infrequent occasions which brought it to open demonstration. Three years -yes, since her mother's last illness. It was then that she had felt the first symptoms of this own great malady of hers. It was brought on, no doubt, by those long spells of watching at her mother's sick-bed, those terrible day-and-night vigils, when she saw the beloved face become more and more wan with the grayness of the approaching shadow. Little by little, but none the less surely, an unconscious resentment had taken root in her as she compared the painwarped frame, wasting away beyond all recognition, with the still upright and sturdy figure of her father, as in seeming unconcern he went about the business of the day. Oh, how gladly would she not have given of her own flaming young life if she could have but added strength and permanence to that weakly, flickering spark! But her father-

And so her anger had sunk deeper and deeper into her heart, became chronic, became a passion, preventing her from suspecting, as she did not suspect even now, what secret and impotent agonies were masked under Zelig's hard unresponsive countenance. To Gnendel it had always seemed—and at this moment the thought came home to her more strongly than ever—that if her father had only loved her mother more truly she might have been living to that day. And obdurate natures they were, the pair of them, both father and daughter; there never had been an explanation.

With her mother's death there opened for Gnendel an era of lawlessness and revolt. Nothing in the old life remained sweet or desirable. The necessity for blunting the aching memory of her loss, the withdrawal of the kindly, beneficent control on her naturally

intractable spirit, the ever-widening breach with her father, all combined to drive her into seeking strange distractions and to reduce her mind to a state of chaotic turbulence. It was torture for her to be at home, where penury in the absence of her mother's redeeming smile had become downright starvation, where the walls were murky with cobwebs of care and the floor honeycombed with the pitfalls of cross-purposes. So she became a denizen of forest and field, making friends with wild things in whom the instincts for liberty were as strong as they were in her, taking delight in converse with rough, uncouth people, and generally losing touch with the conditions of life to which her earlier associations should have bound her. She was beginning to be whispered about in the town. The mothers in the place forbade their daughtersand their sons too, for the matter of thatto have communication with her. Gnendel laughed at all she heard and saw, and, if anything, flaunted herself more in their sight, carried her head higher, for she knew it was no crime to breathe the free air of heaven, and pitied those who were unhappy enough not to be born with the taste for it. She pitied and despised them, all of them, except perhaps-

Yes, there was Calman Schwartz. He had come to Kurnick two years ago from nowhere in particular. He had come quietly and unostentatiously, keeping in the background except for the requirements of his business, although he had plenty of inducements to step into greater prominence. For the householders with marriageable daughters soon found out that he was a steady, painstaking young man, who had made up his mind to get on in the world, and would be able to keep a wife in comfort. His shop was almost next door to Zelig's dwelling, and one evening he had strolled in casually, unceremoniously, after the manner in which acquaintances were started among people of their class. He had sat down, accepted the glass of tea and lemon Zelig had offered him, and half-an-hour later they were chatting as if they had known each other all their lives. Gnendel remembered the incident, because she had happened to be at home tinkering away at some new bit of finery, Zelig's railings at which Calman's entrance had interrupted. The visitor's unruffled calm had got on her nerves, and she had felt sorely tempted to play some prank on him, just because he looked the sort of man on whom one should not play pranks. After that they had met a great many times, in and out of the house; but they had not approached each other an inch in their mutual attitude. Calman's placid, somewhat sleepy eyes did not even flash into recognition at sight of her. And yet of late, now that she came to think of it, a look of inquiry had come into them that had robbed them of their wonted steadiness when they encountered hers. So that was what he [Christmas Number.

had been asking himself: whether he should do her the honour of making her his wife! That had been the stone he had cast into the stagnant pool he called his soul, and had ruffled its surface! Very good! And now he had fished out his stone again-he had had her answer. Gnendel laughed. After all, she had had her chance of playing her great prank on him. She would not have missed it for worlds, and certainly not for this stupid world in which

she was living now! She struggled to her feet, and in the gloom took in as much as she could of the skeleton bareness of her home. Well, to-day finished it. To-day had made history for her, had become the birthday of her new life, a full life, a merry life, with great bright patches of colour in it, with long resonances of cymbal and drum and gay pageantry to cram the hungry heart of her youth. Yes, she would go at once. What had she to wait for? Through the half-open inner door came the stertorous breathing of her father. It conveyed nothing to her-no regret, no reproach. He had never required her good-nights; he would not miss her good-morning. Noiselessly she undid the catch and stepped out into the silent street.

Immediately a figure loomed up beside her. Before she had time to be frightened she had recognised Calman. She was about to pass him without a word.

'Out so late, Gnendel?' he said quietly.

She gave a start. It was the first time he had talked to her so personally or mentioned her by her name. But she speedily brushed these considerations aside.

'What does that matter to you?' she replied coldly. 'I may go about my business whenever

I like, may I not?'

'Certainly, as long as it's business one would never like undone.'

'Insolence!' she snapped.

Calman came and deliberately put himself

in her way.

'Listen, Gnendel. I have been watching here all the time, because I had an idea that after what happened you would do something you might regret. Wait at least till you can think calmly—or at least till you are calm enough to allow me to think for you. Wait, Gnendel, I say.

'That would do you little good,' was her quick reply. 'I will never wait long enough

to say yes to becoming your wife.'

'Why not?'

'Why not?' she mocked him. 'Because you saw me beaten like a dog, and a beaten dog can never aspire to be mistress in her house.'

'You shall be in mine, Gnendel,' he said fervently.

'But I don't want to be, I tell you. Let me go.'
1907.]

'And your father, Gnendel?'

She hesitated a moment; then she turned to him with a mock-confidential air. 'You're not a bad sort, I think, and as a reward I'll let you into a secret. The real reason why I am running away is because—I like my father too well. One of these days I may do something to bring on an apoplectic fit, and that would be the end of him. I have a decided objection to being my father's murderess.

His arms fell limply to his side, and he moved away a few steps. 'Where are you going?' he asked, coming to a halt again.

'That's a matter entirely for myself.' 'Then I shall follow you,' he said resolutely.

'Oh, will you? I should advise you not to. Where I am going they keep big dogs, and they might set them on you if I give the word. And I shall give it, be sure I shall.

'I shall not molest you, only tell me where,'

he implored her.

'Well, then, to the circus.'

He gasped. 'Gnendel—you, to the gipsies?' 'Yes. Why not? They will be glad to have me. The riding-master spoke to me as I went along with the procession. He said I had only to come and they would receive me with open arms. I am going to try them. And now, please, I'm in a hurry.'

She pushed past him and hastened down the

street at the top of her speed.

Calman made no attempt to pursue her. went back into his shop and closed up for the night. On his face a smile and a frown blended curiously. It might be the expression of a man who thinks he has got rid of a great anxiety, but on second thoughts is not quite sure of it.

CHAPTER II.

UMMERS and winters—four of themhad come and gone, but Gnendel did not return. Otherwise Kurnick was still very much the Kurnick it had It still contained Calman, despite the pestering of the marriage-mongers and his resolution to remove to a larger sphere of activity. Yes, Calman Schwartz was a most excellent young man, but it was a pity he should be so obstinate. Chop and stab and break him, you couldn't get him to marry. Instead of taking to himself a nice little wife who would make his home cosy and see that he got his meals regularly, he preferred to keep house with snuffy, doddering old Zelig Kam-nitzer; and how he managed to stand the life goodness only knew. But the fact remained.

It was for two reasons that Calman had stayed on in Kurnick: one was his own, and the other was Zelig's. Zelig's reason appeared in the interview which Calman had with him some weeks after Gnendel's disappearance.

'I have a project, Zelig,' he had said.

'It's sure to be a good one.'

'That will depend on you. I want you to come and live with me.'

'Why, Calman?'

'Because, if I had married your daughter you would have made your home with us. Now that through my fault you have lost a daughter, how much more reason is there that through

me you should find a home!'

Zelig had looked at him with eyes that were clear enough in vision, and from Calman he looked to his own palsy-stricken right hand which told him that never again would he be able to write the tiny phylactery-scrolls and door-post amulets by which he had eked out his scanty livelihood. And then he thought of the bleak horror of the poorhouse, of the pauper's free seat in the synagogue, of the pauper's That free grave free grave in the cemetery. decided him. But as a last loophole from the degradation of eating a stranger's bread, he laid down his condition.

'I will do you the honour of accepting your charity, Calman,' he replied; 'but it must be here in Kurnick. I must finish my days in the place where I have tasted of my few joys and where I have been stricken with my many

sorrows.

Calman agreed to the stipulation with a readiness which greatly surprised Zelig, who of course knew of the young man's larger ambitions. Calman could not explain to him that his own reason for remaining in Kurnick was that here, after all, was the most likely place where his heart's desire would be gratified, and he would set eyes once more on Gnendel. She would come back here some day—he was sure of that. Only, he must not say so, for her name dared not be mentioned in Zelig's hearing. In those first poignant days Zelig had answered curtly and dispassionately to all inquirers, malicious and sympathetic alike, that Gnendel was dead; later on-perhaps it was a sign of incipient senility -he seemed to believe in his own fiction. He began to speak of her again to Calman of his own accord. He even spoke of her with a loving sadness, as though it were unkind to pursue her with malice in a place where it could no longer have any effect on her. Nay, he looked upon her death as a special sign of the favour in which God held him. To how many men was it given to have all their dear ones taken in advance to prepare for them a louder and a cheerier welcome in the lone, solemn spaces beyond?

Calman felt he had a great deal to make good to Zelig. All through he was haunted by a sense of personal guilt. That poor little home—however little it might have been worthy of the name, but such as it had beenit was he who had wrecked it. But morewhat had possessed him to let Gnendel go so lightly to her fate the night she disappeared? He remembered how he had lain awake for hours, the frowning smile still on his face as amusement and irritation struggled for mastery within him at her outrageous threat of joining the gipsy caravan. The only excuse he could make himself was that the very enormity of it had lulled him into a false security. How would she have the heart, the physical courage, to do such a thing? Had he dreamed she was serious he would have followed her and dragged her back even if all the bloodhounds in the world were tearing him by the throat No; he had thought she would find a shakedown with some acquaintance overnight, and in the morning return, not penitent, not aggressive, but just her usual insouciant self. But she did not return the next morning, or the next, or And even if he followed and challenged the gipsies, who had struck camp the next day, what right had he to interfere with Gnendel's movements? He could do nothing without calling in Zelig's co-operation, and that was entirely out of the question. What would Zelig say to the suggestion of receiving back into his house a daughter who had lived in the midst of a set of vagabond mountebanks? No, no; Zelig was much better off in thinking, or in pretending to think, of her as dead.

And Calman himself? In his memories of her there mingled no shadow of pique or chagrin. He thought of her mostly with a deep pity in his heart as a homeless wail, wandering blindly, helplessly through the world, and perhaps finding a little disinterested kindness here and there, but more often struggling desperately to keep a precarious foothold on slippery roads. He liked to imagine that she had found a home with some respectable family, and was doing menial work in return for food and shelter. Her white little hands-how he had loved watching those white little hands!were by now, no doubt, red and rough with toil. Poor little Gnendel! Oh, why had he

wanted to marry her?

So ran his thoughts, and therefore it was a great shock to him when something happened which fundamentally upset all his theories. One morning, on going to the post-office, he found there a registered letter addressed to Zelig Kam nitzer. He received it with a trembling hand. A strong presentiment was upon him that the letter contained something Zelig must not see. As Zelig's patron-guardian it behoved him to keep the old man safe against anything that Quickly, before he threatened him with harm. could change his mind, he tore open the envelope. Its enclosure was strange indeed. Not a word of writing—nothing but ten crisp five-gulden notes.

Calman's heart almost stopped beating. How [Christmas Number.

did these five-gulden notes accord with his supposition that Gnendel was earning her living as a household drudge? And what explanation was he to offer Zelig? Yes, it was just as well that he had opened that letter beforehand. Zelig must never know of it. He did not need the money. He had everything he wanted: the best of food and drink and clothing, and his canister was always full of tobacco for that everlasting chibouc of his. Calman made a detour to call at the local bank, where he deposited the money in Zelig's name.

He did the same with all the following missives, which now continued to arrive at almost regular intervals, always without a word of news from the sender. The only information he could glean was from the postmark. This was never the same—each letter came from a different locality, sometimes Moravia, again from Bohemia, and once even from France. Every successive remittance sent Calman into a greater panic of apprehension. How long would he be able to bear the strain of keeping the secret from Zelig? After all, it was an unpardonable theft to rob this old man of the knowledge that a child of his was still living. Calman began to see clearly that he could not go on playing this dangerous and questionable game much longer. He must take some action, and that soon. The easiest thing to be done was the most difficult: to find Gnendel, to go to her and implore her for her father's sake to give up this hide-and-seek business. There was one circumstance to favour him in the search. The last three letters had all borne the Vienna postmark. It would seem as though she had taken a more permanent abode in that city. True, Vienna was a large place, but it was not so large as the whole world, and he knew at least within what limits to make a start. He clinched his resolve one night, and the next morning he told Zelig that he would have to go away to establish commercial relations with a big firm in Vienna.

'Very well; I shall go with you,' said Zelig

promptly.

Calman was taken aback. This did not fit in at all with his arrangements. Hampered by Zelig, he would not have the freedom of movement he required for his difficult task. He argued with the old man, finding excuses and subterfuges, and disposing of Zelig's suggestion that he might do the transaction by letter as he had always done up till then. And when, in answer to Zelig's pressing question, he had to admit that he did not know how long he would be away, he saw the old face become puckered and wan, and the tears roll down the wizened cheeks.

'It's your own fault, Calman,' said Zelig. 'Why have you been so good to me? You have never let me out of your sight, you have never relaxed your watchful care for an instant,

1907.]

and I have become like a child, depending on you for everything. If you left me behind, alone, I should—I should perhaps die of fright, Calman.'

Calman saw there was no escaping the difficulty. If he wanted to go he must take Zelig with him. But that, of course, was better than not going at all. So he packed Zelig up in a great fur coat—the season was May, but it was still rather cold—and took him to Vienna second class, much as Zelig protested against the extravagance. They took up their lodgings with some relatives of Calman, so that Zelig might have company during Calman's absences instead of being left to his own devices at a hotel.

It was only when, on the morning after their arrival, Calman made his way out into the streets of the capital that he was really confronted with the vastness of his quest. He felt dazed and helpless as he stepped along, caugh. in those great eddies of humanity whirling in and out of long labyrinthine rows of sphir.x-like masonry. Yes, dumb and articulate things alike seemed unable to offer him the least assistance in his task. There was no one to ask, no one to guide him; there was nothing to be relied upon save the elusive mockery of Yet he did not feel disheartened. chance. The spring poured into his soul the elixir of hope, and in his veins glowed the buoyant promise of youth, with its eternally recuperative sense of achievement. He would find Gnendel; he was as sure of it as if he had already found

Among the innumerable posters which covered the hoardings there was one which again and again drew his attention. It showed the figure of a woman driving a team of horses, the whole sketched with a few daring lines in a subtle combination of red and black. The masterly niggardliness of means, the very incompleteness of the picture, left upon one the impression of unlimited breadth and space. The horses seemed to be thudding their way into immeasurable distances. From the woman there emanated a sense of barbaric splendour and elemental strength. She might be an oriental queen driving her triumphal chariot over the prostrate bodies of her enemies. She might be rushing on to meet the mythical sun-god in the empyrean. The legend which haloed her head, in letters drawn to the shape of forked lightning, only seemed to add to the mystery and aloofness of the picture: 'Flamme Noire!' Calman did not even know enough French to interpret the simple words.

He had already passed several of the posters—they were distributed with lavish profuseness—when one struck him again with renewed force at a corner of a broad boulevard, where he could focus it into a better perspective. He stopped, and then mechanically took a pace

backward, and then several more paces, until, without noticing it, he had stepped off the pavement and well out into the roadway. All at once there was a shout, and he felt himself violently jerked aside. When he recovered his footing and looked round, he saw he had been closely shaved by a man on horseback, who was riding by the side of an open carriage. He was a splendid-looking fellow, in the undress uniform of a Cuirassier officer, sitting his horse The carriage was going at a like a centaur. good pace and had not slowed up, and therefore Calman saw nothing of the woman in it except that she wore a red cloak and that her hair shone with a lustrous blackness. The man on horseback had caught her up, and was evidently explaining to her the nature of the accident, for he was laughingly pointing back at the poster. And then the woman slightly threw back her head and laughed as well. Probably they were laughing at the stupid country booby who had nearly got himself run over and perhaps killed in older to satisfy his curiosity at a coloured daub on a wall. Calman did not mind; it was quite a pleasure to be laughed at by two such resplendent creatures. And then suddenly a ray of intelligence flashed across his mind. The poise of the woman's head when she laughed, the lustrous black hair, the flaming red cloak! There seemed to be some vague correspondence between her and the red-and-black figure on the poster; the one appeared to be the other. And further, by some undefined association, the two referred themselves back to a common original, to a familiar intimate prototype struggling up from abysmal depths of memory. Calman shook himself awake. He was letting his imagination run away with him; he was giving himself up to absurd fantasies. He was here to look for Gnendel, and instead he had taken to weaving romances around wallposters and living apparitions in red.

But, all the same, Calman could not drive either from his mind; and when, late in the afternoon, he returned to his cousin's, the first question he asked him—he had been too shy to ask it of strangers in the street—was the meaning of the woman with the horses. His cousin, a grave, elderly man, had no clear recollection of the poster, and suggested that it might be an advertisement of a great firm of harness-makers. Or, rather, now that he came to think of it, it was an annonce of a woman who was supposed to do some wonderful things at the Hippodrome. Zelig, who had been listening, later on in the evening surprised Calman by a rather strange request.

'Calman, I want you to do me a favour.'

'Well?' asked Calman.

'Take me to the circus.'

Calman gave a little gasp, which he quickly turned into a laugh. Still, he did not quite know why there should be that note of uneasiness in his laugh. Perhaps it was due to a certain shiftiness, an air of cunning, in Zelig's manner which he did not quite understand.

'Why, Zelig,' he replied, 'that is about the last thing in the world I expected you to ask for.'

Zelig shook his head rather vehemently as he replied, 'Why not? It may seem a strange notion to you, but it has been running through my head for a long time.'

'What has, Zelig?' 'The circus, Calman. And when the circus was mentioned to-night it took me more strongly than ever. I was thinking that it was on account of some trespass I committed that God took my Gnendel away from me. You remember, Calman, the day when the gipsy circus came through the town? When I looked on those people, I hated and despised-nay, I cursed them all because my Gnendel was running at their heels. Was that their fault? I cursed something that God had willed should be. If God had not willed that there should be circuses He would not have allowed the brain of man to create them. Therefore, Calman, I want to go to such a circus to tell God that I repent of having shown contempt for what, through His wisdom, the mind of man has devised. Am I not right, Calman?

Silently Calman nodded assent. He had intended going to the circus by himself the following evening, but why should he not humour the old man? Away from the reminders of the hoardings, he saw how absurd he had been to magnify the incident of the posters. It only showed him how full he was of the object of his coming that he made even the most utter incongruities fit into the scheme of it. Zelig's motive for wishing to go to the circus was quite rational compared to his; so he would be rational too. He set himself to reduce his adventure to a more practical plan. He would give himself a fortnight for the search. He would first pursue his inquiries privately. After all, a striking-looking girl like Gnendel could not have remained altogether unnoticed, and he had a good many acquaintances in Vienna on whose co-operation he could rely. And if his own efforts proved unavailing. he would, previous to his return to Kumick, place the matter in the hands of a first-rate detective agency.

He was out and about again all the next day, and then went home to redeem his promise to Zelig. He found the old man curiously excited with the prospect of the evening's entertainment. Calman had determined that Zelig should see the show in comfort, and therefore he had booked two fauteuis parterre at one of the booking-offices in the town. He had there assured himself definitely that it was indeed the woman of the posters who was the great attraction at the circus, and he looked forward to [Christmas Number.]

seeing her with a mild sort of impatience. thus felt a correspondingly mild disappointment when, on entering the vestibule of the Hippodrome, he was faced with a placard which said that the management craved the kind indulgence of their patrons, and begged to inform them that the appearance of Mademoiselle Flamme Noire that evening would depend on circumstances as to which they were not permitted to go into detail.

The performance was nearing its close; a good many of the audience were getting ready to leave, grumbling at their ill-luck in having missed the great turn of the programme. man did not sympathise with them. A strange feeling of relief was upon him. Just this night of all nights the woman of the posters was not to appear. Was there anything of the providential about that? If he were not ashamed to admit it to himself, he would have said that, despite all his previous self-reassurances, he feared this black-and-red woman. He had escaped her tonight, and he would never come here again. He could not tell why, unless it was for the halfsuperstitious dread, into which the matter had unconsciously crystallised itself in his mind, that if he saw this woman he would never again stand face to face with Gnendel.

'Let us go, Zelig,' he said, preparing to help

the old man into his coat.

'But it's not over yet, is it?' said Zelig, a little gruffly. 'You have paid dearly enough Let us at least have our full for these seats.

money's worth.

With an indulgent shoulder-shrug, Calman seated himself again. A few minutes more or less, what did it matter? But it mattered a great deal. Almost at the same moment something occurred to galvanise the somewhat jaded interest of the audience back into full swing. Calman, looking up, saw that a box to the farthest left of him had all at once had its curtains drawn aside and had blazed into a brilliant light. He could notice now that it was surmounted by the imperial arms. Presently a group of gentlemen appeared in the box, and among them Calman recognised the young man who had nearly ridden him down the day He was now in full uniform. escorted one of his companions to the chair in the centre, and then with the others respectfully took his stand behind. A look of comprehension passed over the faces of the beholders. Why, of course, that was why Flamme Noire had been reserving herself. One of the archdukes had been expected, and she had had to wait his arrival.

Their surmise proved correct. For, a few seconds later, the great doors at the rear of the ring were flung open, and a crowd of gold-coated grooms and flunkeys sprang forward and formed themselves into a glittering avenue. And then a roar of acclaim rent the air as,

1907.]

standing high on a magnificent gray, Flamme Noire bounded into the enclosure. her way straight up to the imperial loge, she dropped a graceful curtsy, to which the distinguished visitor replied by rising and drawing himself up to the salute. The hush that followed was but an imperfect tribute to the wonderful picture the woman made. The tight-fitting robe of flaming velvet, starting low down at the shoulders and exposing the gleaming neck, indicated limbs exquisite in outline. masses of hair, clustering over the forehead and over the deep, smouldering eyes, undulated endlessly in waves of ebony black, merging in mysterious harmony with the fiery habit, and justifying by a bizarre combination of flame and gloom the contradictoriness of the name she was known by. In a slow canter she made the round of the ring in the direction of Calman and Zelig. To the renewed volleys of applause that greeted her she replied with a barely perceptible smile, her head proud and erect, as one who knows the power she wields.

Calman, seeing—and recognising—her, retained sufficient presence of mind to rise slowly and whisper into Zelig's ear, with an attempted laugh, 'Come away, Zelig. This is not for

'Not for us! Why not?' asked Zelig, lifting

himself half-way from his seat.

'There's no reason, Zelig,' said Calman hoarsely; 'but it's so late. I have some letters to write to go by to-night's post, andand I don't like watching people trying to break their necks.'

Zelig turned and had a good look at him. 'Why do you stare so? Do you see anything?' he asked, craning his neck to follow the direction of Calman's fascinated gaze. Then he gave a lurch, and the fingers of his palsied hand closed on Calman's arm with a grip which made them seem suddenly and miraculously endowed with superhuman strength.

'Calman! Calman!' he whimpered again,

'do you see anything?'

'For the love of heaven, Zelig, let us go!'

replied Calman.

The old man had tottered back into his seat. With a frantic gesture he was passing his hand to and fro before his eyes as though to chase away the mists which had gathered

'Come, Zelig,' urged Calman more fiercely. 'No, no, Calman; let me see—let me have a glimpse of her,' panted Zelig. 'She has come back from the grave, but she has left her shroud behind. Look, she is naked to the waist! My Gnendel, my child, is showing herself naked before the people, like a very wanton! For the sake of her mother, who was a good woman, give her something wherewith to clothe her

shoulders. My Gnendel! My child!' A low whistling sound from his throat cut short his gibbering speech. A storm of angry remonstrances had risen from those sitting near at the interruption. Several attendants rushed to the spot and rudely dragged Zelig to the exit. A journalist a few seats away took note of the incident. It would make good copy. What stronger testimony to the magic of Flamme Noire than this old Jew who had gone mad at sight of her? That old Jew was a far greater compliment to her than even a dozen admiring archdukes.

CHAPTER III.

ALMAN sat by the bedside of Zelig, who lay tossing in the throes of delirium. Calman had nothing else to do now. Gnendel had been found, and he could all his time to Zelig. The doctor's devote all his time to Zelig. diagnosis was that, great as the shock had been -Calman, of course, said nothing about the cause of it-no immediate danger threatened the patient in his present state of mental aberration; but he could not answer for the reaction which might set in when the old man regained his sanity. It was highly advisable that before that happened he should be taken back, by the best means possible, to familiar environments, which would do much to soften the impact of clearer and more rational impressions. Calman eagerly fell in with the suggestion. He was prepared to do everything in his power to rid his conscience of the catastrophe he had brought about. But for him Zelig would not be here, Zelig would not be raving unutterable things. It was he who had driven him mad. What a clumsy fool he was, always tinkering at the destinies of father and daughter, strangers with whom he really had no right to interfere, and always knotting the tangle more confusedly!

Sparing no expense, he had the old man transported back by easy stages to Kurnick, not leaving him for an instant, and installing himself as Zelig's nurse from the moment of their return, to the disregard of all his other affairs. He would lose a few hundred gulden as long as he saved for Zelig from the wreck of his life that one precious thing—his reason.

He succeeded at least partially.

A week later Zelig sat up and looked about him with eyes that were no longer wild and unintelligent. 'Where is Gnendel?' he asked.

Blankly Calman looked back at him, not knowing what the question meant.

'Where is Gnendel?' Zelig repeated impatiently.

'She has gone out, but she will be back soon,' Calman replied at a venture.

Zelig nodded, and with a sigh of content turned on his side and dozed off again. But

half-an-hour later he sat up a second time and put the same question.

'She has not come back yet. I expect her every moment, however,' Calman replied soothingly. He thought he had discovered the way

of dealing with Zelig now.

But this time Zelig was not satisfied with the answer. His face clouded, and he looked angry, as he used to do in the old days. 'Where can she be, the gadabout?' he exclaimed. 'Always away-always away from me, and I want her here and there and everywhere. Look, she hasn't swept the room yet; and I want her to mix some fresh ink for me-this is all clotted. I'll break every bone in her body when I get hold of her, the hussy!'

And that was how it went all day long. Zelig continued to ask for Gnendel, sometimes plaintively, sometimes grumpily, and again in a veritable access of fury. But at last he got tired of grumbling and storming, and took

matters into his own hands.

Calman, after a brief absence from the room, came upon him sitting on the edge of the bed and struggling helplessly to get into his clothes. 'What are you about, Zelig?' he cried, seriously alarmed. 'You know the doctor says you must not get up for a few days.'

'I don't care what the doctor says,' replied Zelig doggedly. 'I'm going out to find my

Gnendel.

Calman looked about him despairingly, as though to discover some way of meeting this unexpected and difficult contingency. Then an inspiration came to him. Now, since you force me to it, Zelig, I'll tell you the truth; but Gnendel will be disappointed that I did not keep the secret. It was to be a surprise to you. Gnendel has gone to Cracow, and has taken with her those two Scrolls of the Law you have not been able to sell. They are building a new synagogue there, and she thought that would be a good chance of finding a pur chaser for them. But, of course, it will take a little time. You know how they are likely to

haggle over the price.'
'Oh, indeed! So she has at last found out which side of her bread is buttered, said Zelig with a sort of sullen satisfaction. But she has been away quite long enough. Her place is here with me. I'm going to fetch

her back.'

Calman's heart heaved into his mouth. 'Oh no, Zelig, you can't do that. How can you venture to travel alone? Why, you wouldn't find the way. But if you won't mind my leaving you for a day or so, I'll go and fetch her my

self.' 'Oh, by all means. I don't care whether you go or I go; but somebody must go, grunted 'Tell her she must come back at

Calman at once set about making his arrange-[Christmas Number.

ments. He provided a trustworthy nurse for Zelig, and then packed his own portmanteau for Vienna. He must lose no time. He knew he could not be away longer than two days at the utmost. And if this thing was to be done at all, it must be done before his resolution failed him. It was a tremendous task he had undertaken, a forlorn hope, a venture doomed to certain failure from the start. Its success was discounted even more by his self-reproach for attempting to meddle again with the affairs of people to whom he had been an influence for evil all through. But the attempt, for all that, had a fascination of its own. He wanted to gauge how deep a man who intended to reach as high as he could be thrust back into the abyss of humiliation. He, the petty shopkeeper, was about to stand before a worldcelebrity, the idol of millions, and ask her to Oh yes, it should be an interestdo her duty. Oh yes, it showing problem, if nothing more.

He reached Vienna in the afternoon, made his way at once to the Hippodrome, and there, by judicious backsheesh, ascertained the address of Mademoiselle Flamme Noire. He took a fiacre and drove up to the house, which rather impressed the porter, who let him through with nothing more than a suspicious scrutiny. He had rather more difficulty with the pert housemaid who answered his ring at the door-bell on the first étage. What did he want? impossible for mademoiselle to see anybody—unless, perhaps, he was the jeweller's man.
No? If not, did he have a letter of introduction? Otherwise he had better write his business to mademoiselle. To this hailstorm of questions Calman replied by standing firm in the doorway and insisting that he must see the lady. He marvelled at his own calmness, but he felt all the time that pent up in his breast there lay a very tempest of emotions which, if once let loose, would sweep him off his feet. But he had not yet got beyond that housemaid.

'Mademoiselle knows me,' he said at last in

desperation.

'Then give me your name, and I will make

sure,' was the reply.

Here was another difficulty. Would Gnendel see him if she knew who he was? He tried to make his answer as non-committal as possible. 'Say somebody from Kurnick.'

'From where?'

'Kurnick,' repeated Calman, much louder

than he had yet spoken.

The sound of the word must have penetrated within, for just as the maid was about to close the door, leaving Calman to wait outside, there was a hasty swishing of frocks and an imperious voice said, 'One moment, Anna.'

The next moment Calman was facing Gnendel. Oh, it was Gnendel right enough, despite the magnificent draperies of her gown and the diamond bracelets sparkling on her arms.

1907.]

Without flurry or surprise, quite simple and unaffected, she held out to him a hand of

'Ah, Herr Schwartz, how nice of you to come and see me like this! I suppose you are in Vienna on business.

'Yes, on business,' replied Calman, trying to

keep an even voice.

Well, come in, and tell me all about Kurnick. How is the old place? Have they levelled up the approach to the pump, or do the women still slip on the ice in the winter and break their legs? And does Mother Krausskopf still manufacture that delicious toffee with poppyseeds on top? If I had known you were coming here I should have asked you to bring me some; I was always passionately fond of it. Now sit down here and we'll have a nice chat.'

Calman sat down on the swelling divan to which she pointed, and as in a dream looked round the beautiful apartment, so rich, dainty, rococo. He could scarcely catch his breath; he was simply overwhelmed by this magnificent woman in her magnificent setting. He felt drab and commonplace among these environments, a smudge on a beautiful picture. It was all so unreal. Presently he would wake up and find himself back in dingy Kurnick. This glorious specimen of womanhood was surely a stranger who mistook him for some one else. What had she to do with wizened, crippled old Zelig? She could be no daughter of his, or else her first question would have been concerning him.

- he began, clearing his throat. 'Gnendel'-

Or, at least—I beg your pardon.'

She clapped her hands with delight. call me that again!' she exclaimed. 'I haven't heard myself called by that name for years. It makes me feel so young again!'

'Gnendel,' Calman resumed soberly, 'my business here is about your father.'

A look of concern overspread her features. She cut short 'He's not ill—or, perhaps'the question.

'No; he is living,' he reassured her.

'I knew he was well the last time I heard of him,' she continued.

'The last time you heard of him!' Calman

echoed wonderingly.

'I made arrangements, unknown to him of course, to have news of him about once a week. I am aware that he has been living with you. I sent him those remittances so that you might not consider him a burden. I suppose you came to certain terms on the matter.

Calman made an indefinite gesture which might have meant yes or no. He was dazzled by the new light which her explanation had thrown on her attitude towards her father. So she had not forgotten the main characteristics of her race, the principal tenets of her religion. Her father was still her father to her. But there was yet one link missing in the chainwhich, however, her next words supplied.

'But, of course, I could not come back,' she said pensively. 'What would he have said to my profession? He would have cursed me, unless-perhaps-he would have preferred to kill me. No, no, I can never come back.'

'But you must come back, Gnendel,' said

Calman slowly.

She opened her great eyes in wonder, and perhaps a little vexation. 'I must, did you say, Herr Schwartz?'

'Your father saw you at the circus last

Tuesday night.'

'Wait a moment. Last Tuesday! I read somewhere that an elderly Jew had been ejected for creating a disturbance. I suppose that was my father.' She saw the confirmation of her conjecture in his face and laughed bitterly.

'Why, it's quite humorous,' she added.

'It was a terrible shock to him,' resumed Calman. 'To his old-fashioned notions you were outraging all maidenly modesty by-by your professional costume. At first I thought he had lost his reason. Now it appears he has only lost his memory. His mind has been impaired in a peculiar way. All recollection of the four years which have intervened seems to have been wiped clean off his brain. He supposes you are still at Kurnick. He thinks you have never left him.'

'Well?' she interjected curtly.

'And so he is asking for you incessantly. I have put him off as well as I could, but he will not be put off any longer. He had actually made up his mind to go and look for you himself. I thought it best to take that task on me instead.'

'And what do you expect me to do?' There

was a hard ring in her words.

'To come back and humour him in his selfdeception; to pretend, as he thinks, that nothing has happened. Unless that is done he will simply waste away with impatience. Or he may get sane, and remember the truth, and then he will die more quickly. I think you told me once,' he continued after a slight pause, which she made no move to fill, 'that you did not want your father's premature death on your That was the reason why you conscience. went away then. That is the reason why you must return now.'

She got up and went to a little side-table, took a cigarette, and lit it. She puffed at it once or twice and threw it away. Then she paced the room with short, quick strides. Calman watched her, outwardly calm, but with an inward quaking of his heart. He felt as if he had blundered into the cage of a young lioness, and had disturbed her in her sleep. She came to a sudden halt in front of him and said, 'Do you know

what you are asking of me?'

'Yes. To prolong your father's life; if not, at least to soothe his last days.

She turned away again, the same mutinous expression on her face he recollected seeing there four years ago when Zelig called her to leave the gipsy procession.

'It was very unfortunate, very unnecessary,' she said at last, standing with her back to him.

'Why did you bring my father here?

He leapt up, startled and entirely thrown off his guard. Yet why should he be surprised at her intuition? Could one be surprised at anything this wizard of a woman said or did? But if she had succeeded in seeing beneath his mask, why continue to wear a mask to himself? He would be frank.

'I gave myself many reasons for coming here,' he said; 'every reason but the true one. Well, then, I brought your father here-because

I wanted to see you.'

'You wanted to see me!' she echoed, dwelling on each word and looking hard at him.

'Yes, I wanted to see you,' he repeated, returning her gaze steadily. 'It was the craving of a man who wishes to lay the ghost that haunts him. It was very rash, very imprudent of me. Punish me for it as you think fit. But -don't let your father suffer on my account.'

'Yes, I will think out your punishment,' she said, her manner harsh and threatening. 'As for my father, I will consider that too.'

'I can give you till nine o'clock this evening,'

he said.

'You can give me?' she cried angrily.

'The train leaves at nine. I am going back by it, with or without you. I must be back at Kurnick by to-morrow morning without fail. If you wish to accompany me, be at the station in time for the train.'

Her eyes blazed at him in inarticulate anger. Nor did she have time to find speech. There were hurried steps in the antechamber, the door opened, and a man rushed in tempestuously. Calman knew him at a glance. It was the young man of the poster incident and the

imperial box.

The new-comer stopped short and looked from Gnendel to Calman, and his gaze remained fixed on the latter. 'Why, I'm blessed if this isn't the fellow I nearly sent spinning under your carriage-wheels the other day!' he said with a laugh. Then he quickly stepped up to Gnendel. 'What does he want here?, suppose he has found out who you are, and is molesting you for compensation. Been bruised, and all that sort of thing, eh? But I'll make short work of him.—Here, my man'-he held out a gold coin to Calman—'take this and buy yourself a plaster for it.'

'Herr Schwartz has not been molesting me, said Gnendel coldly. 'He is an old friend of

mine.

'Oh, indeed !- I am delighted to meet you, [Christmas Number.

Herr Schwartz.-Only, I had an idea-of course, I was quite mistaken—that you were quarrelling as I came in. But perhaps I am de tropam I?'

'That depends whether Herr Schwartz has anything else to say to me,' replied Gnendel, looking at neither of the two men.

'No, there is nothing else,' said Calman

quietly, turning to go.

Gnendel rang the bell, and the housemaid appeared to show him out. There was a tightness about his throat which prevented him from uttering the merest formula of leave-taking. On looking back for a parting glance he caught just one flash of Gnendel's eyes, which told him nothing. The only thing he was sure of was that she had wanted to get rid of him. Well, he had done his best. He could do no moreexcept wait for nine o'clock.

'That ill-mannered friend of yours is evidently a Jew,' said the young Cuirassier with a laugh.

'Why not? I am a Jewess.'
'Indeed! I thought you were a gipsy.'

'No; I did not start so high up in the social scale.' With a gesture of utter indifference she flung herself into the nearest arm-chair.

The young man, with soft, stealthy tread, came over and knelt down by her side, taking her hand and humbly looking up at her. Jewess or gipsy, you are absolutely the most wonderful woman that ever breathed,' he whispered adoringly.

'Oh, yes, we know all about that,' she said, tapping the floor impatiently with her foot.

He sprang up furiously, and strode over to the other end of the room. 'You are in one of your moods again,' he cried. 'Your friend Schwartz has evidently upset you. Here I come flying to you on wings, as it were, to give you the great news . . .'

'Great news, Benko?' she asked with a mild

show of interest.

He approached her again eagerly. great indeed. I succeeded even more than I hoped. The Archduke has asked us to lunch with him at the château. The day is not quite fixed, but he is already having a special ring built in the grounds, where you are to ride to him privately. Just think what that will mean to you! You have had many triumphs, but this '--

'Yes, it's very nice. I will consider the invitation.

He gasped. 'You will do what?'

'Yes; why not, mon cher? I will think it

over-among other things.

He laughed with genuine heartiness. a fool I am, and what an actress you are! really took me in for the moment. I know there aren't many things you hold in respect on this earth; but I presume you make an exception with archdukes, don't you? By the way, you haven't thanked me.'

1907.]

'I will do that when I have considered.'

'Very good. Since you persist in keeping up the joke I will humour you. Besides, I am rewarded already. You are having supper with me at the Belvedere to-night, aren't you?'

'I will see if it's down in my note-book.'

He repressed something which might have been an oath. 'I know it's there, because I put it down myself,' he said. 'And if you really want to please me'— he added tenderly.

'Yes, Benko?'

'Wear your chiffon velours and put my diamond aigrette in your hair.

'I may; but you know I always leave my toilet to the inspiration of the moment.

He looked at her sideways, suspiciously almost. 'You are distraite,' he said.

'Perhaps I am.'

'I had better go.'

'Perhaps you had better.'

He came close, and, taking her hand diffidently, bent low and kissed it.

She lifted her disengaged hand and lightly stroked his hair. 'You are a good boy, Benko,' she said almost softly.

He straightened himself, his face beaming with delight. 'Then at ten o'clock, outside your dressing-room,' he cried buoyantly, waving

her an airy farewell. Scarcely had the door closed behind him when she sprang up, all her abstractedness and indolence vanished. Every movement of hers showed the nervous and muscular tension of one bracing herself for a tremendous struggle. What had happened in this last hour? What had not happened? This hour was the narrow line on which both her past and her present had met, and were balancing themselves, and she had to keep them in equipoise. Compared to that, her most daring equestrian feats were mere child's-play. She clenched her hands and set her teeth to master her inward turmoil and to compel her thoughts to a more even pace. There was no time now to quarrel with the strange chance which had placed her in this dilemma. She might be angry with Calman, but how did that help her? She knew that if it had not been through Calman the news would have reached her through her own channel of information. Her friend the assistant police commissioner would have sent her word in due course. Well, and what did her father's message come to? Like a beaten dog she had been driven from her home; and now, like the same beaten dog, she was to slink back at the first She was to jeopardise her brilliant whistle. career by lingering for months, years perhaps, at the bedside of a whimsical old man who had never loved her. And the Archduke was having a special ring built for her at his château! It was really too absurd. Could she hesitate for a moment in her decision?

And yet she did hesitate. Not till it was time to dress for the performance and the subsequent supper with Benko did she become sure of herself. With defiant tread—though she did not quite know what or whom she was defying—she went to her dressing-room. She did not immediately ring for her maid. What should she wear to-night? Why not the chiffon velours and the aigrette? If she was not going to please the old man who hated her, there was no reason why she should not please the young man who loved her. She opened her wardrobe and cast a careless glance at its contents. Her gaze fell on a little parcel thrust away in a corner. On a sudden impulse she snatched it up and untied it. It contained things strangely out of keeping with the remainder of the wardrobe: a patched-up bodice and skirt, a faded red sash, and a kerchief of the same colour. They were the clothes in which she had left Kurnick. She had kept them, guarded them zealously. They were her talisman, her mascot. As long as she had them she felt her fortunes safe. Every now and then she had taken them out and gloated over them, with heart beating high, with quick-rushing thoughts of triumph and exultation. Heavens! these were what she had started the world with. To-night she knew she needed their admonition more than And yet, to-night, what was the matter with her eyes? She was suddenly viewing everything through a blur, a mist. What in the world was this-tears?

She sat down in a chair, folding the shabby finery in her lap and again hugging it close to her breast. It was to her no longer the memento of her struggles and her successes. These patched clothes spoke to her only of one thing-her dead mother. It was her mother's deft fingers that had made them, the last work they had ever done. It was her mother's honeyed voice that had wheedled from Zelig a few of the scanty gulden for which he toiled so laboriously. Could she have forgotten it? Her mother had prayed for her, and her father had worked for her. It had broken her mother's heart to see their one remaining child going about in rags. Oh, her mother! her mother! And now that same mother was watching her (Gnendel) from her place in Paradise, waiting anxiously to see how this child of hers would decide the fate of her poor, maundering old Zelig. A sob shook Gnendel, another, and then her face was buried in her hands and unresistingly she allowed the flood of tears full vent. No, no, she would not desert her father. Let the Archduke build a ring for her if he liked; he could ride in it himself. She would go.

With trembling fingers she doffed her gown. No shimmering fabrics for her to-night; no gleaming ornaments. She slipped on the patched clothes, bound round her head the

faded kerchief. As she had gone from her father, so she would go back to him. She hurried down to the sitting-room and there called the maid.

'Mademoiselle is going to a fancy dress

ball?' cried the girl, astonished.

'Yes, I may have to do some masquerading,' was the curt reply. Heavens, what a sensation she would create at the Belvedere if she appeared there like this!

She sat down and scribbled a letter, addressing it to the management of the Hippodrome.
'I want this sent off at nine o'clock,' she said to the maid, who had watched all her movements open-mouthed.

'Yes, mademoiselle.'

'And now I want you to lock up every door except the servants' rooms, and give me the keys. You will all remain in the flat till you hear from

me again.'

The girl went off to execute her orders, and Gnendel busied herself with other preparations for her journey until the maid returned with the keys. She then put on her most inconspicuous cloak, took up her satchel containing her purse, and hurried out into the street After walking a little distance she called a cab and told the man to drive by a devious route to the station. She wished no one to spy on her. She hastened into the booking-office-it was three minutes to nine-and took her ticket for Kurnick. On the platform, striding up and down with feverish steps, was Calman. exchanged no words as they met. He only looked at her and nodded. And then, still silent, they took their seats in the third-class compartment.

CHAPTER IV.

HE morning sun was already bright when Calman and Gnendel stepped out at Kurnick station. The long tedious journey had not been re lieved for them by any conversation. Wrapt in their thoughts, they had let the miles and hours crawl slowly away behind them. About three in the morning Gnendel woke up and found her head pillowed comfortably on Calman's shoulder. Without any comment she had with drawn it and sat up straight. It only reminded her of her object in travelling in this hardbenched third-class carriage when she could so easily have afforded the luxury of a wagon-lil. If she wished to play her part properly she must begin to discipline herself to the conditions of the old cheerless existence. Calman had found nothing to say to her. Questions of life and death might be a fit topic of conversation with this extraordinary woman. He had been fluent enough when he had to plead with [Christmas Number.

her on a matter wherein the great human principles were involved, but mere small-talk seemed absurd. He could not even bring himself to tell her of the pretext which he had given Zelig for her absence. Petty untruths seemed utterly incompatible with the great issue upon which she was bent. A woman such as she could hardly fail to prove equal to any and

every occasion without prompting.

They met nobody on the way to the house; the hour was still too early. The nature of her errand came home to Gnendel with more and more force as she made her way through the well-remembered places, leaving her room for no other thoughts, and scarcely allowing her to draw breath until noiselessly the two stepped into the sick-room. Zelig was dozing. At the first glance Calman noticed the change which had taken place in the old man's appearance during the short time he had been away. face had become ashen gray, and beneath the tight-drawn skin the cheek-bones stood out sharp and angular. The fingers of the one hale hand were twisting and twitching restlessly on Silently Calman motioned the counterpane. the woman who had been his locum-tenens to leave the room. Stiffly erect, her arms folded across her breast, Gnendel took her stand against the window-ledge, an unfathomable, living enigma. Calman cowered in the wickerchair by the bedside, his heart drumming within him fit to burst as he awaited the outcome of his daring experiment.

Presently Zelig opened his eyes, but only to the merest slits, and the heavily drooping lids concealed all trace of any emotion he might have felt at sight of his daughter. Then his mouth contracted and he said querulously, 'Where's my gruel, Gnendel? You know I can't eat the hard crusts with my toothless

gums.'

'It shall be ready in a few moments, father,' replied Gnendel; and without any more ado she emptied the bag of oatmeal into a saucepan and placed it on the spirit-lamp which Calman had lit for her.

'And while it's simmering you can black my The leather is already turning white, boots.

went on Zelig.

Gnendel recognised the rasping tones in which her father used to speak to her of old. Yes, there could be no doubt of it; it was as Calman had said. His memory had leapt back across the gulf of those four years, and had stopped dead on the other side. Calman quailed as, without a word, he saw her take up Zelig's boots. He hurried into the adjoining room and brought her a brush and a box of blacking. The tragic farce must be kept up; but how long would it last, and how would it end?

No sound was heard save the simmering of the saucepan and the swishing of Gnendel's brush.

1907.]

When she had finished, Zelig's voice again broke the silence. 'My praying-shawl is so dirty that people look at me in the synagogue. You must wash it at once, Gnendel.'

'Where is the wash-tub?' she asked of Cal-

man in an undertone.

'Gnendel!' he gasped.

'I shall go and find it myself,' she said, going towards the door.

'Stop, Gnendel!' cried Zelig, sitting up suddenly.

Gnendel and Calman turned to him in astonishment at the change in his voice. It was no longer the voice of a dotard, but of a man

whose thoughts ran clear and strong.

'Yes, Calman, you are right; there 's no need to go on with this play-acting,' rasped the old man. 'It's not you that have fooled me, but I who have made a fool of you. Oh, how I laughed that you, the shrewd man of business, could be hoodwinked so easily! Yes, I laughed.'

'What do you mean, Zelig?' queried Calman,

flushing and growing pale by turns.

'That I made you my cat's paw—I, half-witted old Zelig. You went to Vienna on business? God told me otherwise. I knew why you went. I made you take me to the circus because I knew who was the woman with the horses long before you did. God again told me. And then I went mad. Oh, I knew when I was mad and when I was sane. I am quite sane now, I tell you. Gnendel had gone to Cracow to sell my scrolls-my Gnendel did that? And then I sent you for her. I knew well enough that you would go to her in the unholy places where she wallowed, and that by every device of your tongue and mind you would drag her back here.'

'Why did you want to drag me back here, father?' Gnendel interposed quietly.

'Why? Because I had something to say to you, my child, before I died. I had to tell you that you have shamed me before men and before God. I should have kept knocking at my coffin-lid if these words of mine had remained unspoken.'

'Have you anything else to say, father?' she

asked, with no change of mien or tone.

'Nothing to you, my child. The rest I shall say to your mother and your sister when I meet them. I shall be able to tell them that their Gnendel is making a livelihood by showing herself before the lewd eyes of men, by drawing upon her body the evil desires of their hearts. Your brother, too, who died doing his duty to his king, as commanded by our sages, he also will be glad to have such joyous news of his sister. But, oh, my child —the strained voice broke into a whimper—'I shall pray God He should account it to you for a redeeming merit that you came back in time to hear 'Oh, not your curse, father!' came passionately from Gnendel.

There was no answer from Zelig. Clutching wildly at the air, he fell back upon the pillow, a film of white foam covering his blue lips. At the same time, with an ominous hissing, the saucepan boiled over, quenching the spirit-lamp.

Dissembling his fear, Calman bent over and listened intently for a little while; then he turned to Gnendel and said gently, 'I don't think he will need any more gruel.'

Gnendel drew a deep breath. 'He died so that I might escape his curse,' she murmured, gazing stonily in front of her. 'But I killed him after all.'

He gripped her by the arm and drew her into the next room, where, after murmuring a few words such as he thought the occasion demanded, but which she evidently did not grasp, he left her to her own company.

The first intelligence which at last filtered through her dazed mind was when, some time later, she heard through the thin walls the sounds of hushed voices and footsteps, and all the subdued commotion which are the tribute to the august presence of death. Still later Calman brought her some food, which she left untasted. There she sat, trying to think, and only tortured by the emptiness of the effort. Sometimes she felt as though her brain were harnessed to the team of fiery grays she was accustomed to drive in the ring, and they were all pulling in different directions.

After nightfall the hushed commotion began again in the death-chamber. Something was being brought in and set with a hollow thud on the floor. She knew that all the rites and usages for the decent decking of the dead were being carried out. After that Calman came again into the room and asked her if she wished to take a last look at her father. She rose at once and followed him. Yes, her father as she saw him now was worth looking at. was no longer the grim, discontented face she had known. It was a face on which the assurance of peace was written large and clear. The half-smiling mouth gave no token of reproach or accusation. No; why should it? Its sting was gone; the poison rankled elsewhere.

They buried him next day. Gnendel, according to the custom of her people, did not follow the funeral. She remained behind, seated on the mourner's stool, indifferent to and unconscious of all that went on around her. Neighbours and gossips had flocked into the room, ostensibly for the pious purpose of comforting her, but really in order to satisfy their curiosity over Zelig's runaway daughter, who had strangely come back just in time to see him die. Evidently she did not take it much to heart, for she had not shed a tear. Nor would it appear that things had gone very prosperously with her out in the world, for she had

returned with nothing but the clothes she had to her back when she left. What a warning her fate should be to all disobedient children! And now, no doubt, she intended to quarter herself on that good-natured fool of a Calman, the shameless thing! She thought she could take advantage of him as that cunning old father of hers had done. But it should not happen; if all the women in Kurnick had to band themselves together and appeal to the Government, or even to the wonder-working Rabbi of Saddogorra himself, such a scandal would not be tolerated. A girl with such flashing eyes-they flashed more than ever; did you notice it, my dear?—was a danger to the place. And Calman had to be protected against himself. Now that he had got rid of Zelig's malign influence he would probably prove more tractable to the marriage-mongers. As for Gnendel, she would be allowed to stay out the seven days of mourning, and then away with her back to the beggars and vagrants with whom she had been consorting.

Late that same day, however, something occurred which put quite a different complexion on the conjectures as to Gnendel's doings and social status during her disappearance. Half-adozen gossips were keeping her company, when suddenly the rattling of spurs and the clatter of a sabre were heard in the passage without The door opened, and Calman entered, followed by a splendid young man in an officer's uniform. Ah, quite so! Gnendel had done something and now the police had traced her, and would take her off to prison. But the officer's behaviour soon knocked that theory on the head With a cry of joy he sprang forward, plumped down on his knee, and, utterly disregarding those present, snatched up her hand and covered it with passionate kisses.

'Come away; he wants to be left alone with her,' said Calman to the gossips, a strained look on his face and a hard ring in his voice, and setting the others an example by going towards the door.

The room cleared as if by magic. It was unwise to trifle with a man in an officer's uniform, although he demeaned himself by being in love with a Gnendel.

'So you found me out, Benko! That was very clever of you, Benko,' said Gnendel, with a little laugh, and yet with slightly wrinkled

brows.

'Your maid told me that some one had come for you from Kurnick. I hurried here and asked for Herr Schwartz,' he replied eagerly. 'Oh, why did you not tell me? Why

did you not confide in me?'
'Because I preferred to keep my own
counsel,' she said, shrugging her shoulders

'But what does it matter so long as I have found you again?' he exclaimed joyously. 'You did give me a fright, though! And, oil, [Christmas Number.

the havoc you left behind! The Hippodrome directors are in despair; they are scouring the country for you; they say they must have you back by hook or by crook. Are you ready to come back with me now?

'No, I'm not quite ready, Benko.'

'Then I shall wait for you till you are. I'm not going to lose sight of you again.'

She shook her head, but said nothing.

'Oh yes, yes,' he said importunately, 'you must be back to-morrow morning. Listen, dearest. We are to lunch with the Archduke the day after to-morrow—much sooner than I expected. Isn't it glorious?'

She had closed her eyes. Was it to avoid his ardent gaze, or was she looking at things that could not be seen with the mere physical

vision ?

'But did you hear me—did you hear what I said?' he cried, puzzled by her silence.

'I heard, Benko.'

'Ah! no wonder you are overwhelmed.' He looked round him exultantly. 'So that is where you come from,' he continued. are even a greater miracle than I guessed you to be. From the hovel to the palace! And now I have something else to say—much greater news still.' His tone sank to an endearing 'There is hope for us now, dearest whisper. one. I think this will solve our difficulty; I was thinking of it coming along in the train. The Archduke is my friend. With his influence you may be received at Court. And thenand then my father could no longer object. Oh, don't think ill of him; he can't forget that the blood of the Poniatowskis flows in his veins. Dearest, dearest, will you love me a little when you are my wife? Oh, speak, speak! Don't torture me so !'

'Benko, I can't give you any answer now.'

'No, no, of course not. How can I expect it? Your father died only yesterday, as I have just heard. You are upset, unstrung. I shall wait. Perhaps there may be a decent hotel in this place. If not, I shall sleep in the

'But you must not stay here in Kurnick.

You must go back at once.

He looked at her suspiciously. 'I don't know what you mean,' he began. 'I don't know myself. But do as I tell you.' 'I don't

'Then I suppose I must,' he said with a sigh

of resignation.

'Good boy, Benko!'

'Oh, don't say that,' he burst out; 'it almost

sounds like "good dog."

'There are hundreds of men who would have been satisfied even with that,' she said in a matter-of-fact way which robbed the remark of any tinge of vanity.

'I know,' was the sullen reply.

'And now I want you to promise me something, Benko.'
1907.]

'Promise you-what?' he asked cautiously.

'To tell no one where I am to be foundnot till I choose to come from my hiding-place

of my own accord.'

'Oh, I'll keep quiet enough,' he assured her with alacrity. 'Do you think I want the others to come buzzing round you when I have to stay away? And when you come back—well, it'll be only another one of Flamme Noire's escapades. You know people forgive you everything. And the Archduke on top of it! What an advertisement! The very pavement stones will talk of you.

'They may, Benko-they may.

'I may stay a little now, eh?' he asked with childish wistfulness. He was, after all, little

more than a boy.

'No; you must leave Kurnick at once, as I have said,' she replied firmly. 'If there is no train due get a horse to the next station, and let the train catch you up there.' Her hand went to her throat as though she were struggling with her breath.

'You-you frighten me,' he said.

'I am a little bit frightened myself, Benko,' she said with a queer laugh. 'But I shall be all right again presently. Now, go, please.'

'I'll send you a reminder about the Arch-

duke to morrow,' he said.

'It's unnecessary, Benko.'

salute, he clattered out of the room.

'I should think it was.' He laughed heartily, his assurance fully restored.

She held out her hand, and he snatched it hungrily to his lips; then, with a stiff military

'Good boy! good boy!' Gnendel murmured to herself, her lips moving automatically. The words seemed the mechanical refrain to some forgotten song. They might have applied to anything and anybody—not merely to Benko. Of Benko it was only necessary to remember that he had obtained for her the favour of an archduke, and that through him she, the daughter of a poor Jewish scribe, might marry into a princely family. Benko's father would be got to give his consent. There was only one little hitch in it all: how was she going to obtain her own father's consent? Perhaps Calman could help her to that. Calman had engineered this whole business; he was a wise and shrewd young man, although he had allowed himself to be taken in by an old dotard. She would ask him at once. She would call him. No, on second thoughts she would not. She was rather curious to see how he would behave under the anomalous and difficult circumstances which had brought her to accept his hospitality forto him at least-an indefinite time. But was it less indefinite to her? She had certain data to go by. If she wished to pay the proper tribute of respect to her father's memory, as enjoined by her faith, she must stay here for the seven days of mourning, sitting idle and inactive, and refraining from everything that per-

tained to her usual occupation.

Seven days! And meanwhile Benko was waiting, the Archduke was waiting, the whole world was waiting for her. It was ridiculous. Of what avail was all the knowledge she had gained during those broad, adventurous years, the enlargement of her spirit, the clarifying of her reason, if she could not now shake herself free of the trammels of these old-world, timeworn superstitions? No one could say that she had not done her best to redeem her fault, whatever that fault might have been. She had done what she had been asked to do. She had hurried to her father's deathbed regardless of all consequences. She had found it not a sanctuary where she might expiate her trespass, but a trap in which her conscience was to be snared. And it was only by the merest accident that they had not succeeded. Well, they could take to themselves for it whatever credit they She herself had not come off so badly either in the deal. They might take from her her peace of mind, her chance of atonement, but they could not rob her of Benko and the Archduke.

She did not see Calman again till he came to tell her that supper was ready. He did not look at her as he spoke. His eyes were on the ground. Oh, what a difference from her bold-faced, high-spirited young Cuirassier!

'I am leaving here to-morrow morning,' she said to him, after having curtly refused his

invitation to the meal.

'Quite so,' he replied, nodding in a matterof-fact way.

'I am glad my arrangements meet your views,' she said with somewhat superfluous sarcasm.

'Why shouldn't they?' he asked, quite un-'They give me all the time I require for saying to you what I have to say—with your permission, of course, he added with an ungainly bow.

What! you have something to say to me,

Herr Schwartz?'

'I want to ask your pardon for all the annoyance I have caused you. It was quite unintentional.'

'That goes without saying.'

'It might have gone without doing. All my other failures should have warned me that they

could only culminate in a great fiasco.

'Oh, there you are quite wrong, Herr Schwartz. The fiasco was by no means a foregone conclusion. You see, there is the law of contraries, if you know what I mean by that. At any rate, you deserve every credit for your perseverance.'

He would have given years of his life to know how much of irony there was in her words. From her face he could gather nothing.

It was a mask.

'Still,' she continued lightly, 'if you really think you have done me an injury, and insist !

on making me reparation, you might do it by helping me out of a quandary.'

'Willingly.'

'I want you to help me to conjecture what my father would have said if old Prince Poniatowski had come to him and begged of him to do him the honour of allowing me to marry his son.'

He was quite prepared for such a question. He was prepared for it when Benko came into his shop and asked him where he could find Mademoiselle Flamme Noire. Smart young cavalry officers did not lose their way into Kurnick without very good reason for it.

'What your father would have said to your marrying a Gentile?' he repeated significantly.

'Yes, a Gentile-even a prince,' she prompted him impatiently.

'I think your father would not have said

more—than he did not say.'

She bit her lip meditatively. 'I see,' she said finally. 'You put it very well—quite delicately, in fact. You are cleverer than I thought. I am surprised you made all those mistakes.'

A wave of anger drove the blood to his face. Why should he stand here and allow himself to be tormented by this creature without a heart? She should see she was presuming too much on her power. He would make an end of it.

Before you go, there is just one small matter of business I wish to settle with you,' he said

coldly.

'A matter of business? Oh, the funeral

expenses?'

'Not at all. I have to give you something which belonged to your father. One moment, please.' He dived into his coat and drew out a leather pocket-book. From it he took some papers. She watched him curiously. 'Here are the vouchers for all the remittances you sent him, and which I saved up for him at the bank—twelve hundred and fifty gulden. I should think there must be another sixty gulden or so for interest. Take it. The money is twice your own, once because you have earned it, and again because you inherit it.'

'Why didn't you put it to the use for which I intended it?' she asked, taking a pace or two

away from him.

Because his care and maintenance was to me a labour of love, and I could easily afford

'You mean you don't like keeping money which was earned by—by drawing upon one's person the evil desires of men.'

'That seems to have been your father's view,

he said quietly.

'But not yours? Oh, how brave and pious of you to tell lies through a dead man's mouth!'

She flung the words at him in a positive transport of fury. He looked nonplussed at [Christmas Number.

This was very strange. Since when had he acquired the power of making her angry? She might mock him. Yes, that was natural. But upbraid him? He felt himself growing A sudden sense of masterfulness came over him. It gave him the courage, which otherwise he never would have gained, of doing the boldest deed he had ever done in his life. Yes, why should he not, at the eleventh hour, strike at least one blow for himself?

'There is only one other thing,' he said; but for all his vaunted courage his voice shook

perceptibly.

'What! only one other thing?' she echoed, having apparently regained her self-possession.

'I thought you might like to take away with

you some memento of your father.'

'Yes, I should,' she said instantly. pick out something from his belongings.

He drew himself up and looked straight into

her eyes.

'If I were sure you would not misunderstand

my meaning I would make a suggestion.'

'Oh, don't trouble about that, Herr Schwartz,' she said almost flippantly; 'the time for misunderstandings between us has passed. speak too openly to each other. Now, what do you suggest I should choose?'

He quickly stepped over to a little iron safe in the corner of the room, unlocked it, and took from it a folded document. He came back and

held it out to her.

'Perhaps you will like this. It's the last thing your father's hand ever penned. He became paralysed two or three days later.'

She had snatched it from him, and was examining it. She had not been taught the cursive Hebrew letters in which it was written, and therefore could not read it. And yet it seemed to her as if she ought to know what it 'Will you read it for me?' she asked.

'There's no need to do that. It's simply the betrothal contract between you and me which he wrote the day you went away. had fluttered to the ground unnoticed, and I

took the liberty of appropriating it.'

For a few moments she toyed with the paper, holding it with both hands. Every instant he But she did expected she would tear it across. not tear it. She folded it up again, looking at him calmly with her large, fathomless eyes.

'So you think I should take this, Herr Schwartz? It's curious. The clothes in which I came here are my mother's last handiwork, and this— Very well. I am much obliged to you for your suggestion.' She paused and allowed a smile to flit across her lips. 'But, really, Herr Schwartz, you are developing all sorts of unsuspected attributes. Now, would anybody have ever taken you for a humourist?

He scowled, not so much with anger against her as against himself for the feeling of vanquishment which had come over him. What,

1907.]

She indeed, was the good of fighting her? always got the better.

'Shall I send your supper in here?' was all he could say as he turned to leave the room. 'Pray, don't trouble, Herr Schwartz.

see this bowl of milk and bread is still untouched. I sha'n't need anything else to-night.' Once alone again she looked at her watch.

It was half-past nine—rather later than she thought-just about the time, to the minute almost, when she should have made her appearance in the ring at the Hippodrome. How far off and shadowy it all seemed, as if it had never The lamp on the table flared with a wan, ghost-like flame. Gradually all the noises without hushed one by one as the little town settled itself down to sleep. Gnendel, stretched on the makeshift bed into which the sofa had been converted for her, wondered when she would fall asleep. Upon her was a paradoxic feeling of apathy and restlessness. She wished that one of her beautiful grays were champing outside, ready saddled for a furious gallop across the darkened fields, and yet it seemed to her that her fingers had lost the strength to manipulate the reins. They were only just strong enough to hold—— What was it they were clutching so tightly? Oh, how stupid of her! She was still retaining the paper Calman had given her, the last manuscript on which her father had exercised the skill which had brought him so little joy and profit. She wondered how her life would have shaped if she had allowed herself to be bound by this contract. Perhaps it was due to the hushed quietude and homeliness of her surroundings, but the idea did not seem to her so very repugnant. Her heart suddenly felt empty and chill. It was as though a great fire, hollow and undermined by long burning, had all at once settled down into cold gray ashes. Yes, her spirit had flamed with a fierce blaze for four years, which seemed four centuries. Was it possible it had burned itself dead?

No, not quite dead, for among the dun cinders one spark gleamed brightly; but only just one spark, and therefore she must husband it, cherish it, fan it into some great significance. What should it mean to her: Benko, her ambition, her future? No; all these seemed insufficient. What, then-what else was left in her life, into which she might construe it? Ah, she had it! It should mean to her the desire to do something by which she would please her father. The thought was no accident, not even an inspiration. It was the inevitable upshot of the sequence of ideas which had burrowed their way through her mind from the moment she had stepped into her father's death-chamber. That was the secret undertone to which her whole soul had vibrated ever since. It had brought that strange note of discord and hesitation into her talk with Benko, had made her

irresolute and difficult, and like to one groping the way blindly along tortuous paths. But now she could walk straight, her goal was fair in view. The loyalty she had not shown her father in life she must show him in death. The desire waxed into a passionate craving. That, and something else-which had not yet shaped itself quite so clearly—goaded her up from her couch. It was long past midnight now. The sky was paling in the east. Through the thin partition wall came to her the snore of the old woman whom Calman had installed as chaperon in the house. It reminded her of her father's laboured breathing the night she had run away. From all sides her father called to her. She was glad the looking-glass was overhung with the white linen sheet, as was customary in a house of mourning, else she was sure it would have mirrored back on her not her own pallid countenance but the shrivelled old face which only smiled when death would no longer let it frown. She began to understand. That was why her father had died so quickly. He knew he would wield greater power over her dead than living. She shivered. Something icy cold seemed passing across her heart. Surely that was her father's palsied hand. Then the touch became warmer, softer, more caressing. It melted the glacial surface of her soul; it loosened the frozen fountains of her eyes. But she speedily checked her tears. They were too dangerous. One never knew what they might wash away-perhaps the better part of one's self. Who could tell?

She threw herself on the bed and fell into a troubled sleep. She could not have slept long, for when she woke the morning was quite young yet, and the thread of her thoughts showed no break anywhere. It was still her father who dominated her mind. No; if anything, he had become more paramount. The daylight showed her her course stretching more clearly before her. Then came the first sounds of the waking world to claim her attention. From the courtyard below uprose indications of much bustle and commotion. She stepped to the window to find out the cause of it. She saw half-a-dozen men unloading a huge dray. Among them was Calman in his shirt-sleeves. He had just shouldered a large case of pottery and was carrying it indoors. The prosperous merchant working like one of his hired navvies, instead of standing by with his hands in his pockets, as he well might, and idly superintending the others! What was there in the spectacle that it should touch her so to the quick? That heavy case of goods personified to her the determined attempt of a strong man to crush down his heart-ache. That she had made his heart ache, that she still made it ache, was plain enough to her from the love he had lavished on her helpless father, from the flimsy, ungrounded hope which had driven him in

search of her. And most of all from this paper, which he had treasured all these years, and now had given up to her as the most precious keepsake he could think of her taking along with her. A strong man indeed! One of the men who did the world's work, and did it well; one of the men who counted, a solid unit of the rank and file, not a mere inflated figurehead. It was good to ask favours of such a man. And she had to ask him the greatest favour of all: to help her in her desperate desire to win from her dead father the grace she could never achieve in his life.

She remained at the window, seeking to attract his gaze. But he did not look up, although he surely must have known she was there. Much better so. Before such self-respect it was easy to humble one's self.

'Herr Schwartz!' she called to him.

He came at once. Before entering the room he had put his coat on, just as Benko would have done. 'There is a train at midday,' he informed her without waiting for her to speak. 'Thank you.' Her quiet tone made him look sharply at her.

'Are you ill?' he asked.

'I have had a rather restless night.'

'Oh, you will be able to sleep in the train.' 'I am not sure that I shall go by this train.'

'No? There is no other till midnight. She made a sound that was suspiciously like the swallowing of a sob. 'It will depend on you whether I go at all.'

He gave a forced laugh. 'I see; now it's

your turn to be witty, he said.

She shook her head vehemently. 'I am not jesting. I swear it. I don't want to go back to the circus. Answer me, Calman, do you want this contract to hold good between us?

He fell back before the paper she held out to him as before the sharp point of a dagger. Now he was on the alert again. So she had not finished with him yet? She did not want to go back to the circus? His thoughts reverted to the tremendous scene in which she had been the principal figure. To forgo such triumphs, to step down from such heights to the groundlings-if that was what she meant-

'It would be more than human,' he said at

last in answer to his own thoughts. 'It is more than human,' she replied brokenly. 'It is no earthly consideration that has brought me to this resolve. My fate is now in hands which have more than mortal powers. Oh Calman! I have thought it all out thoroughly in the long, lonely hours I have spent in this My father's curse was unspoken in life, but it still tarries on his dead lips. The hammer is suspended in mid-air. The moment I go back to the old life it will come crashing down on me. I can see him watching me pityingly with those grim eyes of his, waiting for what he knows is going to happen. And I am still so [Christmas Number.

young, Calman, I don't want to die yet. I dare not ride any more. I know the next time I drive my team through the ring I shall fall, and they will batter my brains out with their hoofs. And I am still so young! I don't want to die yet!'

Her words had given him time to recover himself.

'This is only a mood of yours; it will pass,' he said gently.

'No, Calman, it will not pass. My cowardice has become too deeply ingrained in my soul.'

He was silent for a few moments. Then he said almost brusquely, 'Is that quite fair to me? You want to marry me because you are afraid?'

'Oh, don't think of it in that way!' she entreated him. 'There is in this more than fear. Have I not played with my life each time I made my bow to the shouts of the applauding mob? And I will do it again if you force me to it, Calman. I can die, but that will not set me right with my father, or with God, will it? No, Calman; I want to live, because I'm not yet fit to face my father. The only one that can make me fit is you. And knowing the hard task I set you, shall I not do my best to make it easier for you? This fear of mine may

turn to anything; you can make it what you like. The root of it is love; why should not the flower of it be love? Only tie me to you, hold me fast, guard me against myself. Oh! don't refuse. You gave me the right to speak to you like this.'

to you like this.'
'Yes, I brought you back here,' he said with

a break in his voice.

'No, that's not the reason. Do you remember you asked me to think out a punishment for you?'

. 'A punishment?' he stammered.

'Yes. What greater punishment can there be for a man than to marry a woman who killed her own father?'

He stepped close to her, all his soul in his eyes, and scrutinised her face in silence.

With quick intuition she put her hand to her heart. There was a faint blush in her cheeks. 'I know what you are asking,' she whispered. 'Thank you for not putting your question into words. You shall have a straight answer, Calman. I have been tempted more than falls to the lot of most women; but I have not forgotten that I am a daughter of Israel. Are you content?'

And his trembling lips, as they sought hers, made eloquent reply.

EVENSONG.

SUNSET and close of day
Bid us to rest;
You last long ling'ring ray
Fades in the west.

O'er the warm afterglow Shades gently creep; Rough places soften so— Just ere we sleep! Chords that the Day struck strong, Fainter now grow; Nature's kind evensong Falls sweet and low!

Voices from 'far away'
Echoed are borne,
Crooning the songs that they
Keep for the Morn!

Close tired eyes awhile,
Strain them no more;
Vain thou'lt not look for smile—
When Night is o'er!
J. S. REDMAYNE.

THE HAUNTED 'SMOKER.'

By EDWIN L. ARNOLD,

AUTHOR OF 'IYVINDA,' 'PHRA THE PHŒNICIAN,' &C.

DOUBT if I have ever been in a more antiquated compartment of a railway carriage than that which was coupled on to the 'down express' Little Mudburgh Junction on the night of this story, with myself in sole possession of

Nominally a first-class, a its dim interior. slight, stale odour about the cushions would have suggested mildew to some nostrils and tobacco to others. Indifferently padded, lit with a dim oil-lamp in the centre of the roof, an indefinable air of age pervaded its narrow windows, low arched ceiling, and badly fitting doors. This coach, as our grandfathers would have called it, had brought myself up from the far byways of a Midland shire; and for some unknown reason the authorities at Mudburgh, instead of making me change into the big London express which came flashing and roaring into the junction a few minutes after us, hitched my decrepit old conveyance on to the fast train; and through the black hours that followed we clattered and rattled south, every spring and joint in the 'smoker' seeming to bemoan the swiftness of modern

Still, the carriage was good enough as long as it held together during the journey; and it was pleasant, as an Englishman always thinks, to be alone. So I snuggled into my corner on starting, with my wraps well tucked in against a cold and chilly night, though a dry one; and even before we left the junction was dozing off into a half-sleep, across which moving lights and sounds outside merely seemed like parts of an indistinct dream.

Whether it was the stale pork-pie—that horrible confection dear to refreshment contractors—I had eaten half-an-hour before, or what else, I know not; but it is certain that my dreams gradually grew more and more sombre, till to my fancies the bath-buns in their bag by my side turned to gold. And as I put my hand over them, in uneasy avarice, all the air seemed full of hungry eyes, and the darkness, which the flickering lamp did so little to dispel, deepened round a form from which a ghostly hand came forth and gripped me by the throat, while the night turned cold and heavy with that presence; and, wrestling with the invisible thing, with a cry and a

start I awoke gladly to find myself alone

again.

But was I alone? As I roused and stretched, cursing as I did so the man who first packed stale pork into staler pie-crust for the ruin of human sleep, I looked round, and was startled to see another passenger in the carriage-a man with his chin sunk upon his chest, and occupying the opposite far-corner seat. His entrance had been quite unobserved, and my first thought took the form of a hope that I had not been making a fool of myself. It flashed upon me that indigestion promotes snoring. Perhaps I had been kicking or talking foolishly as I dozed! What a bore he must have thought

With an apologetic cough to imply I, the sleeper, was awake, and would be more careful in future, I reached out for an illustrated magazine, meaning to offer it to the new-comer, and at the same time taking another glance at him. He was a curious-looking individual; and a vague, unaccountable feeling of chilly alarm crept over me as I gazed awhile. There was an indescribable appearance of limpness in his every limb; his hands lay palm upwards at his sides; his hair hung in dank, wet tags across a face that looked extraordinarily pallid in the oil-light; and he was dressed-that was the strangest thing of all-in tight trousers, under a blue cloth coat with gold buttons, such as old men still sometimes wore in the middle of last century! Yes, he was miserably, horribly limp; he looked as a drowned man might who had been propped up there upon the cushions, and I stared with still increasing apprehension while the black night whirled by outside, and the wind whistled through the ill-made window-framing like a gale in the shrouds of a ship. And as I stared like that, mile after mile, I remembered with a foclish, growing terror that an hour would elapse before we reached our next stopping place, and that that wretched old carriage had been built in the days before communication with the guard was thought of.

At last I could bear it no longer. The air of the compartment seemed absolutely freezing and the silence of the uncanny, hatless indi-

vidual opposite was horrible. 'Sir,' I said, desperately holding out a late edition, 'would you care to see a paper-or I have several here. a magazine perhaps? [Christmas Number.

And then my tongue forgot its office, and I shrank into my corner; for, as though roused from lethargy by a familiar sound, the being suddenly tossed his arms aloft in a fierce pantomime of despair, and went—there in his corner, all by himself, in grim, dreadful silence—through all the choking struggles and contortions of a man who drowns.

Then he started to his feet, and I saw he was wet, dripping wet, while a faint odour of seaweed and slime from a sea-bottom appeared to emanate from him. But all this was as nothing compared to the shock which followed when in a moment that midnight passenger turned upon me a face handsome in its way, but ghost-white and dead-obviously, palpably dead—a dreadful face of contending emotion, amongst which fear and rage predominated, with two eyes shining in it that burned with a light utterly out of keeping with the pallor of

lips and cheek.

I scarcely think I was frightened—the feeling was more of intense fascination; and when the presence-looking over and through me as though I were the immaterial essence and did not exist to its perception—commenced to move hastily up and down the footway of the carriage, I drew in my knees and made myself as small as I presume any one would have done in like circumstances. To and fro that grim passenger went, his bygone clothing clinging to him in sodden dampness, chattering as he moved, and carrying here and there a horrible chilliness which was not of the night outside, and a rank, fishy smell infinitely appalling. Then presently he stopped with a jerk at the far window, which happened to be half-open, and put his head out. I shall never forget the expression that shone under the water-soaked pallor of that face as the light of a chance wayside station flashed upon it. Then in he came again; and now, after appearing to ponder a minute, during which the evil smelling water collected in a pool about his feet, he began feeling over the stuffed backs of the seats first on one side and then on the other, down to where I was sitting. It was with a faint, shrinking feeling I saw those dead, outstretched fingers coming slowly but steadily my way, and then they were close by-only a foot from my face. The curious thing, however, was that their owner did not see me; I felt it then instinctively, and I am equally sure of it now. Thus, when those clammy hands were just about to touch me I did the most natural thing under the circumstances: throwing away my wraps, I dodged down, and slipped on to the opposite seat, whence—with a beating heart, I confessa retreat was effected to the opposite corner of the carriage.

Then happened a singular incident. After regarding intently the very corner where I had only a moment before been sitting, the stranger

1907.]

suddenly pulled away the lining in the upper corner, and exposed behind it another and far older quilting, threadbare and yellow with age. Of this, too, he tore down a foot or so, and with extraordinary eagerness thrust his right arm into the dark recess in the backing of the seat. What would he draw out? His own eagerness infected me, and I craned anxiously forward, clutching the arm-rests, as slowly the ghost-hand came back from the hollow and dragged with it into the yellow light an old, faded leather wallet !

There was something of the fond mother dandling a recovered child, and something of the hungry wolf gloating over a prey, in the way the shadow fondled that faded leather! He played with, hugged, and chuckled over it in choking ecstasy, minute following minute in swift sequence till I thought he would never have done. How long he might have gone on gloating and fingering the wallet it is impossible to say; but suddenly the apparition raised his head, listening eagerly for a moment; then up he sprang, thrust the wallet back into the recess, closed the opening by some unearthly jugglery, and with a horrible, wailing, spluttering cry that rings in my ear to this moment, swung round and sank down and down, struggling and choking, through the green water that swept before my vision; down until I saw him at my feet on a sea-bottom writhing helplessly; saw the lifebreath leave him in an ascending string of silver bubbles; saw the little crabs run across the smooth bottom, and the deep sea-sand spurt and smoke as his convulsive fingers clutched wildly into it. Then everything became hazy. With a shudder I hid my eyes in my hand, and remained in dreadful thought till a gruff but friendly voice exclaimed in my ear, 'Tickets, please! Sorry to wake you, sir; but I must see your ticket!'

Perhaps I need not say I changed carriage with promptitude and decision at that welcome stopping-place; and there, I thought at the moment, the matter would end. But more was still to come. At the terminal station next morning I made a note of the number of the haunted compartment as a matter of curiosity, and then in the vortex of London existence tried to forget all about the matter. Yet it would not leave me; and a month afterwards, happening to be at the station on my way north again for two days, I spoke to the chief superintendent -a good fellow, as most of them are—and telling him part of my story, at which he, of course, laughed, got him to look up the history of laughed, got how to moker, in his ledgers. We that ancient 'smoker' in his ledgers. traced it back and back through an illimitable series of small repairs into the dawn of railway enterprise.

Well, said the inspector as he turned the last folio, 'nothing here, you see! Yes,

though, there is—a pencilled note entered soon after the first running of the carriage.' cleaning his glasses, he tilted the book and read out, "This was the compartment in which Mr Beamish was murdered in 1850; but no official entry of the fact is to be made. -By Order."'

'Where is the carriage now?' I asked after a

moment's expressive pause.

'Working on the east branch line, I fancy, sir,' answered the official, looking at me with a new but dubious kind of respect.

'Can you have it brought down here by the time I return—in two days?' I asked.

'Yes,' he answered, becoming more and more astonished as he thought the matter over. 'Against regulations, perhaps, sir, to order rolling stock about for private passengers; but this is curious—most curious. The compartment will be here awaiting you when you return.

Need I say that if I had before failed to shake off the remembrance of that strange evening, it held me with a grip of iron now? In the big town to which I went, directly a spare moment came I drove to a library and had down a bound volume of the Times for the year in which that faded, pencilled note had said the crime was committed. And Fate itself seemed hurrying me to a solution of my speculations. On the opening page a paragraph caught and riveted my attention instantly. It was a short one, but how strangely it fitted in with the rest of the chapter !-

'MURDER OF MR BEAMISH.-A singular sequel has occurred to this now famous crime in the death by drowning of the undoubted assassin. The victim, a diamond merchant, was, as fully reported in these columns at the time, done to death nearly a month ago in a first-class compartment of a main-line train, and the valuables he had with him, amounting to nearly sixty thousand pounds presumably, carried off by the murderer. The latter made good his escape at the moment, but last week it was ascertained that he was leaving England by the French packet. On the detectives attempting to arrest him just as the vessel was starting, the villain-who was a young and active man-broke away and leapt overboard

with the apparent intention of swimming ashore. A considerable sea was running, however; and even before a boat could be launched he was seen to throw up his arms and sink. Not a trace of the stolen property was found amongst his baggage, and its hiding-place is, and may remain for ever, a complete mystery.

Then back south a few hours later, to find my friend the superintendent almost as interested as myself, and No. B, 8492, its last journey done, awaiting examination in the neighbouring engine-sheds. To the official I showed a copy of the paragraph from the Times, and told the whole of my story. An hour later, with the stationmaster, a gentleman from Scotland Yard, and a carpenter, we went to the sheds.

The mere sight and musty smell of the old carriage brought up the recollection of that midnight ride so clearly that it was only with hesitation I could bring myself to enter. But presently we scrambled in, and I told them just what I had seen, and the strange corroboration their own books and the newspaper file had lent me. 'Quick,' I said to the carpenter; 'down with the lining here in this corner, and you will find another yellowish one under it' Down came the padding amid clouds of dust, and there, sure enough, was the faded backing I had seen before. Down with that next, man,' I cried; 'there is a hollow behind!' The frieze was torn aside, and there was the hollow at last, black and plain. 'Now, sir,' I said to the stationmaster, put your hand into that recess, and if you do not find something there I am a dreamer, and will never touch pork-pie again.'

Very slowly and cautiously the head official thrust down his arm and felt about. We watched his face with desperate interest, saw its doubt change to interest, the interest to hesitation, and hesitation to sudden satisfaction, and the next minute, with an exclamation of wonder, he dragged into daylight the long-hidden wallet, bearing its burden of notes and gems which I had been the means of so strangely recovering long after its story and that of the crime it was associated with had passed out of living

memory.

COUSINS.

By F. C. ARMSTRONG, AUTHOR OF 'TWO LETTERS,' &C.

CHAPTER I.

THE YOUNG COUSIN.

MAN and woman in a garden. The situation is old as Eden, albeit social conventions have altered the environment. In this case Adam and Eve were young and comely-the man a well-set-up figure in the undress uniform of a naval lieu-

tenant, and the girl wore a lilac print frock, with a little sailor hat tilted over her eyes.

They were busily picking raspberries.

'Well, it is provoking!' she was saying, and her voice was very sweet and tunable, with the soft ring of the South upon her tongue. 'It's just horrid that you are ordered off so suddenly! You won't be able to help me any more with the raspberries.'

'Is that your only regret, Jessie?' asked the

young man in an aggrieved tone.

'It's the practical point of view,' she replied lightly. 'You sailor-men have such dexterous use of your fingers that you can put your hand to anything, and you have saved me a lot of fag.' She laughed, and the laugh was as sweet as the voice, while both voice and laughter suited the fair young face, with its flying dimples and soft gray eyes.

'And you won't miss me in any other way?'

the young man responded.

'I wouldn't say that, O Son of my Uncle!' she rejoined. 'I sha'n't be able to take any more delightful expeditions across the bay. Aunt Sophie has implicit confidence in you, and none at all in Peter Branaghan.

'I wonder'-there was a puzzled knot on his brow—'I wonder if you remember what I said

to you last night, Jessie.'

You said a great deal last night. Most of

it was nonsense.

'Not a solitary word.' He leaned towards her and took hold of her arm. 'I meant every word of it, and a great deal more besides.

'Oh! just look what you've done—spilt the whole of that big cabbage-leaf of raspberries!'

she cried.

Her light laugh vexed him. 'That's no answer,' he said with a touch of irritation. the raspberries lie; there are heaps beside.'

'You forget that those poor raspberries represent current coin of the realm, Basil,' she 1907.]

cried, as she stooped to pick up the crimson fruit. 'I am bound to have those twenty-four pints of fresh fruit on board the Admiral's ship by sundown. They mean ices for the dinner-party this evening.

'You sell my aunt's fruit?' cried the young

man in surprise. 'I had no idea'-

'My dear Basil, you don't know everything. We have to make the garden pay for itself, and we can do that, and something over, even if we are the Lady of the Manor, and a very great personage besides, O Son of my Uncle! Since Sir Francis was gathered to his fathers, and Sir Philip reigns in his stead, we are driven very close to the edge-so close, indeed, that it is only by much good management we avoid going over altogether.'

'I had no idea,' he faltered. 'My uncle's widow has been so hospitable, everything looks prosperous, and I always heard there was a

great deal of money in her family.'

'So there is, but it isn't well divided. It is all in the hands of one hard old woman, who will leave it away from Aunt Sophie. I mean Miss

Anne Hamilton of Fairy Mount.

'Let me help you,' he was grovelling on the earth, picking up the fallen berries with a light, swift touch, until they were all safely restored to the leaf. 'I thought you were gathering them for tea,' he said.

'If you look round on the walk you will see a tin can that holds twelve quarts standing there,' she replied. 'It is almost full, and must go off the moment it will not hold any more. Peter will row across with it, and bring me back eight shillings current coin, whereof the messenger shall receive his sixpence.' She laughed. 'Respect my business qualities, Cousin Basil.' She laughed gaily as she looked up into his face.

But he was not laughing, not even smiling. His face was troubled. 'Can't you be serious

for a moment?' he asked.

'Not I. I couldn't be serious—that is, if you are going to talk nonsense, Basil,' she added. 'Didn't I tell you last night I wouldn't listen to any folly? And I won'tthere now!'

'But what I have to say is not nonsense,

'Then the folly would be with me did I listen to you,' she cried.

'Jessie, I know you like me,' he said im-

petuously.

'I do indeed, Basil, like you very much—in "a cousinly way," of course, even if the cousinship is the merest figment and fiction of a tie. You are the nephew of Sir Francis's first wife, and I the niece of his second. Isn't that the fact?'

'Something like it,' he rejoined, with a little smile; 'but we are cousins all the same, although

not within the forbidden degrees.'

'Very much within the forbidden degrees,' she cried. 'Don't I know your story-how you were done out of your patrimony, and left with nothing but your profession and a few hundreds beside? Poverty, especially in your class, is the worst foe a man can encounter. It's hateful, horrible, disgusting, and I won't drag you into it. No, not under any circumstances. I tell you so once for all; and now, trouble me no more.' She was deeply, painfully in earnest; her face glowed like a rose; her eyes were on fire. 'And then, when aunt has been so good to me, how could I be so mean as to entrap her husband's favourite nephew into an entanglement that would most certainly turn into a clog to hang round his neck and ruin his career? Basil, I couldn't be so horribly ungrateful.'

'It was all my own doing, Jessie,' he said with a deep vibration in his voice. 'Ever since the time when I came to Kilronan after uncle's death, and saw the way you took things in hand, and pulled them through, I said to myself, "Here's a girl to make a man's life what it ought to be." I'm not one of those fellows who go in for the "clinging" lot. I want a woman to help me, a woman I can rely upon, and that's what you are, dear.

'Basil, I tell you it can't be-can never be, she said, her colour dying down. 'I'll be poor all my life; but I won't make you any poorer than you are. You are bound to rise in your profession. I'll never be a weight to hold you

back.'

She fussed over the closing of the can, and then, trying to be matter-of-fact, she cried, 'Here is "something attempted, something done," like the village blacksmith of the song. Now, I'll summon Peter and speed him on his way.' She put her hand to her waistbelt and drew from thence a little silver whistle.

Before she could put it to her lips the young man had caught her in his arms and kissed her. 'I'll never give you up, no matter what you say,' he said, still holding her fast.

But, red as a rose, she sprang away from him. 'Come back when I inherit old Anne Hamilton's thousands,' she cried. 'Possibly I'll give you a different answer then.'

'I'll come back in any case, and force you to marry me,' he cried, as he went swiftly down the path to the sea.

She heard the gate clang behind him, and then she sat down on the path beside the can of raspberries and cried a little. She knew how much of her life went with that young man, in his well-fitting uniform.

Her tears did not last very long; they were but a passing shower. She put her silver toy to her lips and whistled long and loud. In response to her call a shambling, rough-headed figure appeared from a distant gate, and blundered towards her.

'Get out the boat, and row these raspberries across to the flagship,' she said. 'You will receive eight shillings from the steward, and you will bring the money straight back

He was a big, loosely built fellow, with wandering blue eyes under his shock of sunburnt hair. He looked vacantly into her face.

To the big ship?' he said thickly.
'Have I not told you? Be a good boy, Peter, and take care of the money. Come back soon. Her ladyship will want you by and-by.'

He lifted the heavy can as if it had been a feather, as he looked intently into her

'Who made you cry?' he said quickly. 'If it was any one but Herself I'll go an' bate them.'

'I'm not crying,' she returned with an impatient movement. 'Go and get the boat.' 'Yourself won't be comin'?' he asked as he moved off.

'No, no! Hurry! hurry!' she cried, and he shambled away towards the path to the water's

Maybe you hurted yourself wid the can?'

he called back over his shoulder.

'No-yes! Hurry with the fruit. Ask the steward if he'll want any more to-morrow,' she called after him.

'It'll rain to-morrow,' he returned, standing still on the path and casting his wandering eyes

to the zenith.

'Run along!' she called impatiently, and the rough figure vanished through what they called

the sea-gate of the garden.

She lingered in the fresh, sweet air until all traces of tears had left her cheeks, and then she took a path leading away from the sea, to emerge upon a tangle of roses run wild, which was known in old times as 'My Lady's Paradise at Kilronan Castle. Like the gardens, the old castellated house was run to seed; but it was a fine house for all its decayed condition. Since Jessie Hamilton had taken things in hand about the old place she had contrived to do much. She found treasures in the gardens [Christmas Number.

27 COUSINS.

which had been neglected for many years—treasures of old herbaceous flowering plants which the whirligig of fashion had brought to the front again. She discovered that daffodils were as remunerative as cabbages, if not far more so; and that violets could be made to bloom in season and out with a little care. Her neighbours looked on with scornful surprise while she made money out of the garden and the poultry-yard. I am not sure that they did not think her 'mean' for her pains; but she knew that she made her dear old protectress more comfortable, and that she filled her own empty days with everchanging interests; and, being quite satisfied with herself, cared but little for the trend of public opinion.

Looking back from the steps of the hall door, she saw the bright bay spread below, a shining expanse of fretted silver in the sunlight, with its background of purple mountains, and the great ships riding at anchor. Her eyes filled. One ship was to carry the best of her life away into the Unknown before the sun touched those giant peaks again. But she dashed those tell-tale drops aside. Aunt Sophie must not

see their traces.

She went hurriedly through the great flagged hall and down a passage to the door of the smallest of three drawing-rooms, the room used by Lady Young, in which the old lady was now seated before a little tea-table set out with rare old Irish silver and china that was fired in the eighteenth century.

'I thought you were never coming,' said the trim old lady, looking up from her cup.

kept you so late?'

'Those raspberries for the Admiral. I picked

twenty-four pounds.

'All by yourself?' queried the old dame, with a sharp glance.

'Basil helped me,' she replied, helping herself

to a scone.

'Basil!' She was a very brisk old lady, with eyes bright as a blackbird's, and a quick, sharp way of looking at you. 'Is he not coming to tea?'

'No; he went back to the ship. They are to sail to-morrow,' Jessie said, occupied with her

But he hasn't come to say good-bye!' cried Lady Young.

'He was in a hurry.' Jessie spoke with a slight hesitation. Yet he had time to help you with those

raspberries!'

'He-yes, but- Oh, Aunt Sophie! he talked a great deal of nonsense, and-I didn't ask him to stay.'

'Humph! Making love to you, I suppose? Very sensible on his part, when neither of you

has a penny!

'So I told him, and he went away.' The

1907.]

lump was rising in her throat once more, but she would not suffer the tears to come. Her aunt was not very tolerant of such weakness; therefore it behoved her to

be strong.

'You know he was done out of his moneyseventy-three thousand pounds-by that old rascal Carr, who played ducks and drakes with his fortune while he was a minor. It couldn't have been honestly done. No, no! Nothing could persuade me that it was on the straight. Banks that went smash, and securities that ran away. Tush, tush! A good deal of my own cash went in the same way, and old Carr retired upon three thousand a year. Tut, tut! Never tell me that everything was straight. One of the lot flourished, how-ever—your cousin, Anne Hamilton of Fairy Mount.

'She is my cousin, isn't she, Aunt Sophie?'

Bless the child, yes! Your mother and she were full first-cousins; but she is no relation of mine. I come in on the father's side. Although they owned the same name, your father and mother were not related. Hamilton is a generic name in Ireland.

'I told Basil I would marry him when I was as rich as my miser-cousin,' Jessie said with a pitiful little laugh. 'Which meant

never.'

'I knew her when she wasn't a miser,' said Lady Young. 'She is my senior by a dozen years, and I was but a child when she was frequently at my father's place. Then she had a terrible disappointment which soured her, and turned her against her relations in Cork. has made a cousin on her mother's side her heir-Philip De Courcy, who married one of the Dublin beauties, a pretty, brainless thing, with no more heart than the-dustbin. Philip's in Parliament; that is why Anne made him her heir. She thinks he'll get a title. Ho, ho! You are the nearest relation the old woman has, but you won't get a ha'p'orth from her. Amy De Courcy has won the soft side of her hard old heart, and she'll have the diamonds and pearls and lace and everything. Have you finished your tea? I want to drive round to Mrs Daly's; she is to give me a pen of Buff Orpingtons; we haven't got into a good strain of them yet. Will you come?'

But Jessie begged off. There were more raspberries to be gathered, she said; so Lady Young drove out in her donkey-chaise alone, with Hughie, Peter Branaghan's clever little brother, to act as running footman. Jessie went back to cry out her cry amongst the rasp-

berry-canes.

It was growing dusky twilight when Lady Young returned. 'I heard some news,' she said. 'Nancy Hamilton is dying—dead by this time, I expect; and Amy De Courcy is in possession at Fairy Mount.'

'Then,' said Jessie very quietly, 'Basil need never come back. The conditions cannot be fulfilled.'

CHAPTER II.

THE OLD COUSIN.

N the big four-post bed lay Anne Hamilton, drifting down to death. The dingy canopies and curtains had been looped back for air; but the room was darkened,

and the oppressive gloom lay like a nightmare upon the pretty, frivolous woman who sat near one of the windows keeping watch with an old and faithful servant, but bored to death, and feeling in the worst of tempers. Miss Anne took an unconscionable time in dying.

Fairy Mount, at the best, was a depressing place. Mrs De Courcy hated her duty-visits there, and this was the worst of all. But her husband had insisted upon her presence in the

house.

'The servants are all right,' he said, 'but then one never knows what a swift temptation may do, and the house is full of valuables. I can't go-I am tied here for the present; but of course I'll run down for the funeral.'

So here sat the little lady, yawning her pretty jaws almost to dislocation, and feeling ex-

ceedingly sorry for herself.

The old woman who kept company with the prospective mistress of Fairy Mount whispered an occasional remark.

'She won't last until mornin', ma'am,' she said. 'It's far through she is this minute, the crater!'

'She is quite unconscious?' queried Mrs De Courcy.

'Augh, sure, 'tis as good as dead she is. Sorra word will she ever spake again. Lord help her!' replied the woman.

'I suppose her diamonds are somewhere in

the room?' Mrs De Courcy inquired.

'She keeps them in the "borrow" beyant,' said the woman, in her subdued voice, as she jerked her thumb in the direction of a fine old Sheraton cabinet in a corner by one of the windows.

'I think I'll have a look at them,' said Amy

De Courcy, and she rose to her feet.

Mary Doyle, the old retainer, looked anxiously towards the bed.

'Faix, I wouldn't touch one o' them until the breath was out o' her,' she said. wouldn't be lucky, like.'

'Oh, but I call that nonsense,' answered the lady, who was longing for a sight of the jewels with which she hoped to dazzle and astonish the eyes of her devoted-and envious-friends and acquaintances during the ensuing 'season'

in Dublin. 'The poor old thing is quite unconscious. She will never know.

Mary Doyle shook her head as she heard the key turn in the lock. 'I wouldn't lay a finger on one o' them for the life o' me,' she muttered. 'But, sure, it's little any o' them think o' a ha'p'orth but what they'll get through her death. The Lord save us!'

Muttering a prayer, she went to the bedside and looked at her dying mistress. Her white face lay amongst her pillows, with eyes that seemed already darkened with the dread shadow. Her wrinkled hands lay supine upon the coverlet. She was breathing heavily. Mary shook her head.

The little lady stood by the bureau and put aside the window-curtain, thereby admitting a streak of sunshine into the room. Mary extended a prohibitive hand, which she waved 'Why, she is quite unconscious,' she 'She neither sees nor hears.' said.

The key made a grating noise as it turned in the lock. Mrs De Courcy let down the front flap of the bureau. 'I suppose the diamonds are in this little central cabinet?' she said as Mary drew nearer, as if fascinated by her boldness.

The central division had a key of its own, which took some time to find amongst its neighbours on the ring; and, when it was found, there was a trick in the lock which required time to master. At last, with a loud tick-tock, it gave way, and the little door opened.

Mrs De Courcy uttered a cry of delight, for the gems exceeded her most vivid imagination. Resting upon faded cotton-wool lay a lovely string of pure white diamonds, perfect in colour and flashing from a hundred facets. Beside the necklace there were sprays for the hair, brooches, pins, and ring after ring—a treasure of brilliants such as she had never dreamed of possessing. And in another division of the inner cabinet there were pearls, amethysts, turquoise ornaments, necklaces, ear-rings-every imaginable trinket that a woman fond of adorning herself had gathered together in the course of a long life.

'Oh, they are quite beautiful—far finer than I expected!' cried the little lady. 'Really, I never dreamed of having such splendid

things.'

Mary Doyle looked on with wondering eyes. 'Sure an' I never seen the like,' she said in hushed, awe-stricken tones, as Mrs De Courcy tried the glittering chain round her neck, placed the exquisite sprays against her pretty hair, and put some of the rings upon her fingers. 'They say the mistress had lace that was worth more than them jewels,' she said beautiful of the said be said breathlessly; 'but I don't know how that could be.

Mrs De Courcy divested herself of the diamonds, and turned to the huge, old-fashioned [Christmas Number.

wardrobe which occupied the other corner between the window and the door.

'Lace is very valuable, Mary,' she said, 'and I'm sure Miss Anne had only the best.' put the key into the ornamental brass-work of 'I quite expect to find treasures the lock. here also,' she said.

The great wardrobe was piled with parcels done up in every possible shade of paper, faded blue, and white that had turned brown with age. Also, some wisps of what had been old tissuepaper, now frayed into ragged fragments like ancient cobwebs; but each little package contained its share of Miss Anne's treasures of old

Mrs Doyle could scarcely understand the value of the delicate morsels laid out before her as Mrs De Courcy untied the queer little packages one by one, and went into raptures over their contents. At last a larger bundle fell from its hiding-place.

'I'll take my livin' oath that's the dress she had made for the weddin' that never came 'It was sixty off,' Mary whispered shrilly. year ago, an' she was full sure Lord Crookhaven was goin' to marry her. Didn't me mother tell

me about it many a time?'

Amy De Courcy unbound the faded ribbons which secured the parcel, and, with a cry of delight, shook out the exquisite web of delicately tinted lace which it contained. had mellowed its colour into a softened ivorywhite; its perfect texture made it fall into the most ideal folds as the little woman held it high in air. She was almost speechless with admiration. 'I never saw anything more lovely—never. I'll wear it at the first drawing-room of the season!' she cried when she could find voice. 'It shall be mounted over the very richest cream satin. I'll have it done in Paris. They know how to treat lace there. With those diamonds reset, and this lace on my dress, I'll be the talk of Dublin for the whole year-every one dying of envy '-

Put that lace back!

From whence had that dreadful voice come? Did it drop from the ceiling or rise from beneath her feet? Who had spoken?

Mary Doyle fell upon her knees and prayed

Again that awful voice rang through the room: 'Put down that lace. How dare you, you thief!-you robber!-you-you-ghoul, feasting upon the dead! Put everything back where you found it, and get out of my house this moment. Out, I say! Go!'

Still holding the web of delicate lace in her trembling hands, Amy De Courcy faced the gibbering figure in the bed. Miss Anne had raised herself amongst her pillows, and was sitting straight up in bed, her ghost-like hand extended towards her cousin's wife, her

1907.]

eyes glittering with an almost unearthly light, her toothless mouth working convulsively, while a stormy red was gathering upon her cheeks.

'You, there—Mary Doyle—turn her out!' the voice went on. 'Put all my things back. Lock them up, and give me my keys. Put that woman out! Never let her enter the house again-never!'

Mrs De Courcy dropped the lace in a sheeny

mass and fled.

Miss Anne uttered a grunt of satisfaction. Lock the door on her, Mary Doyle. Lock the

door, I tell you!'

Trembling in every limb, the old servant hastened to obey the mistress so strangely recalled to life; and when she had turned the key in the door she bethought her of a bottle of Miss Anne's own peculiar claret, which had been brought to the room for the refreshment of the visitor. Miss Anne gulped down a big wine-glassful which her faithful maid brought to her, and with renewed vigour issued still further directions.

'Put everything just as it was,' she cried. 'Now, the keys—the keys; and go downstairs and hunt that woman out of my house, quickquick! She'll never stand under its roof again

-no, nor her husband either. Go!'

Mary's old hands fumbled sorely in her task, but at length it was accomplished, and the ponderous wardrobe doors safely shut upon the treasures which were the joy of their poor owner's heart. Then, still 'all throughother,' as she expressed it, she descended the stairs to see the rest of her mistress's commands duly executed.

Mrs De Courcy left the house before the going down of the sun. What had called the old woman's stormy spirit back from the dread confines and restored it to the battered tenement which had clothed it for more than eighty years? Who can tell? Perhaps she had not been so low or so near the dark gate as those round her imagined, or perhaps a flash of her old unsubdued temper had so wrought upon the poor body as to recall its failing powers and endue them with renewed vitality at the sight of the havoc wrought amongst her cherished treasures by ruthless hands. By whatever spell her spirit had been called back, she was very much alive now, and ready to live another life in the spirit which she had brought back from

the Borderland. Mary Doyle sent for the doctor.

'Sure, 'tis a miracle was wrought,' she said as she related what had taken place. 'Just a miracle—her lyin' for death one minute, an' up as strong as ever she was the next.

'Miss Anne has a great amount of vitality in her battered old body,' said the man of medi-cine. 'She must have been only in a state of coma, and the opening of her treasures roused her. I suppose the lock clicked, or something --eh?'

Mary said she thought it had. 'But it was a sore day for Mr Philip,' she added mournfully -'a sore day.

Philip De Courcy had very little welcome for his wife when she returned to her pretty home in Clyde Road, that most beautiful of outlets

from the dear old city of Dublin.

'You've made a nice mess of it, my dear,' he 'Why couldn't you have waited? said dryly. She wouldn't have lasted long; and after all'— he shrugged his shoulders—'you have done for yourself now. Miss Anne will never forgive you.'

'But, Philip, you can make it all right with her. You haven't offended her. She can't alter her will, let what will come to pass. She has no one else to whom she could leave her money, has she?' Mrs Amy was very penitent

and tearful.

Her husband laughed. 'There are dozens of charities,' he said; 'and, by Jove! there's Jessie.'

'Jessie! Who is Jessie?' asked the little

lady.

'Jessie is Jessie Hamilton, whose mother was Anne's first cousin, a girl who has lived for a year or two with old Lady Young, companion or something of that sort. Quite an insignificant girl.'

'Miss Anne would never leave her money to a person of that description,' cried Mrs De

'Well, no matter to whom she leaves it, it won't be to either you or me,' said her husband in an aggrieved tone; 'I'm quite prepared to take my oath upon that point. Your little bit of "previousness" has cost me dear.'

She knew by his voice how very deeply he had been wounded by the untoward circumstance, for which she alone was to blame. She availed herself of the woman's ultimate resource. She began to cry.

'But, Philip, she appeared to be dead to all intents and purposes,' she sobbed. Mary said so.'

Philip De Courcy had all a man's horror of He threw down his morning paper and

started to his feet.

'There isn't any use in crying over it,' he said sharply. 'Tears won't mend matters. Miss Anne isn't the person to be softened by oceans of them, nor is she likely to forget what has taken place. However, I'll take no notice of it, but go and visit her when I'm at Castle Falcon for the Twelfth. Maybe she'll see me, and be talked round. Don't cry, Amy, it won't help us a bit.'

But when Philip De Courcy reached the gates of Fairy Mount about a fortnight later he found them closed in his face. Moreover, his host, Mrs Daly's husband, informed him that Gerard

Carr, the son and successor of the very prosperous John Carr who had 'managed' Basil Moultrie's affairs during his minority, and profited thereby, had been several times to see the old lady. 'Looks like a rearrangement of her affairs, my boy,' he said. 'Old Lady Young is dining here this evening; she and my wife are as thick as thieves over their poultry-yards. Ask her about Miss Anne.'

But De Courcy carefully avoided the subject.

CHAPTER III.

DEVELOPMENTS.

OW, a most unprofitable bit of the Young property which lay between the foothills of the great mountains and the sea had suddenly grown into a popular

A low stretch of sandhills-chiefly inresort habited by rats, which had exterminated a flourishing rabbit-warren-under the hands of skilled labourers became a much-frequented and popular golf-links and a source of revenue to its mistress. To these breezy downs did the gilded youth of the neighbouring naval station much resort, as did also most of the local inhabitants who could afford to expend their leisure hours in the fascinating game-that game which, to those who yield themselves to its charms, becomes an all-absorbing passion.

No one denied the beauty and perfection of the Kilronan Links. The 'greens' were all that man could desire, or woman either; for many fair ladies found that golf was an entrancing game when once you could manage to hit the ball, that it was splendid exercise, and, best of all (from one point of view), it brought young

people together!

'To be sure,' said Mary Doyle, who was an inveterate gossip, 'wasn't it on them sandy hills that they're calling links, an' beetlin' them balls about on them all day, that Miss Susy Daly met her man, an' had him married before you could say "Jack Robinson"? Didn't I see them stravaigin' over them heights an' hollows day in, day out, even when it was peltin' an' pourin' hail an' snow; an' Miss Susy wid a drab on the tail o' her gown a foot deep? It was sore work she had to get him, but she done it, so she did.'

'Tush!' said Miss Anne, who was now completely restored to her usual condition of chronic invalidism, 'I saw golf played in Scotland years ago; but girls weren't in it then, and men were quite infatuated over the game. Does Jessie Hamilton spend much of her time on the

links?' 'Well, ma'am, to tell you the livin' truth, I never seen her there except by a time when she an' the ould lady would be givin' tea at [Christmas Number.

the wee house they call the Pavilion. No, ma'am; Miss Jessie does have her hands too full o' work at the castle, wid her vi'lets an' her chickens an' the eggs she packs an' sends off—maybe twenty dozen in a week. Och, she's the crater that never is a day idle, but works for that ould lady as if she was her own daughter, so she does.'

'Humph!' said Miss Anne.

'Jessie, who was the man that hung after you all the afternoon?' demanded Lady Young as she and her companion returned from the links, where the old lady had been dispensing hospitality to the club. 'I didn't admire him. Did you?'

'Not particularly, Aunt Sophie, but he could

talk. His name is Carr.'

'Carr! Not old John Carr's son?' The old

woman turned sharply upon the girl.

'I really did not go far enough with the acquaintance to find out whose son he was,' laughed Jessie. 'But he spoke as if he knew every one in the neighbourhood, and I thought him amusing.'

'He's no beauty,' remarked Lady Young.
'I have a prejudice in favour of good

looks.'

'Have you? It's a matter of perfect indifference to me whether a man is or is not good-looking when I find him pleasant to talk to and easy to get on with,' Jessie answered. 'Mr Carr seemed both one and the other.'

A few days later Jessie was walking home from the village. A man rode by, drew rein, dismounted, and approached her. 'So glad to meet you, Miss Hamilton,' he said. 'I consider myself most fortunate.'

'Mr Carr!' cried the girl, who had a very misleading trick of changing colour on the slightest provocation. 'I did not know you were in the neighbourhood.'

'I happen to have business in the town,' he said. 'I'm engaged at the Petty Sessions.'

'Oh, you belong to the law, then?' Jessie had quietly shaken hands with him, and was standing on the footway, while the man, who was faultlessly got up in riding-dress, remained in the road, holding his horse's bridle.

He gave his shoulders a little shrug. 'Unfortunately I do,' he said. 'It does not often

lead me to such pleasant paths.'

She laughed. 'I thought the road very unpleasant,' she cried gaily. 'If you have any influence over the local council, please call their attention to the condition of the pathways.'

'I haven't,' he returned, in the same gay tone as her own. 'And the local council occupies itself too much with politics to mind the condition of the footpaths. You live near here?'

'Yes, of course. I thought every one knew 1907.]

that I live at Kilronan with Lady Young,' she cried.

'Ah, true; but, you see, I'm quite a stranger

here, and know so little.'

She looked into his face from under the long eyelashes which were such a beautiful finish to her expressive eyes. 'It struck me the other day that you know a great deal about us all,' she said slyly.

He laughed. 'But although I may know a great deal about the everyday lot, I may not possess the most valuable knowledge of —of—all,' he said with a curious little embarrassment in his voice that was pleasant after a fashion.

(T 3-

'I don't know why my place of abode should be catalogued as "valuable knowledge," she laughed. 'There isn't anything very precious about it—or me, as far as that goes. Do you make a long stay here, Mr Carr?'

'Not as long as I could wish,' he returned, 'for the links are the best in the county. I shall join the Kilronan Club—in fact, I was just riding round to Castle Falcon to ask Valentine

Daly about it.'

'Mr Daly would be glad to enroll a new member,' she said. 'We like entertaining strangers.'

'Ah, then, you are a member of the club,

Miss Hamilton?'

'Officially; but I never had a golf-club in my hand save once, and then I made a fool of myself.'

'That isn't possible,' he said, drawing a step

nearer to her.

'Oh, but it was very possible. Jack Daly undertook to teach me the game, so I put myself in his hands. He proceeded to make a delightful little mud-pie on the green in front of the Pavilion, upon the top of which he set a dear little white ball. Then he put an implement into my hands, and showed me how to grasp it in the orthodox fashion. I was to what he called "approach"—no, "address"—the ball; you see, I'm not "up" in golfing terms—forgive me, I was going to say slang.' And she laughed gaily. 'Oh, I was very docile. I did "address" the ball—in fact, I talked to it—and then I made a swing. Poof! I thought I had sent that ball flying; but there it sat on its little mound perfectly unconcerned. No, I'll never make another effort; one failure is enough for me.'

'But Jack Daly is only a beginner himself a mere schoolboy. You should have a better instructor,' he said—'some one who knows

how.'

'I'm quite satisfied with Jack—we are great chums; but I don't want to yield my soul to the fascinations of golf. I haven't time.'

'You must have plenty of spare time on your hands, Miss Hamilton.'

'Never was there so great a mistake,' she

'I'm busy from morning to night. laughed. You would be amazed at the multiplicity of duties that crowd upon me. I couldn't be

happy unless I had plenty to do.'

His eyes expressed more than his tongue. 'You are a rare development of your sex,' he said, with a certain ring in his voice which brought another flying tinge of colour to her face.

'Oh, I don't know,' she returned. 'There are plenty of women-workers in the world.'

She moved on as she spoke.

He followed. 'My way leads past the Kilronan gates,' he said. 'May I go so far

in your company?'

'Isn't the king's highway free to us all?' she laughed back; but she was beginning to feel uncomfortable, she scarcely knew why.
'To me it is the queen's road,' he said

lightly.

He talked, and talked well, as they went along. Nevertheless, Jessie was glad when she reached the old gate with its rusty ironwork, and the picturesque lodge with its broken porch and sagging thatch.

'I am sorry we have reached the limit,' her companion said as he held her hand for an 'I only hope I shall be as fortunate instant.

another day.'

She muttered something; but in her heart she resolved that she would find out the days when the Sessions were going on in the little town, and keep strictly to the garden at such

Later there was another field-day at the links, Mrs Daly being hostess. Jessie felt slightly relieved when she noted that Carr was not present. But another person was there who soon contrived to be introduced to hera man who persistently stayed by her side all the afternoon.

'Jessie, what attraction have you for the law?' demanded pleasant Mrs Daly, who was a light-hearted matron, upon whom the cares of life sat very easily. 'It was the senior partner a month ago, and now it is the

junior.'

'But I don't in the least understand you,' the girl answered. 'Who is this Mr Calgey? He doesn't strike me as being particularly charming. Good-natured, and perhaps some people would call him good-looking; but-he's a little slangy, isn't he?'

'I can't say I admire him,' laughed Mrs 'I thought you knew that he is Gerard Carr's partner-Carr & Calgey, the

solicitors.

'Oh,' cried Jessie, 'is Mr Carr son of the John Carr Aunt Sophie has some reason for disliking?'

'He is, and present head of the firm; but he bears a very different reputation from his father, whom your aunt has exceedingly good reasons for disliking. He is a most respectable young man, and rather popular. By the way, he is agent, or something, for old Nancy Hamilton, whose almost miraculous recovery from the very jaws of death has been a month's wonder to the whole county. Mary Doyle said it was a real miracle.'

'We heard the news, and sent to inquire, but all we were told was that Miss Anne was as well as ever. We don't visit her,

you know.'

'Queer old woman! There has always been some mystery about her,' said Mrs Daly. 'Philip De Courcy never mentioned her name while he was with us, although his wife was in the room when the resuscitation Mary Doyle said she was horribly took place. frightened.'
'Poor old lady!' Jessie said compassionately.

'I wonder why she was recalled to life. She

has not much to live for.'

'Nothing but her money. Good gracious!' cried the good lady, 'here is Admiral Henshaw and half-a-dozen of the new arrivals. Do come and help me to entertain them; those girls of mine are scattered all over the links. I hope the Octopus men will be as popular as the Trident lot. Have you heard from your cousin since he left?

Rushing off on hospitable cares intent, Mrs Daly did not wait for an answer to her question. Yes, Jessie had heard from Basil; but no one

had seen that letter.

The winter which came upon the heels of that pleasant autumn was more than usually trying. Dr Hervey ordered Lady Young to a drier climate than her native South, as her rheumatism increased hourly; therefore, much against her will, the old lady and her niece crossed the Channel and settled in Bournemouth before the spring set in with its wonted rigour.

'Aunt Sophie, who do you think escorted me home from the Pavilion?' Jessie was looking very fair and sweet, albeit there was a certain wistfulness in her deep-gray eyes at times, which her aunt did not fail to observe.

'Am I a witch, my dear, that I should know what is occurring half a mile off?' demanded the old lady, who greatly enjoyed her pleasant

days by the quiet sea.

Well, some one I never expected to meet

here,' Jessie returned. 'Mr Carr. 'Whom do you say?' demanded the old lady.

'Mr Carr, from Cork?' 'Even so. I met him as I went through the gardens, and he insisted upon seeing me

home. 'Jessie, what brings him here?' demanded

Lady Young.

'How can I tell?' laughed the girl. 'Hewell, he talked a great deal of nonsense—about [Christmas Number.

Ireland seeming a desolation, and that sort of rubbish; and I laughed it off. I didn't ask him to come in, as he seemed to expect. Aunt Sophie, was I right or wrong?'

The old lady mused a moment or two.

'He's a very steady and prosperous young man, Jessie,' she said slowly.

'Is he, Aunt Sophie?

'He was not responsible for his father's faults,' Lady Young went on.

'I suppose not.'

'Humph!' Lady Young mused for a little, while the girl flitted hither and thither through the room, and rang for tea.

'It wasn't a bit nice in the gardens to-day.' Her niece was pouring out tea as she spoke. 'There was quite a cold wind.'

'Was there?' Lady Young seemed abstracted. 'But there are daffodils in flower already. I wonder how my poor dears are looking at Kilronan.'

'Scarcely over the ground yet, I should say. Aunt Sophie took her tea-cup from the girl's

hand and looked her full in the face. Jessie laughed under the scrutiny. see anything strange about me, Aunt Sophie?'

she asked.

'Well, candidly, I do,' Lady Young returned. 'You are not quite what you were a year ago. But I think you are improved; yes, decidedly

Thanks for your flattering observation.' The girl laughed. 'You were always a favourable

critic.' 'You are a very pretty girl, Jessie, and I

don't wonder-in a way.'

'What excites your qualified surprise, my dear?' Jessie smiled upon her aunt with much affection in her eyes.

'I don't wonder that man has followed you here,' she said brusquely. 'He has eyes in his head, and good taste.'

'Aunt Sophie!'

I conclude that this young man told you— or implied, if he had not the hardihood to speak out-that he had followed you?'

Jessie blushed crimson. 'I didn't believe

him,' she said.

'But a man will do such a thing if he takes a fancy,' said Lady Young.

'Fancy!' cried the girl contemptuously. 'A

fancy!'

'Fancy is the beginning of something more,' returned the wiser woman. 'My dear, don't you know your future is, to say the least of it, problematic?'

'My future is very much in my own hands.

I can make a fight for it, aunt.

Lady Young shook her head. 'All very well when you are young, and able to fight for it, Jessie,' she said. 'But afterwards, when powers begin to fail, when one grows too old to bear the stress and strain, my girl.'

1907.]

Jessie threw back her head. 'Like the girl in the song, "I may die ere I live to be old,"' she said. 'Time enough to think of that for many a day to come.'

Lady Young shook her head. 'Time slips away like water. We never know when 'she stopped short. 'I'm thinking of myself, There won't be anything for you when Tessie.

I go, my dear.'

COUSINS.

'There will always be my will to work and my capacity for earning, dear,' the girl replied. 'If you mean that I should secure my future by a good marriage, No! and No! a thousand times over-that is my answer.' drawn her slim figure to its fullest height. Her face was pale; her eyes were on fire. Better the hardest work that ever woman put her hands to than a marriage based upon such a mean foundation. Aunt Sophie, how could you, of all the women under the sun, propose such a thing?

'Because it was just what I did myself,' replied the old lady. 'And it turned out exceedingly well.'

'Aunt Sophie!'

'Yes, my dear, I married Sir Francis without caring for him, and-what was worse-having cared for another man from the time I was a girl, younger than you are yourself. It was an impossible business from first to last; but I threw my youth away because of it; and then, on second—or twenty-second—thoughts, I married, and was quietly and soberly happy and content. Sir Francis was very good to me.

'But I couldn't! I couldn't!' Jessie threw herself into a chair and hid her face. 'Oh,

I couldn't!'

'Well, well, my dear, not this man, perhaps, but some other, by-and-by, when the glamour has passed away. Meantime, if you should meet the man Carr again just be civil to him, and if you like to bid him come and see me I won't object. He is, after all, a neighbour, and we Irish like to be neighbourly.'

The sound of a motor-car stopping at the door, and of a thundering ring of the bell, cut short the lady's hospitable instruc-

tions.

'Visitors for the parlour floor,' said Jessie, glad of the break in a conversation that was distasteful for many reasons.

But, to the utter amazement of both ladies, the door was thrown open, and the prim maid announced pompously, 'Sir Philip Young! Mr Carr!

Lady Young was on her feet to greet her stepson with a welcome in which cordiality and frigidity were blended. Relations between them had been somewhat strained for a considerable time.

But Sir Philip was effusive. He had only just heard that his father's widow was staying here. Nice place, wasn't it? Just the right distance from town to allow a fellow to motor down for the week-end. Didn't Miss Hamilton like it? Good music, and plenty of it. Nice little theatre, eh? By the way, there was something good to-night. Wouldn't it be jolly to dine at his hotel-they did you well thererippingly, by Jove!-dine with him, and see the play which had had such a tearing success in town? Just the four of them. Carr was at the same place.—Weren't they well done for,

The new acquaintance was rather mute and meek in the presence of his client, but he contrived to seat himself close to Jessie, and talked to her until Philip Young cut in and chattered so glibly that she could scarcely follow his outpourings.

Carr moved away and began a very polite

conversation with Lady Young.

'Only heard yesterday from old Carr—you knew him in Ireland, he says-that you and the dowager were over here, so I tooled down this morning. Often do it, you know. My motor's a jewel—finest one on the road—rippin' she is. You must come for a run with me, Miss Hamilton. We're cousins, you know. Jove! I ought to call you Jessie at once. Queer thing I never met you before! Come now, we'll be pals at once, and no humbug over it, eh?'

He was by no means a beauty, this young man who had driven so close a bargain with his stepmother as to leave her the very barest pittance for her support-Kilronan had been settled upon her at her marriage; but he was pleasant, cheerful, determined to please, and Jessie found herself laughing with him and at ease in his company.

'Jessie Hamilton, what's the meaning of all this?'

It was a week after the invasion of their quiet lodgings by this whirlwind of a young man who pursued them with attentions—of course all under cover of doing his duty by his stepmother. Carr held on, now and then contriving to get a moment in which he could speak to the girl, who, to avoid him, let herself slip more and more into the company of the other. There could be little doubt of Sir Philip's intentions. From the first he had taken no pains to conceal his admiration for the girl, whose very existence he had hitherto ignored. Lady Young looked on in amazement. Jessie had always been charming, the sweetest girl she knew, and as good and unselfish as she was fair to see. But how had these men discovered it so quickly? That was the mystery.

'Jessie, I don't understand it at all,' she went on. 'You have not changed; you are just the same. A year ago, two years ago, you were

as pretty and as good as you are at this moment; but—I'm amazed! Indeed I am.'

'Mr Carr proposed to me this morning in the gardens,' said Jessie meekly.

'He did! Well?' demanded the old lady. 'I sent him away as gently as I could-told him I never meant to leave you.'

'But I must leave you soon, dear?' said the

old lady tenderly. 'What then?'

'Time enough to think about that' Jessie was on her knees at the old lady's side and holding her aunt in her arms. 'You will stay with me many a year to come.'

Lady Young kissed her. 'Well, well, who

knows? How did he take your answer?'

'Not at all as I expected,' she returned. 'He actually implied a threat. Said he could undo what he had done. I didn't understand.'
'Humph!' said Lady Young. 'Phil will be

here with the motor presently. Suppose he

makes you an offer also?'

'Nonsense, aunty,' cried the girl. 'The thing is out of the question; but, dear, why can't we go home and get out of all this worry, not to mention the east winds, which are getting upon every one's nerves? Janey Daly tells me that Kilronan is looking sweet just now.'

'Philip would be a brilliant match for you,

Tessie.

'I don't mean to marry any one,' cried the girl. 'Why worry me with such impossible things? No; I want to go back to Kilronan and my flowers, not to mention the dear chicks, the ducklings, and the little pigs. Oh aunty, let us go home!'

'If Philip makes you an offer you would do

well to consider it, my child.'

'My dear, he won't make it. He hasn't a notion of it. Do say I may wire to old Branaghan. We can leave to-morrow.

Lady Young pondered. 'Life is expensive over here,' she said slowly, 'and I do feel the east winds. Also, the chickens are a responsibility. Susan has no proper ideas about those Buff Orpingtons.'

'Oh aunty! of course we must go back, if it were only on account of the Buff Orpingtons,' cried Jessie, and she at once wrote out a

telegram.

On her way to the post-office she met Sir Philip Young. The dreaded moment came and went. Also, the young man went away in a rage. 'Hang it all!' he muttered. 'But suppose she had accepted, and I found out that Calgey had made a mistake, that would be a jolly hole to have put one's self into!'

Jessie Hamilton had thrown open the wide French window of the morning-room. Kilronan was looking its best, with all the sweet freshness of early spring tinting the woods with many shades of green, and the early sunshine making 'Isn't it nice to be glories upon the bay. [Christmas Number.

Her aunt was at her side in a moment. 'Why, there's a woman on the car!' she cried—'an old woman! Mary Doyle! Can it be any message from Anne Hamilton?'

They heard the crunching of wheels upon the gravel-path, the loud clanging of the hall-door bell, voices, hurrying feet; and then Calgey, the junior partner in the firm of Carr & Calgey, was bowing to the two startled women; while Mary Doyle, with her face wrinkled up between smiles and tears, was pushing into the room behind him.

'You will excuse my intrusion, Lady Young,' the man said, as he bowed low. 'My errand is urgent, and, possibly, not an unpleasant one. Miss Anne Hamilton died in the night. As I happened to be in the neighbourhood, Mrs Doyle at once communicated with me. I hastened to convey to you the news of her demise.'

'But—does it concern us?' asked Lady Young, as she stood, trembling a little, looking at the man in startled surprise.

'It concerns your niece, Miss Hamilton,' he said, bowing towards that amazed young person, who still stood by the window.

This abrupt intrusion could not possibly be any affair of hers. She started now when her name was mentioned—started still more when the man bowed to her.

'Perhaps you may be surprised to hear that the lady so recently deceased has, with the exception of a few trifling legacies, left all her fortune to you?'

For a moment Jessie was almost transfixed with amazement.

Lady Young uttered a cry, and sat down very suddenly on the couch.

'It is not possible!' stammered the heiress.
'She never saw me.'

'Troth an' it is possible, an' it's the livin' truth,' cried Mary Doyle, unable to restrain 1907.]

herself. 'Mr De Courcy was to have all an' everything, an' would have had it this blessed minute only that his wife was that much o' a fool to count her chickens before they were out o' the shell, an' take possession o' Miss Anne's diamonds before the life was out o' herself. It was a bad day for you, Mrs De Courcy, but a real good one for the darlin' young lady that has the good word o' every one.'

35

'But I do not understand,' faltered the heiress.
'I never expected'——

'Augh, sure none o' us did, an' sorra one o' us knew who was to come in over us until Mr Calgey there tould us in the parlour, afther we found the poor soul lyin' could an' stiff in he bed this mornin' at seven o'clock, an' had him sent for, to the town where he was stoppin' for the Quarter Sessions. Sure, an' we just give a cheer when we heard it was yourself, an' no one knowin' a word but himself there an' Mr Gerard Carr that drawed out the will.' Mary Doyle was tearful with her congratulations, as she wrung the girl's hand and almost prostrated herself at her feet.

'One other person knew,' Mr Calgey said modestly. 'I did not think it would be a very great breach of confidence if I told Sir Philip, who is practically head of your family, Lady Young. I happened to meet him in London some little time ago, when I was in town upon railway business. He was the only person outside the firm who was aware of the young lady's expectations.'

He wondered why aunt and niece exchanged a meaning glance, and why both ladies tried to conceal the smiles which flitted over their faces.

'Possibly you encountered my partner in Bournemouth,' Calgey said, with a ray of light breaking upon him. 'I did not myself know he was there until I had a rather perplexing telegram from him a few days ago—a telegram which, by the way, alluded to Miss Anne Hamilton.'

With a start Jessie remembered the veiled threat which Carr had uttered after receiving an answer unfavourable to his hopes.

'I think it would be wise of you to take possession of your property at Fairy Mount as soon as you conveniently can,' said the lawyer. 'The house is full of valuables, and there is the funeral to be arranged.'

'Yes, yes, my dear child, you had better go at once,' cried Lady Young. 'Mr Calgey will, I am sure, give you his valuable assistance.'

The young man blushed deeply as he bowed to the old lady. 'I could not presume to offer my services had my partner been in the country,' he said.

'I would very much rather have my affairs in your hands than those of your partner,' cried Jessie, smiling upon him. It was a fair inheritance to which gentle Jessie Hamilton succeeded when she entered into possession of Fairy Mount and all it contained. In the course of her long and penurious life Miss Anne Hamilton had contrived to more than double the fortune bequeathed to her in her youth; therefore, Jessie found herself at the head of a very considerable estate. In fact, at a bound she had become the richest young woman in the district.

'And Gerard Carr knew you were an heiress!' cried Lady Young when, for a wonder, she and

her niece were left to themselves.

'So did Sir Philip,' answered the girl. 'I was perfectly certain that neither of those men cared a pin about me; but I couldn't understand why they both wanted to marry me. Oh, Aunt Sophie! is it any wonder that I have a very bad opinion of mankind in general?'

'But there are glorious exceptions, Jessie!'

cried the dear old lady.

'There are indeed,' answered the girl, while her face glowed like one of her own June roses.

For it was June now, and a message had sped in a flash of fire under the sea. It was Lady Young who despatched it, for, she said, life was very uncertain, and she wanted to see the young people happy before her turn came to lay it down. Even now, as the girl stood by the window of the morning-room and looked out over the sparkling bay, she knew that some one was on his way—some one who was the exception to all the men in the world.

'If it hadn't been for the contrariness of that old woman, who persistently did the wrong thing all her life long, Jessie Hamilton would never have touched a ha'penny of her money,' said Gerard Carr to his partner with a growl. 'I wouldn't have named her as heir at all, only for the off-chance '—

'An off-chance you never had, my dear fellow.' Calgey could afford to take a high hand with his partner: had not Jessie Hamilton committed her very lucrative business into his hands? 'She has been engaged to her cousin, Basil Moultrie, for years.'

'Basil Moultrie! The Navy chap? Why,

he hasn't a farthing in the world.'

'But she has heaps of them; and he must one loyal heart in which have something, because he had some thouther future and be content.

sands to settle upon her,' returned Calgey. 'I drew up the deed.'

'There now, I tell you, had I come back in time I would have made that old woman alter her will. I meant to do it if Phil Young had been successful.' Gerard Carr was too angry to conceal the truth.

His partner looked at him in surprise. 'Philip Young! Do you mean to say he

made up to Miss Jessie?' he cried.

'He did. Dashed down from London in his motor, and cut in; but he went back rather crestfallen. I didn't think of it at the time, but possibly he knew'—

'I told him,' Calgey said quietly. 'I thought it would be a very good thing for the Young property, and I knew I hadn't a chance myself.'

His partner swore at him for a fool. 'She never would have looked at you,' he said con-

temptuously.

"I wasn't such a fool as to think I had a chance from the first time I spoke to her,' the other returned quietly. 'And Peter Branaghan said something about the cousin which gave me a clue. I'm satisfied with my part of the business, and I'm very glad the money has gone in the right direction. She'll make the best use of it, and be a very happy woman. She richly deserves it—that's all I can say.'

Carr looked keenly at him. 'Pon my soul, I think you were gone about her yourself,' he

said sarcastically.

'I confess that I never met a more charming or unselfish girl in my life,' the other man replied, 'and I am not ashamed to acknowledge that I feel honoured by the confidence she has reposed in me, and shall make it the business of my life to prove worthy of it.'

Carr growled something about not being up

to such high-falutin notions, by Jove!

And the partners soon afterwards dissolved a union which had become irksome to one of them.

There was sunshine over all the land on the day when bells were ringing and flowers strewn before the feet of two happy people who stepped out of the little church at Kilronan one day in September. For the message which had flown under the sea had brought back the true lover to his lady, and Jessie Moultrie, looking into her husband's eyes, felt that her world held one loyal heart in which she could confide her future and be content.

'MR JAMIESON.'

BY LAWRENCE B. JUPP.

CHAPTER I.

N the early evening of a blusterous day in October of the year 1750, Colonel James Seton of Newlands Hall, near Mildrum, in the county of Northumberland, paced the floor of his library in considerable perturbation of spirit. Every now and

of spirit. Every now and again he consulted his watch impatiently, and when the quaint Dutch clock upon the overmantel struck six strokes he started as guiltily as a school-urchin detected in a forbidden orchard.

'He should be here by this time,' he muttered, plucking with nervous fingers at his tawny moustache, flecked in places with thin gray threads. 'Hark! What is that?'

He paused in his perambulations, and leant forward in the attitude of one who listens intently. Night was closing in fast. The wind came rushing down from the Cheviot Hills, raving through the walled policy, scattering the hectic leaves, setting the tall elms aswing, soughing through the dusky fir-trees with the murmur of an unquiet sea, rattling the sealed casements of the house, and rumbling drearily in the tall chimneys.

'I thought I heard the trampling of horses' hoofs,' said Colonel Seton. 'It must have

been my fancy.'

He took another turn or two across the room, then stood stock-still again. Somewhere overhead a window slammed noisily, and there was a tinkle of broken glass. The door opened, letting in a current of keen air.

'Mr Jamieson and Captain Long, sir,'

announced Rob, the old butler.

Colonel Seton gave a little cry. 'At last!' he said. 'Welcome, your Royal Highness, to the home of one of your humblest He bent and kissed the hand servants!' of a tall, elegantly formed young man, very plainly habited, who wore no ornament save a brooch in his cravat containing the miniature of a lovely girl set about with

The new-comer shot a half-scared, halfwhimsical glance at the serving-man. have dispensed with our titles for the present, Colonel Seton,' he said, speaking with a slightly foreign accent; 'plain Mr Jamieson will suit the occasion admirably.'

1907.]

The colonel smiled. 'You cannot think, sir, that I would allow any but those devoted to your House to be in attendance upon your person. This is my butler, Robert Duff, who was sergeant in my company on the day of

Drummossie.

The Prince stretched out his hand to the old "Tis more of a pain than a pleasure for me to see my faithful friends now, he said with a sigh, 'when I think of all they have gone through on my behalf, and the perils they run in sheltering me from the malice of my enemies.-You and Captain Long are acquainted, colonel.'

The two men gripped hands.

'See that dinner is served within half-an-hour, Rob,' said Colonel Seton .- 'Now, gentlemen, I will show you the poor accommodation I am able to offer; but first, by your leave, we will take a dram together. Mr Jamieson, Captain Long, "The happy day of the Restoration, and may it soon dawn in all its splendour!"

The Prince laughed. 'That is better-you have got my name, I see.' And they clinked

glasses.

A few minutes later the three men stood together in a wide room furnished with heavy antique fittings. A wood-fire burnt cheerily on the hearth, and candles set in silver sconces gleamed from the panelled walls.

A tall, fair girl, with eager, expectant face, rose from a carved walnut-wood settee to greet them as they entered. Her eyes shone, and her bosom rose and fell beneath the white cockade she wore on her dress. She came forward impulsively.

'Gentlemen, I think that you have both met

my daughter before,' said Colonel Seton.

She swept the floor with a curtsy, then sank upon one knee, and with her lips just touched the hand the Prince extended.

'Nay, fair Mistress Alison,' he said, raising her gently, 'the days of Holyrood are past. am no longer Regent for a royal father, but a poor fugitive who steals from place to place like a hunted fox from cover to cover. Tis I should kiss your hand in token of the homage of a grateful heart that is thrice blessed in that it can still count upon the love and service of a few tried and faithful friends.

'Sir,' she said, and a wave of colour mantled her beautiful face, 'the Setons are ever loyal to their God and King. Shall we refuse you in the day of your distress the honour we so gladly gave you in the hour of your prosperity?'

'That time shall come again,' said Captain Long. 'There is a cloud gathering, no bigger than a man's hand at this present; but there are not lacking those who prophesy that it shall grow and grow until the tempest breaks and the usurper of Hanover is swept back into the obscurity from whence he emerged.'

The Prince smiled sadly. 'No, my good friends,' said he; 'that hope is past. My mission has failed. To-morrow I embark in a vessel which even now awaits me at Berwick.

This is my farewell.

'Your Royal Highness,' cried Colonel Seton, greatly moved, 'will take back into exile with

you the hearts of a host of loving friends.'
The young man pressed his hand. 'It is all over. Le jeu ne vaut pas la chandelle,' he said, and shrugged his shoulders.

'Dinner is served.' Old Rob stood on the

'No man is altogether unhappy who is certain of his dinner,' quoth the Prince as he passed from the room with Alison Seton on his arm.

An observer could not have failed to be struck by the strong resemblance which existed between the two. Equal in height, both slimly yet perfectly proportioned, the same blue eyes and brown, wavy hair, they might easily have been mistaken for twin brother and sister.

The dinner went off merrily enough. There

was no hint of sadness in the air.

After Alison had retired conversation was free and unrestrained. Rob Duff waited at table and kept a watchful eye that no man's glass stood empty. Mr Jamieson pledged his host, Colonel Seton pledged Mr Jamieson, Captain Long drank to them both until his round, red face rivalled the crimson of the fullbosomed roses which drooped languidly over the rim of a great porcelain bowl set on the window-seat. The subdued light fell upon massy silver and white damask napery.

The Prince pushed back his chair and sighed contentedly. His hand shook somewhat as he took his wine. 'Egad, Seton,' he said, 'this is better than the days when I wandered with O'Neal across barren Benbecula, and from cave to hovel in those dreary Western Isles.' He paused and emptied his glass. 'I had word when in London that my fair deliverer, Miss Macdonald, is on the eve of her marriage with

Kingsburgh's eldest son. Is that so?'

"Tis to take place next month," replied Colonel Seton. "The lass deserves a worthy husband, and such an one no doubt young Kingsburgh will prove.'

Charles Edward drummed upon the table

with his fingers.

'She is a very fine lassie,' he said. remember well the first time I saw her. 'Twas !

in a cottage on Benbecula. The second time, I was cooking a sheep's liver in a hut by the seashore when she and Lady Clanranald walked in. Gad's life! I thought at first they were the soldier-bodies; my heart was in my mouth, and in swallowing it I quite lost my appetite for the liver.' He laughed, and his eyes watered 'What's this? Punch?' he asked, as old Rob set a steaming bowl upon the table.

'Yes, your Royal Highness,' replied Colonel 'We will drink to our next meeting, Seton.

and brighter days in store.'
'With all my heart,' said the young man, and

stretched out his hand.

He had the brimming glass to his lips, when there came a thundering at the front door of the house which woke reverberating echoes in long corridors and dim, silent rooms.

The three men started to their feet and gazed blankly at one another. Colonel Seton turned pale beneath his tan. 'Who can it

be?' he said in a hoarse whisper.

He had hardly uttered the words when the old butler burst into the room, and close behind him came Alison Seton with wideopen, affrighted eyes and heaving bosom.

'The soldiers!' she panted.

They are all round the house!'

'God save us! We are undone!' moaned Rob.

Captain Long fumbled at his sword-hilt His usually rubicund face was of an ashygray hue; he opened his mouth as if to speak, but no words came.

'Impossible,' cried Colonel Seton sharply.

Oragoons! Why, where would they come 'Dragoons! from? Sheer nonsense! You must be dream ing, Alison.'

Again the imperative summons rang out

harshly.

Charles Stuart, his features unmoved, took snuff. He was the only person present who preserved a due composure. 'Quite like old days,' he said calmly. 'I wonder who in the devil's name put the hounds on the scent.'

Suddenly Alison uttered a cry of joy. She measured the Prince with her eyes, then

whispered in her father's ear.

'By Gad,' he cried, 'the lass is right! Tis a bare chance, but the only one.-Rob, open the door, and be as leisurely as you can about it. When you have done so, see to it that the horses are put into the travelling-chaise, and tell Allan to be on the alert.

He drew the Prince and Captain Long aside

and spoke a few hurried words.

The former gave a low laugh. 'Once more a woman's wit!' he cried.—' Miss Seton, you are a woman's wit! he cried.—'Miss Seton, you are my preserver!' He bent his knee and raised her fingers to !" her fingers to his lips.

'Quick! quick!' she cried, and, seizing him by the hand, half-led, half-dragged him from the

[Christmas Number.

Barely had the door closed behind them when loud voices and the tramping of heavy feet were heard in the entrance-hall.

Colonel Seton took Captain Long by the arm and pushed him into a chair. 'Brace yourself, man,' he said savagely. 'Put off that

hang-dog air and all will yet be well.'

The door reopened, and two men attired in the uniform of the King's Dragoons, and wrapped about in drenched and bemired

cloaks, entered the room.

The taller of the twain made Colonel Seton a curt little bow. 'Colonel Seton, I believe?' he said brusquely. 'I cannot congratulate you upon your servants, sir. We have been hammering at your doors loud enough to raise the dead for the last ten minutes.

Colonel Seton rose from the table. 'I am at a loss to account for this apparently un-

warranted intrusion, sir,' he said coldly.

The dragoon laughed. 'Warrant enough,' he replied. 'I am Captain Mansell, very This is my subormuch at your service. dinate officer, Cornet Ellis. We have received information that the Chevalier Douglas, the Young Pretender—or, if you will, Charles Edward Stuart—is at the present moment an inmate of this house. I must be so troublesome as to request the immediate custody of his person.

Colonel Seton smiled blandly. 'I am afraid there is some mistake, he said. 'So far as I am aware the unfortunate party you refer to is in France. But I am very pleased to welcome any gentleman who rides on His Majesty's service. May I have the honour of introducing Captain Long, a near neighbour of mine who has been dining here with his daughter? I regret that they were just on the point of leaving when you arrived.

The dragoon bowed stiffly. 'It is no use, sir,' he said, turning to Colonel Seton. bandying words is a mere waste of time.'

The door opened, and Alison Seton entered the room in travelling attire. Close behind her came the Prince. Colonel Seton uttered a

badly stifled execration.

Captain Mansell smiled evilly. 'I lament having to perform a painful duty in the presence of a lady, he said, making the girl a low bow. Then, swinging round on the Prince, he laid a hand upon his arm. 'Charles Edward Stuart,' he said, 'you must be so good as to consider yourself my prisoner.'

The young man shook the soldier's hand off

contemptuously.

'My name is Jamieson, sir,' he said. 'You give far too exalted a title to a mere cadet

of Royal Écossais.

'Indeed, sir,' retorted Captain Mansell with a sneer, 'I believe I am not mistaken in identifying the two as one and the same He stamped his foot upon the floor, person.' 1907.]

and immediately half-a-dozen dragoons came clanking into the room, with old Rob hovering anxiously in their rear.

'S' wounds, 'tis quite monstrous!' cried Colonel Seton. 'Captain Mansell, you shall answer to me for this.—Long, my dear fellow, you and Alison are best out of this very discreditable affair.—Is Captain Long's carriage ready?' This to the butler.

'Yes, sir, it is in waiting now,' replied Rob.

'I presume, sir, you have no authority to detain all my guests, said the colonel. 'Perhaps you will be good enough to give orders that Captain Long and his daughter may be allowed to break through your infernal cordon.

'With all the pleasure in the world,' said the dragoon, with a smile of undisguised triumph. 'I am only sorry that I shall not have the pleasure of their further acquaintance. 'Tis a

rough night for travelling, though.

'Many thanks for your consideration, sir. We have but the matter of a short mile to go,'

said Captain Long dryly.

'Well, so much the better for you and your cattle,' replied the other. 'I wish I could say the same. - Here, Johnson, see that this gentleman's carriage is allowed to pass without challenge.'

The fellow saluted.

Colonel Seton shook hands in a somewhat agitated manner with Alison and her adopted father, and they quitted the room with the sergeant at their heels.

CHAPTER II.

OW, sir, said the Prince, turning to Captain Mansell, 'if you are sufficiently at liberty, perhaps you will be so obliging as to explain the meaning of this foolery.

You will learn that quite soon enough for your health's sake, sir,' replied the officer.—
'How far is it to Berwick, colonel? We have

ridden post-haste from Rothbury.

'You are not acquainted with the district,

then?' asked Colonel Seton.

'No, thank the Lord!' replied the other. Before yesterday I had never been nearer this God-forsaken country than Prestonpans.' He paused, looked foolish, and bit his lip.

The Prince smiled mockingly. 'You have excellent reasons for remembering that place, doubtless, he said.

Colonel Seton intervened hastily. 'Berwick is twelve miles of rough travelling from my house, he said. It is a wicked night for riding. Had you not best remain here until morning? Everything I have is very much at the disposal of you and your men. Hark to the wind and rain!'

A sudden squall swept down from the hills, so that the building shook to its very founda-

Captain Mansell took his chin in his hand and turned to the cornet. 'I think we might risk it, Ellis,' he said. 'We could get away at dawn. The prisoner will be safe locked in a room together with a strong guard.

The cornet, a man of few words, nodded.

'Very well,' said Colonel Seton; 'that is settled, then. Your troopers shall be accommodated below stairs. I have no doubt,' he continued in a lower tone, 'that you will allow this unfortunate young man the privacy of his chamber without quartering these rough fellows upon him.'

The captain laughed. 'That's a good one,' he said; 'and have him slip betwixt my fingers? No, no, sir. He shall be kept under the strictest surveillance until I hand him over to the Berwick

authorities, I assure you.'

'Well, you have no objection to my accompanying him as far as his room, I suppose?'

urged the colonel.

'None at all,' replied Captain Mansell.-'Now, Johnson, bring with you three men; and, mind, I shall hold you responsible for the safe keeping of the prisoner. The guard is to be relieved every two hours.—Come, colonel, I must see Mr Jamieson'—this with a goodhumoured sneer-'into his quarters.-Are you ready, Ellis?—Then hey for supper and that bowl of punch that smells so invitingly!'

The Prince suffered his captors to close All his about him without remonstrance. assumption of debonair light-heartedness had left him, and he gnawed his lip in gloomy

The apartment was situated high up in an old turret. It was spacious and airy, but nothing lacking wings could have made an exit save by way of the door. A bright fire burnt on the hearth. Captain Mansell poked his nose into every corner. He was in great feather, what with his capture and perhaps the near prospect of supper and a bowl of punch.

'There are no priest-holes or such-like bedevilments here, are there?' he asked at

length.

The colonel shrugged his shoulders. 'No,' he said; ''tis as good Protestant a chamber as any in the land—not as much as a mouse-hole,

if you'll believe me.'

The dragoon laughed uproariously. all,' he said, 'I don't see why the poor fellow shouldn't be alone if he prefers his own company. 'Twill be his last night in comfort for some considerable time, I expect, even should he manage to cheat the headsman.—Here, Johnson, take your men outside, mount guard at the door, and don't let the key leave your breeches-pocket until I ask

you for it .- Will that satisfy you, sir?' This to the colonel.

The latter hardly dared speak for fear lest his tones should betray his joy. 'It is an act of courtesy, sir, for which both I and my friend are grateful, he managed to blurt out. He took the Prince's hand in his. 'I grieve that this unfortunate contretemps has happened beneath my roof, Mr Jamieson,' he said; 'but only time is needed to convince this gentleman of a very regrettable error.'

'That's right; keep it up. I like to see a joke well carried through,' said Captain Mansell with a would-be cunning leer. 'Now, sir, I'm horribly hungry .- Pleasant dreams, Mr Jamie-

son.'

The two dragoon officers and their host trooped off down the wide staircase, and the key was turned upon the luckless Stuart.

The supper proved excellent. The captain talked and jested incessantly; his subordinate spoke very little, but to make amends he ate and drank a great deal. Colonel Seton bore himself with a dignified courtesy, although his eyes twinkled with a malicious merriment. Old Rob was assiduous in his attentions, and the wine circulated freely.

Below stairs such of the troopers as were off duty drank and smoked about a blazing fire, and thanked their lucky stars that they were not splashing along the twelve miles of muddy road that led to the ancient town of Berwick-upon-

Tweed.

Over a freshly brewed bowl of punch, Captain Mansell called upon his companions to make a night of it, and laughed the idea of sleep to scorn. The cornet had his own ideas upon the subject, however, and was soon snoring blissfully upon a settee what time his superior and Colonel Seton engaged in a quiet game of piquet. From cards they passed to dice. The captain won at piquet; the captain won at hazard. The colonel's smile was sphinx-like. It was his business to keep the dragoon in good humour-how better than by letting him win his money, if you please?

At dawn the wind dropped and the rain ceased. A gray, ghastly gleam crept into the room through the chinks of the closed shutters subduing the light of the guttering candles and glinting on the pile of gold at the captain's

elbow.

'Gad!' cried that worthy, 'I had no idea of the time. We must be getting to saddle. I'll give you your revenge at our next merry meeting, colonel.'

'A moment,' replied the other. 'Double or quits that you don't get Charles Edward Stuart

as far as Berwick to-day.

Captain Mansell gave him a quick, suspicious 'Excuse me for two minutes,' he said, and lurched from the room. Presently he returned. 'Done,' he cried; 'I take you!' [Christmas Number.

The colonel laughed, and picked his teeth with a gold toothpick. The dragoon turned to his still peacefully slumbering comrade and shook him roughly by the shoulder. 'Get the men together, Ellis,' he said. 'We ride at once.'

Rubbing his eyes and yawning cavernously,

the cornet rose and quitted the room.

'We must drink a stirrup-cup together,' said the colonel.—'Here, Rob!'

The old serving-man entered with red and sleepless eyes.

Bring two or three bottles of claret.'

'And a tass of brandy for me,' put in the 'I' faith, my head is spinning like an urchin's top! Nothing like a dram of real old brandy to steady one's nerves. But first I must see if your good friend Mr Jamieson is bestirring himself, colonel. By the way,' he added with a laugh, as he swept his winnings into his pocket, 'you shall hear from me at Berwick, but you might just as well pay up the double now. It was a fool's wager, sir, if you will forgive my bluntness of speech.

'There is an old proverb concerning the premature counting of unhatched chickens, Captain Mansell,' replied Colonel Seton dryly. With your leave I will accompany you up-

stairs.'

'By all means,' said the other; 'it is your house, sir, and you have given us most hospitable entertainment. I can only regret that my duty renders it imperative for me to rob you of your guest; but 'tis the fortune of war.'

The colonel smiled serenely. Outside the prisoner's room the guard came to the salute as their officer approached on somewhat unsteady

'Open the door, Johnson,' said Captain

Mansell.

The sergeant obeyed, then fell back with a muttered oath. The captain stood transfixed,

with dropped jaw and protruding eyes.

'I trust that you will forgive the intrusion, Alison,' said her father apologetically; 'but it seems Captain Mansell is looking for a certain Mr Jamieson, and he would take no denial.—I have the honour of presenting my daughter, sir.'

'S' blood!' cried the bewildered dragoon, 'where is the prisoner? What devil's pranks are these?—Johnson, I will break you for this neglect of duty; by heaven, I will! Sir,' stammered the crestfallen sergeant,

'the key has never left my pocket.'

Captain Mansell strode forward and caught

the girl roughly by the arm.

'You jade!' he cried, hoarse with passion; then his eye fell upon a little heap of masculine clothing flung in disorder on the floor, and he stood mute and gaping

Alison shook herself free from his hold and

1907.1

confronted him with a contemptuous smile upon her lips.

'If you ride, captain,' said Colonel Seton suavely, 'you may reach Berwick in time to wave your friend Mr Jamieson and his friend They sail early this Captain Long adieu. morning for France, I believe.

The dragoon swung round on him, his brow

purple with rage.

'You shall take his place, sir,' he cried furi-'Within two hours I will have you ously. under lock and key in Berwick jail.'

Colonel Seton tugged at his moustache, an

amused twinkle in his gray eyes.

'I should advise you to hush it up if you can,' he said sympathetically. 'The whole story is fair absurd-not creditable by any means. You will be the laughing-stock of His Majesty's forces. Still, if you insist, I have no option but to obey. I think I see the faces of certain high-placed personages when they learn that Captain Mansell of the Royal Dragoons spent the night dicing with a poor country gentleman, while Charles Edward Stuart'-

'Enough, sir,' stuttered the luckless captain. 'It was clever roguery, I don't deny; but they laugh longest who laugh last.—Johnson, get the men together.—Curse you! We may yet tread on this masquerading trickster's

corns.

He blundered heavily down the broad staircase, closely followed by Colonel Seton. As they reached the hall the latter spoke.

'I must trouble you for fifty-one guineas and odd shillings, sir,' he said airily, 'the amount

of the bet in question.'

Captain Mansell plunged his hand into his pocket and sent a veritable shower of gold pieces scattering over the oak flooring. lips were flecked with foam. He spat out a volley of foul oaths.

'They would sully the hands of an officer and a gentleman, you bogus colonel, you!' he cried, half-inarticulate with shame and anger .- 'Ellis, have you mustered, or are the swine too drunk

to climb into saddle?

The cornet gave his shoulders a barely per-

'We are waiting, sir.'

ceptible shrug. 'We are waiting, sir.'
'A moment, Captain Mansell, if you please,'
said the colonel. 'I could overlook your impertinence to myself as the mere childish spleen of an outwitted and (if I may be pardoned) halfwitted booby. But you have dared to lay your hand upon a lady in my presence, and that lady my daughter. If this gentleman will be so obliging as to accompany us, there is a secluded alley within my shrubbery where we may discuss the matter at further length and without fear of interruption.'

Captain Mansell went white beneath his tan, and took his under lip between his teeth.

'I am on duty, sir,' he stammered. 'As a soldier you should know that I am bound to reach Berwick without delay. Any other time you will find me very much at your service.'

'A bogus colonel I think you said, sir,' replied the other with a glance of mingled amusement and disgust. 'Also, your duty did not prevent your losing a night in dicing with such an undesirable character.—Mr Ellis, I wish you good-morning, sir, and a more reputable associate.'

A table near the door was set out with wine. The colonel poured himself out a glass of claret. 'A ton plus grand courage, monsieur,' he

said, and made a little mocking bow.

Choking with fury and white to the lips, Captain Mansell clapped his hand to his sword-hilt, then, thinking better of the business, swung round on his heel, and so out of the house.

The cornet turned to Colonel Seton. 'Sir,' he said, 'I am not responsible for this man's conduct, but I will see to it that he has

his deserts. You yourself have my sincerest regrets.'

He strode clanking off, and heaved himself into his saddle. There came a sharp word of command, the rattle of accourtements, and then the trampling of horses' hoofs down the long avenue sodden with fallen leaves. The colonel turned and found his daughter at his elbow. She was very pale, and trembled like a tall white lily shaken by the wind. He took her in his arms.

'Alison,' he said, 'you have saved not only the Prince but the cause itself. Heaven knows you have made James Seton a proud man this day!'

With a sudden swift impulse she tore the white cockade from the bosom of her dres and flung it from her across the hall. 'Pray God I may never set eyes on his face again!' she cried, and fell in tears upon her father's shoulder.

AUNTIE JANE.

AUNTIE JANE is nice as can be, Pleasant to hear and pretty to see; She never was wed, but I hear them say She was to have been long years away. Something happened; she bears a pain Still in her heart, poor Auntie Jane!

Auntie Jane is kind to all,
Ever ready at each one's call.
She reads and sings and plays and talks,
And takes us the happiest summer walks,
Or romps in the schoolroom if it rain.
A lot of nice games knows Auntie Jane.

If ever we happen to be in a scrape She is the one to help us escape. Mother was angry, and father wroth; Auntie contrived to soothe them both The day that I banged the schoolroom pane. A blessed peacemaker is Auntie Jane.

If ever we're sick she comes to our bed, Pats the pillows beneath our head, Sits by our bedside all the night Knitting her sock by the candlelight, And fetches us nicely round again. The best of all nurses is Auntie Jane.

When I am a man, and earn my bread,
She is the wife I mean to wed;
But when I tell her she only laughs,
Crumples me up in her arms, and chaffs;
And that anybody can see quite plain
Is very unkind of Auntie Jane.

T. P. JOHNSTON.

[Christmas Number.

THE LOCKED WING.

By KATHARINE TYNAN.

AUTHOR OF 'THE HANDSOME BRANDONS,' 'A FAVOURITE OF FORTUNE,' &C.

I was a whimsy of the Judge's to go back to his native wilds every year for a holiday, and that was a sore trial to madam his wife; what with the horrible long coach-journey, and the packet (that, if the winds were contrary, might be blown about

for a week between the two coasts), it was an ordeal for the poor lady. And afterwards there were two months among savages—'Not a creature fit to speak to, my dear'—with all manner of inconveniences of living, while madam's friends were enjoying themselves at the Wells or by the sea, and meeting hosts of fashionable acquaintances.

It gave madam the spleen; but, as she explained to her friends, she did not oppose the Judge's will, 'else, my dear, he might be monster enough to buy a house in that wild country,' where there were palaces to be had dirt cheap; and then madam would have to

retire there when the Judge was grown too old for the Bench.

It chanced one summer that, to the Judge's much perturbation of mind, the great house at Inch, which he had inhabited summer after summer until he had come to look upon it as his own, was taken over by the family to whom it belonged, who had grown tired of being absentees, as they call it in those parts.

For a little while madam hoped that she was to have a summer in England, but the hope was cruelly shattered. The Judge remembered Lismore, a huge place on the cliff, overlooking the sea. It belonged to the widow of a bishop, an impoverished lady, and it was to let, if any

one could be found to take it.

Why, it was a thousand times worse than Inch. There, at least, things were in some sort of repair. Madam had never visited Mrs Verschoyle, the bishop's widow, but she knew what she should find: leagues of empty, echoing rooms and corridors which had been stripped of their furniture, acres of broken windows, worm-eaten draperies, damp walls, rats in the wainscotting—in fact, all sorts of horrors.

'La!' she said to the Judge; 'why, I shall die of the damp and the loneliness. The place would give any one the vapours.'

'Not you, Clarissa,' the Judge replied carelessly. 'You know you are as strong as a 1907.] horse, and only carry hysterical water about with you because it is the fashion.'

It was true enough that madam never knew what it was to suffer from an ache or pain, that she had the appetite of a fox-hunter, and slept the sleep of a young child; but she did not like to hear it from the Judge's lips. The Judge was always so sympathetic with other ladies when they ailed or pretended to! It was all very fine for the Judge. He fished and shot and rode and walked all day, and enjoyed himself at night over the card-table, where the Abbé Murphy (a charming man who had been educated abroad) and Mr Neville, the parson, made up the rubber. Madam was often bored to extinction. The abbé was vastly polite, but his habit of snuff-taking was disagreeable to madam. And Mr Neville was stupid, knew no world but this narrow and dull one. Madam yawned behind her fan while he talked with her.

The widow of the bishop was a little, soft, pretty person, who pleased the Judge at first sight. In the interview they had concerning Lismore they talked more of the lady's sorrow than they did of practical things, with the result that the Judge agreed to pay far more for the place than it was worth. Madam sniffed over the arrangement when she was told of it. 'Without doubt,' she said, 'the bishop's widow was a pretty, not to say designing, person.'

She was hardly prepared for the extent of Lismore, although she had seen it standing up naked on the cliffs above the sea. What she had not bargained for was the sunk story, which, with three floors above, made the house four-storied. The main body of the house was of red brick, and the odd feature of it was that the wings on either side were stuccoed white.

'What a great, lumbering barrack of a place!' she said. 'How are we to keep it in use, even when we have visitors? And, la! yonder wing is not lighted at all; all the windows are blind.'

'It is lit from the other side, which overlooks the sea,' the Judge said. He was standing by the coach door waiting patiently for madam to alight. 'But you need not trouble about it, my dear. All that wing is locked. The poor soul has put away her treasures there.'

'No doubt,' snapped madam, 'and left us

nothing but worthless rubbish of chairs and tables to live among for three months.'

The Judge said nothing; and madam, bridling, walked into the house, followed by her niece, Arabella Romney, a cold and proud beauty, who relished no more than madam being banished to these wilds.

But, whatever Mrs Verschoyle had stored away in the locked wing, madam had nothing to complain of on the score of the furniture that had been left for their use. Every room, indeed, was full of beautiful and valuable furniture, that overflowed into the corridors. Such tall, graceful cupboards, such chairs and tables, such gilt mirrors, such gilt and brocade sofas and fauteuils, were not to be bettered in the finest houses of madam's friends. walls were covered with pictures of value. Judge had made the Grand Tour, and was a connoisseur of pictures. There were valuable old china and plate and bric-à-brac. Madam wondered at Mrs Verschoyle for not selling it, since she was poor; having no clue to the state of mind which makes a descendant of an old, proud race cling as fondly to the inanimate things which had belonged to it as though they were flesh and blood.

Miss Romney was as much bored as her There was not a soul in the place fit to speak to, she declared; and she gave herself very haughty airs when the abbé and Mr Neville came to dinner, which were quite thrown away on those simple gentlemen.

She displayed little interest in anythingin the beautiful old house, the delightful overgrown garden, the wonderful scenery, the kindly, primitive people. But then it was her way not to be interested. It would be another matter when her sister Primrose came. Primrose was the Judge's delight. She was so fresh, so fair, so simple and unworldly. When Primrose came she and the Judge were going to have rare times together!

Just one little interest developed in Arabella's mind during the first week at Lismore. came into the room overlooking the sea which madam had taken for her boudoir, with a beautiful piece of Sèvres china in her hands.

'Look!' she said, 'it is from Madam There is much more Verschoyle's china-closet. where that comes from. There it lies for the rats and the spiders to enjoy. There are cups there would drive them wild in St James's. Supposing we make use of it while we are here! But, la! what would be the good of it, seeing there is never a soul but the priest and the parson to visit us?'

'But how did you come by this, Arabella?' madam asked, her eyes gloating on the piece. 'I have never seen anything so perfect.'

'Why, a window of the closet looks into the kitchen, and a pane is broken. Jessamy, my maid, brought me there to peep. She is a | curious thing. By reaching it is possible to fetch out a whole shelf of the china.

'The Judge would never hear of it,' said 'Put this back where you found it, Arabella, and bid Jessamy keep her fingers from touching. Mrs Gloag had better cover the window with a sheet of stout paper.'

Madam always brought her own servants with her on these expeditions, else she declared she could not live in such barbarous surroundings. So, from Mrs Gloag the housekeeper to Smutts the scullery-wench, they all came trooping over in the Judge's train, to their dissatisfaction and scarcely less so to his. They wanted to go to Bath or the Wells, where the manners and society of the servants' hall were scarcely less genteel than the life upstairs; while the Judge desired a simple life, with a few barefooted girls to clean the house and wait table, and the daughter of the woman who had been cook for his mother long ago to send him up simple fare.

After that it became an obsession to Arabella to wonder what beautiful things the locked rooms might hide. She would have picked a lock, or at least procured its picking, if she had dared; but the Judge had odd ideas about certain things, and madam and Arabella knew him too well to do anything which he might

consider dishonourable.

The thing was put out of Arabella's head by

a very unexpected happening.

The Judge brought home a young gentleman to dinner one evening. He was handsome and ingenuous. He stared at Arabella at their first introduction as though her beauty dazed him, which was mightily pleasing to the young lady. He wore a sailor's uniform and he was brown and sunburnt as became that profession. He had white teeth and a pleasing smile, and he carried himself with a diffidence which pleased both the ladies and the Judge.

He was Lieutenant John Stafford of His Majesty's Navy; and at the moment he was engaged, to his great disgust, in doing the inglorious work of the Revenue, when he ought to have been with that glorious man of war,

Admiral Nelson, in Egypt.

It seemed that from time immemorial French wines and brandies, and foreign silks and laces, and other such matters, had been smuggled ashore at this part of the coast, eventually to find their way to London. The inhabitants of the villages round about were in league with the smugglers. So also, if you could believe it, were the few gentlefolk in these parts. The smugglers had gone on so long with impunity that it might have lasted for ever; but some thing had wakened the Revenue to a sense of its duty. It had placed a gunboat off the coast, with Lieutenant John Stafford in command. He had been there some six months without result. The smugglers had always managed to [Christmas Number.

get their cargo ashore somewhere just before the gunboat made its appearance. It was most discouraging, said the young man. times he had thought to catch them, and they

had always eluded him.

'These are very lawless parts,' said madam, who had a jugged hare as pièce de résistance for The hare was poached, of course, as were a brace of grouse which would precede the hare; and madam, or Sarah Gloag for her, had bought them for a song. The Judge would have had fits if he had known of it; but, 'La!' said madam, 'you can't tell the gentlemen

everything.

For a few days Lieutenant Stafford sunned himself in Arabella's smiles. It was so long since the young gentleman had known female society that it was delightful to have to dance attendance when he was off duty on Arabella and her aunt. The Judge had taken a great fancy to him for a straight, manly fellow, and was rather distressed at his being the victim of Arabella's bow and arrow. Arabella was a hard-hearted coquette, and had not so long since sent a simple boy to destruction by her wiles, a matter which had made a little scandal at the time and had greatly worried the Judge. However, he took heart of grace.

'Wait till my pet Primrose comes,' he said to himself; 'Primrose, sweet as her name. If I know anything of the lad, he will desert the proud, flaunting Peony for the modest Prim-

1907.]

His anticipations were fulfilled. The young gentleman fell a victim at first sight to Primrose, who was like her name, with her soft, pale cheeks and her golden head. She was wearing a pink frock with a white muslin kerchief about the neck; and when he looked at her she was as pink as her frock. He looked once, and he looked again; and he looked no more at Mistress Arabella, who was deeply chagrined at his desertion, although she had it in her mind only to play with him and leave him. A plain officer in the King's Navy was not to be thought of as a serious lover. Yet there was not another beau in the country-side, and it was intolerable to the proud beauty that he should have been carried off from her by her little country sister.

The Judge looked on at the love-affair which he had prophesied with a feeling as though he were young again. When he was alone he jingled the seals of his fob and smiled pleasantly to himself. He had been afraid that when Primrose came to town from the old rectory in Warwickshire, which was a fragrant place in his thoughts, she might be carried off by some fine gentleman of the town, and, being my Lady This or the Countess of That, become spoilt and a worldling. Not like her sister-oh no! she could never be like Arabella, who took after her mother's family, while pretty Primrose favoured her father's. But he might lose her; she might become a flower of the parterre instead of his little wild flower.

Now he would marry her to the young sailor; and there would be always a place for him by the fire when he had a desire to avoid the somewhat overpowering splendours with which madam surrounded him. They would make up to him for his childlessness. The Judge was very tender in his thoughts of dear Jasper, his brother, Primrose's father, who, like himself, had made a not altogether congenial marriage. Primrose's son should carry on the name. When the Judge was away from his professional duties he delighted in day-dreaming.

Primrose heard in time of the locked wing and the treasures the wing was supposed to It stirred her imagination but little. contain. She had other things to think of at the moment. But before she slept that first night at Lismore a thought of the solitudes on the other side of the wall came to her with a slight suggestion of

fear.

They had put her at the extreme end of a long corridor which ran the full length of the house, and was only stopped by the oak door sunk deep in its arch of stone which led to the locked wing. Her room was next to the locked wing, and she was the only one on that floor, for the servants slept on the upper floor, and madam and Arabella between them had taken the principal rooms, which lay on the floor beneath.

Little Mistress Primrose had not thought to be afraid. She had good country health and a harmless country conscience; and she would not have feared the least bit in the world to be out in the fields and woods at night, so long as she did not encounter man there, but only

the kindly creatures.

Yet the thought of the empty rooms had a terror for her-not sufficient to keep her awake, however. She slept soundly for some hours; but she must have had a horrid nightmare, for she awoke trembling and crying out as the gray was about to give way to the golden and rosy dawn.

She knew there had been a great tumult and commotion in her dream, and that it was something that went on in the locked wing. Even when she was awake and knew the sun would soon be on her window and on the glittering sea outside, she yet quaked with fear; she longed to get up and seek comfort from some one, but she felt as though something would seize her if she stirred. While she lay in the unreasonableness of fear the clock in the courtyard above the stables clanged out three strokes.

So it was morning, and the ghosts were all gone back to their shadows, and the cocks were crowing. There was not a sound now but the stir of the sea and the crowing of cocks and the crying of sea-gulls. And soon the living people would be about.

She slipped out of bed with a beating heart, impelled to seek for society and comfort. With a fearful glance at the door of the locked wing, she sped along the corridor, where the shadows were retiring into corners and trooping away before the cheerful lances of the dawn. She dared not look behind her as she went flying along in her white, beribboned night-rail, a little ghost herself.

She opened her sister's door without knocking

and crept in beside her in bed.

Arabella pushed her away angrily. She had been awakened from a delicious slumber, and her sister was cold. She would hardly listen to

Primrose's story.

'Mercy me!' she said, 'what is all this? Ghosts in the locked wing! What a farrago of nonsense! 'Tis what the kitchen-wenches are saying, and grumbling that they must remain. If they have it from thee, sister, they will pack off in a body and we shall have only the savages of these parts to attend us.'

With contempt and anger she drove Primrose from her. There was nothing for the girl to do but to return to her apartment; but not to sleep. She dressed herself with trembling fingers, and when she was dressed stole down through the silent house, took the bars off the door, and slipped out into the delicious morning. She was not afraid, with the good sun warming all the world and the sea-wind in her face.

As she was running along the cliff-path, so glad to have escaped from the terror of the house, she ran straight into the arms of Lieutenant Jack Stafford. He had come ashore from the gunboat, and was, like a foolish and romantic boy, on his way to gaze on the house that held his beloved, when, to his amazement,

she came tripping down the path.

They held hands a second, and then she broke into a confused account of how she had been desperately frightened, and did not dare remain in the house. As she talked the memory of her terrors returned to her, and suddenly she burst into tears. In a second she was in his arms, being caressed and comforted with a greater kindness than she had thought possible in a man.

Her sobs relaxed on his breast, and he soothed her out of her fears, bidding her to remember that she was in her lover's arms. After a time he led her back towards the house, and stood watching her while she entered it. It would never do to have the tongues of scandal say that Mistress Primrose stole out at daybreak to meet a lover, although she would not have thought of it; but the man was wiser.

She was not afraid now, with the exquisiteness of her lover's first kisses and caresses about her. She was glad there was no one to see her as she stole along the corridors, now flooded with the morning sun, to her room, where she lay smiling and blushing till the servants were about the house and she might reasonably make her appearance. Her fears had fled away. How silly she had been to be frightened by a nightmare! No wonder Arabella had been vexed with her. But how he had comforted her! There had never been any one so deliciously kind.

If she sometimes quaked at night when she found herself alone in her room, she was so exquisitely happy that her golden thoughts sufficed to drive out the fear; and in time, since she had no more nightmares, she forgot, or only remembered to smile at, her folly.

The Judge had taken the young couple under his protection, so it was useless for madam to cry out on such a pauper marriage, or for Arabella to direct wounding remarks at her young sister. To be sure, 'love in a cottage' would do very well for Primrose, when it would have been a horror for Arabella, who still looked to make a great match, although she had been a toast for some seasons now.

The one thing that hurt Primrose was that Arabella was so disagreeable to Lieutenant Stafford. She did not often address him, but she never failed to ask, in her shrill, affected voice, 'Well, sir, and what news of the

smugglers?'

At the question the young man would turn red and bite his lip. His failing to catch the smugglers was a sore point with him. Time after time he had been misled by false information. Time after time he had given chase to the smugglers, only to lose them and their cargo in the impenetrable shadows of the cliffs and the winding creeks that led inland. They ran their contraband goods ashore in the very teeth of the gunboat, and were off, showing a clean pair of heels. Or—the whole countryside was in league with the smugglers-he would receive information that a cargo would be run ashore at a certain point on a certain night, and would lie in wait, only for nothing to happen; and he would learn later that he had been on a false scent, and that the smugglers had really landed their cargo somewhere else while he was engaged in the useless watching.

The wearing game of hide-and-seek, the consciousness of being fooled and outwitted, the knowledge that promotion would pass over his head if he should fail in this enterprise, was the canker in the rose of his love. Therefore he winced, although he tried to carry it off bravely when Arabella asked him, 'What news of the smugglers?' Therefore he grew darkly red when she suggested, with light malice, that a lover within reach of his mistress was not the best person to be sent to catch the smugglers.

The Judge was as anxious that he should succeed as the young man himself. When he IChristmas Number.

got back to town he would have interest enough to advance Lieutenant Stafford; but he did not want to make interest for a failure. He did not want his Primrose to marry a man who had failed. And he was fond of the lad. He did not know any man among the fine gentlemen to whom he would have given his little Prim as cheerfully.

The Judge stayed late that year, although madam moped and Arabella sulked and the servants were in rebellion. He stayed late because he hoped that Lieutenant Stafford would do something; and, in order to save him distraction for the last few weeks of their stay at Lismore, Mistress Primrose had been packed off on a visit to some old friends of the Judge

and her father in Dublin.

The nights were very dark when Primrose came back in time for the packing-up. nights were dark, and it was mild October weather; and madam was eager to be gone before the equinoctial gales, now somewhat overdue, should arrive.

It came to the last night but one. Primrose and Stafford had seen little of each other, for he was making a determined effort to capture the smugglers, and he gave neither his men nor himself any rest. And this last night, when he was full of furious energy, he slipped on the cliff-path below Lismore, fell a few feet on to a dangerous ledge, and was discovered there, helpless, with a broken leg, just about the time when he ought to have been lying in wait below Cooldhu cliffs, on which Lismore stood. Time after time the smugglers had seemed to disappear into the great cliff-face. Somewhere, not far from Cooldhu, they must have their secret landing-place and their secret way of reaching the world above.

It was low-tide about the middle of the night, and there would be no moon. It was the very night for the smugglers. And here was Jack Stafford disabled, lying in the library at Lismore on a sofa near the fire, groaning in spirit even while the Judge did his best to

cheer him up.

The household had retired for quite a long time, but still the Judge sat up talking with his guest, now and again throwing a log of ship's timber on the fire. He had an idea that when he left the young gentleman to himself the blue devils would come to take his piace; so he sat on, and they talked of many things, and the Judge tried to console him for his failure so far to capture the smugglers, and to cheer him up with hopes for the future, although in his own heart he was perplexed about what ought to be done with the boy. What good would he be to himself or any one lying there with a broken leg when they had all gone back to London? And the thought of poor Prim's distress at the accident touched the Judge in his softest place.

Prim meanwhile was sound asleep, after many 1907.]

tears, oblivious at last of her lover's accident, and the parting that was so near, and all other painful and disagreeable things. But suddenly she awoke in the thick darkness to a wild terror and a babel of noise. She could not tell exactly what it was like, that noise. She said afterwards that it sounded as though giants were dragging forest trees over mountains. noise seemed all about her. There were voices too-low, muttering voices. Suddenly the clock in the courtyard above the stables struck three o'clock, and she remembered. It was not the first time. That was no nightmare. The terrible noises were in the locked wing !

She sprang out of bed in wild terror. She did not dare lie on there with only the wall between her and she knew not what. Supposing the noise were to pass the door of the locked wing! Supposing her own door were to

open-and-

She was out of bed, and flying, flying, barefooted, with but a shawl she had caught up about her-flying silently, with Fear at her heels. Suppose the door of the locked wing should open behind her and they should pursue her! She slipped on one of the stairs, and her heart almost stopped beating. Down, down, past the rooms where madam and Arabella slept soundly. She was on her way to her lover-who was not to be moved from the library for the night-to her lover, and the Judge, who had sat up with him and would be sitting up with him still. She was too distraught to think of appearances, proprieties, anything.

She launched herself like a mad thing into the room where the two men sat talking in low tones. She flew straight to her lover and dropped beside his couch, unable at first to speak. It was the most overmastering terror, she said afterwards, as though she had stepped over the borders of a soft, comfortable world

into one full of horror and dread.

After a little she was able to tell her tale. The Judge listened with an air of tender incredulity, humouring his pet. But John Stafford broke out into a shout.

'Open the locked wing, sir,' he said, 'and we shall find those barrels of wine, and bales of silks, and rolls of laces, and cases of sweet waters. They have some way of reaching Lismore. I ought to have thought of it before. And Madam Verschoyle is in league with them, like every man, woman, and child in this confounded place.

It was as he said. The locked wing was a storehouse for the smugglers. Instead of the beautiful old furniture, the chandeliers, the tapestries, the pictures, the rich carpets, the mirrors and gilding madam and Mistress Arabella had imagined, the great rooms were heaped with barrels and packing-cases and such dull-looking matters.

There was a secret way from a little beach

below the cliffs to Lismore House, hidden except at very low-tide. It was easy to see that the way had been in constant use.

There was a fine haul of contraband goods for His Majesty's Government; but, more than that, there was found wedged among some beautiful laces a packet of documents which proved of great importance to His Majesty and his advisers, for they were not yet done with plots to bring in the descendant of the Stuarts as king of these realms. And it was a great thing for many people that the packet never reached those for whom it was intended, for His Majesty was clement, and by that clemency won over many from what was indeed a lost cause.

The Judge would always have it that Madam Verschoyle was a Jacobite agent. However that was, the lady stoutly denied any knowledge of the smugglers or their plans, although the evidence was all against her.

But Lieutenant Jack Stafford got his captaincy, and in due time much greater promotion. He had no more hunting after smugglers, of which fact he confessed he was glad, for he had no mind to the work. And presently the time came when—madam being called to the reward of her virtues, and Mistress Arabella married to an elderly peer with a bad reputation—the Judge and Commodore John Stafford and Mrs Stafford returned to the wild country of the Judge's love, where he had acquired an estate, and spent the evening of his days in happiness with those he called his son and daughter.

Rumour had it that in time both the Judge and the Commodore were no better than their neighbours, and winked at and even profited by the doings of the smugglers. But that their friends on this side of the water were loath to believe.

THE OLD HOME HEARTH.

AN EXILE'S SONG.

OH, the sunshine's blithe and bonny in this land of bush and veldt,
And it's nothing else but sunshine that I see;
But my heart knows one snug island where my childhood's days have dwelt,
And it's Memory's sun that lights that land for me.
Oh, the flicker of the log on the old Home Hearth!
Oh, the faces it has lit for me!
Is there a joy so sweet
As at twilight tryst to meet
The dear ones 'neath the old roof-tree?

There are sunny hearts around me in my land of exile here,
There are tender words of welcome where I stray;
But they know not twilit evenings with the hearts I hold most dear,
In a land of mist and mem'ry far away.
Oh, the flicker of the log on the old Home Hearth!
Oh, the faces it has lit for me!
Is there a joy so sweet
As at twilight tryst to meet
The dear ones 'neath the old roof-tree?

But the log shall never flicker as it did for me of yore,
Nor the ruddy embers quite so warmly glow;
For some have crept out darkly by the dusky shadowed door,
And my heart is fain to ask them where they go.
Oh, the flicker of the log on the old Home Hearth!
Oh, the faces once it lit for me!
Oh, twilight hour so sweet
When our tryst was still complete
Round the hearthstone 'neath the old roof-tree!

MARY ADAMSON.
